A typographical error appeared in the fourth paragraph of the article on the Boston Elevated Railway, Boston, Mass., in the issue of the JOURNAL for Aug. 18, page 276, in which it was stated: "The 'L' averaged about 1,074,000 passengers weekly in 1917," etc. This number is the week-day passengers; that is, passengers per week-day, excluding Saturdays and Sundays. As printed previously the statement seems to give the company this number of passengers per week. Apparently, from the article, the company had more passengers per day on Sundays and holidays than it did on week-days, whereas, of course, the reverse is the case.

High Safety Records in Chicago

New high records in accident prevention were established in 1927 by employees of the Chicago Rapid Transit Company, Chicago, Ill., according to the annual report recently issued by Melvin W. Bridges, safety engineer. Employees of the Loop division led the transportation department, with a safety operation average of 99.51 per cent for the twelve months of last year. During this time there was only one disabling injury and only nine days of lost time due to employee accidents. The metropolitan division employees of the department came second with a score of 97.31 per cent safe and the south side division finished third with a percentage of 97.30.

Other interesting figures in the report show that 358 safety meetings were held among employees during 1927 and that approximately 625 suggestions were received for raising safety standards.

Amalgamated Asks Concessions in New Orleans

Members of the Amalgamated Association have addressed a letter to the members of the Commission Council as well as all of the officials of New Orleans Public Service, Inc., New Orleans, La., asking the Council to use its good offices and the company to accede to their request that division No. 194 be recognized as the only carmen's union in the city with which a working agreement should be made by Public Service.

The letter states that an existing working agreement, reached in Council chamber, on Aug. 12, 1926, forbids any other organization making an agreement over working conditions with the company and charges that several men not members of the rival organization can violate many rules without even being cautioned or reprimanded.

Another working agreement is to be signed between the company and the men in October and under the agreement the union must notify the company 60 days in advance of the termination of the contract what it will ask in any new agreement. It is because of this that the union sent the letter to the Council and officials of the service company.

Not Quite Sinister

IN THE opinion of Senator Walsh, the results already achieved by the Federal Trade Commission in its investigation of the electric light and power industry have "revealed conditions as startling as they are sinister." Activities of the utility companies which the commission, in an *ex parte* proceeding, has been reviewing and the Senator has been finding both startling and sinister, are those of organized "propaganda" against public ownership. It will be conceded, even by the public utility interests themselves, that many of their salaried molders of public opinion were indiscreet to the point of impudence. That is the head and front of their offending, on the record the Trade Commission has made to date.

So far from being sinister or alarming, their doings have appeared only boresome and at times a little grotesque. Everybody is engaged to some degree in some kind of propaganda, Senator Walsh a little more so than most of us.

Utility associations would have done better to carry on their activities more openly and to let the schools alone. The fact remains that their cultivation of public opinion could not possibly have been as secret and underhanded as the management of the inquiry to date seems to imply, or as the Hearst newspapers would have their readers understand. Everyone knows that the great corporations are against public ownership. What the user of their services must ask himself is whether that interest, so far as this broad issue is concerned, is identical with his own and that of millions like him. One who thinks so is not necessarily an alarming or sinister creature.—*Wall Street Journal.*

City Protests St. Louis Fare Ruling

Notice of the appeal of the city of St. Louis, Mo., to the Cole County Circuit Court for review of the ruling of the Missouri Public Service Commission in the St. Louis Public Service Company rate and valuation case was served on the commission at Jefferson City on Aug. 20. Judge Westhues will set the appeal for hearing at the October term of court. The city has attacked the valuation placed on the property, the rate of return allowed on that valuation, the methods used in determining value and the 8-cent fare allowed the railway.

Purging the Park of Undesirables

Emerson W. Baker, president of the Fitchburg & Leominster Street Railway, Fitchburg, Mass., which controls Whalom Park, has warned bus drivers that they will be prosecuted if they bring undesirable passengers into the amusement park. Mr. Baker said:

The railway has been bothered with parties from Boston and vicinity in the past. We do not like to have them and wish they would not come. If the situation persists the registration numbers of the buses or trucks bringing them into the park will be taken and recommendation will be made to the registrar of motor vehicles that the licenses be revoked.

Turns Against Lights Permitted in Baltimore

Cars of the United Railways & Electric Company, Baltimore, Md., have been authorized to make right and left turns against red signal lights just installed on Baltimore Street. Heretofore they have been required to make turns only on the green signal. Under the present arrangement the turns may be made against the red lights at a signal from the policeman in charge of the intersection. The turns will not be permitted at night, however, when the lights are operated automatically and there are no policemen at the crossings.

Strip and Commutation Tickets Advanced at Green Bay

Fares charged on the city and interurban lines, both electric and bus, operated by the Wisconsin Public Service Corporation at Green Bay, Wis., are to be increased under an order by the Railroad Commission. The cash fares are not increased, the commission merely changing the price of strip tickets and commutation books. The cash fare on the city lines is 10 cents. Under the decision of the commission strip tickets, formerly sold at four for 25 cents, will be sold at six for 50 cents. Commutation books of 50 tickets, formerly sold at $2.50, will be sold for $3 in the future. On the interurban and bus lines, zone books of 40 tickets each, formerly sold for $3, will be sold for $4 under this order.

Tramway Is Indispensable, Says Lord Ashfield

At the general meeting of the London & Suburban Traction Company, London, England, Lord Ashfield said that the actual contribution made by the tramways to the carriage of London's traffic is still so material that no other form of transport could lightly take it up if, for any reason, the tramways were to cease operation. He said:

We must recognize that tramways are an indispensable part of any complete system of transport that can be contemplated in Greater London for many years to come. The crux of our problem is that the people are heedlessly acquiescing in a competition upon the streets which must, unless checked, ultimately prejudice them. It fails to realize the value of the tramways, and that without the tramways, comfort and convenience would be seriously impaired. Each year, however, some favorable omens appear. The year 1927 was one of growth in traffic. The tide turned late in 1926 and has continued to rise steadily since. There was an advance of about 7 per cent during last year, and this still persists in 1928. It may be attributed to the interaction of two causes—the stabilization of the bus services on tramway routes, and the continuous growth of the travel habit in London, which is increasing in all directions. Our major hope, however, must center upon the scheme which the London and Home Counties Traffic Advisory Committee propounded in July of last year for a common fund and a common management to embrace all the local passenger transport-carrying agencies within the London traffic area.

The advisory committee consists of representatives of local authorities, transport undertakings and labor, and its business is to study traffic problems and to advise the Minister of Transport as to the best means of solving them.

Sydney Electrification Progressing

Electrification of the main suburban railway of Sydney, Australia, is proceeding rapidly. It is expected that electric trains will do much to relieve the congestion of traffic during the peak periods. Two stations on the Sydney underground system are now satisfactorily handling traffic that previously required eight platforms at the central station.

Traffic Increases in Lisbon

For the year ended Dec. 31, 1927, the Lisbon Electric Tramways, Ltd., Lisbon, Portugal, carried 104,581,427 passengers compared with 97,422,768 the preceding year. The increase is largely due to the inclusion of the passengers carried on the Ascensores Lines, which were previously worked as a separate enterprise. After deducting interest charges and the payment of £24,540 interest on and the redemption of the debentures a net profit of £161,-875 is shown. To this sum is added the credit balance of £8,370 of profit and loss brought forward from last year, which leaves a balance of £170,-182. Capital expenditure during the year amounted to £47,384, represented by additional rolling stock and extensions of the system. These facts were disclosed in the report of the directors at the general meeting held in London on June 13, 1928.

Madras Suburbs to Electrify

Proposals of the Railway Board for providing electric traction in the Madras, India, suburban section of the South Indian Railway, have been accepted by the standing finance committee. Electric energy will be supplied by the Madras Electric Supply Corporation at specially low rates. The work of electrification is to commence at once.

The South Indian Railway is now carrying out a project for the improvement of suburban traffic in Madras. With the adoption of electrification it is proposed to modify the work already in progress to meet the requirements of electric service.

Electrification Needed in Egypt

Some time ago the Egyptian Government appointed Sir Philip Dawson, M.P., to investigate and report on the possible electrification of the railway between Cairo and Helouan. The report stated that more than a mile of the Cairo end of this line is an obstacle to city traffic and recommended construction of a subway or elevated line to relieve the congestion. It has now been decided to construct an overhead track from the Bab-el-Louk Station to the outskirts of the city. Eventually this line may be extended to the central portion of Cairo.

New Subway for Barcelona, Spain

By a royal order, Mariano Rubio, a prominent engineer of Barcelona, Spain, has been granted the concession to build and operate a subway between Barcelona and Badalona, the latter an important manufacturing city of 30,000 inhabitants 9 kilometers from Barcelona, and now connected with it by railway, tram line, and autobus service. The construction is to be completed within four years, and will cost, judging from the amount of the bond specified in the contract, about 50,000,000 pesetas (current value of the peseta about $0.17). Mr. Rubio is chief engineer of the Sociedad Anonima El Tibidabo, Barcelona. It is rumored that he has sold the concession to the group of Barcelona capitalists owning the Tranvias de Barcelona, which operates the tram lines of the city and also controls the subways and the autobus services now existing.

Brazil Line Nearing Completion

Electrification of the branch of the Oeste De Minas Railway, Brazil, from Barra Mansa to Augusto Pestana, is nearing completion. This constitutes the first electrified branch of a railroad belonging to the government.

Swiss Federal Railways Enters Gasoline Business

Establishment of gasoline tanks in 200 Swiss Federal Railways stations, from which sales will be made to the public by the station personnel, was recently approved by the board of directors. The foreign company with which the arrangement is to be made, agrees to transport all of the gasoline by rail to the various stations. In return for this agreement the railway is forbidden to accord to any other company, either Swiss or foreign, any similar concession under more favorable terms. It is believed that this business will pay the railways a yearly commission of approximately 1,500,000 francs ($288,600).

Italy Extends Electrified Lines

Another 16,000,000 lire, or about $750,000, will be spent by the Italian State Railroads for the electrification of the Cuneo-San Dalmazzo line to the French frontier, a distance of 64 kilometers, according to a recent report. The building of power houses, transmission lines and distributing plants will be completed by the Societe Generale per Costruzioni of Rome.

Railway to Construct Public Building

Construction of an exhibition building at Earl's Court, London, England, is planned by the London Underground group of electric railways. It is expected that this will be not only the largest and best building of its kind in London, but also one of the finest exhibition structures in the world. The site is that of an old exhibition building. It is twenty acres in extent. The plot adjoins Earl's Court stations of the Metropolitan District Railway and the London Electric Railway. If the plans are carried out it is expected that the building will be completed within the next two years. The Department of Overseas Trade is said to plan to hold the annual British Industries Fair in the building.

Trackless Trolley in Chesterfield

Installation of trackless trolleys was made in Chesterfield, England, some few months ago, superseding the electric tramways. The Town Council also operates petrol buses, the total number of both classes of vehicles now being 72. The trolley buses are single deck, center entrance, with seating accommodations for 32 passengers. The total length is 26 ft., and 60-hp. motors, working at 500 volts, are employed.

Recent Bus Developments

More Cars Express and Buses Local in Detroit

Express service by street cars was instituted by the Detroit Municipal Railway, Detroit, Mich., on Grand River Avenue on Sunday, Aug. 19, with strong probability that similar service will be installed on both Woodward and West Fort Street. The Grand River Avenue service is operated in the same manner as that on East Jefferson Avenue, except that auxiliary buses are not run all through. Street Railway Commissioner Ellis was quoted as follows:

We have found the auxiliary buses being used on Jefferson Avenue are maintaining runs much too long to prove profitable at a 6-cent fare. So we shall try to find a way to shorten the bus runs on Grand River Avenue.

Following the installation of the service Del A. Smith, general manager, was quoted as follows:

The new Grand River service seems to be universally popular. It is even more of a success than was the introduction of similar service on East Jefferson Avenue. This probably is due to the fact that the Jefferson line, the real pioneer in this field, has done much to educate the public to the idea. There was an increase of between 10 and 15 per cent in the number of passengers carried over the usual Sunday crowd. Many of the passengers expressed delight at the new service.

Mr. Ellis also said:

Inasmuch as the express service we have been operating on East Jefferson Avenue was tried out on one of the most favorable streets in the city, the Grand River Avenue express service, because of the differences between that thoroughfare and East Jefferson Avenue, will be purely in the nature of an experiment. Should the experiment work as nicely as it has on Jefferson, there is every reason to believe we will institute the same sort of service on other principal streets. There are some, of course, such as Gratiot Avenue, where express service is impossible.

By Railway, Bus and Ferry Proposed

Announcement of plans for a ferry line across the Chesapeake Bay from Sandy Point, on the Western Shore, to Stevensville, on Kent Island, Eastern Shore, has aroused interest in both electric railroad and bus transportation circles. If the ferry is established the Washington, Baltimore & Annapolis Electric Railroad will consider extending its service to provide transportation to the western terminus. This the company could do by a bus line connecting its road with the ferry instead of extending the railway. At the same time the Red Star Bus Lines, Inc., may apply to the Maryland Public Service Commission to extend its facilities on the Eastern Shore, operating through Stevensville to the Eastern end of the proposed ferry. Both projects, however, are contingent upon the plans for the ferry being carried out by its backers.

More Buses for St. Joseph

The St. Joseph Railway, Light, Heat & Power Company has applied to the Missouri Public Service Commission for authority to substitute buses for street cars on the Grave Avenue line in St. Joseph. The petition states that the buses can be operated more economically than the cars and at the same time will serve more territory and furnish more adequate service. The commission has the petition under advisement, and will set a date for a public hearing later.

Bus Routes Suggested for Hamilton

A drastic plan to avoid congestion on the West Side, a residential district of Hamilton, Ohio, will be brought before railway officials and the City Council by R. P. Price, City Manager, before a new franchise is drafted. The rails on Main Street would be torn up under the plan and two bus routes substituted, neither of them operating over Main Street, which would be left free to private vehicles. The project is an indication, city officials say, of how bus lines will be emphasized when new routes are laid out to extend service from present railway lines before a new franchise is granted.

Double-Deck Ban Overruled by New Jersey Court

The Supreme Court of Trenton, N. J., set aside as unreasonable an ordinance of the city of Camden prohibiting the operation of double-decked buses not equipped with pneumatic tires on any street south of Federal Street. Protest had been made by the Pennjersey Rapid Transit Company. The court ruled that the number of decks on an autobus did not seem to present a substantial basis for regulations to conserve the highways; that the weight, and not the height, of the vehicle seemed to bear relationship to the preservation and proper maintenance of the streets of the city.

Staten Island Operator Posts Bond

The New York Transit Commission has announced that the Tompkins Bus Corporation, which received a certificate of convenience and necessity to operate twelve routes in Staten Island, has complied with all financial requirements, including the posting of a $250,000 bond to provide indemnity against accidents to passengers. The Richmond Railways, Inc., which protested the application before the commission, has carried its opposition to the courts.

Interurban Buses a Menace in Kansas City

An ordinance is to be introduced soon in the City Council by Councilman Charles H. Clark providing that bus lines operating in and out of Kansas City, Mo., be brought under the regulation of the city and be made to pay some revenue to help in the upkeep of city streets. Mr. Clark pointed out that the bus companies operating in the city were using the streets for traffic and parking purposes free, whereas the railway not only paid revenue to the city but was subject in the routing of its cars to the direction of the City Council. Mr. Clark was firm in his belief that the Council should control bus routings over the city to prevent congestion. He also said the city should have some means of knowing whether the companies operating the buses were responsible. He believes the Council has the right to control buses within city limits.

Southwestern States Seek Interstate Plan

A conference of railroad commissioners, truck directors and bus line operators of seven Southwestern states has been called by the Texas commission for Amarillo, Tex., Sept. 6, to discuss possible means of regulating interstate bus traffic in the absence of federal laws and to initiate a program of federal bus regulations. States to be included in the conference besides Texas are Oklahoma, Arkansas, New Mexico, Colorado, Arizona and Louisiana. Recommendations for bus legislation deemed necessary probably will be drafted and submitted to the congressional representatives of the states interested. A reciprocal agreement may be sought to make it possible for states containing portions of a proposed interstate line to co-operate in the granting or denial of intrastate permits.

Buses in Utica

Hearings were held recently before the Public Service Commission on applications by the New York State Railways for consent to the abandonment of two portions of its route in Utica. The territory covered by these two sections of line are now being served by bus lines of the Utica Co-ordinated Bus Line Company, Inc., a subsidiary of the New York State Railways. There was no opposition to the two abandonment proposals. The city of Utica was said to be favorable to the approval of both applications and desired the tracks removed as soon as possible so that repairing in the streets named might be carried on without delay.

Financial and Corporate

Sale at Fort Smith

Stockholders to meet Sept. 4 to vote on Standard Gas & Electric offer. Growth of territory slow

STOCKHOLDERS of Fort Smith Light & Traction Company, Fort Smith, Ark., have been notified of a special meeting in Fort Smith on Sept. 4 for the purpose of voting on the question of authorizing the sale and transfer by the company of all its property to the Standard Gas & Electric Company.

This decision follows the conclusion that no appreciable change in operating conditions can be looked for and that the railway department of the company cannot be made to operate on a profitable basis. A very substantial proportion, in excess of 35 per cent, of the investment represented in the company is in its railway properties. Earnings of the railway department have been showing a steady decline and have not been sufficient to take care of adequate maintenance charges and, of course, insufficient therefore to provide any interest on the money invested or set up any depreciation on these properties. The regulated nature of the utility business provides that unless each department is operating profitably, the business as a whole cannot earn money.

In the case of the Fort Smith Light & Traction Company the percentage of the investment in the railway property, as compared to the whole, was so great as to preclude any possibility of profitable operation by the electric and gas departments carrying the business along. The present annual net earnings of the electric and railway properties of the company and its subsidiary are about $250,000 annually, with fixed annual interest charges of more than $290,000, without including any charges for depreciation or full return on public money invested in the Mississippi Valley Power Company.

Stockholders were previously advised that a contract had been entered into by the company, to dispose of its gas properties for a cash consideration directors believe to be reasonable. This sale has been consummated and the proceeds deposited with the trustee as security to the company's first mortgage bond. The company now proposes to dispose of its electric and railway properties and its interest in Mississippi Valley Power Company to Standard Gas & Electric Company for a consideration sufficient, together with the cash which is now on deposit with the trustee, to pay off all of its indebtedness, consisting of $2,850,000 first mortgage bonds, $1,100,000 second mortgage bonds and about $2,000,000 floating debt, and to provide a balance equivalent to $20 a share for the 7 per cent preferred stock at present outstanding.

In line with the demands of the times, the Fort Smith Light & Traction Company carried out a building program of its own, improving the service already being rendered and extending same to points up to that time not being served. Much new trackage was added to the railway to supply transportation it was believed these then growing communities would shortly require.

Contrary to expectations, the history of the territory served by the company has been a most disappointing as well as uncertain one. This has resulted in the company's failure to receive the increased earnings expected and, in certain instances, to lose business due to interests moving from these communities to other places considered more advantageous. An official statement says:

The decline in general business throughout this territory, along with the advent of the automobile, practically pronounced the doom of the company's railway business. Everything possible has been done to stimulate it, but without success. Concerted efforts to interest new industries to locate in this section have generally failed. In the year 1922, the management acquired territory contiguous to its operations and formed the Mississippi Valley Power Company in an unsuccessful effort to strengthen the Fort Smith situation. Fort Smith Light & Traction Company's credit was not sufficient to finance this territorial acquisition, again requiring further advances by Standard Gas & Electric Company, in addition to the continual demands already existing.

The Fort Smith Light & Traction Company was incorporated under the laws of the State of Arkansas in 1903, and was acquired by H. M. Byllesby & Company interests in September, 1904. At the time of acquisition, the company was furnishing Fort Smith and suburbs with electric light and power, gas and railway service. In January, 1910, the utility serving Van Buren with electric light and gas was purchased and, about that time, other properties were acquired, establishing the company practically as it has existed up to the present date.

Hearings on Consolidated Returns

Sept. 10-15 set as date for consideration of new provisions of revenue act. Railway association prepared to help. Representation at Washington suggested

SO DIFFICULT is the task before it that the Treasury Department has issued a call for the presentation of the views and suggestions by persons familiar with consolidated return problems of the taxpayers beginning Sept. 10, and continuing through Sept. 15, in room 276, of the Treasury Building in Washing ton, D. C. This, of course, indicates that the Treasury Department realizes the difficulties that will arise in the interpretation of the new clauses of the act of 1928 and further that Congress has given it wide latitude in the determination of rules. It is suggested that companies which propose to present consolidated returns keep in touch with these hearing and if necessary be represented there.

The revenue act of 1928 was signed by President Coolidge on May 29. It contains several new provisions of considerable interest to the electric railway industry. One of the most important relates to consolidated returns.

G. G. Brownell of Henry L. Doherty & Company has summarized the new income tax provisions as follows:

For the year 1928 the provisions of the act of 1926 with respect to consolidated returns have not been changed. For the year 1929 and subsequent years, whether corporations may file consolidated returns will be determined by new rules regarding affiliation. The new law defines an affiliated group as "one or more chains of corporations connected through stock ownership with a common parent corporation if (1) at least 95 per cent of the stock of each of the corporations (except the common parent corporation) is owned directly by one or more of the other corporations; and (2) the common parent corporation owns directly at least 95 per cent of the stock of at least one of the other corporations. The term 'stock' does not include non-voting stock which is limited and preferred as to dividends."

A consolidated return can be made only for domestic corporations within the affiliated group, except in the case of a domestic corporation owning or controlling 100 per cent of the capital stock of a corporation organized under the laws of a contiguous foreign country, and maintained solely for the purpose of conforming to the laws of such country, in which case such corporation may be considered as a domestic corporation. Consolidated returns, however, may not be filed in Class B affiliations (those in which the stock of two or more corporations is owned by the same interests).

Commencing with 1928 the law gives the commissioner the right, in order to prevent the evasion of taxes, to apportion, allocate or distribute the income or deductions between two or more trades or businesses owned or controlled by the same interests. Previously the commissioner could "consolidate the accounts" of related trades or businesses and was required to do so if requested. The new law eliminates this phrase and authorizes the commissioner to make such allocation, but gives the taxpayer no right to demand such action.

The American Electric Railway Association through its economist, Leslie Vickers, is keeping in close touch with the situation and will be glad to send information about the provisions of the act or the course of the hearings in Washington to those interested.

Revenues Up Only 4½ per Cent in Portland

The results of the recent fare increase on railway lines operated by the Cumberland County Power & Light Company, Portland, Me., as shown by the report for July and by figures compiled for the first two weeks in August, have not been as satisfactory as expected, due to a substantial decrease in the number of passengers carried.

The July report shows an increase in gross passenger revenue of $4,666 over the corresponding month of last year, but this figure represents an increase of only 4½ per cent whereas the ratio on which the fare increase was based was one of approximately 25 per cent. The gross passenger revenue in July, 1928, was $107,211 compared with a gross passenger revenue of $102,544 in July, 1927.

In spite of the increase in passenger revenue, the July report shows a deficit of $7,049. The deficit reported for July, 1927, was $18,008. A comparison of these figures shows an improvement but the decrease in deficit was not due entirely to the fare increase but partly to a decrease of $5,690 in operating expenses in July, 1928, compared with July, 1927.

This decrease in expenses of operation is principally the result of two factors (1) 100 per cent one-man operation and (2), a lower cost of power and the generation of more energy because of a better flow of water in the Saco River.

If the July report indicates no great improvement in the finances of the company, the gross revenue for the first thirteen days in August tells an even more significant story. During this period the increase over the returns of the corresponding period of last year is a matter of less than $200.

To Fred. E. Gordon, general manager, is attributed the explanation that "people aren't riding." He does not believe that the decrease in traffic is due to the fare increase which became effective July 1 or to the new zoning system which was installed at that time. He bases his opinion on the fact that he has received "little or no complaint due to the raising of the rate or to the zone system." He points out that prosperity and automobiles have made a serious inroad on the railway business, since "most people have one car and many have two or more."

The company recently petitioned for the discontinuance of certain lines and when its petition for an increase in rates was granted by the commission the new schedule was adopted as an experiment to maintain all existing lines.

Director Concerned About Trend of Kansas City Earnings

Dr. H. P. Saunders, New Orleans, La., one of the directors of the Kansas City Public Service Company, Kansas City, Mo., appears concerned with the decreases in patronage, continuous now over 35 months. The company's $6,600,000 rehabilitation program is about completed with $5,900,000 expended as of Aug. 1. Earnings still show a substantial surplus above bond interest and preferred stock dividends due in large measure to savings in operating expenses of almost $1,000,000 a year. Meanwhile, however, fixed charges have increased as a result of the new capital brought into the company and the necessity of setting up depreciation funds. The doctor fears the company is near the end of economies while the reports of patronage continue to show decreases. In addition to the railway problem, there is the fact that bus revenue has decreased. It has been suggested that fares be readjusted and that a zone system be instituted. The six-months' trial period under the new system of bus fares, to which reference has already been made, ends on Dec. 1.

Results in Cincinnati Approximate Estimates

Operations of the Cincinnati Street Railway, Cincinnati, Ohio, for July showed a deficit of $13,514. Walter A. Draper, president of the company pointed out on Aug. 16 that this deficit was expected, for the 1928 budget submitted last December indicated a deficit of $13,062, or within $500 of this result. Deficits also were experienced in July and August of 1927 and 1926, it was observed. Mr. Draper also said that "notwithstanding the fact that a deficit can be expected in the midsummer months, the deficit was due also last month to the fact that operating expenses and fixed charges are showing a continued increase on account of the enlarged program of improvement and expansion."

For the first time since the railway began the operation of motor coaches more than two years ago, a small surplus was realized from this source last month, it was stated. Mr. Draper regards this favorable trend in motor coach operation as quite gratifying, since it will help to offset any loss that may result from the coach service to the new Western Hills High School to be started next month.

The number of revenue passengers carried in July was 8,150,523, compared with 8,140,221 in July, 1927, or an increase of 10,302.

STATEMENT OF EARNINGS OF CINCINNATI STREET RAILWAY FOR JULY

Operating revenue	$727,350
Operating expenses	523,470
Net operating revenue	$203,879
Taxes	69,026
Operating income	$134,852
Non-operating income	1,993
Gross income	$136,846
Rental, interest, sinking fund and return on capital	150,361
Deficiency	$13,514
Total in fare control fund June 30, 1928	448,716
Total in fare control fund July 31, 1928	$435,201
Revenue passengers	8,250,523
Transfer passengers	2,771,323
Free passengers	123,129
Total passengers carried	11,144,975

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

$110,000 Equipment Issue Under Advisement

Transit Commissioner Godley, after a brief hearing, has taken under advisement the application of the Surface Transportation Company, a Third Avenue Railway subsidiary operating bus routes in the Bronx, New York City, to issue $110,000 in equipment trust notes. The notes are to be for a three-year term. The proceeds realized by their sale are to be used for the purchase of new buses and equipment.

Worcester Net Increased

Although operating revenues decreased, there was a noticeable increase in net income for the first half of 1928 over 1927, according to the semi-annual report of the Worcester Consolidated Street Railway, Worcester, Mass., filed with the Department of Public Utilities. Operating revenues for the first six months to June 30, 1928, were $1,641,266 and for 1927 $1,685,505; operating expenses, 1928, $1,278,586; 1927, $1,380,339; operating income, 1928, $308,086; 1927, $252,372; gross income, 1928, $311,634; 1927, $256,547; interest, etc., 1928, $231,634; 1927, $183,074; net income, 1928, $80,347; 1927, $73,463.

Wisconsin Interurban to Suspend

The Wisconsin Public Service Corporation has been authorized to discontinue the 23-mile interurban line connecting Green Bay and Kaukauna. The abandonment was opposed by representatives of Wrightstown and the county sanatorium, but the commission declared that it was outside its power to require service to be continued since an order of that kind would deprive the company of its property without due process of law.

The City Council of Green Bay had previously agreed with the company for the substitution of bus service on the South Broadway line, namely, the portion of the Kaukauna line within the limits of Green Bay, should the commission permit the Kaukauna line to be discontinued. Under this agreement the tracks used by the Kaukauna and South Broadway cars will be removed from the streets, including those over one of the city's bridges. The company does not plan to substitute buses for the interurban, but trippers may be operated mornings and evenings between West DePere and Green Bay, a distance of 5 miles.

Short Abandonments Sought by Pacific Electric

The Pacific Electric Railway, Los Angeles, Cal., has applied to the Railroad Commission for permission to abandon passenger service on its line from Venice to Inglewood, in Los Angeles County. It is also seeking permission to abandon passenger service on its main line between Huntington Beach and La Bolsa, maintained for the purpose of serving the factory of the Holly Sugar Company at La Bolsa, abandoned as a sugar plant a number of years ago.

Butte Railway Sold With Clark Holdings

Mineral, timber and banking properties of the late Senator W. A. Clark have been sold to the Anaconda Copper Mining Company for a consideration between $6,000,000 and $9,000,000. Included among the properties conveyed to new owners is the Butte Electric Railway.

New Ruling on Expenditures of Less Than $100

Expenditures by electric railways for additions and betterments under $100 must be charged to operating expenses under a revision of the Interstate Commerce Commission accounting rules for electric railways. Revision applies mostly to minor items of road and equipment expenses. The order, dated July 21, 1928, follows:

It is ordered, That the following instructions are hereby prescribed as the fourth paragraph of section 1 of the general instructions on page 91 of the Uniform System of Accounts for Electric Railways, issue of 1914:

(a) When the property change involves: (1) the acquisition of property (other than land, a section of track, or a unit of equipment) the cost of which is less than $100; (2) the betterment of property (see paragraph 2 of section 2 of the general instructions on page 91 of the Uniform System of Accounts for Electric Railways) the excess cost of which is less than $100; or (3) the retirement of property (other than land, a section of track, or a unit of equipment) the ledger value of which is less than $100, the cost of the property acquired or the value of the salvage from the property retired shall be appropriately included in operating expenses, and no adjustment shall be made in the property investment account.

(b) The carrier shall not parcel expenditures or retirements under a general plan for the purpose of bringing the accounting therefor within this rule, neither shall it combine unrelated items of property for the purpose of excluding the accounting therefor from the rule.

(c) This exception to the general instructions of this classification shall not apply to property changes involving the retirement and replacement of property when either the ledger value of the property retired or the cost of the property acquired is $100 or more. The accounting for such changes shall be in accordance with section 4 of these instructions on page 92.

(d) The carrier is permitted to adopt for the purpose of its accounting a limit of less than the aforesaid amounts provided it first files with the commission the maximum amount which it proposes to adopt and makes no subsequent change in this amount except by authority of the commission.

It is further ordered, That the last sentence in the first paragraph of section 4 of the general instructions on page 92 of the Uniform System of Accounts for Electric Railways, issue of 1914, be rescinded.

It is further ordered, That these orders shall be effective on Jan. 1, 1928.

Net Holds Up in Baltimore

Revenue passenger figures of the United Railways & Electric Company, Baltimore, Md., continue to reflect the increased use of the automobile. In July they declined 8.70 per cent. The service to the public, however, continued to be well maintained, with a decrease of only 1.46 per cent in car-miles and a little more than one-half of 1 per cent in seat-miles. Passenger revenue for July increased $15,662, or 1.25 per cent over the similar month last year. Despite heavy increases in wages, power costs and general operating expenses, continued careful and economical operation made it possible to record net income of $1,863, a sum only 5.12 per cent less than the amount for July, 1927.

EARNINGS OF UNITED RAILWAYS & ELECTRIC COMPANY, BALTIMORE

	July, 1928	Increase
Passenger revenue	$1,266,130	$15,662
Other revenue	21,099	†2,736

July	34,506	1,866
Totals	$264,181	$119,669

Suburban Holdings at Memphis Sold

Lake View, Miss., well-known summer resort and bathing pool, has been sold to R. T. Richardson, by the Memphis & Lake View Traction Company, subsidiary of the Memphis Street Railway. The property will immediately be developed into a pleasure resort by its new owner.

Last May the railway abandoned operation of the 11-mile line built to the resort in 1911 when Lake View appeared to give promise of developing into an important residential locality. The proposed liquidation of the road was reviewed in the JOURNAL for July 7, page 33.

Personal Items

New Head of Brazilian Company Knows Property

Miller Lash, K.C., who has succeeded Sir Alexander Mackenzie as president of the Brazilian Traction, Light & Power Company, and the subsidiary enterprises in Brazil, has for many years been associated with the company's undertaking both as a director and also as the principal executive vice-president of the company in charge of its head office. Mr. Lash will continue to make regular visits to Brazil in order to keep in close touch with the operation of the business.

H. H. Couzens, who is resident in Brazil, will continue as executive vice-president, and will have full charge of and authority over the operations and staff in Brazil, and A. W. K. Billings, also a vice-president resident in Brazil, will as heretofore, continue in control of the hydraulic construction and concessions.

Sir Alexander found it necessary to resign because of ill health, but it is stated the company will continue to have the benefit of his advice and experience. He assumed the presidency of the company in 1915 and has been associated with the undertaking for nearly 30 years, during which the growth of the business under his able and far-seeing administration has been remarkable.

F. B. McCurdy Succeeds W. B. Ross at Trinidad

At a meeting of the directors of the Trinidad Electric Company, Trinidad, British West Indies, held recently in Halifax, Nova Scotia, F. B. McCurdy, P.C., was elected president of the company to succeed W. B. Ross, K. C. J. H. Winfield and W. H. Couvert, were elected to the board to succeed F. W. Teale and W. B. Ross.

E. B. Meissner Heads Airport Bond Committee

Edwin B. Meissner, president of the St. Louis Car Company, was general chairman of the St. Louis Municipal Airport bond issue committee which recently directed the campaign on behalf of the proposed $2,000,000 bond issue for an airport voted upon by residents of St. Louis.

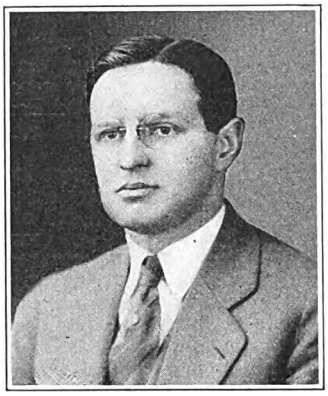
August Menger With Electric Company

August Menger recently resigned as assistant treasurer of the San Antonio Public Service Company, San Antonio, Tex. He joined that company in 1906 as a stenographer to W. B. Tuttle, now president. While working at stenography he studied electrical engineering at night. Completing this course, he left the company to go with the Denver Gas & Electric Company. After serving the company at Denver several years he returned to the San Antonio Company and worked in the operating end of the business, later becoming assistant treasurer. It is understood Mr. Menger will become actively associated with the Crowther Electric Company.

John A. Seymour Made Auditor of Chicago Rapid Transit

John A. Seymour, assistant auditor of the Chicago Rapid Transit Company, Chicago, Ill., has been appointed auditor, succeeding the late T. B. MacRae.

Mr. Seymour's first employment was with the Chicago, Racine & Milwaukee



J. A. Seymour

boat line and the Northern Michigan Transportation Company, holding the position of auditor with both companies until 1917. He worked with the Federal Electric Company as a special accountant for one year when he went to the North Shore Line as assistant auditor in 1918. In 1922 he was appointed assistant auditor of the Rapid Transit Company and acted in that capacity until his promotion to the position of auditor.

Mr. Seymour was born in Manistee, Mich., in 1889. He was educated in the grade and high schools of that city, at St. John's Military Academy, Delafield, Wis., and the Ferris Institute, Big Rapids, Mich.

Obituary

Col. George B. Harvey

So multifarious were the activities of Col. George B. Harvey, who died on Aug. 20, that sight is likely to be lost of the business activities of this stormy petrel with his tripartite career—political, diplomatic, and journalistic. Had he chose to do so, there is no doubt that Colonel Harvey could have made business his forte, but whatever of romance there might be in business, it was not the type of activity that made a lasting appeal to him. What did not appeal to Colonel Harvey he did not do.

One of the first men correctly to appraise the talents of the colonel was the late William C. Whitney, financier and transit owner, with whom the colonel served as assistant in the days of the Metropolitan Street Railway in New York City. This was as long ago as 1893. But even then the colonel had manifested the proclivity which made it almost necessary that he work alone. That is what he did. Colonel Harvey had a share in the construction of the electric railway on Staten Island and the Atlantic Coast Electric Railway at Long Branch and Asbury Park, N. J. He became an official of the Staten Island Ferry Company, the General American Reduction Company, and vice-president of the National Salt Company. He extended his railroad interests to the electric railway in Havana. Moreover, he reorganized a vast publishing business, and probably saved from extinction a name honored wherever the mechanics of literary production are appreciated.

On Colonel Harvey's advocacy of the candidacy of President Wilson, and on his breach with the President, the daily newspapers have dwelt at length. Caring nothing about political office himself, the colonel almost may be said to have made and unmade candidates. In this process he gave vent to talents that were almost impish, yet so forceful and at times so profound were his delineations that his piquancy did its work without the personal destruction that is so deadly in the case of so many outstanding commentators on men and events. In other words, the colonel could differ honestly with others, and still do so in a way that did not destroy the commentator at the same time that it flattened his victim. That, of course, is art. And Colonel Harvey was an artist. There can be no gainsaying that. One of the most penetrating quips Will Rogers ever uttered was made on the occasion of the colonel's return from the Court of St. James, when Rogers said that he had gone down to the dock to hear the colonel land.

It has been said that the Irish immigrant has lent to the United States just the leaven needed to make life here tolerable. It can just as truly be said that the few commentators of the Harvey type it has been the good fortune of the United States to possess, have kept its journalism from becoming prosaic. There has been no successor to Colonel Watterson in journalism in the United States and there is little present evidence that a successor is likely soon to arise who will dim the recollection of this man who "made things interesting because he was himself keenly interested." Colonel Harvey kept people amused and excited. In doing so, seldom did he offend. That is indeed a great achievement.

Construction Work Livens Market

Shop and garage structures proposed for Oklahoma City and Baltimore. Car purchases planned by several railways in this country and Canada

RECONSTRUCTION by the Seattle Municipal Street Railway, Seattle, Wash., of its tracks on Third Avenue at an estimated cost of $90,000 is provided for in an ordinance passed by the City Council, according to reports received this week. This reconstruction work will be carried on in connection with the repaving of Third Avenue and the widening of the roadway by reducing the width of the sidewalk on each side. The Seattle Utilities Committee has requested the railway department to furnish a full report on the cost of a new and permanent elevated fill from the West Waterway to First Avenue South. The Community Traction Company, Toledo, Ohio, has let contracts for track renewals in Monroe Street, Central and Stickney Avenues, the repaving of which is now in progress.

The Worcester Consolidated Street Railway, Worcester, Mass., has completed the reconstruction of 1,415 ft. of double track on James Street, requiring 87 tons of rail. Other equipment required on this job was 2,830 tie plates, 20 kegs of spikes, 95 thermit joints, 475 tie rods, and 1,415 ties. The expense of this work was about $14,000. The Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., has completed construction of a single-track extension of the Waukegan City street car line, approximately 2,650 ft. long. Steel ties, 100-lb. rail, and welded joints were used throughout. The entire extension is laid in concrete requiring 3,550 sq.yd. of paving.

Levis Tramways Company, Levis, Quebec, proposes to renew about a quarter of a mile of track and is now rebuilding 1 mile of trackwork. Montreal Southern Counties Railway, St. Lambert, Quebec, is building 600 ft. of passing track and is rebuilding and paving with granite blocks its track on Common Street, Montreal. The New Brunswick Power Company, St. John, New Brunswick, is relaying approximately 1,500 ft. of double track with 82-lb. rail on stone ballast foundation, and approximately 1,000 ft. of single track on wooden ties with stone ballast.

Omaha & Council Bluffs Street Railway, Omaha, Neb., is relaying tracks and paving between rails on Leavenworth Street at a cost of $51,400. The Reading Transit Company, Reading, Pa., has installed a new crossover at Fourth and Penn Streets and is now reconstructing track on Fairview Street, in Mount Penn. Los Angeles Railway, Los Angeles, Cal., is renewing special work on Tenth and Main Streets, is constructing curbs and landings on Vermont Avenue and is retieing, ballasting and paving track on East Ninth Street.

The United Railways & Electric Company, Baltimore, Md., is having plans prepared for a structure to be used for storage and maintenance of all the motor buses operated by the company. It is estimated that the structure will cost more than $250,000. The building will have a frontage of about 200 ft. and a depth of about 400 ft., and will be a one and two-story building equipped with the latest machinery. It is expected that bids for this building will be received in the fall.

A new repair shop to cost approximately $100,000 will be built on Noble Street, Oklahoma City, Okla., according to plans being made by the Oklahoma Railway. The Oshawa Railway, Gananoque, Ontario, has been receiving tenders for the erection of a carhouse, store and station building in North Oshawa, Ontario. London & Port Stanley Railway, London, Ontario, is proposing to increase the coal handling plant at Port Stanley from 100,000 tons to a capacity of 300,000 tons with additional sidings and other facilities to cost $193,000. The New York Central Railway, New York, N. Y., has recently awarded a contract for the installation of a rotary converter and transformer in substation 1A, 43d Street, New York City.

The Illinois Traction System, Springfield, Ill., is inquiring for from 100 to 200 composite gondola cars, of 50 tons capacity. The Midland Utilities Company, main office Chicago, controlling the Chicago, South Shore & South Bend Railway, has ordered two 30-ft. steel underframed caboose cars from the American Car & Foundry Company. Calgary Municipal Railway, Calgary, Alberta, is expected to order two one-man cars and will probably be in the market next spring for several more cars. Hydro-Electric Railways, Toronto, Ontario, it is said, expects to be in the market shortly for five-passenger motor cars, one observation trailer car, one electric locomotive, and one motor express car. Detroit Department of Street Railways, Detroit, Mich., has ordered 26 A.C.F. 40-passenger Metropolitan coaches. Eastern Massachusetts Street Railway, Boston, Mass., has ordered five 29-passenger A.C.F. de luxe urban coaches.

Municipal Terminal Proposed for San Francisco

A union terminal for the use of all railroads, electric railways and motor stages to be erected, owned and operated by the city of San Francisco, Cal., has been proposed by Supervisor Milo F. Kent. He has presented a resolution to the Board of Supervisors calling for a survey of the situation by a group of leading citizens authorized to confer with the transportation officials. The resolution was as follows:

Resolved, That the public interest and necessity demand the establishment of a municipal union depot for the terminal of all rail and bus lines carrying passengers in and out of San Francisco, to be centrally located, where electric and steam trains, and buses will have modern and adequate facilities for embarking and disembarking passengers in safe and rapid mannner, and

Further resolved, that to consummate this revenue producing project of a municipally owned union depot for the welfare of our citizens that the Public Utilities Committee call in consultation a group of citizens properly to survey the situation, confer with railroad, bus and transportation officials and report back to this board their recommendations.

New Cars and Carhouse for Tacoma Municipal Line

Ira S. Davisson, Public Utilities Commissioner, of Tacoma, Wash., will immediately seek authorization by the City Council of a $140,000 utility bond issue for the municipal railway belt line, with the direction that the sinking fund board proceed with the sale of the issue. This amount, he stated, will be requested to provide funds to erect a new carhouse, buy new rolling stock and extend the railway to new industries on the Hylebos waterway. The carhouse and rolling stock were destroyed by fire in June. Since then the city has been renting equipment at a charge of $900 a month.

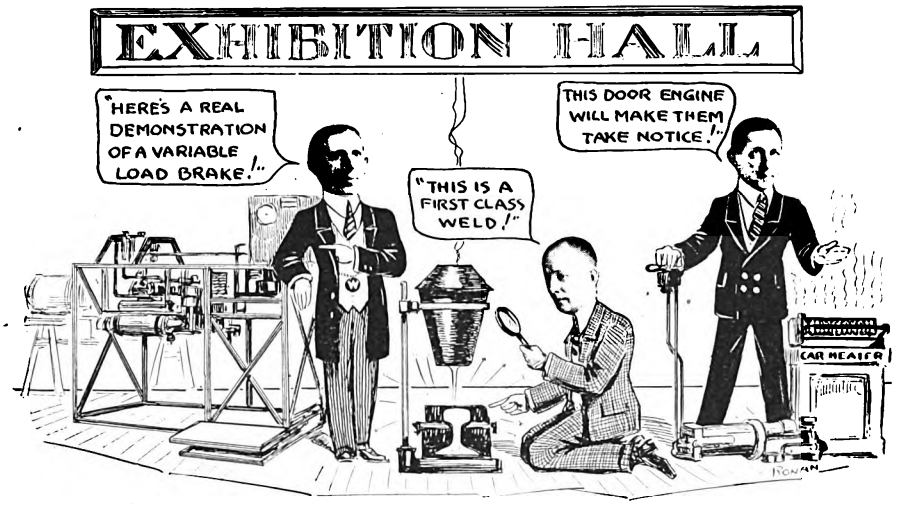
Business Conditions Expected to Improve

Business during the remaining months of 1928 will probably be better than it was during the corresponding months of 1927. So far this year the key industries of iron and steel, building construction, and automobile production have made an impressively good showing, and there seems to be good prospects that they will do well during the remaining months. Car loadings on the railroads and coal production are now beginning week by week to produce records that are a little better than those of the corresponding weeks a year ago according to the Cleveland Trust Company.

Electrical World data on electrical energy consumption indicate that the rate of general production during July, corrected for seasonal variation was the highest ever attained. The present rate of general production is materially above the average summer period of previous years. Automobile

Digitized by Google

Exhibitograph No. 18



If you have anything to brag about, the Cleveland Convention and Exhibit is the proper time and place

manufacturing plants, including parts, are operating 40 per cent above last year and the metal working plants are operating 21 per cent over last year.

The optimist now has distinctly the better of the argument, according to the National City Bank, as to whether 1928 is to show improvement over 1927. The last quarter of 1927 showed a let-down of activity which caused misgivings about the new year, but the first quarter of 1928 showed recovery, the second quarter gave increased confidence, and the beginning of the third quarter has established a general belief that the year's record will surpass that of 1927.

Commerce Yearbook Shows U. S. Prosperity

"The business of the United States in 1927 was on a very high level, continuing the prosperity which has been characteristic of every year since 1921 and which reflects the steadily increasing efficiency of both industry and trade," the U. S. Department of Commerce yearbook, reviewing 1927, says. "Some recession in activity toward the end of the year has been recovered in the early months of 1928.

"Manufacturing output, the best measure of general economic activity, was less by only an insignificant margin than the record attained in 1926. The somewhat more marked decline in railroad traffic was chiefly due to the abnormally large shipments of coal in 1926, the traffic in 1927 exceeding that of any other previous year.

"In quantitative volume export trade was considerably larger than in any other post-war year, owing primarily to the continued growth of exports of manufactured goods, but the decided decline in average export prices, especially of certain raw staples, left the value somewhat below that of 1925, the peak figure of recent years. Wholesale prices continued to decline during the first part of 1927 and the average for the year as a whole reached about the same low level as in 1921.

"Manufacturing production in 1927 was 44 per cent larger than in 1921. Owing to a slackening in the second half, total output was about 2 per cent less in quantitative volume than in 1926. Mineral production exceeded the figure for 1921 by 47 per cent. Petroleum output showed an unusually large increase as a result of the record-breaking production in the new Seminole field.

"Building construction was again extremely active. Total of construction contracts was substantially the same as in 1926, and more than 50 per cent larger than in 1923. Building construction throughout recent years has been a very important factor in maintaining strong demand for numerous classes of manufactured products. Total value of construction contracts awarded in 36 states in 1927 was $6,084,000,000, only 1 per cent less than the record figure of 1926.

"Factory employment declined during 1927 and averaged lower than in any of the four preceding years. The increasing efficiency of production has made possible an expansion of output with a curtailment of the quantity of labor. Most, if not all, of those leaving factory industries have been absorbed in other occupations."

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	Aug. 21, 1928

St. Louis Car Organizes Aircraft Company

The Cardinal Aircraft Company has been organized as a subsidiary of the St. Louis Car Company to manufacture airplanes and similar aircraft. The St. Louis Car Company constructed 450 planes for the United States Government during the World War and the present facilities of the car company will be used in the manufacture of aircraft.

The incorporators of the new company are E. B. Meissner, N. L. Rehnquist, and Sears Lehmann, counsel for the St. Louis Car Company.

It is planned to turn out a popular priced plane to sell for about $3,000. Two or three other models will also be developed. The first models will carry two passengers, but it is probable a ten-passenger plane will be among the products of the plant. Production will start in the near future.

Propose Standardization of Mechanical Equipment

Initiation of four new standardization projects for mechanical equipment under the auspices of the American Engineering Standards Committee has been requested by the American Society of Mechanical Engineers. These projects, which are now being considered, are standardization of stock sizes, shapes and lengths for iron and steel bars including flats, squares, rounds and other shapes, particularly in reference to the dimensions and tolerances of hot and cold finished bars, standardization of splined shafts and splines, standardization of rolled threads for screw shells of electric sockets and lamp bases, and standardization of dimensions of stud bolts, including thread dimensions and working tolerances.

TRADE NOTES

OXWELD ACETYLENE COMPANY, New York, N. Y., has issued a new publication describing the uses of the Carbic portable generators.

AMERICAN STROMBOS COMPANY, Philadelphia, Pa., has recently dissolved and its entire business has been taken over by J. Thomas Rhamstine, Detroit, Mich., who will continue to manufacture the same model horns made by the American Strombos Company.

The Sword Falls

NO ONE recognizes better than does the railway executive the stark danger that is potentially present in every fast-moving train. He lives under the sword constantly. Safety, safety, safety! Day and night the need for carefulness is drilled into every man on a railway property. The new recruit gets it on his first day and grows gray in the service with the word constantly in his ears. Safety is the first consideration in the selection of every piece of railway equipment. It dictates every operating rule and practice. It colors every thought and action, day after day, month after month and year after year. Yet at an unexpected moment; in the performance of routine duties by the same men who have performed them thousands of times before, something goes wrong. A single mind relaxes vigilance for a moment; a piece of equipment, carefully inspected and tested, fails to function properly; a safety device becomes inoperative. Years of training, precaution and care become impotent in a single instant. And in that instant death stalks forth to take its relentless toll of innocent lives and to leave on the railway executive's shoulders a heavy cross of sorrow, increased worry, and baffled ideals.

Sympathy and understanding go out today from every electric railway man in the civilized world to those who mourn their loss and to the Interborough Rapid Transit Company. Its operation has been a marvel of the industry. Human ingenuity was exhausted in making it one of the best protected railroads in the world. Mechanical and operating skill of a high order had developed an efficiency that elicited the admiration of engineers both in this country and abroad. But human ingenuity failed to protect it from one of those terrifying disasters that make transportation men grow old before their years.

Once more man's own creations have broken their leash and become engines of destruction. Underground in the labyrinth of subways through which New York's millions have been shuttled back and forth for many years, a switch guarded by many protective devices to prevent just such an occurrence, changed position under a moving train. Just how or why has not yet been decided. But in an instant, a steel car with one truck on one rail and the second on another, was completely cut in two by being hurled sideways against the end of a partition wall. The accident occurred at the height of the rush hour, at one of the busiest points on the system, just below the Times Square station. That the toll in death and injuries was not even greater seems almost miraculous.

Several separate investigations are under way to determine the cause of the accident. But will they go beyond this immediate tragedy and examine deeper into the factors that are allied to it? How far can mechanical facilities and human ingenuity be taxed without breaking under the strain? Even to the casual observer it is evident that New York has been exceeding the limit of endurance for years. The Interborough has made an extraordinary record for carrying millions of passengers safely between their work and homes. It has accomplished this despite the fact that it has been hamstrung by politicians, starved by a 5-cent fare fetish, hounded by ambitious labor agitators and ignored by an unthinking public.

Back in December, 1926, Frank Hedley, president and general manager of the Interborough, speaking before the American Institute of Electrical Engineers, called attention to the fact that the subway had originally been built with an estimated capacity of 300,000 passengers a day and an estimated maximum capacity of 500,000 per day. Only a short time after the lines were opened they were carrying 1,000,000 passengers a day, and by 1926 this had reached 2,500,000 passengers. While the costs of labor and material mounted steadily, the fare remained the same. While the loads doubled and trebled and then went to five times what the engineers had estimated as the ultimate capacity, the need for higher speed, longer trains and closer headway became imperative. Every possible safety device was incorporated to provide adequate protection. But despite everything that the company found itself able to do under the limitations imposed upon it, the system is so badly overloaded that even common decency is defiled, and safety of the weak or feeble is endangered. In the light of these facts the record of the company is little short of amazing. Something was bound to snap under the strain. The blame, if blame there is, lies on the heads of those false prophets who have hoodwinked and misguided New York's millions by a policy of procrastination and bickering that imposed intolerable operating conditions.

How long will these conditions be permitted to continue? When will the public rise up and demand a reckoning? Certainly not before the leaders of the city's business and social life recognize their responsibility for the creation of an enlightened public opinion regarding transportation, that will sweep away dog-in-the-manger politics and substitute for it a conscious regard for the public's real interest.

Refusal to Accept Economic Change Blocks Progress

NEW means for efficiency are reflected in the recent achievements at Buffalo, Lockport and other Niagara frontier towns, and in Kansas City, in changing over to one-man operation without the discharge of a single employee. It is not with the vehicle itself that concern rests at this time, but rather with the one-man car as a means to the end of preventing disintegration of service. Full adoption of the one-man car in these cities

Digitized by Google

was the one way out for them, if anything like the complement of lines formerly in service was to be maintained intact.

Organizations must adapt themselves to the inventions of an ever-changing society if they are to survive, and survival is not promoted by retrogression or artificial attempts to preserve a decrepit order of things. This is a doctrine that the employees generally have come to indorse no less heartily than have the employers, by their acceptance of the one-man car. It is the doctrine under which there is complete one-man operation not only in the cities mentioned, since they are among the latest to achieve that end, but on many other important properties, such as the Public Service system in New Jersey, the Eastern Massachusetts and many others.

In sharp contrast with the action of the trainmen on these properties and even in the face of the acceptance of the one-man car on the part of the Amalgamated, the car men's local in Des Moines still insists upon compliance with the letter of its contract with the Des Moines City Railway that there shall be two men on the Des Moines cars until the contract expires in 1940. There the union spokesman even threatens to demand enforcement of this absurd provision on the part of the successor company after sale of the present property under foreclosure. That this very insistence has been a material factor in the present financial plight of the company apparently counts not at all. There is, of course, good reason to believe that the courts would not inflict upon the successor company compliance with the terms of a contract that has proved so onerous in the past and so detrimental to others with a stake in the company no less material than that of the employees. This, however, is a judicial point still to be decided in the event that the employees are so foolish as to raise it.

It does seem, however, in the light of the history of the introduction of the one-man car and of its exclusive use by so many systems, that the responsible union operating officials at Des Moines have been much less astute in refusing to bow to the inevitable than were their fellows elsewhere. Already they have sacrificed more than they have gained. Their inflexibility in this respect has destroyed whatever respect was previously felt for them, since they have been placed in strange contrast to their fellows by their unbending attitude.

The world has advanced only because men have capitalized changes they first supposed were their undoing, not through blind devotion to those who resisted these changes. The success that has attended the use of the one-man car demonstrates the acceptance of their obligations by the companies. These obligations the employees must also share, if employee and employer alike are not to perish economically.

Developing Latent Possibilities Through Competition

FROM time immemorial competition has been looked on as one of the most effective means of spurring the human race on toward higher and better things. The Olympic Games are one of the outstanding examples of how the ancients strove to develop a higher type of physical manhood. Not only those who won the prizes, but all who entered the contest, got the benefit of the training and exercise involved. It is noteworthy that much of the advantage came from the wide appeal made to the populace.

There are those who are inclined to scoff at the value of competitions in the industry. But let them enter, let them get the spirit of the thing, and see what a difference. A prominent official remarked some time ago that he could not see the advantage of entering his company in a contest. After considerable urging, however, he decided to do it. The rank and file of the employees took it up, and the enthusiasm, small at first, grew as the contest continued. Imagine the surprise of this official when his company romped off with the principal prize! He afterward confessed that he had entirely misjudged the effect on the company and its employees, the effect on the public, and the effect on himself. He is now firmly convinced of the value of this competition.

A contest that has perhaps not received the attention it merits is the Anthony N. Brady safety medal award. When it was revived last year the number of contestants was not large. Yet those that went in have been repaid in great measure for the work they did. To enter the competition their accident records naturally must have been good. But the opportunity for publicity by enlisting the citizens of the town in behalf of a better accident record is too great to be passed by lightly. In several cities the public generally have done everything in their power to prevent street car accidents. Win or lose, there always is the chance to pit the men against themselves, to do this year what could not be accomplished last. And when the public feels that it has a part in making the record better and in bringing victory to the home team, an asset has been built up that cannot be measured by dollars on the balance sheet.

The Trackless Trolley Comes Back

RENEWED interest in the trackless trolley attaches to the demonstration of the first of its new vehicles recently made by the Utah Light & Traction Company, the news of which was published in last week's issue of ELECTRIC RAILWAY JOURNAL. A total of ten of the new coaches are included in this initial order. Further extension of this type of operation is contingent upon the experience with this first installation.

There is little similarity between these trackless trolleys and those which were put into service at various points in this country several years ago, with varying degrees of success. Some of the earlier installations are still in use. Others have been abandoned. Interest in these pioneer experiments did not spread very far, however, and the electric railway industry as a whole dismissed the trackless trolley as a major factor in the urban transportation situation. Perhaps the rapid improvement which took place in the gas and gas-electric buses had something to do with crowding the trackless trolley out of the picture.

These very developments in the bus, however, have brought the trackless trolley back for further attention and study. Two basic things happened; first, the effort to increase carrying capacity of the bus led to radical changes in chassis design which culminated in the Twin Coach, Versare, and Metropolitan Coach types. The old trackless trolley chassis had been a comparatively crude effort. Awkward appearance, hard riding and mechanical troubles soon checked what little enthusiasm had been created for this type of vehicle. But with the coming of the new chassis developed for buses, the idea of driving a vehicle of this type from an overhead trolley was again resurrected.

Radical changes in electrical equipment, both motors and control, represent the second great change which has

Digitized by Google

taken place. This again resulted from bus developments, particularly the gas-electric drive. Light weight, high-speed motors, and control suitable for use on a free wheel vehicle, became available in place of slower speed, heavier rail equipment to which the earlier trackless trolleys were limited. It soon became apparent that this type of electrical apparatus offered attractive possibilities for an all-electric vehicle designed to retain the attractive features of the gas bus, but eliminating the engine, and taking its power from an overhead trolley.

How important a part this new type of vehicle may be expected to play it is obviously too early to predict. The double trolley and more or less complicated overhead construction, still remain as inherent disadvantages. Smoothness, quietness, operating economy, and freedom from fumes of the relatively short-lived gasoline engine, constitute the advantages claimed in comparison with the bus. Obviously, the latter still has the advantage of greater flexibility, although the trackless trolley permits curb loading and running around obstacles, which have long been held to be important advantages of the bus in city service in comparison with street cars.

This new installation in Salt Lake City will be watched with considerable interest by the entire industry. A few months of actual service should give a much better indication of the possibilities for extension of the idea than is available now. If successful, the trackless trolley will fit into its proper niche in the scheme of urban transportation. There seems very little promise that it will take the place of either street cars or buses. It does, however, seem to open up new possibilities for economy and improved service in that border territory between the distinctive fields of the bus and street car.

Detroit's Express Service Meets With Approval

WHEN the Detroit Department of Street Railways inaugurated street railway express service over a 4-mile route on the heavily traveled Jefferson Avenue line, carrying local passengers in this zone by means of buses, the experiment was viewed with much interest and some misgivings. At that time there was an implied understanding that if the idea was successful from an operating standpoint and met with the approval, both of those who used the cars and those who used the streets, it would be extended to other lines in the city. Less than a year later and after a thorough trial, a similar arrangement has now been put in effect on the Grand River Avenue line. The city has found the faster service very much to its liking.

The achievement is noteworthy from the fact that it was brought about at little expense and without the aid of enabling legislation. It was not a question of securing new equipment, of widening any streets or of passing an ordinance. With such rolling stock as it had at hand, aided only by use of printer's ink for informing the public, the plan was undertaken.

From a dollars-and-cents standpoint the advantage may not be immediately apparent. The expense of running buses to supplement the rail service has more than offset any economies effected by the saving in cars. The ultimate capacity of the street, both for cars and other vehicles, has been increased considerably. Over a period of time, as the advantages of the faster operation become more apparent, it is reasonable to assume that increased patronage will compensate, to some extent, at least, for the additional expense incurred. After all, however, the plan was not adopted as a money-saving measure. The primary object was to speed up all traffic. This has been accomplished to a notable degree. Practical street railway men have always maintained that any measure that would facilitate the movement of the cars would at the same time speed up all other traffic using the street. The difficulty has been to have the idea accepted. Detroit has supplied a concrete example that is too significant to be ignored.

"Blessings Brighten as They Take Their Flight"

PATHETIC, indeed, are the efforts being made by public authorities at Columbia, S. C., to compel the Columbia Railway, Gas & Electric Company to restore railway service there. The special referee of the State Supreme Court says it cannot be done, and it is expected that the court itself will sustain this finding, since that means only the rule of reason.

As Managing Director Storrs said before the Wisconsin Utilities Association, "enthusiasm is a large factor in developing false conclusions." And the difficulties of the railway in Columbia started at the time of the strike in 1922 when the people there, without full knowledge, but with much enthusiasm, reached the false conclusion that perhaps the railway was not a necessity. Jitneys flooded the streets. They ran hither and yon, and for an extra fare they diverged from their regular routes to carry passengers to their door. Enthusiasm ran high. It all seemed very wonderful—while it lasted. Then came a promised bus service. It, too, started with a great fanfare, but with no disposition on the part of its backers to assume obligations similar to those that have ruined the railroad. They were too astute for that. In consequence, Columbia began to groan over its situation and yearn for the railway, which found it necessary first to retrench and finally to withdraw all service.

This is history—history that has made Columbia wince, but not quite soon enough. It shows, as Mr. Storrs has said, that "the need for public transportation is not going to decrease as time goes on. It will become greater." Columbia is the specific instance that drives home the statement that "experience has proved that the electric street car in mass transportation is as necessary today as it was ten years ago." This is not special pleading. It is a fact. Some such responsible service is necessary to every community larger than a village.

It is true that public realization of the need of dependable transportation service is the best insurance the public transportation industry can have, but it is also true that that realization is the public's own best insurance. The case of Columbia proves it. If the essentiality of the service of the Columbia railway had been recognized six years ago as that recognition is reflected today in the pathetic appeals to the court to require the company to continue, a way out of the dilemma could probably have been found. By their unwillingness to afford the measure of relief from burdens under which the company could not possibly be expected to function, the people of Columbia have furnished another specific instance that should deter other communities from subscribing to any such foolish doctrines as led Columbia astray. To Columbia has been brought home at last the truth of the adage that "Blessings brighten as they take their flight."

One of the articulated cars built for the Cleveland Railway. Quick and uniform loading are features of these cars

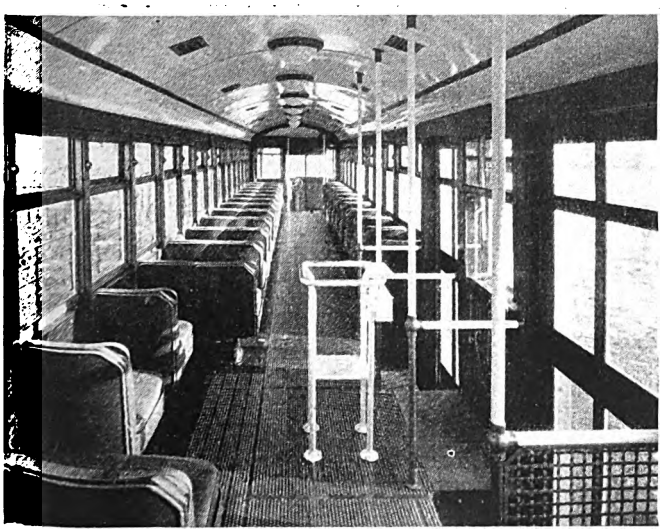
Cleveland Articulated Cars

Make Uniform Loading Possible

LARGE transportation units which may be loaded uniformly and quickly and which may be operated by either two men or three men have been obtained by the Cleveland Railway in its purchase of 25 articulated-type cars from the G. C. Kuhlman Car Company, Cleveland, Ohio. In the experience of the railway with trailer service during the past sixteen years, there has always been difficulty in loading the motor car and the trailer car of the same train uniformly because there is no connection between the two units. The articulated train eliminates this difficulty. The rapid loading and unloading of these cars is a particularly suitable feature in traffic, as they are intended for continuous service throughout the day. Departing from previous practices in cars used by this company these articulated units have wide front windows and leather upholstered seats, 21 of which are individual in type. The illumination of the interior is by diffused light from dome type fixtures mounted in the center of the ceiling. Treadle steps, better ventilation and a new color scheme mark a new vogue in the street cars of Cleveland. Acceleration is at the rate of 2½ to 3 m.p.h. per second, which is about 25 per cent greater than in the older type of cars used by the railway.

Improved riding is obtained with this type of car because there is no overhang of the inner ends of its bodies beyond the trucks, adjacent ends of each body being carried on a center bearing on the truck bolster. When entering curves the lateral movement is reduced to a minimum because there is no overhang at the adjoining ends. Cars coupled in trains in the ordinary manner are subjected to lateral movement and have a tendency to roll on account of the oscillation transmitted back and forth between the different cars. Although in the articulated car, each body is perfectly free to adapt itself to any curve of irregularity in track, there is no tendency to transmit rolling from one car to another. In fact there is a damping action through the side bearings on the connecting vestibule which tends to check any rolling which may occur.

In addition to the advantages of better riding qualities the articulated unit has the advantage of lower operating costs, lower first cost, lower annual maintenance cost and lighter weight. There is a direct saving in cost of energy required to operate the lighter cars with fewer trucks, a direct saving of labor in the inspection and maintenance of the consolidated units and also a reduction in platform expense. Another major advantage in the articulated



At left—Interior of the front section. The wide aisle gives a high rush-hour capacity. At right—Interior of rear section

Digitized by Google

cars is that they will move more people without increasing traffic congestion. The primary disadvantage is that the car is limited to use only where traffic density justifies operation of two-car units.

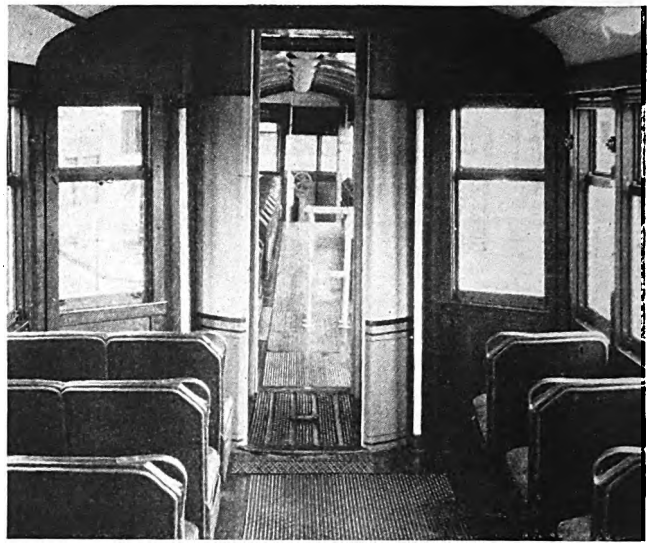
No attempt is made in the new units to achieve extremely light weight. Each complete assembly of two bodies and three trucks with motors and all equipment ready for service weighs approximately 76,000 lb. They are 101 ft. long, the front section being 51 ft. and the rear section 50 ft. in length. The length over the vestibules is 100 ft. The over-all width is 8 ft. 5¼ in. and the width over the body posts is 8 ft. 2 in. They are 10 ft. 10½ in. high from the rail to the top of the trolley boards. The trucks are spaced on 37 ft. 6 in. centers on each section. The side post spacing is 29¼ in. and the width of the side exit door opening is 31⅝ in. The underframe is built completely of steel, the side sills being 4x4x$\frac{5}{16}$-in. angles. The front end sill is the drop type, of steel plate and 3-in. channels and the rear end sill is the box type of 3-in. channels with top and bottom plates. The top plate at the pivot end is of $\frac{3}{16}$-in. gage extending across from side sill to side sill. The bottom plate at the pivot end is ⅛-in. gage. The pivot truck bearing is a steel casting fitted and attached to side and end sills, center box sill construction and top and bottom plates. The bolsters are of the built-up box type with a 14x½-in. top plate and 8x¾-in. bottom plate and $\frac{5}{16}$-in. web plates extend the full length of the bolster.

The body frame is of steel construction. The corner posts are 2x2x¼-in. angles, and the side posts are 1½x 1½x$\frac{3}{16}$ to ¼-in. tees. Four 3-in. channels formed to arch, extending from side sill to side sill, are located one at each side of the door openings, one at the pivot end of the body, and one at the center of the body in the first section. In the second section two of these channels are placed at the pivot end of the body, and one at each side of the door openings.

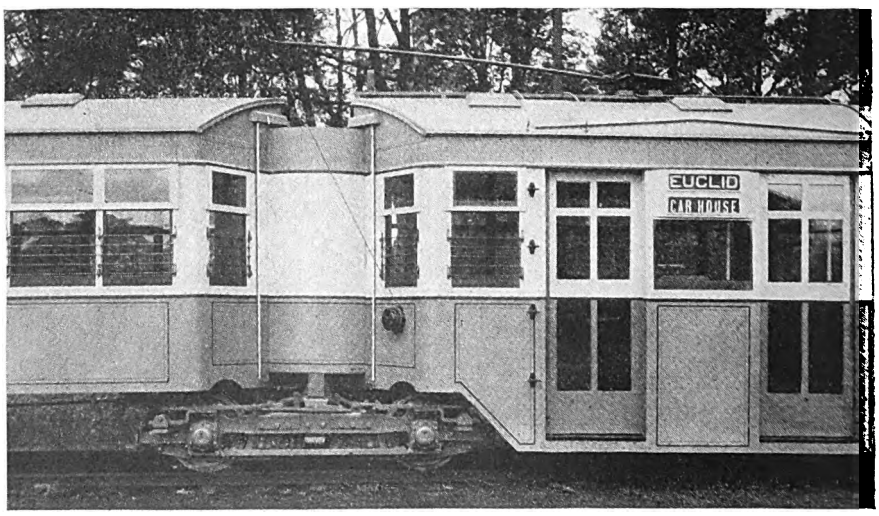
The roof is constructed of ⅜x2½-in. poplar boards with 1½x$\frac{3}{16}$-in. steel carlines braced approximately 15 in. apart and is covered with No. 8 canvas. The floors are single of $1\frac{1}{16}$-in. yellow pine, rift sawed with Kass safety treads in the aisles. The entire floor is level with the exception of the motorman's compartment in the front section, which is dropped 6 in. Trap doors are installed over the motors. The front vestibule platform is semicircular in shape and has four windows within the motorman's partition, and one window at the left hand side between the motorman's partition and the car body proper. The window in front of the operator is equipped with a Folberth automatic window cleaner. With the exception of the two sash at the right hand side under the signs, all sash in the front vestibules are made to raise and the one at the left of the center window is equipped with a ventilating top sash. Double steps of the stationary type are at all door openings. All step wells have rounded corners. The connecting vestibules are lined with molded Haskelite and the same material is used in the roof and the vestibules.

The interior finish is in mahogany treated as antique walnut. The headlining is of Agasote and the wainscoting and other interior trim is Haskelite. The lower sash is of the all-metal type and arranged to raise. The upper sash is of the continuous type constructed of cherry and arranged with a ventilating sash at every other opening. The ventilating sash have all-metal frames. The raising of the lower sash, coming into contact with the strike plates when open, will automatically close the ventilating sash and allow the lower one to raise to its full height. All sash fixtures are furnished by the O. M. Edwards Company. The metal sash and all interior metal trim is finished in statuary bronze and the ceilings are finished with cream and sepia. The exterior is colored orange and cream with Glidden metal finish. Five-bar type window guards are fitted on the outside and are arranged to swing up or remove. Curtains of Fabrikoid are installed over each side window and at the motorman's partition.

All doors are of $1\frac{1}{16}$-in. cherry. The doors in the front end are the double inward-folding type and are controlled pneumatically through the brake valve. The four body doors, two in the front section and two in the rear section, are of the sliding type. The body doors in the front section are operated selectively through an electro-pneumatic control located at the conductor's position.



Passage through drum over pivot joint. The minimum opening of the passageway is 22 in.



Exterior of drum over pivot joint, showing truck mounting. The connection is designed to operate on a 45-deg. center radius curve

Digitized by Google

The doors in the rear section are operated selectively by treadles and are rendered inoperative by a switch at the conductor's position. All door operating mechanisms are furnished by the Consolidated Car Heating Company. All glass in the door panels is ¼-in. protex.

Ample Ventilation is Provided

The cars are ventilated by twelve Nichols-Lintern special low-type ventilators in each section. They are covered on the inside with grilles and half of the ventilators are equipped with regulators. The car interiors are illuminated by eighteen 101-watt lamps mounted in nine Graybar dome lighting fixtures in each section. Two overhead step lights operating with the front doors are located in the bottom of the engine cabinet. The front signs are illuminated by three 101-watt lamps. A Golden Glow headlight is mounted flush on the front end of the car. A duplicate of the headlight with a red lamp is located in the center of the rear dasher and is so connected as to act as a stoplight.

Each front section is equipped with 27 Consolidated Car Heating Company grid resistor heaters, as well as 24 additional single-coil heaters connected in the regular heating circuit. In the rear section are eighteen panel type double-coil heaters. All of these heaters are located in ducts extending the full length of each side of each section and are thermostatically controlled. An independent cab heater of the flush type is built in the back of the interior finish below the belt rail at the motorman's position. A push button is located near the control apparatus for the purpose of cutting out the heater current while passing over electric track switches.

A Consolidated high-voltage type push button is mounted on each side post and connected to a buzzer. A single-stroke bell is mounted at the motorman's position and is operated by a push button at the rear of the car. A 12-in. Brill dedenda gong is located beneath the front platform.

Hunter destination signs are mounted at the panel between the doors on each section. These signs are the removable type, 15 in. high, and 32½ in. long. Another destination sign of the removable type is mounted over the center window on the front end and a route number sign is installed over the right-hand wing window bearing two curtains with numerals from 0 to 9. Fifteen Hale & Kilburn double seats and fourteen single seats are installed in the front section, and twenty-three double seats, with seven single seats, in the rear section. Five seats are arranged in semi-circular order in the rear of the second section. These seats are upholstered in genuine leather. The steel work is painted brown and the seat grabs are finished in statuary bronze. No foot rests are furnished. The motorman's and conductor's seats in the front section are supplied by the H. H. Trolley Supply Company, the motorman's being removable and the conductor's the non-removable type. The conductor's seat in the second section is located between the doors and is of the same non-removable type and make as the conductor's seat installed in the front section.

The cars are mounted on Brill 68-E-2 trucks with 4x8-in. journals, and a wheelbase of 6 ft. They are equipped with slack adjusters, graduated springs, and Timken roller bearings. Each truck has two inside-hung Westinghouse No. 340-P 50-hp. motors. The wheels are rolled steel of 26-in. diameter. The armature bearings are of the plain type. H-B type life guards are installed under the front platform.

These cars are operated from the front end only by multiple-unit platform type control equipment. The platform control is mounted within a switch cabinet which is attached to the partition in the motorman's compartment. All wires are run in Duratube non-metallic conduit. The Ohio Brass Company trolley is mounted over the rear of the first section and is equipped with an O-B trolley catcher located on the front of the rear section. The Westinghouse Air Brake equipment includes a quick application and release valve. The safety car control is furnished by the Safety Car Devices Company. Air is furnished to the brakes by a 25-cu.ft. compressor. The brake valve is equipped with a sanding feature operating two Nichols-Lintern traps. Sand is furnished at the forward trucks from two sand boxes located beneath the front seat on each side of the car. Located on the front platform of the unit is a Peacock staffless hand brake with a 14-in. wheel operating at an 8 to 1 ratio. This brake is connected with the foundation brake rigging and operates on the first two trucks only. There is also a drop handle located at the conductor's position which is connected to the foundation rigging.

Railways Have Huge Investment in Man Power

By W. J. McCarter,
Supervisor of Training
Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

Editor's Note — In this article, which is based on a paper presented at the annual meeting of the Wisconsin Utilities Association, Transportation Section, held at Sheboygan, Aug. 16-17, the author calls attention to the great economic importance of care in the selection of platform men.

As street railway men you have all been confronted with the problem of obtaining platform men for work on your cars, even though you may not have come into direct contact with the problem. You have also had the responsibility of selecting equipment. Which of these problems has been more important in your estimation? From the method, time and care devoted to the selection of each, the answer will invariably be "equipment." Why should this be the case. A $150 per month man presents the same commercial problem as a $30,000 machine. Each must earn $150 per month on the investment. You have spent hours over the specifications for the purchase of a new car. Have you ever specified in anything like the same detail the kind of man you want to run that car? Before that car is purchased you test its performance in every detail. Can you predict with the same degree of accuracy the performance of the man who is going to have absolute control of that car after it is put upon the road?

If the man does not perform as expected we hide behind that much-overworked term "man failure." We have grown to expect man failure. Isn't man failure just as much a preventable and predictable thing as car failure? Man failure is more dangerous than car failure and should be deserving of as much thought. We should know at least as much about that man as we know about the car.

Some time ago I was riding on a car which was approaching a street intersection with a clear view of the cross street. An automobile was approaching from the

Digitized by Google

opposite direction on the same street as the car. As the automobile came to the cross street it suddenly turned left in front of the street car to go down the cross street. The motorman had sufficient time to stop his car but made no motion to do so. The car just missed the automobile but as it crossed the intersection and after the automobile had passed on out of the line of danger the motorman threw his brake handle into emergency. This shows a distinct delay in response to a visual situation.

Annual Convention Number—Sept. 8

"Selling Better Transportation Better"

Analyzing the New Trend of the Industry—

TOWARD MERCHANDISING!

Service No. 2—See page 335.

A real accident will illustrate another case of man failure. An air motor fuse had blown but the operator did not notice that his air pressure was getting low. He applied the air to make a stop at an arterial highway but the car did not stop. There happened to be a truck in the way and the two vehicles collided. The operator's immediate statement was, "Why didn't I reverse the motors?" He knew what to do but he didn't do it. It was called a case of man failure. I started a private investigation of the case and found from the man's selection test that he had been declared "motor-minded." An examination of his training record showed that he had been told that when his air failed he should reverse the motor. He had had the experience of reversing the motors but had never been confronted with this particular kind of a situation. A proper analysis of that man with the proper kind of training would have prevented that man failure.

There was a time when the only specification for the man was his physical strength to perform certain tasks. With the advent of machinery to take care of physical labor this particular factor is diminishing in value. In the street railway business today it doesn't take much strength to turn the controller handle, to move the air brake handle, to issue or punch a transfer, to make change, or to form the desirable public contacts which are so necessary. It takes something which is entirely different, something which cannot be measured by brute strength, by physical examination, or by the outward appearance of the man.

On the street car we want to know whether or not a man can notch the controller evenly and safely and operate the air handle at the same time; whether or not he can manipulate them quickly and accurately when confronted with certain street conditions; whether or not he will maintain an attitude of continued attention. We must know whether or not he can issue transfers and make change quickly and accurately, and if he will form the proper contacts with the passengers. He must also be able to learn to understand his equipment in sufficient detail to be able to locate the troubles which may develop. These abilities must be analyzed in terms of the human mechanism.

In many respects the human control through the nervous system is similar to the wiring on a street car. The energy or stimulus to cause the man to perform comes from a sense organ such as the eye over nerves to the brain, where it is controlled and distributed in a definite way. From the brain the stimulus is sent on to the muscles which cause the man to act. If the wiring on a street car is exposed it can be traced to see whether the circuit is continuous. If the wiring is not exposed it must be tested by sending a current over it to see whether the other end of the wire receives the signal. In the human mechanism we cannot tear the body apart to determine that the connections are properly made.

No one can predict exactly what any man will do under a certain set of circumstances until that set of circumstances has been placed before him. Because of these fundamental differences in every human being, if we are going to know each man's ability it must be tested. Testing, whether it be machine or man, is a sampling of abilities. In a man, as well as in a machine, we must know what the test is for, how the test is to be performed and how to interpret the results.

In our transportation work we cannot test the ability of a green man to run a street car but we can test his ability to learn to run it and to react properly to given situations. In the car operator's job it is of primary importance that he should possess mechanical aptitude. In other words, he must have a good co-ordination between his hands and between hands and feet. He must have a precise control of arm and hand muscles in response to desired manipulation, such as exact notching of the controller and fine adjustment of the air brake handle. He must be able quickly and accurately to shift from these manipulations to the operation of the exit-door handle, to the issuing of transfers, and to making change. Without interfering with these operations he must be able to sound the gong and apply sand. To avoid accidents in normal operation he must have a persistence of attention, alertness, and a good memory span. He must have the ability to grasp in one moment of attention a number of distinct and variable stimuli. He must be able to foresee and anticipate from previous experience the actions of traffic and pedestrians. Proper reaction to these situations must be learned responses associated through experience with a given situation stimulus. In an emergency he must have the ability to change his response under a sudden emotional stimulus. With respect to public contact he must have the correct response attitude to passenger problems. He must have honesty in fare collection and loyalty to tradition. These are the qualifications for a successful, efficient and competent car operator.

Cincinnati Advertisers in Telephone Directory

TWO pages in the classified section of the telephone directory have enabled the Cincinnati Street Railway Company to place considerable information regarding its trolley and bus service where it is readily available to thousands of its patrons. The advertisements show a map of the street car and bus lines, a diagram of downtown loading places, a list of car lines and route numbers, a description of motor coach routes and much information of general interest. Attractive posters calling attention to the advertisements in the telephone books are prominently displayed in the company's cars with the view of getting the people into the habit of consulting the telephone directory for information relative to car service.

There are to be three inspection bays, each like the bay shown above, with each track long enough to hold a train

Hamburg Elevated

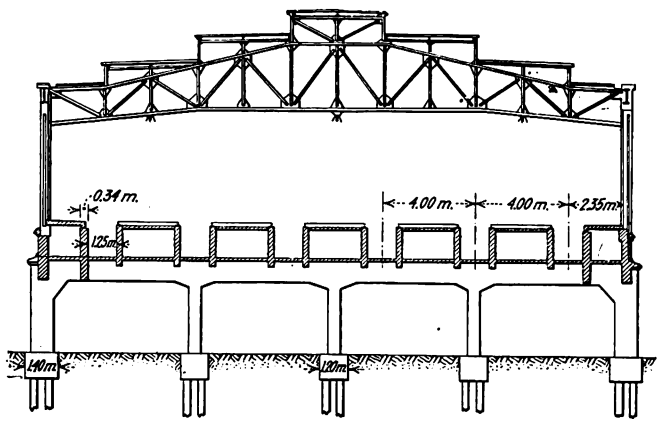
Increases Facilities

Company completes new operating yard and inspection carhouse. Inspection is conducted by officially trained crews and troubles have been greatly reduced

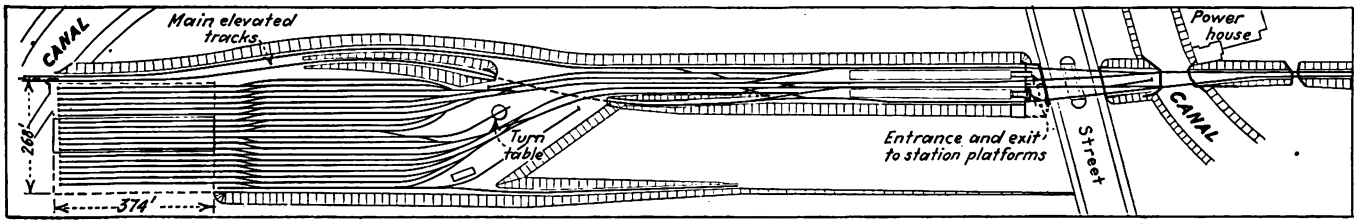
COMPLETION of a new operating yard and inspection car house close to its Stadtpark station gives a material increase in the facilities of the Hamburg Elevated Railway, Hamburg, Germany. These improvements adjoin an earlier carhouse, known as the Barnbeck carhouse. They are also close to the company's power station and repair shops. The layout of new yards and of the final form of the carhouse with eighteen tracks is given in the accompanying plan.

To permit easy entrance and exit of cars between the elevated structure and the new carhouse, the elevated structure at this point is equipped with four tracks. The two in the middle are used for trains entering on or leaving the structure from the carhouse, and each is connected to ten yard tracks. The two outside tracks at this point are for the through trains.

There is a separation of grade where the carhouse tracks cross the main line. Each carhouse track is also protected by signals. The yard is equipped with a turntable to reverse the cars. This is done four times a year to insure a more uniform wear on the tires and avoid sharp flanges. The headquarters for the train employees are in a special building fronting on one track and connected by a bridge to the other track. An-

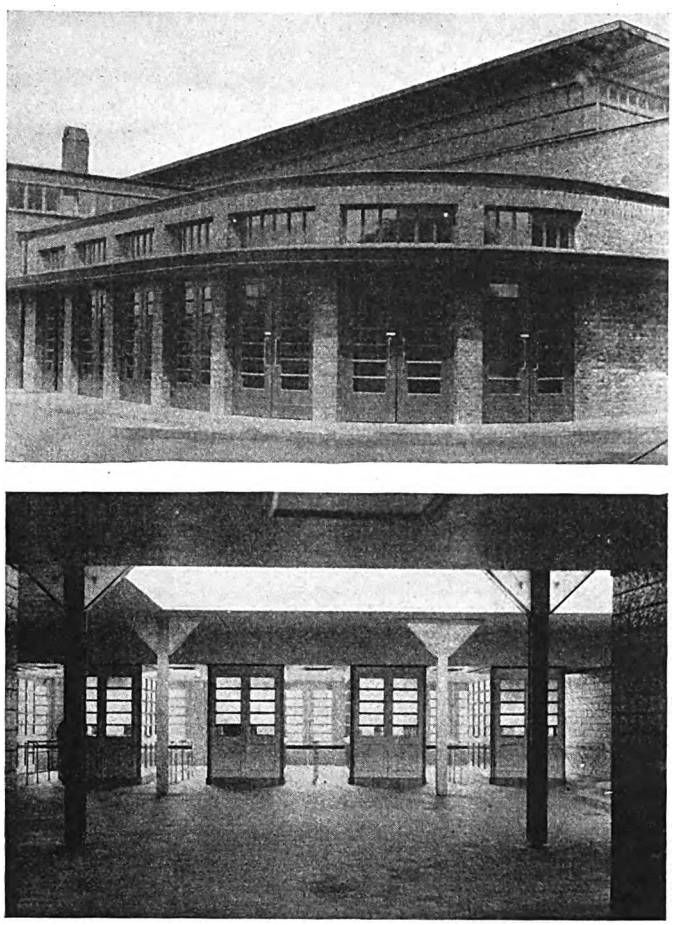


Cross-section of one bay of inspection carhouse. The dimensions are in meters



Trains can be run from either operating track over any inspection pit, then out to any track in the storage yard

Digitized by Google



Exterior and interior of Stadtpark station passenger entrance. At times large crowds have to be handled at this station

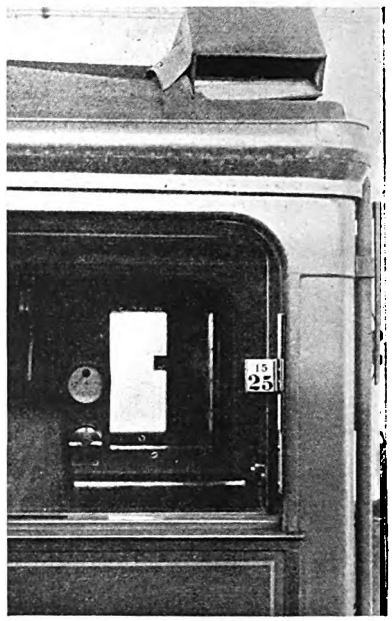
other, but smaller, building has been erected as headquarters for the yard crew. It is near the turn-table.

The carhouse was erected on re-enforced concrete pillars, on account of its great height above the ground. It has plenty of skylights, making its interior very light. All tracks in the carhouse are equipped with pits for their full length, a plan which was necessary because the trains remain in the carhouse only for the short time required for their inspection. They are then run out to make room for other trains.

This switching is done by the use in front of the carhouse of a double row of interconnecting switches. This makes it possible for a train to be operated from any track in the carhouse to any track in the yard. As this means outside storage for the cars at night, the air line pipes of all cars are equipped with a condensation equipment so that their air pipes will not freeze in winter.

The auxiliary rooms required for the work of inspection and light repair, such as wash rooms, toilets, blacksmith shop, machine shop, carpenter shop and storeroom are in the rear part of the carhouse. A large compresser and heating plant is located in the cellar.

The present inspection schedule calls for a fairly detailed division of the work among several crews, each specializing on certain parts of the equipment. These crews handle trains continuously, which means that the time of labor for every member of each crew has to be the same. The plan has worked out very satisfactorily and has been responsible for a considerable decrease of troubles. Previously an average of 34 troubles were reported for every 100,000 car-km., or 62,500 car-miles. At present the monthly average is often as low as seven. Each car carries in its cab window a card showing the date when it should go in for inspection. This card is readily visible from the station platform, so that the withdrawal of a train for the purpose of inspection causes no difficulty. In the illustration the lower large number represents the day of the month for the elaborate inspection, while the upper smaller number indicates the day in which bearings have to be oiled, compressors have to be inspected, brakes have to be adjusted, and the cars are to be given a thorough interior cleaning.



This view shows the way in which each car carries a card to tell when it is due for inspection

The Stadtpark elevated passenger station adjoining the new carhouse has been greatly enlarged and improved, as it has to handle large crowds occasionally. The fare passageways are now equipped with passimeters. The lettering indicating the names of the stations, is now made of wooden block letters instead of being shown by enameled signs. The wooden letters are thought to be more easily read at a distance as they stand out in relief.

Paris Tries Aluminum-Alloy Overhead Fittings

Lighter trolley wire appliances have reduced overhead troubles. Catenary construction also being installed by Paris surface lines

TWO papers presented at the last annual meeting of the French Electric Railway & Bus Association (L'Union des Voies Ferrées et des Transports Automobiles) in Marseilles in November, 1927, give particulars of some interesting developments in overhead construction by the Paris surface lines. They are just made public in the official organ of the association.

The first paper was contributed by Mr. Laspeyres, one of the electrical engineers of the company, and tells of a test in actual service by the company of overhead material made in various aluminum alloys, primarily to reduce the number of trolley wire breaks. Experience has shown that a large part of these breaks occur at points where the overhead wire enters or leaves the ear. It was believed that lighter overhead material would help reduce this trouble. The previous standards for feeder suspension, pull-off and splicer ears had been drop-forged, brass or bronze, which was lighter than the cast ears previously employed and had reduced the breakage over that formerly experienced. It was to secure even better results that the trial was made with aluminum alloys.

Service No. 3—See page 337

Of the alloys available, duralumin, avi, alferium and francalu were selected for consideration, as they were commercial products, their treatment and properties were known and they were capable of being drop-forged into the forms desired. These alloys contain about 95 per cent aluminum, 0.5 per cent of magnesium, 4 to 5 per cent of copper, a little manganese, and traces of iron and silicon. While this material is not affected by the weather, the company believes that it is probably desirable to use galvanized screws in putting the parts together, and possibly some kind of varnish over the whole appliance, although this question of outside protection has not yet finally been settled.

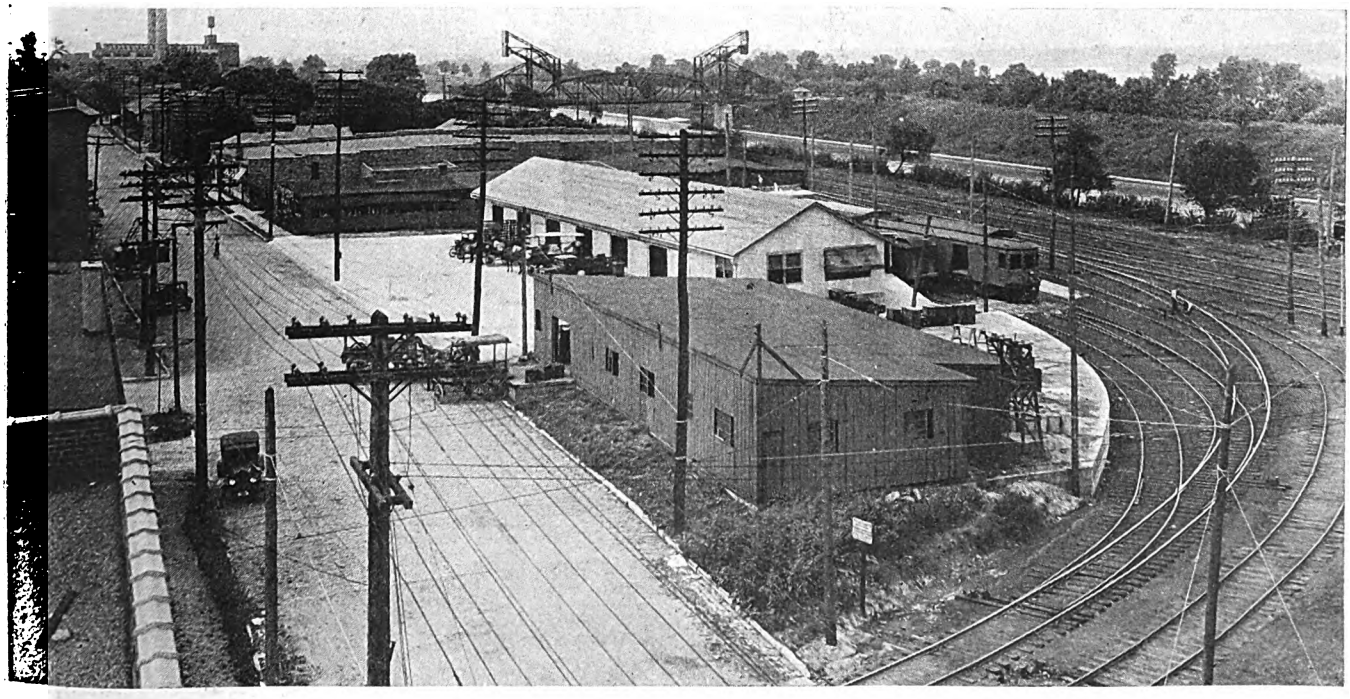
In 1924 the company put in service 100 clamps of avi metal under a variety of conditions, and after 468,000 passages of trolley wheels under them they show no greater wear than would be the case with a brass clamp under similar conditions. Individual appliances weigh only from 38 per cent to 55 per cent as much as corresponding parts made with brass or bronze. The alloys used so far have been avi and duralumin. The cost per appliance is but little if any more than with the heavier material, the scrap value is greater, and a lighter overhead material, particularly at complicated overhead crossings, where much material has to be used, is obtained. Incidentally, the use of aluminum appliances so lighten the whole structure as to make it possible to reduce the size of the supporting structure.

The trial installation made of catenary construction on the Paris surface lines was described in a paper presented at the same meeting by Mr. Henrich, electrical engineer of the company. The installation is purely experimental and is on a section of double track, 2 km. (1¼ miles) in length, where there is considerable traffic. The primary purpose was a reduction of maintenance because of the greater flexibility of the overhead line and a reduction in the number of overhead breakages. Incidentally, it is expected that there will be considerably reduced wear on the trolley wheel and possibilities of higher speed. This is not the only line in France to use the catenary. Lyons and Strasbourg also have it, among others.

The first cost for catenary for a double-track line is reported in the paper to be 7 per cent higher than for ordinary construction, and for single track about 3 per cent higher, but with the possibility of reduced maintenance, the saving may very easily be in favor of catenary construction.

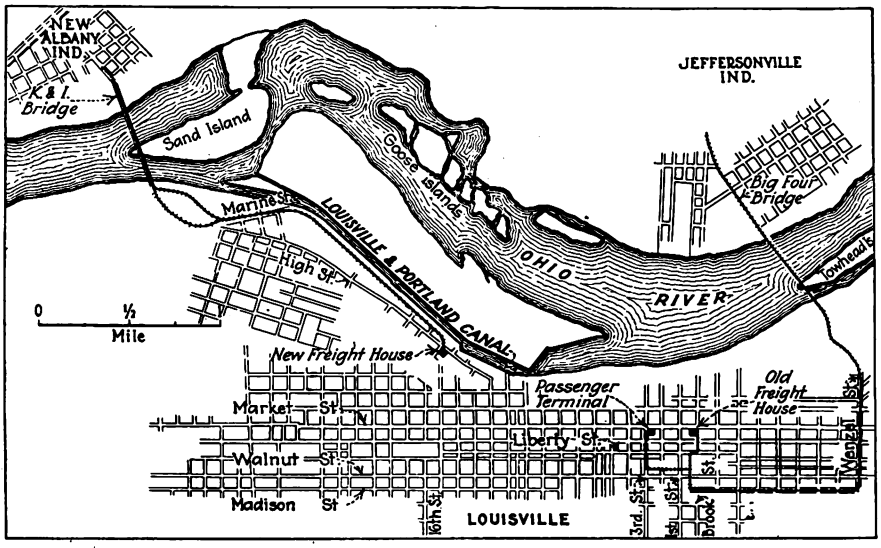
Interurban Builds New Freight Terminal in Louisville, Ky.

RECONSTRUCTION of the Big Four Railroad bridge over the Ohio River connecting Jeffersonville, Ind., with Louisville, Ky., over which cars of the Interstate Public Service Company had been routed for several years has necessitated a change in the handling of the freight and passenger business of that line. Four 29-passenger parlor car buses were put in service between Sellersburg, Ind., and Louisville, operating by way of New Albany, Ind., to handle the passenger but taking care of the heavy volume of freight which moves over the Interstate presented a more difficult problem. It was solved by laying about 600 ft. of twin gage track in New Albany, this being made necessary by the fact that the trolley line connecting New Albany with Louisville was 5 ft. gage, and connecting up with the standard gage track of the Kentucky & Indiana Terminal Railroad. The freight cars of the Interstate are then hauled over



Overhead trolley lines are provided for maneuvering the freight cars on the tracks immediately adjacent to the freight terminal

Digitized by Google



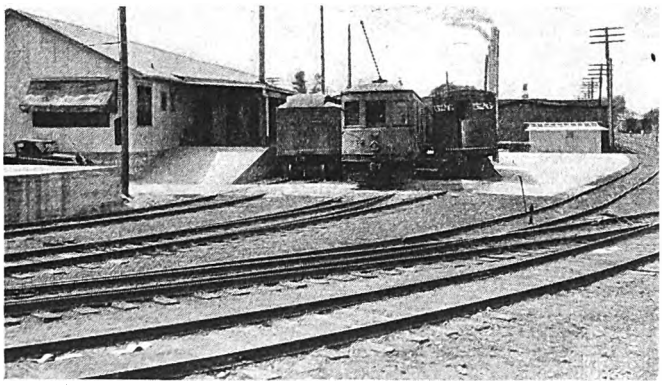
Map showing relocation of freight terminal of Interstate Public Service Company in Louisville, Ky.

the K. & I. bridge from New Albany to Louisville by steam locomotive.

When operating over the Big Four bridge the trains of the Interstate Public Service Company had been routed through Louisville along Wenzel and Madison Streets to Brook Street, as shown in the accompanying map. The freight terminal was located on Brook Street and access to the passenger terminal, three blocks distant, was provided by a private right-of-way paralleling Walnut Street to Third Street.

As the tracks of the K. & I. Terminal Railroad, over which entry to Louisville was made, did not run anywhere near the Brook Street freight terminal it became necessary to construct a temporary freight depôt at some point adjacent to that road. Accordingly a point was selected at Sixteenth and High Streets on which a temporary structure was erected. As previously stated the Interstate freight cars are hauled to this point by steam locomotive, but in order to facilitate the movement of cars around the new yard a complete system of electrical overhead was erected.

While this new arrangement has been regarded as only a temporary relief pending the reconstruction of the Big Four bridge the new freight house location has proved so satisfactory as a local distributing point that it may be found desirable to continue it permanently after the bridge is completed. There is a heavy movement of freight over the Interstate line through Louisville to steam railroad connections serving territory east of the Mississippi and south of the Ohio River.



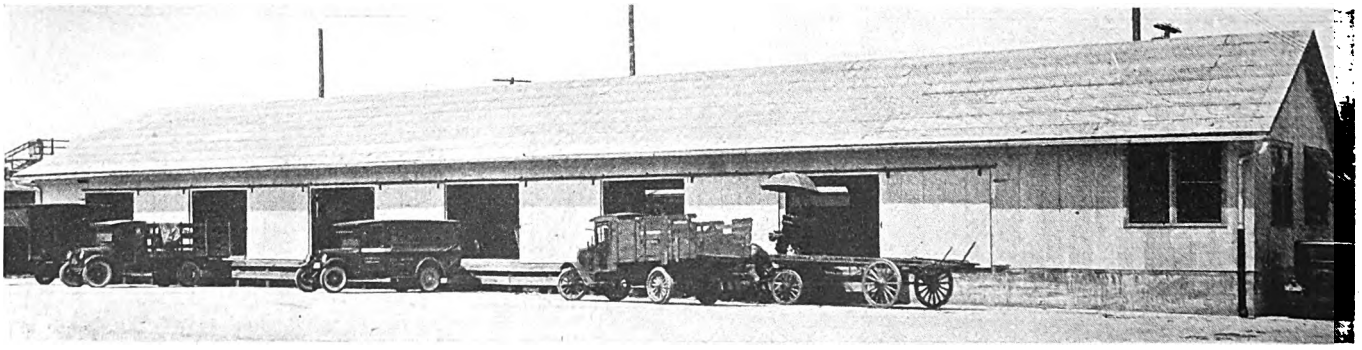
A wide platform extending the length of the freight house facilitates handling shipments

Safety Display in Asbury Park

This car was one of the features of Safety Week in Asbury Park

SAFETY WEEK in Asbury Park and vicinity was sponsored this year by the American Legion, together with the Chamber of Commerce, the Rotary Club, Kidwanis Club and various other civic bodies.

The Eastern New Jersey Power Company and the Coast Cities Railway entered heartily into the campaign. The car shown in the illustration was part of their contribution in this important work. It was operated during Safety Week, early this summer, over the lines of the company.



Six wide doors on the side opposite the unloading platform permit the transfer of freight to trucks almost as rapidly as it is unloaded

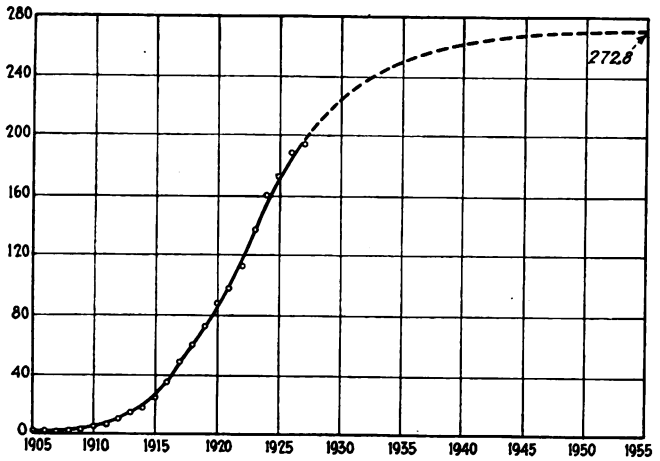
State Curves Point to Automobile Saturation

FORECASTING automobile increase from the experience of the past 23 years, Robert Whitten, city planning consultant, New York, writing in the *American City Magazine* for August, attempts to predict the saturation point. Thereafter the number of automobiles will increase, he believes, only as the population increases.

One way to forecast the growth of an artificial phenomenon is to establish its relationship to some natural phenomenon that grows in accordance with rather well-defined laws. In the case of the motor vehicle, population is the most obvious thing with which to attempt to establish a relationship, and the relationship that it is most convenient to study is the number of motor vehicles per 1,000 persons.

In an accompanying chart are shown the curves of motor vehicles per 1,000 persons for the United States and for various individual states from 1913 to 1927. The



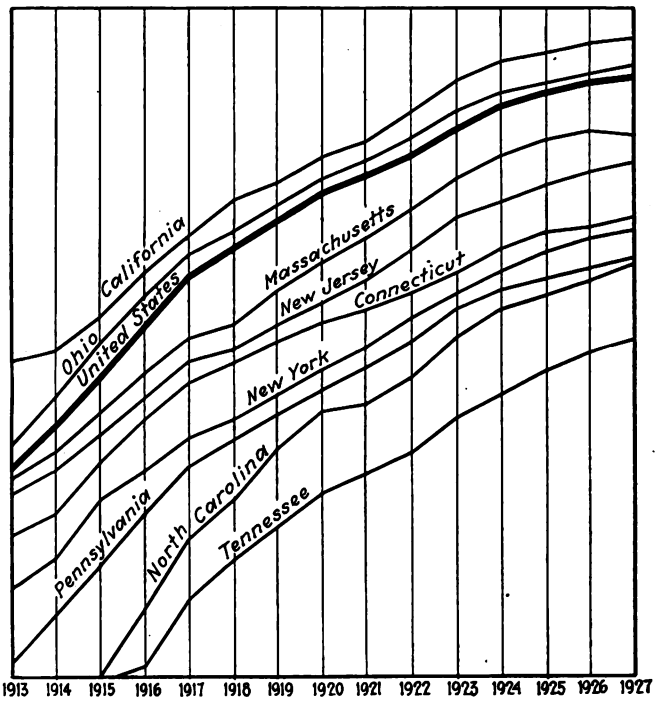
Motor vehicles per 1,000 persons in the United States with forecast to 1955

POPULATION AND NUMBER OF MOTOR VEHICLES IN THE UNITED STATES WITH FORECAST TO 1955

Year	Population	Number of Motor Vehicles	Motor Vehicles per Thousand Persons	Persons per Motor Vehicle
1900	75,995,000	8,000	0.11	9,499.4
1905	83,984,000	78,000	0.93	1,076.7
1910	91,972,000	468,500	5.1	196.2
1915	99,195,000	2,445,666	24.7	40.5
1920	105,711,000	9,231,941	87.1	11.5
1925	115,378,000	19,937,274	172.7	5.8
1930	120,200,000	26,973,000	224.4	4.5
1935	128,000,000	31,936,000	249.5	4.0
1940	135,800,000	35,525,000	261.6	3.8
1945	143,000,000	38,210,000	267.2	3.7
1950	152,200,000	41,155,000	270.4	3.7
1955	160,850,000	43,687,000	271.6	3.7

curves are drawn on a semi-logarithmic scale, but have been moved vertically to show to better advantage the slope of the individual curves. They show the relative rates of growth in the various states, but indicate nothing as to the actual magnitudes. While the curves have been moved so that they do not bear a true relation to one another except as to slope, they have been arranged as they stood in 1927 with the highest, California, at the top, and the lowest, Tennessee, at the bottom.

These curves are all approximately parallel. The scale is semi-logarithmic, so that the straight line from 1913 to 1917 indicates that the number of motor vehicles per 1,000 persons increased at a uniform percentage rate during this period. In 1917 the United States entered



Motor vehicles per 1,000 persons in the various states

No vertical scale is shown, as the curves have been moved up or down to prevent their crossing and recrossing each other. The vertical scale is logarithmic, however, so that the rates of increase may be compared, though not the actual magnitudes

the World War. This did not cause a change in the nature of the increase; it continued at a uniform rate, but slower. In 1923, however, something different happened. Apparently, the turning point in the increase in automobiles with respect to population was reached in that year, and thereafter the increase has been at a constantly decreasing rate. When anything increases at a decreasing rate, it is approaching a limit. If the increase at a decreasing rate has been going on for a sufficiently long time so that the rate of decrease in the increase can be found, the limit can be determined. In this case, however, we have only four points since 1923, so that the trend indicated must be used with caution.

Up to the present time the curve of growth has resembled that of various organisms and is similar to the Pearl-Reed curve of population growth. Projecting the curve of automobile growth according to an accepted mathematical formula, Mr. Whitten reaches the conclusion that 272.8 is the upper limit of automobiles per 1,000 persons. This is twice the 1923 figure.

While the upper limit of 272.8 motor vehicles per 1,000 persons, or 3.7 persons per car, will theoretically never be quite reached, the approach to it by 1945 will be so close that for all practical purposes we may say that the economic limit will be reached by that year and that thereafter the number of motor vehicles will increase only as population increases. Moreover, of the total increase in the ratio of cars per 1,000 persons, 77.8 per cent will occur within the next ten years, or by 1937.

Reducing Noises in Street Cars

By Silas B. Tobey,
Menominee & Marinette Light & Traction Company, Menominee, Mich.

Editor's Note.—This article is condensed from the report presented by the author to the Wisconsin Utilities Association, Transportation Section, as a summary of the work done during the year under the fellowship established by that body at the University of Wisconsin. A report of the earlier investigation was published in this paper, issue of Sept. 11, 1926, page 413.

THREE years ago Kent Woolridge started the study of noises in electric traction cars in connection with a fellowship established at the University of Wisconsin by the Wisconsin Utilities Association, Transportation Section. His work consisted mainly of developing apparatus for the measurement of noise. The following year Erwin Summers assumed the fellowship and continued the work, spending most of his time modifying and perfecting the instruments to meet the needs of the tests. It was with this perfected measuring apparatus that the investigation was resumed this past year.

Tests were commenced the latter part of October, being confined for the first part of the school year to the measurement of noises from points outside the car. During the latter half of the year the tests were carried on inside the car proper.

The apparatus used in this study consisted of a sound pick-up and a recording device. This latter consisted of a microammeter and a mechanically-operated stylus which translated the noise into curves varying in height with the intensity of the disturbance.

Tests Made in Cars and at Curb

For the outside tests this apparatus was placed in a car at the side of the street where the pavement was to be tested. As the street cars passed the instrument recorded the accompanying noise. A large number of runs were taken on various streets and the maximum points on the graph for each street were averaged so that the average noise intensity for each type of pavement could be determined. These averages were then used in comparing the sound absorbing ability of the various pavements.

The tests in the cars were made to get two different comparisons. The first was to get the comparison of the effect of various pavements on the intensity of the noise heard by the passengers. This was done by making runs in each car over the same pavements. For example, the tests on many of the cars in Wausau were made over concrete streets with rail filler, wood ties, Dayton mechanical ties, brick, and asphalt macadam pavement. The tests were repeated in Madison and Milwaukee so that a number of different types of pavements could be compared.

The second comparison to be made from the inside tests was that between the different types of cars. To do this, tests were made in each car as it was run over a pavement common to that over which the other cars were tested. In Milwaukee, for instance, a number of cars were tested over Vliet Street between 40th and 60th.

Soft Street Surfaces Prove Quietest

The Madison tests on the outside of the car were the most important ones of that type and gave the best idea of the contribution of the pavement to the noise from the passing street cars that reaches the ears of the pedestrian. The types of street tested in this manner were concrete macadam, brick, creosote block and dirt. As might be guessed the street with the rougher and the softer surface was the quietest. When the dirt street froze, however, the passing cars made much more noise. These tests showed that the macadam street was more quiet than the brick and the brick more quiet than the concrete.

Inside tests in all of the cities mentioned gave results which are worth considering. As mentioned before, the aim of these tests inside of the cars was to determine the effect of various types of track construction and pavement on the noise which reached the passengers and the effect of the various parts of the cars in producing noise.

The effect of the pavement can best be shown from the tests in Madison and in Wausau, although those in Milwaukee gave some valuable information. The inside tests showed, as did those on the outside of the cars, that the concrete was the most noisy of all pavements, other things being equal. This was proved to be true in all three cities. The fact that a street is covered with a plastic material such as asphalt reduces its sounding board qualities and makes the cars seem more quiet to the rider. Another thing that proved to be of value in reducing the noise in the car was the rail filler such as is used in Wausau. Mr. Woolridge found this to be true from his tests also. Streets where tracks were laid on Dayton mechanical ties were compared with similarly surfaced streets having wood ties. It was found that the mechanical tie absorbed as much, if not more, noise than did the wood. The thermit joint, however, proved to be the greatest noise reducer in track construction encountered in this study. It tended to reduce the propagation of car noises better than the other elements could absorb the noise produced.

In these tests the brick pavement proved to be more quiet than the concrete, and the macadam, water-bound or tar-bound, more quiet than the brick. Very little creosote block pavement was tested and so conclusions as to its qualities as an absorber of car noises are merely guesswork as far as this study is concerned.

In these inside tests it was noticed that if dust or dirt, be it sand or tar, is on the track the noise that reaches the passengers is much increased.

Reducing Noise in the Car

The final comparisons to be made with the data from the tests inside of the car were those of the different type cars. Because of the many variables it was very difficult to determine just what was the best method of reducing the noise within the cars themselves. Cars with spur gears were tested and compared with other cars of the same type, but with helical gears. It was found that the helical-geared car was just as noisy as the other. Other things, such as the effect of the size of the wheels and the type of trucks were investigated, but to no avail. There were three things which might seem obvious, however, which were proved. The first and the least obvious was that the type and number of seats in the car does affect the intensity of the noise in the car. It was found that the softer and the larger the number of seats in the car the more quiet it seems on the inside. The next thing was that the practice of putting an insulating material between the inside and the outside walls of the car not only keeps the heat in but also the noise of the trucks out. The last and the most obvious point proved was that the flat wheel is the worst noise maker on the car. It is known by every one but where is there a street car system wholly free from this defect?

The lower panels are finished in a lemon yellow with black trim, while a cream color is used above the window ledges

Ohio Interurban Modernizing Its Cars

De luxe seats, better light, smaller wheels, and ramps replacing the vestibule steps are some of the improvements

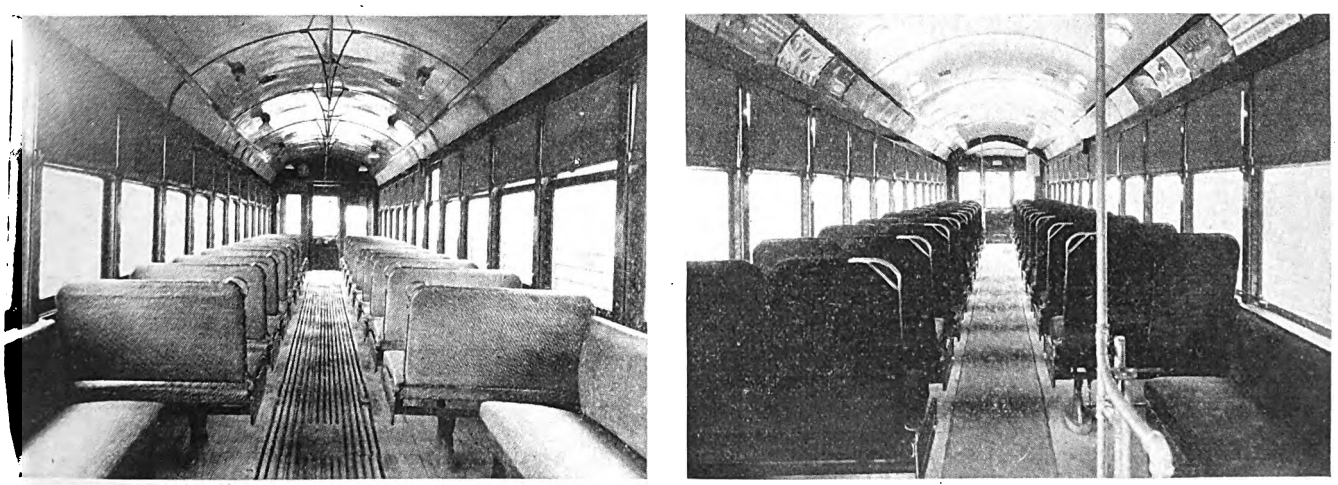
SEVEN of the nine interurban cars being rebuilt by the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, have been completed and placed in service. The first car to be finished was returned to service on Jan. 6. The other six were completed at succeeding intervals of about one month.

The rehabilitation work includes the substitution of a ramp for the inside step in each vestibule, eliminating the closed bulkheads, rearranging the equipment in the motorman's compartment, installing de luxe seats and better lights, refurnishing both the exterior and interior, and remodeling the trucks, using smaller wheels. Four of the cars are of combination steel and wood construction and were built by the Kuhlman Car Company. The remaining five are of all-steel construction and were purchased from the Cincinnati Car Company. The wood and steel cars as reconstructed weigh 24 tons; the all-steel cars weigh 25 tons.

The vestibules and inside floor which were formerly at different levels are now joined by ramps. These ramps have a slope of $3\frac{5}{8}$ in. from bolster to center post, and another slope of 2 in. from this point to the front of the crown sheet. In the vestibule proper the floor slopes 1 in. each way from the center line.

Uninterrupted passage from the car vestibules to the body of the car has been obtained by the elimination of closed bulkheads. This change necessitated extra bracing at the former bulkhead location in the car body. The narrow arch at this point is strengthened inside with a $\frac{1}{4}$x$1\frac{1}{4}$-in. angle across the ceiling. Three-inch channels extend the full length of the body from corner post to corner post, just below the top rail. The platform framing is given additional strength by $\frac{1}{4}$x4-in. channel braces from the body bolster to the car bumper. On the two-door side of the car a $\frac{3}{16}$x4-in. channel gives added support.

On five of the cars, folding doors, built in a unit with the door frames enclose the inside step wells. On the other cars the construction differs. Each of these has double two-part folding doors at the diagonal left-hand corners of the car for loading passengers and single-part folding doors at the opposite corners to assist the unloading from the motorman's end of the car. The door engines have been concealed over the doors.



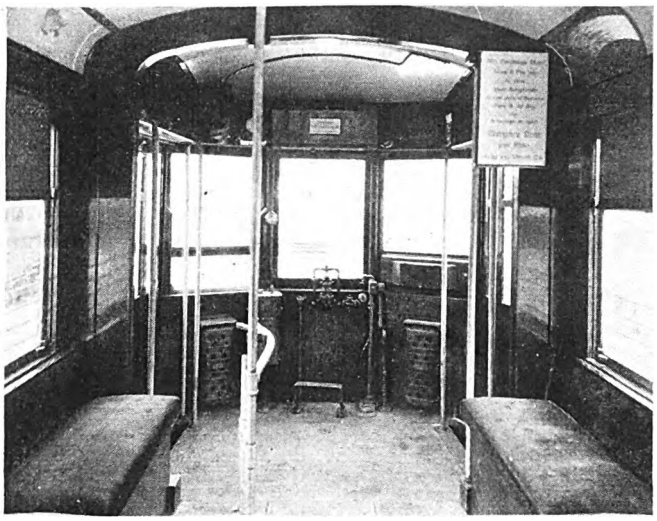
At left—Interior of one of the cars before being rebuilt. At right—The same car with plush seats substituted for the old type, the fare register equipment removed and new dome fixtures installed

Digitized by Google

Two 1-in. pipe stanchions from floor to ceiling, and spaced about 3 ft. apart, are connected by a horizontal pipe at waist height. The fare box and door valve control are carried on these stanchions. All switches in the motorman's compartment are mounted in neat cabinets over the front windows of the car, and practically all air piping has been covered with a panel extending the full width of the car beneath the windows. The only equipment visible other than the control box and the air brake handle is an Economy meter and a hand brake rod. The lower sash in the left-hand front window can be raised to provide direct ventilation.

The cars have transverse seats for 44 passengers and longitudinal seats for 12 passengers, giving a total seating capacity of 56. Brill winner seats covered with dark green plush are used. The seats have pressed steel pedestals and the seat backs have polished nickel handles on the corners. The seats are 37 in. wide and are spaced 32 in. apart. The width of the aisle is 22 in.

Artificial illumination is given by two rows of eight



Air pipe and wiring have been concealed as far as possible in the vestibule. This view also shows how the cars appear with the closed bulkheads removed

Ivanhoe units, located directly over the seats. There are a total of twenty lamps in the car. They are wired in series but have special switching circuits which permit the darkening of the two units at either platform end, depending on the direction of travel.

The interior woodwork has been finished in a dark red mahogany enamel. The arched ceilings have been enameled in an old ivory cream. Several shades of enamel were experimented with before the old ivory cream was selected. The side windows have Pantasote curtains, mounted on Rex all-metal curtain rollers. The windows themselves have Rex brass sash frames.

The outside of each car is painted a combination lemon yellow and cream, the lower panels being in yellow and the upper ones in cream. A narrow black trim is used on the lower panel, which extends the full length of the car body. The window frames of dull brass have been left in a natural metal finish. The whistles with which all the cars are equipped are located under the floors instead of on the roof, to eliminate objectionable oil spray on the car front. Nichols-Lintern classification lights have been installed on both ends of the cars. Hunter destination and route signs are located in the bottom sash of each right-hand vestibule window.

In remodeling the trucks 28-in. wheels were substituted for the 33-in. wheels formerly used, and elliptic springs were installed. Steel top plates, measuring $1\frac{1}{8}$ x 3 in. have been added and $\frac{3}{4}$-in. mild steel plates have been substituted for the cast steel gusset plates.

The Reader's Forum

News—No Matter Whence It Comes

NEW YORK, N. Y., Aug. 20, 1928.

To the EDITOR:

It will be unfortunate if the point of your editorial "Real News Still in Demand," published in the Aug. 18 issue, is lost on any of your readers. It points out and underscores real truth.

A news story is a story no matter whence it comes and no one knows this better than the newspaper editor. There is news in the operations and daily affairs of the utility companies and they have every right, legal and moral, to send information about themselves to newspapers.

True, not everything the utility companies do is news and undoubtedly executives untrained even in the rudiments of newspaper practice have tried from time to time to make news appear where it was non-existent. There can be no excuse for using up somebody's good white space in pure propaganda. But even in propaganda there may be news. Witness the spreads the political utterances of our aimers at the Presidency get in the newspapers. Propaganda, all right, but news, too.

Mark you this: the newspaper editor needs no guardians, well-meaning friends or anti-publicity crusaders to save him. He is over 21, very much on the alert; retains his ability to pick the worthwhile from the buncombe and, above all, still is able to tell news when he sees it.

The public utilities information bureaus have every right in the world to exist and the industry has every right to maintain such bureaus. Granted that they are doing their job right, that is, sending out legitimate news to the press of the country, there is no legal warrant for telling them to stop. Transportation and power are needs we all share. Surely in the background of these great public services there is news.

Publicity is an agency by which the news of an organization, whether it be a corporation or what not, is brought into the light of day. There is no conflict here with paid advertising, for which, in the "moving of the goods from the shelves," there is no adequate substitute possible. But there are developments in the utilities which are essentially news, that is, from the standpoint of the newspaper man. These stories belong in the news columns.

Once upon a time (in my own day as a newspaper man) there was a great hue and cry about the difficulty we had in getting even the time of day from the corporations. Now they will see reporters, will tell something about themselves, and the cry goes up about space-grabbing and such. Mayhem, arson and high treason seem only misdemeanors when compared with the crime of preparing a release and sending it to the local or national newspapers.

Real news still in demand? You bet it is.

Electric Railway Journal Maintenance Data Sheet

TRACK AND WAY DEPARTMENT—34

Trolley Trough for Low Headroom*

By H. E. Bean
Engineer of Way and Structures
New York State Railways, Syracuse, N. Y.

WHEN clearance is small between car roofs and overhead bridges or other structures, difficulty is often encountered in preventing dewirement with consequent bending of trolley poles, damage to overhead or equipment and delays to cars. The installation of 8-in. steel channels, as shown in the accompanying illustration, has proved more satisfactory on lines of the New York State Railways than the regulation trolley wire suspensions of bridge hangers or angles.

With this construction dewirements are infrequent, even when bent poles

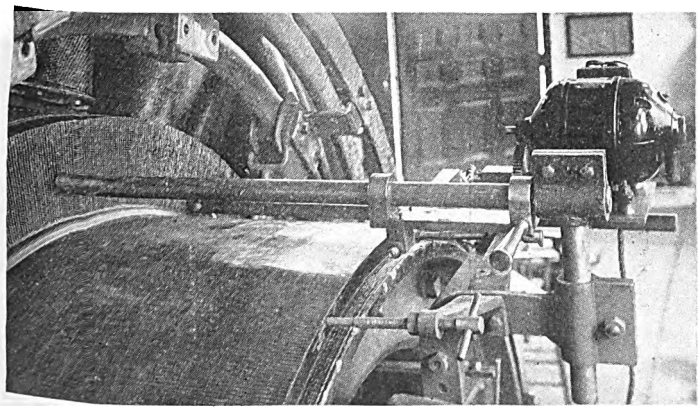
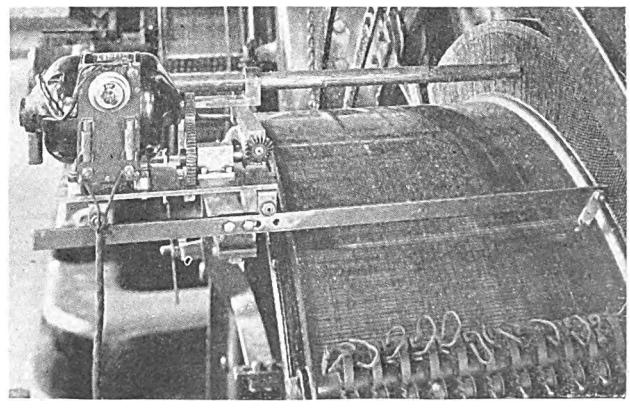
Commutator Slotting Device*

By G. Hopper
Electrical Department Toronto Transportation Commission, Toronto, Ont.

FOR slotting the commutators on 1,000-kw. rotary converters of the Toronto Transportation Commission, a device has been designed which cuts three slots at a time. The three milling saws and the motor, which are rigidly connected, move horizontally on two guides which parallel the face of the commutator. These guides are supported by a frame which is fastened by means of a split collar around the main shaft. The device is brought into proper alignment by the adjustment of two thumb screws, and when once set the whole commutator may be cut without further adjustment. The depth of the cut may be varied by adjusting another thumbscrew. The whole device is counterbalanced by a suitable weight which is rigidly suspended from the collar on the shaft.





Commutator slotting tool in place for slotting commutator of rotary converter

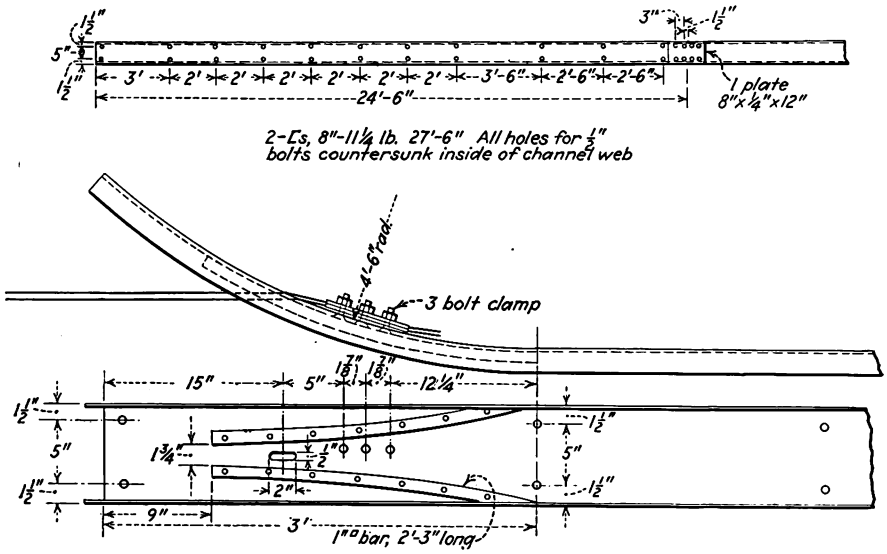
TRACK AND WAY DEPARTMENT—34



Details of construction of 8-in. channel trolley trough

The channel is bolted to a 2-in. plank platform 40 in. wide, which is bolted to 2x4-in. stringers, and the stringers are bolted to the bridge.

ride the channel on the elbow. Insulation is secured by proper spacing of bolts through the energized channel with those supporting the wooden platform over it. The platform is secured by wooden cross stringers, which are bolted to the overhead structure. However, the headroom and amount of moisture present are factors that determine insulation methods and requirements. The New York State Railways, Syracuse division, has made three such installations.

Safety Cover for Acid Pots*

BY JULIAN M. SCOTT
Assistant Superintendent of Rolling Stock Montreal Tramways, Montreal, Canada

WHEN a mechanic was dipping a large bolt in a pot of acid to prepare it for tinning an accident of serious nature occurred recently in one of the shops of the Montreal Tramways. He and other mechanics had done exactly the same thing in exactly the same way a great number of times previously without trouble, but on this particular occasion for some unknown cause a violent eruption occurred when the bolt was inserted. Acid was scattered in every direction and some lodged in the man's eyes. By prompt treatment permanent injury to the workman was prevented.

Safety cover as used on acid pot in shops of the Montreal Tramways

To prevent a repetition of this kind of accident, a cover with a hole and collar was made for each acid pot. The hole is just large enough to admit easily the largest soldering bolt. The accompanying ilustration shows the construction.

American Association News

A.E.R.A. Announces Program for 47th Convention

First sessions will be held Monday, Sept. 24, while doors will open for exhibit on preceding Saturday morning. Tuesday will be reserved as exhibit day this year

CONTINUING the plan inaugurated at the Cleveland convention last year, the doors will be opened on the exhibit for the 47th convention of the American Electric Railway Association at 9 a.m., Saturday, Sept. 22. An open meeting of the American Association executive committee will be held the same morning. At this meeting committee reports on such important topics as economics of street traffic, rapid transit, industrial relations and motor vehicle information will be presented. All delegates are invited to attend.

No formal activities are planned for Sunday. In the morning there will be a golf tournament open to all members of the A.E.R.A. It will be played at the Hawthorne Valley Country Club.

As usual, the regular sessions of the American Association will be held in the mornings, while those of the affiliated associations will be held in the afternoons. Tuesday instead of Wednesday will be set aside as Exhibit Day, and no formal sessions will be held during the day. There will be a meeting under the auspices of the Advisory Council in the evening, and informal luncheons will be held at which specific topics will be discussed.

Following is the complete program corrected to Sept. 1, as announced by the general secretary, J. W. Welsh:

American Association

Monday, Sept. 24, 10 a.m.

Auditorium Ball Room, Third Floor

R. P. STEVENS, Chairman

General Subject—*Economics*

Welcome, by Hon. W. R. Hopkins, City Manager, Cleveland, Ohio.

Address of the President—R. P. Stevens, president Allied Power & Light Corporation, New York, N. Y.

Routine.

"The Economics of and Need for Public Participation in City Transportation," by Henry I. Harriman, chairman Metropolitan Planning Board of Massachusetts, Boston, Mass.

"Regulation of Transportation—Its Aims and Trend," by Lewis E. Gettle, chairman Railroad Commission of Wisconsin, Madison, Wis.

"Problems of Urban Transportation Rates," by William M. Wherry, Jr., Wherry & Wight, New York, N. Y.

Round Table Luncheon Conferences

CLEVELAND HOTEL, 1 P.M.

No. 1—"Safety," J. P. Barnes, sponsor.
No. 2—"Fares," C. D. Emmons, sponsor.
No. 3—"Taxation," W. A. Jackson, sponsor.
No. 4—"Manufactures," E. F. Wickwire, sponsor.

Tuesday, Sept. 25, 10 a.m.

Exhibit Day

Round Table Luncheon Conferences

STATLER HOTEL, 1 P.M.

No. 5—"Interurbans," D. W. Snyder, Jr., sponsor.
No. 6—"Traffic," E. J. McIlraith, sponsor.
No. 7—"Education," Edward Dana, sponsor.
No. 8—"Merchandising," Barron Collier, sponsor.

Tuesday, Sept. 25, 8:30 p.m.

Auditorium Ball Room, Arena Floor

B. C. COBB, Chairman

Selections by B. A. Rolfe's orchestra.

Address of the chairman—B. C. Cobb, chairman of the board, Allied Power & Light Corporation, New York, N. Y.

Presentation of Charles A. Coffin Award by President R. P. Stevens.

Miss Phoebe Crosbie, soloist.

Address—Owen D. Young, chairman of the board, General Electric Company, New York, N. Y.

Selection by B. A. Rolfe's orchestra.

Miss Phoebe Crosbie, soloist.

Informal dancing; music by B. A. Rolfe's orchestra.

Wednesday, Sept. 26, 10 a.m.

Auditorium Ball Room, Third Floor

R. P. STEVENS, Chairman

General Subject—*Modernization*

Report—Managing Director Lucius S. Storrs, American Electric Railway Association, New York, N. Y.

Report—Committee on Nominations—Britton I. Budd, chairman, president Chicago Rapid Transit Company and Chicago, North Shore & Milwaukee Railroad, Chicago, Ill.

Election of officers.

"What Are the Financial Results, Achievements and Future Needs of Modernization," by H. G. Bradlee, vice-president Stone & Webster, Inc., Boston, Mass.

"How Can Modernization Be Justified from Its Financial Results so that Additional Capital Can Be Secured for This Purpose?" by Alonzo R. Williams, first vice-president and general manager United Electric Railways, Providence, R. I.

"Opportunities of Modernization and Economies that Can Be Effected by Mass Production Methods," by W. T. Rossell, general manager Pittsburgh Railways, Pittsburgh, Pa.

"Applying Modern Merchandising and Sales Methods to Transportation," by Charles Gordon, editor ELECTRIC RAILWAY JOURNAL, New York, N. Y.

"Prosperity and the Automotive Industry," by C. F. Kettering, vice-president General Motors Corporation, Detroit, Mich.

Round Table Luncheon Conferences

HOLLENDEN HOTEL, 1 P.M.

No. 9—"Car Financing," Charles Gordon, sponsor.
No. 10—"Public Relations," W. E. Wood, sponsor.
No. 11—"New Cars," J. R. Blackhall, sponsor.
No. 12—"Small City's Problem of Transportation," Harold L. Geisse, sponsor.

Thursday, Sept. 27, 10 a.m.

Auditorium Ball Room, Third Floor

R. P. STEVENS, Chairman

General Subject—*Viewpoint of Others on Our Industry*

Award—*Electric Traction* Speed Contest—T. Fitzgerald, chairman, vice-president Pittsburgh Railways, Pittsburgh, Pa.

"Service and Business," by E. H. Sniffin, assistant to vice-president Westinghouse Electric & Manufacturing Company, New York, N. Y.

"The Street Railway Industry, Present and Future—Opportunities of Improving Qualities of Service," by P. S. Arkwright, president National Electric Light Association and president Georgia Power Company, Atlanta, Ga.

Big Demand for

Luncheon Tickets

WITH the sale of 300 tickets for the conference luncheons to be held during the Cleveland Convention 50 per cent of the space is gone. Leslie Vickers, economist of the American Electric Railway Association, who is in charge of arrangements for the luncheons, requests that orders be sent to him as early as possible to avoid disappointment. Address him at A.E.R.A. headquarters, 292 Madison Avenue, New York City.

Act Now!

Digitized by Google

"Transportation from the Viewpoint of the City Newspaper," by N. D. Cochran, editor - in - chief *Scripps - Howard News*, New York, N. Y.

"National Aspects of the Association's Activities," by W. H. Sawyer, president Stevens & Wood, Inc., New York, N. Y.

"Some Phases of the Electric Railway Situation from the Manufacturers' Viewpoint," by E. F. Wickwire, vice-president Ohio Brass Company, Mansfield, Ohio.

Installation of officers.

Adjournment.

Round Table Luncheon Conferences

CLEVELAND HOTEL, 1 P.M.

No. 13—"Freight," L. M. Brown, sponsor.

No. 14—"Management," R. F. Carbutt, sponsor.

No. 15—"Motor Bus," A. M. Hill, sponsor.

Friday, Sept. 28, 9-12 a.m.

Inspection of Manufacturers' Exhibits.

Accountants' Association

Monday, Sept. 24, 2:30 p.m.

Room A—Third Floor

O. H. BERND, Chairman

Address of Acting President.

Report of Executive Committee.

Report of Secretary-Treasurer.

Report — Committee Representing the Accountants' Association at the Annual Convention of the National Association of Railroad and Utilities Commissioners, W. L. Davis, chairman, auditor Lehigh Valley Transit Company, Allentown, Pa.

Discussion.

Report—Committee on Standard Classification of Accounts, M. W. Glover, chairman, general auditor West Penn Railways Company, Pittsburgh, Pa.

Discussion.

Report—Sub-committee on Bus Accounting, E. A. Tuson, chairman, general auditor Public Service Co-ordinated Transport, Newark, N. J.

Discussion.

"Accounting in Steel Works," by Walter C. Bird, assistant to the auditor American Steel & Wire Company, Cleveland, Ohio.

Discussion.

Tuesday, Sept. 25, 10 a.m.

Exhibit Day

Accountants' "Get-Together Luncheon" at the Cleveland Athletic Club. This is to be an informal gathering of accountants and railway men interested in accounting subjects for the purpose of becoming better acquainted.

Wednesday, Sept. 26, 2:30 p.m.

Room A—Third Floor

Joint Session—Accountants' Association and Purchases and Stores Division

O. H. BERND and JOHN Y. BAYLISS, Chairmen

Report—Standing Committee on Purchases and Stores, John Y. Bayliss, chairman, director of purchases and supplies Virginia Electric & Power Company, Richmond, Va., and Committee on Stores Accounting, R. A. Weston, chairman, special accountant the Connecticut Company, New Haven, Conn.

General Discussion.

"Pricing Problems," by R. A. Weston, special accountant the Connecticut Company, New Haven, Conn.

Discussion—Led by A. A. Ordway.

Reports—Special Committees:

No. 1—Engineering Manual, by J. Fleming, chairman.

No. 2—Unit Piling and Standard Packages, by W. F. Scott, chairman.

No. 3—Investment in Material and Supplies and the Cost of Operating Stores, by C. A. Harris, chairman.

No. 4—Price Records and Pricing Materials and Supplies, by A. A. Ordway, chairman.

General Discussion.

This concludes the joint session, which will be followed immediately by a short business session of the Accountants' Association as follows:

Report—Committee on Nominations, by T. P. Kilfoyle, chairman, auditor Cleveland Railway, Cleveland, Ohio.

Election of Officers.

Thursday, Sept. 27, 2:30 p.m.

Room A—Third Floor

O. H. BERND, Chairman

"Auditing Control in Manufacturing Industry," by F. H. Corregan, assistant general auditor General Electric Company, Schenectady, N. Y.

Discussion.

Report—Committee on Fare Collections, by E. A. Tuson, chairman, general auditor Public Service Co-ordinated Transport, Newark, N. J.

Discussion.

Report—Committee on Freight Accounting, by Walter Shroyer, chairman, treasurer for receiver Union Traction Company of Indiana, Anderson, Ind.

Discussion.

Report—Committee to Review Accountants' Proceedings, by J. E. Heberle, chairman, assistant to the president Capital Traction Company, Washington, D. C.

Discussion.

Central Master Mechanics to Meet in Cleveland

SEPT. 25, beginning at 9 a.m., Eastern Standard time, the Central Electric Railway Master Mechanics' Association will hold its next regular meeting at the Auditorium, Cleveland, Ohio. This meeting will be held in meeting room "R" located in the basement of the Auditorium, this being the room assigned to the rolling stock group of the American Electric Railway Engineering Association on Monday and Wednesday afternoon.

A short program is being arranged for this meeting, but the greater part of the time will be devoted to discussion of specific subjects to be furnished by the program committee and the discussion of individual problems of members in attendance.

News of the Industry

Philadelphia Agreement Reached

Operation of Broad Street subway to begin under temporary plan. Ford, Bacon & Davis among city's consultants

AN ORDINANCE embodying the agreement between the city and the Philadelphia Rapid Transit Company for three months' operation of the Broad Street subway was introduced in City Council on Aug. 23 and referred to the Transportation Committee. It will be reported back to the chamber with a favorable recommendation at a special session of Council. The Public Service Commission will then be asked to ratify the agreement immediately so that the tube can be placed in operation on Sept. 1.

The agreement provides for operation between Grange Avenue and City Hall. The present rate of 7½ cents, same as now in effect throughout the P.R.T. system, will be maintained. The railway will retain the gross receipts from all sources of the line and will pay all operating expenses. In addition, the P.R.T. agrees to pay the city $200,000 a month as rental for the tube, a sum which amounts to one-half of the carrying charges on the bonds issued by the city for the construction of the subway. Upon the expiration of the three months' lease, the P.R.T. will continue operation on a day-to-day basis on the same terms, with privilege provided for either city or company to terminate the contract upon 24 hours notice.

Throughout, the experimental period of operation the company will establish and maintain a uniform system of accounts, which will be checked by the auditors engaged by the Mackey Administration under the supervision of the Department of City Transit.

Mayor Mackey has engaged the New York engineering firm of Ford, Bacon & Davis to audit the revenues and expenditures of the line. The Mayor also intends engaging Charles C. McChord and J. Rowland Bibbins, utilities experts, of Washington, to act as advisers to the city in connection with the subway accounts.

Particular attention has been concentrated on the subway audit, as those findings will be used by the Administration and the P.R.T. as a basis for the negotiation of a permanent operating lease for the line.

Another transit development is Mayor Mackey's announcement that the city engineers had been instructed to proceed at once with drafting of plans for the construction of the Ridge Avenue extension of the Broad Street subway. In furtherance of that program an ordinance has been introduced in Council authorizing the opening of a diagonal thoroughfare from Ninth and Vine Streets to Eighth and Race Streets, which would provide an extension of the Ridge Avenue high-speed line required for an adequate engineering turn at Eighth and Race Streets. The delivery line would proceed south on Eighth Street from Race and hook up with subways planned east-and-west south of Chestnut Street.

The lease was passed by the Council on Aug. 28 and was laid on Mayor Mackey's desk for his signature on Aug. 30. A copy of the lease was rushed to Harrisburg at once so the pact could be considered by the Public Service body at a special meeting.

Failure of the operating agreement to provide transfer or exchange privileges from the subway to surface lines in the central business district south of Spring Garden Street again evoked criticism from various members of the Council when the ordinance came up for final passage.

Ratification of the subway lease by the Public Service Commission on Friday was expected to be the final important move preparatory to opening the new tube on Saturday.

Highway Traffic Increasingly Fatal

2,360 persons are being killed or seriously injured daily on highways. In 1927 there were 26,618 killed and 798 seriously injured. Discourtesy and carelessness largely responsible

DURING every 24 hours of 1928 an estimated average of 2,360 persons are being killed or seriously injured on the streets and highways of the United States. The estimated economic loss for the first six months of 1928 was $350,000,000, exclusive of small property damage and insurance premiums. At the present rate of increase the Grim Reaper will exact a toll of 40,000 human lives in highway accidents during 1935. These figures were part of an analytical highway safety report issued on Sept. 1 by the American Road Builders' Association.

During the first six months of 1928 the American Road Builders' Association estimates that 13,750 persons were killed and 412,500 seriously injured in highway accidents. The toll for 1927 was 26,618 killed and 798,700 seriously injured, a total of 825,318 casualties. At the present rate approximately 27,500 persons will be killed by the end of 1928.

Highway accidents are attributed to discourtesy and carelessness on the part of both drivers and pedestrians. The statistics prove:

1. That the most important causes of highway accidents where motorists are principally at fault are, in order of their importance — inattention, speeding, traffic law violation and intoxication. Of the 26,618 killed in 1927, motorists were at fault in 11,765 fatalities and all but 1,882 were attributed to these causes.

2. That the most important causes of highway accidents where motorists are principally at fault are: children playing in the street or crossing in violation of traffic law, adult jay-walking, inattention, and confusion. Of the 11,367 deaths caused principally by pedestrians in 1927, all but 1,250 were attributed to these causes.

3. That adverse physical conditions such as wet streets, defective roads, poor lights and narrow streets, caused only 3,586 deaths.

4. That the human factor is responsible for 95 per cent of all accidents.

5. That the human factor, which causes highway accidents, is largely the result of certain definable physical conditions such as complex traffic laws, traffic congestion, discourtesy on the part of fellow motorists, carelessness on the part of fellow motorists, fatigue, physical incompetency, lack of confidence and the improper conduct of pedestrians.

6. That approximately 60 per cent of all fatalities are pedestrians.

7. That more than 30 per cent of all fatalities are children of school age.

8. That accidents involving pedestrians continue to climb in number much faster than accidents involving only motorists.

The American Road Builders' Association has collected many data related to the causes of highway accidents. The organization has used, in addition, much information already made available by other associations interested in the safety problems. The road organization has launched as a result of its studies, a national highway safety campaign based upon what it believes to be the fundamental principles of highway accident prevention. These are in brief:

1. That all cities and communities should undertake local campaigns to educate pedestrian traffic in the principles of courtesy and caution while on the public street or highway. The use of common sense is recommended in lieu of complex traffic rules.

2. That all states should adopt a system of examination and licensing of motor vehicle drivers.

3. That the adoption of the uniform codes of state and municipal traffic laws based on the report prepared by the National Conference on Street and Highway Safety is desirable.

4. That the education of drivers in the principles of courtesy and caution should be undertaken in all communities.

Accident in New York Subway

Many casualties when Interborough train is derailed in Seventh Avenue south of Times Square

SIXTEEN persons were killed, 25 others seriously injured and more than 100 others hurt, many of them only slightly, when the ninth car of a ten-car train of the Interborough Rapid Transit Company, New York, was derailed shortly after 5 p.m. on Aug. 24. The accident occurred just south of the 42nd Street station on the company's Seventh Avenue line.

Just what happened is still a matter of inquiry on the part of the Transit Commission and the railway, although the commission did make a preliminary statement on Aug. 25 in which it is said:

The train that was derailed was a ten-car steel subway express train. It left Times Square, southbound, at 5:08 p.m. The first eight cars passed over the north end of crossover No. 17, located south of the station.

The first truck of the ninth car took the regular southbound express track. The rear truck of the ninth car and the rear car took the switch leading into the middle track. This resulted in the ninth car's colliding with the curtain wall between the southbound express and the middle tracks. The impact of the collision caused this car to be cut in two at the center side door; the forward section was dragged approximately 100 ft. before the car stopped.

In the opinion of the commission's signal and switch experts, the switch that caused the derailment was turned into the middle track while the train was passing over the switch. There is nothing to show that the switch was turned by the train itself. It might have been turned over by a movement of the lever in the tower or by someone moving the switch valves located near the track.

It is the opinion of the commission's signal and switch experts that the accident was the result of man failure.

The switch that caused the derailment was not the switch that was out of order, but the one normally operated on the same circuit with the switch that was out of order. Good railroad operation would have required that the switch should have been spiked immediately when found out of order.

The switch being out of order could not have alone caused the derailment. When a switch goes out of order, the safety devices come into play, as they did, and halt the trains. The derailment was not directly caused by the switch being out of order, but by some improper operation of the switch while it was out of order.

President Hedley of the Interborough was quoted as follows:

I can only repeat that we sincerely regret this very unfortunate occurrence. I do want to say, however, that we have co-operated with the public authorities in every way by furnishing them with all the facts in our possession and producing employees as rapidly as we could after Police Commissioner Warren asked for them. While making our own investigation we will continue to co-operate with the public authorities.

The public may be assured that we will continue by constant vigilance to assure the utmost safety in the operation of this railroad.

The switch where the accident occurred had been repaired during the evening, and was supposedly in good condition. While the train which was wrecked was at the station, Baldwin, an employee in the signal tower, did not get a signal showing him that the switch was in correct position.

When the lever in the tower indicating this did not go back into place he went to the tracks and to the switch and said that it was in place for the train to pass. Baldwin accordingly instructed Carr to signal the train past, even though the signal light was against it. All of the train went over the switch satisfactorily until the ninth car, when the switch "split."

I never attempt to fix personal responsibility until I know all the facts.

William S. Baldwin, Interborough maintenance foreman, is charged with homicide in connection with the accident. It is expected that he will be arraigned on Sept. 17 after the facts are established as a result of the investigations now under way.

It was explained on Wednesday that the Interborough's investigation was still under way and that until it had been completed Mr. Hedley would make no comment, on the accident, the allocation of blame, or the offer to arbitrate the accident claims likely to arise as a result of the accident.

On Monday Mr. Hedley did say:

I find that our claim department has advised claimants that whenever they are ready we will pay whatever is fair and reasonable, and it has proceeded with such negotiations and has advised claimants to bide their time and take the matter up with the claim department at the claimants' convenience. Every person will be treated equitably and fairly and paid promptly. There is no need of law suits or even delay.

Scene while rescue work was in progress

Faster Service on Indiana Union Traction

Faster time of trains and greater convenience for travelers are provided in the new schedules issued on Union Traction Company lines, particularly between Indianapolis, Anderson, Muncie and Bluffton, and between Anderson and Wabash, Ind. F. D. Norviel, general passenger and freight agent of the company, says it is the plan to operate all trains as express trains except four of the fastest. All other trains will make all regular town and country stops where passengers desire to board or leave the cars. The time of trains, however, is from five to twenty minutes faster than those operated under previous schedules.

Little Things in Chicago Lead to Bigger Understanding

The Chicago Rapid Transit Company, the Chicago North Shore & Milwaukee Railroad, the Chicago Aurora & Elgin Railroad and the Chicago, South Shore & South Bend Railroad, all under the same general management, are carrying on a joint program for the standardization of forms and stationery. This work is being co-ordinated by the Business Research Corporation. As the result of investigations thus far, 219 forms have been eliminated as obsolete or unnecessary. In addition reductions and replacements have been made.

The necessary conferences have resulted, not only in discussions of stationery and forms, but in a broader understanding of the "other fellow's" company and the "other fellow's" job.

Newspaper Comment on Schenectady Advance Favorable

In connection with the recent fare increase by which the rates in the city zone were advanced by the Schenectady Railway, Schenectady, N. Y., from 7 cents to 10 cents, with three tickets for 25 cents, and the interurban zone rates were increased to 10 cents each, regular riders will be permitted the use of tickets at the rate of 8⅓ cents per zone. Comments from the local press are interesting as showing an attitude of fairness toward the railway, and all the more so when it is considered from the political attitude of the papers printing the editorials, one being the Republican organ and the other sponsoring the Democratic cause.

The *Union-Star* said in part:

In granting the Schenectady Railway's application for permission to raise its fares to 10 cents, the Public Service Commission has done what it was expected it would do. The absence of comment would seem to augur well for the operation of the new rates. The experience of the Boston Elevated Railway, where fares were raised from 5 to 7 and then to 10 cents, was that whereas the 7-cent fare actually produced less revenue than the 5, because of the large falling off in the number of car riders, the 10-cent fare, with a smaller percentage of defections, easily supplied the necessary revenue to lift the company on to the right side of the ledger.

President Hustis assures the people of Schenectady that if the new fare works out as it is expected to do, the public will share with the company in the benefits. It will be time enough to renew requests for improved service when the results of operation on the new basis become known. The people realize that giving service at a loss cannot continue indefinitely. We believe they will co-operate with the company and make the new rates a success.

The *Gazette* said:

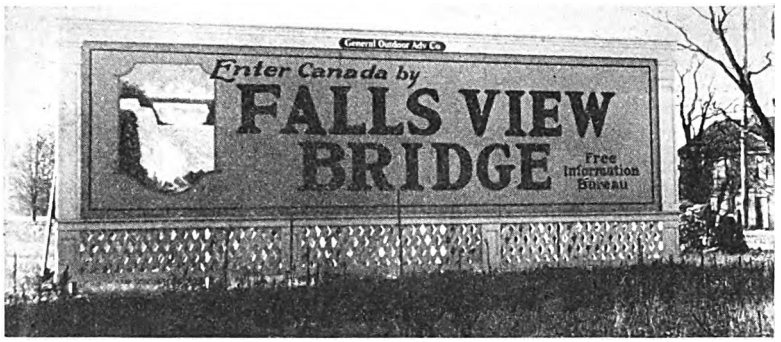
We believe that a majority of the people here have been more interested in having the Public Service Commission decide the 10-cent fare question than in what the determination itself might be. The railway is a local institution, affecting most of us directly or indirectly; and any uncertainty in connection with its affairs naturally makes conditions here less stable.

It was generally recognized that the railway was not earning sufficient money under the 7-cent fare to care for necessary improvements. Returns to the stockholders were out of the question. We well know that this is an intolerable situation, especially with a public utility.

The real question has been whether the people wished the railway to continue in operation, or to stop. To go on it had to meet certain demands, street paving being one of no mean importance.

Automobiles especially, and buses, have become such heavy competitors of the railways as to make their future something of a question. Hence, if the people wished the company to keep on operating, increased compensation became a necessity.

We may believe now, with the added fare, the railway will be able to carry out at least a part of the official program of improvements. This will give better service to the citizens in various ways. As a community's welfare depends so greatly upon the prosperity of its industries, it is well that the period of waiting, of indecision, is past.



Niagara Cataract Advertised by Railway

Nine large billboards, each 50 ft. long and 10 ft. high, and more than 1,000 directional arrows have been installed along more than 500 miles of state highways in Western New York and the province of Ontario, Canada, by the International Railway, Buffalo, urging motorists to use its Falls View Bridge at Niagara Falls connecting Canada and the United States across the Niagara Gorge.

On the American side of the border, these signs say "Enter Canada by Falls View Bridge," while on the Canadian side of the frontier, the signs say "Enter the United States by Falls View Bridge." For many years the bridge was known as the Upper Steel Arch Bridge, but some time ago the company changed the name to Falls View Bridge to differentiate the company's bridge from other vehicle bridges across the Gorge that do not provide a view of the American and Canadian cataracts.

The railway reports that the use of highway signs has stimulated motor traffic across the bridge. The billboards show a view of the cataract. The sign itself is in colors to command the attention of motorists.

"Making It Easy to Fly from Chicago"

Chicago is to have the first consolidated ticket office for airplane passengers in the United States. Announcement of the establishment of a completely-equipped air travel bureau and union ticket office in the new Palmer House at State and Monroe Streets was made during the week ended Sept. 1 by Thomas Wolfe, Jr., president of the Chicago Air Traffic Association.

In co-operation with hotel officials and the Parmelee Transfer Company, the Air Traffic Association will open an elaborate waiting room for air travelers in the downtown hostelry on Sept. 8. Robert L. Woodcock has been appointed manager of the new office.

Complete timetables on railroad connections and air line operations throughout the United States and Europe will be found at the station and attendants will be present from early morning until late evening to make through reservations. Room reservations at hotels along the route will be made by the bureau as well as for meals at wayside landings.

Members of the Air Traffic Association, which is sponsoring the project, include the National Air Transport, Inc., Northwest Airways, Inc., Embry-Riddle Company; Robertson Aircraft Corporation; and the Boeing Air Transport, Inc. This group of companies operates a total of 6,160 miles of airways, approximately 50 per cent of the total of air mail lines in the United States. These companies connect with all air mail lines, which will make it possible to secure air transport tickets at this office to almost every point in the United States. Connections with other lines give this group a total of 15,210 miles of airways. Mr. Wolfe was quoted as follows:

This station will mark one of the greatest steps forward in air transportation in this country and will put the industry on a basis comparable with the excellent European services.

War Veterans Have Preference in Seattle

Seattle war veterans who lost their jobs as employees of the municipal railway at the first of the year, when a wholesale reduction in the personnel was made, recently won a victory when the Supreme Court rendered a decision in favor of B. H. Beebe, one of the veterans, who had brought mandamus action against the city as a result of the department's moves. The court held that the preference given war veterans by law applied to retention in service as well as original employment.

The corporation counsel originally advised the civil service commission and the street railway department against the policy of letting men go, according to their efficiency rating and without regard to their status as veterans. Despite this he was later called upon to defend the city when Beebe brought suit. Beebe will not only win reinstatement on his regular run, but will also get $40 a month for the entire period since his discharge at the first of the year. He has been doing part time work for the railway since the loss of his regular run. The suit is an echo of the wholesale reduction in operating expenses in January, when 50 men were either laid off or put on part time. The matter was taken to the Supreme Court at the suggestion of the street railway superintendent and the civil service commission to make it a "test case."

Fare Advance Likely in Kansas City

Readjustment of fares by the Kansas City Public Service Company, Kansas City, Mo., appears to be inevitable. Representatives of the company probably will not appear before a Council committee for some weeks, but they are devoting the interval to an extensive statistical study of the situation, with inquiry into the experience of other cities on fare schedules.

The rate most likely to be suggested would provide three tickets for 25 cents and a 10-cent cash fare. Street railway officials estimate that if some such fare schedule were adopted, 90 per cent of the car riders would buy tickets or tokens, paying 8⅓ cents for a ride. The occasional rider would pay 10 cents.

The plea for the 2-cent boost in cash fares and an advance of what is estimated to be about 1 cent in average fare is that the company otherwise cannot meet demands for service extensions or set up a depreciation fund, or even keep itself financially afloat if patronage continues to decline.

Under the existing schedule the cash fare on the railway lines is 8 cents. About 70 per cent of the riders buy tokens, two for 15 cents, which makes the cost of a ride 7½ cents. Tickets, under a provision of the last franchise, sell 15 for $1.

Action on Unification in New York Unlikely Till Fall

That the city administration has no intention of pushing consideration of the transit unification plan of Samuel Untermyer, special counsel for the Transit Commission, until fall was indicated on Aug. 15 when the Board of Estimate failed to discuss it. Mayor Walker said it was not likely the board would take any action until Sept. 27, when the board would hold its first regular meeting after the summer adjournment. In the interim, however, it was indicated the Untermyer proposal probably would be discussed in several executive sessions.

Seven-Cent Cash Fare in Lynchburg

The Lynchburg Traction & Light Company, Lynchburg, Va., has been authorized by the State Corporation Commission to increase cash fares from 6 to 7 cents. In its order allowing the increase the commission held that the company "is not earning a fair rate of return on the fair value of its property" and is entitled to the relief it asked in increased rates. The schedule of fares allowed by the commission became effective on Aug. 27.

The company sought new rates as follows:

1. A $1 transferable pass entitling the holder to unlimited transportation upon the lines of the company for a period of seven consecutive days, beginning at midnight every Sunday; or

2. Four tokens or tickets to be sold for 25 cents, each token or ticket entitling the passenger to one continuous trip between any two points on the company's lines, with a free transfer where necessary; or

3. A 7-cent cash fare, entitling the passenger to one continuous trip between any two points on the company's lines, with a free transfer where necessary.

Allied Power in New Offices

The Allied Power & Light Corporation and its affiliated companies announce the removal of their general offices on Sept. 1 to the new Chase National Bank Building, 20 Pine Street, New York City. The telephone is John 5560. President R. P. Stevens may be reached there, likewise B. C. Cobb, chairman, and directors J. T. Harrington, T. A. Kenney, W. H. Sawyer, Jacob Hekma, A. L. Loomis, H. S. Scarritt and L. K. Thorne.

Rockford Interurban Now Operated by Its Owner

B. J. Arnold, Chicago, its owner, is now operating the Elgin, Belvidere & Rockford Interurban Railway, it was announced by Adam Gschwindt, manager of the Rockford Electric Company, Rockford, Ill., who has been in charge of the electric line. The electric company explained that its desire to be relieved of the detail of operation of the interurban caused the change. The two concerns continue their association, the cars used as rolling stock being rented, terminals provided and power supplied by the Rockford Electric to the railway. Freight service will be discontinued on Sept. 1 and the Rockford Electric Company expects to discontinue its Illinois interurban freight lines at the same time. The Wisconsin Railroad Commission has not yet acted upon a petition to discontinue the lines in Wisconsin.

100 Per Cent One-Man Operation

All cars of International Railway in Buffalo, Niagara Falls and Lockport run with one man. Accidents greatly reduced in number

IN THREE cities of the International Railway system on the Niagara frontier—Buffalo, Niagara Falls and Lockport—all local street car service is now rendered by one-man cars. Mitten Management began the program of conversion to one-man operation in Buffalo in 1923 and extended its replacement of two-man operation line by line as rapidly as it was able to provide its cars with full safety equipment.

During this gradual change in the method of operation there has been a continuous reduction in accidents. In 1927 there were 15 per cent fewer accidents than in 1926 and 33 per cent fewer than in 1923, when conversion to one-man operation began. Excluding automobile collisions, which should not be considered on account of the enormous increase in the number of these vehicles now using the streets, I.R.C. accidents are now running approximately 50 per cent below those experienced ten years ago.

In the earlier months of the transition period, the company followed the policy of giving the public complete information regarding the change, in order that riders might know the advantages of one-man operation from their standpoint. When the first few lines were converted there was some public opposition. As operators and passengers became more familiar with the new conditions, however, this public suspicion of the innovation ceased and criticism, either expressed or implied, is now extremely rare.

With the thought in mind that it is obviously unwise to have cars standing at heavy loading points with other traffic piling up behind while the one-man operator strives to make a quick job of his fare collection, change making and transfer issuing, the company started on each one-man line the pay-in-the-country method of fare collection. Thus fare collection is eliminated from the heavy loading points and on the outbound trip the entire car becomes a loading platform with obvious advantages in inclement weather or under peak load conditions.

Dash signs were used to indicate the method of fare collection, while "read as you ride" folders and newspaper publicity were employed to describe the improvements in equipment and service, which included increased seating capacity and shorter headway, as well as greater safety.

Changes in the equipment included a complete overhaul from track to trolley wire of 251 cars, which were actually rebuilt in the company's shops, and installation of 100 per cent safety apparatus in all city cars. Three types of cars comprised the majority of equipment, the so-called 6000 type, a near-side car of the front entrance, front exit type, on which the pay-as-you-enter system of fare collection had been employed; the double-end car with the pay-as-you-enter system adapted to rear entrance, front exit, and the Peter Witt type on which the pay-as-you-pass system had been in vogue, passengers entering by the front of the car and leaving by the center. All types of cars were adapted for front entrance, front exit in order to conform to the pay-in-the-country method of fare collection.

At the start of one-man service on each route, the line was literally flooded with cars in order that no operator might have an overload during the transition period and in order that pas-

Digitized by Google

sengers as well as men might have a chance to adjust themselves to the changes. As the men became more experienced trippers were removed until the schedule showed only slight additional service over that provided with two-man operation. An average of 10 per cent was added to the running time during the transition period, but practically all the additional running time was removed after a few months of operation.

The economies produced through one-man operation have permitted a higher standard of maintenance of equipment and have enabled the company to start a track and paving reconstruction program in addition to providing safer service.

The change from two-man to one-man operation was accomplished without the discharge or laying off of any employees. As the last few lines, which were heavily traveled routes passing through the business section of Buffalo, were converted the oldest and most experienced employees voluntarily selected runs on these routes in order to assure themselves that the exacting conditions of the first few weeks of operation over these heavily congested streets should meet every test.

Selective Stops Urged for Indianapolis

Efforts of residents in the eastern section of Indianapolis, Ind., to have the Indianapolis Street Railway place in operation a selective stop system during rush hours each day have been revived in a petition to the Indiana Public Service Commission. The petition, which was the same as that presented some time ago to the Indianapolis Board of Public Works, contained the names of more than 500 residents of the section. It suggests that cars be divided into three groups, the cars in each group to be marked by a distinctive emblem. Emblems similar to those on the cars would be placed at street intersections along the line and the patron would know that a car with a certain emblem stopped only at certain street corners.

Boston Elevated Warns Against Transfer Abuse

In an attempt to stop misuse of transfers the Boston Elevated Railway, Boston, Mass., has posted signs at the Northampton Street and Dover Street stations, calling attention to the number of persons prosecuted since Jan. 1, 1928, for misuse of transfers obtained at these stations. The management hopes, by these signs:

To deter persons from using transfers not properly obtained.

To deter persons from procuring, on cars or at stations, transfers which they do not intend to use and then giving them away or throwing them away where they may be picked up.

To stop the practice of swapping transfers.

To stop the using of transfers as stop-overs by traveling from point to point and transacting business in various places all through payment of one fare.

To stop the practice of taking two or more transfers on leaving a station and then giving them to persons waiting at transfer points, who thereby secure transportation without payment of any fare at all.

Mussolini of Traffic Demanded by Detroit's Ex-Mayor

Unification of all transportation under city ownership, with buses, taxicabs, jitneys and street cars owned by the public, and the appointment of "a transportation Mussolini with full power to act in spite of the threats in intimidating, and sometimes corrupt, lobbyists for special interests," is the two-fold transportation plan of John W. Smith, former mayor. He is quoted by the Detroit *Times* in part as follows:

We'll never get anywhere until all taxis, all buses, all means of transportations are municipally owned, and co-ordinated. And we will never get this unification of transportation facilities until we get a Napoleon or a Mussolini of transportation who isn't afraid of all the lobbyists for special interests who are blocking every unified transportation scheme proposed.

We may get experts to figure out in a cold-blooded way what is best for the greatest number. They may do it without regard to political expediency or interest. Then what happens? I have seen the city employ numerous experts and I have never seen the city accept the report of a single one of them.

In comes the lobbyist. He blusters and bluffs and intimidates, and Councilmen waver. Finally they do what he wishes.

That's why we need a transportation czar, not subjected to anybody, like the Council, which adjusts its course to every political wind that blows, whether it be a squall or just a sunset breeze.

Unification under city ownership is the answer. But it is only part of the answer. The transportation czar is the other part. A man who will kick out of his office every corrupt lobbyist who cares not for the welfare of the whole people, but wants only something for his own little selfish group, or something which is in accordance with his own pet scheme.

The present situation is an indictment of public officials. Here is a city committed to municipal ownership which permits buses, jitneys and taxis to take revenue from the municipally owned Department of Street Railways.

If the people want jitneys, let them have them, but let them be municipally owned. If they want buses, let them have them, but have them municipally owned. Whatever they want, give it to them, but have every intra-city means of transportation co-ordinated under municipal ownership.

There is no question that the Department of Street Railways needs refinancing. There is no doubt but that the city needs immediate relief, instead of relief at some future date. Let all transportation be co-ordinated under city ownership, eliminating waste, duplication, and even bloodshed; let the street railways be refinanced so that improvements and extensions can be made, and you will have immediate relief.

Let us have city officials with courage enough to take the city's municipal ownership principles seriously, and then let us have some one as a transportation head who will co-ordinate all transportation to eliminate waste, duplication, and unnecessary expense. Let this "czar" be free to say to the lobbyist for special groups, "Get out of my office. Here's the money we have to spend. Here is what is best for all the people."

Leading the People Astray

BUSINESS cannot sit dumbly by and trust to luck to foster a proper public appreciation of the things it is doing to improve its service and to deserve public trust and confidence. It must not suffer itself to be misrepresented by every Tom, Dick and Harry who would curry brief favor by exaggeration of half truths and downright scandal-mongering. Such negligence to speak the truth in its own behalf is unfair both to business and to the public, for, in the last analysis, the welfare and prosperity of every one of us—the public—is intimately intertwined with the welfare of those processes we call business.

If business neglects this duty, this duty of truth-telling as to its own functions and processes, it has no right to complain if the people are led astray after false doctrines and deceived and beguiled by untruths in relation to that which they have never been taught properly to understand.—President Butterworth before the Rock Island Rotary Club.

Virginia Power Operators Identified

The Virginia Electric & Power Company, Richmond, Va., has instituted the custom of carrying the name of each car and each bus operator on a brass plate inserted in the front of the fare box. The purpose is to assist the passengers in identifying the operator and to add a personal touch which, it is believed, will work for better service on the part of the employees and promote friendly relations between the riders and the company. The name plates are being used on the rolling stock run in Richmond, Norfolk, Portsmouth and Petersburg.

Large Route Numbers in St. Louis

In a further effort to improve transportation service in the city and county the St. Louis Public Service Company on June 28 adopted a system of large route numbers for all its cars. The old system of destination signs, bearing the names of the various divisions, is continued, but is supplemented and improved by the larger route number, which appears in a panel to the right of the old signs.

Bus lines operated by the company also carry the new numbers in addition to the destination signs. The numbers reserved for the street car routes run from 1 to 100, while the bus numbers start at 100. The system includes 44 car divisions and twelve bus routes.

Rights of New Company in Indianapolis Upheld

An injunction prohibiting the Indianapolis Street Railway from interfering with the operation of interurban cars of the Indianapolis & Southeastern Railroad for 90 days has been issued in Circuit Court at Rushville, Ind. The injunction holds for a sufficient time to permit the new owners of the Indianapolis & Southeastern to sign contracts with the Indianapolis Street Railway permitting them to operate cars from the interurban line over the city streets in Indianapolis and also use the electric railway terminal building in Indianapolis. The litigation resulted from a twelve-hour delay of service a week before when the Indianapolis company prevented the use of its tracks by the interurban company.

Payroll of Bus Company Stolen by Bandits

Five minutes after an $18,000 payroll had been delivered in an armored car at the Surface Transportation Company garage, 180th Street and Webster Avenue, the Bronx, at 10 a.m., on Aug. 23, four armed thugs held up the office force and seized the money. Through a hail of bullets from a riot gun they escaped in a Lincoln sedan, but only after they had wounded one man, nearly run down another, wrecked their automobile and commandeered a second one. The Surface Transportation Company is a subsidiary of the Third Avenue Railway.

New Stone Mountain Operating Plan

The Georgia Power Company, Atlanta, Ga., has been authorized by the Public Service Commission to run its Stone Mountain cars only as far as Decatur on the way to Atlanta. The company has also been authorized to rearrange its schedule so that more cars could be run at night during the rush hour and fewer in the day time when business is light. Passengers on the Stone Mountain line will be permitted to transfer at Decatur to the south Decatur or the north Decatur line and proceed to Atlanta without additional charge. The company has also been authorized to discontinue the sale of commutation ticket books. A passenger station in which passengers may wait for connecting cars is being maintained at Decatur. The order went into effect on Aug. 20.

Ohio Interurban Confronted With Demand for Improvements

Efforts of the City of Columbus, Ohio, to force the Indiana, Columbus & Eastern Traction Company to do its share of the proposed repaving of Columbus streets may precipitate abandonment of the company's line from Columbus to Zanesville. The company now is facing demands for improvements in Columbus, Newark and along the National Highway, but it is unable to proceed because for some time it has been operating at a loss.

Should the company decide to abandon its line to Zanesville, it is predicted that this also will mean the abandonment of the East Mound Street car line of the Columbus Railway, Power & Light Company, which leases the right to run its cars over the tracks owned by the Indiana, Columbus & Eastern Traction Company.

Winners of Sales Essays to Go to Cleveland

All car and coach operators and all shop men of the Erie Railways Company and the Erie Coach Company, Erie, Pa., have been invited to submit articles on the subject "Selling Rides to the Public," the men submitting the three articles adjudged to be the best to be rewarded with a trip to the convention of the American Electric Railway Association in Cleveland in September. The foremen, supervisors and superintendents are not eligible to compete since the program of the company contemplates their being sent. An official announcement says:

Do you want a free trip to Cleveland?

The week of Sept. 25 the American Electric Railway Association will have a convention and exhibit at Cleveland and anyone employed in the street railway industry who attends that meeting will see and hear many things of interest.

This company would be very glad to have any employee (this means you) submit an article on the subject, "Selling Rides—Making Friends for One's Self and for the Company.

Limit your article to 250 words. Have the same in the hands of Mr. Nolan not later than Monday, Sept. 10. Mr. Nolan, Mr. Schuwerk and Mr. Brown will be the judges, and the authors of the three best articles, as selected by this committee, will be entitled to a free trip to Cleveland on Wednesday, Sept. 26, the day set aside at the convention for a general inspection of all exhibits.

The company will pay the winners their full day's wages and all their expenses for transportation, meals, etc., while at Cleveland.

Three fellows are going—be one of them.

R. C. Ashworth to Assist in San Francisco Valuation

City Engineer O'Shaughnessy of San Francisco, Cal., has announced the appointment of Raymond C. Ashworth as valuation expert to assist his office in fixing valuations on the properties of the Market Street Railway and California Street Cable Railway, preliminary to negotiations for their acquisition by the city. Mr. O'Shaughnessy said that the valuation of the railway properties will require between two and three months and that the preliminary steps have already been started under direction of Paul Ost, assistant city engineer, and his staff. Mr. Ost is engineer in charge of the Municipal Railway for the city.

Opposition to Illinois Traction Withdrawn at St. Louis

Opponents of the 50-year franchise recently granted to the Illinois Terminal System by the city of St. Louis, Mo., have abandoned their plans for a city-wide referendum election on the question. The company proposes to spend about $5,000,000 in improvements in St. Louis, including a subway, surface and elevated system connecting the McKinley Bridge with a new downtown passenger and freight terminal at Twelfth Boulevard and Lucas Avenue. Opponents of the plan contended it would create a dangerous grade crossing at Cass Avenue.

Seattle Suit to Be Heard Sept. 17

Sept. 17 has been set as the date for the hearing of the case of the Puget Sound Power & Light Company vs. the city of Seattle, Wash., and others in the Circuit Court of Appeals. At San Francisco on Aug. 20 the court denied a petition of the company for a rehearing of the suit of J. G. Von Herberg, Seattle capitalist, against the city of Seattle. Attorneys for the power company indicate that an appeal to the United States Supreme Court will probably be taken. The Von Herberg suit seeks to establish the priority of wage claims against the railway over bond retirement payment on the $15,000,000 purchase price the city agreed to pay the power company for the railway property now included in the Seattle municipal system.

The recent circuit court decision again remands the case back for trial in the Superior Court in Seattle. The federal court in Seattle originally considered the matter, but the appeal court later held that it had no jurisdiction as no interstate issue was involved.

Seven Sisters Falls to Go to Winnipeg Company

The latest advices from Ottawa bear out the opinion, frequently expressed, that the Winnipeg Electric Company is to obtain the Seven Sisters Falls power site. It is said that within a few days the final settlement may be expected between the Dominion and the Manitoba governments as to the disposition of the site. When Premier John Bracken, of Manitoba, was in Ottawa for the conference on natural resources, he withdrew the application of his government for the development of the Seven Sisters site. Hence, the field is now left open for the consideration of the Winnipeg Electric Power Company's application. It is understood, moreover, that the Manitoba premier has notified the Dominion government that he is in favor of having the falls awarded to the private company for development. Hon. Charles Stewart, Federal Minister of the Interior, has been in Winnipeg conferring with Premier Bracken, and it is said that the transfer will be completed very shortly.

Recent Bus Developments

Additional Bus Service in St. Louis

The St. Louis Public Service Company, St. Louis, Mo., has increased the bus service for the Pine Lawn and Jennings sections of St. Louis County. Seven new 40-passenger twin coaches have been placed in service on the Natural Bridge line No. 104, operating from Natural Bridge Avenue and Kingshighway Boulevard to Robin and West Florissant Avenue via Jennings Road.

Four 29-passenger buses have been placed on the line from Kingshighway to Helen and Melrose Avenues. This gives four-minute bus service on Natural Bridge Avenue as far west as Pine Lawn and an eight-minute service for the balance of this loop line. During non-rush hours a twelve-minute schedule will be maintained.

The east end of the Natural Bridge Avenue line has been divorced from route No. 105 and a new bus line known as route 116 established. It runs from Shreve and Natural Bridge Avenues to Taylor and West Florissant Avenues. At its south end this line loops around Sacramento, Marcus, Natural Bridge and Shreve Avenues.

Crosstown Service in Gary

A new crosstown bus route providing half-hourly service to a rapidly growing residential area of Gary, Ind., lying west of Broadway, was opened for service on Sunday, Aug. 26, by the Gary Railways. The new line, traveling a rectangular route over 25th Avenue, Grant Street and 15th Avenue, approximately 3½ miles in length, connects with street cars operated to the downtown business district on Broadway at 25th and 15th Avenues. Free transfers are issued from bus to street car.

Around the U. S. A., from Akron

M. R. McNutt, who has specialized in chartered car and bus service ever since he joined the Northern Ohio Power & Light Company, Akron, Ohio, contributed to the *Northern Light*, published by the company, for August an article on its chartered car and bus service. He concludes as follows:

With the demand for special buses steadily growing it is reasonable to believe that by next year we will have handled trips from Coast to Coast and from Lakes to Gulf. It is a common occurrence now to be called on for trips to Boston, New York City, Atlantic City, Washington, Detroit, Buffalo, Chicago, and even to southern cities such as Montgomery and Nashville. The tendency is towards longer and longer trips, although the number of shorter ones continues to increase.

"John Public" is developing "bus appeal" and getting "bus wise." He is bound to "ride on rubber and air," free from soot and smoke, through nature's own wonderland, which is best enjoyed from a comfortable seat in a motor coach rolling along our network of highways.

We have the buses and we have the men. The public is thoroughly sold on the idea of chartering buses. Our booking offices are located in Cleveland, Akron and Canton, right in the heart of Ohio and the great Middle West. The entire organization is enthusiastic. What other combination of favorable conditions could be considered more ideal or promise a brighter future?

Patrons Protest Indianapolis Bus Fare

Notice has been filed with the Indiana Public Service Commission by Joseph H. Schaub, Jr., and a group of patrons of the Peoples Motor Coach Company, Indianapolis, announcing that an appeal will be taken from the commission's order of July 18, in which the 10-cent fare of the company was held reasonable and was continued in effect indefinitely. Schaub and his associates filed a complaint with the commission in November of last year against the fare charged by the coach company and asked a reduction. In the course of the investigation, the commission had an inventory made of the company's property and audited the company's books. The appeal will be taken to the Circuit Court in Indianapolis.

Taxicab War Threatens in Cleveland

The possibility of a taxicab war loomed in Cleveland, Ohio, when three newly established companies announced almost simultaneously on Aug. 29 that they are planning to invade the city within a few weeks with hundreds of cut-rate cabs.

Joseph H. Alexander, president of the Cleveland Railway, immediately served notice on the taxicab companies and the public generally that the railway will oppose any taxicab operations which might tend to slow up the movement of street cars and thereby increase operating costs and bring higher fares.

He pointed out that all desirable taxicab stands are now taken by established taxicab companies and that new companies, in order to operate, would have to depend for their business on cruising, which undoubtedly would result in increased traffic congestion and slower movement of street cars in the downtown district.

Before any of the new cab companies started in operation, Safety Director Edwin D. Barry called in the officials and warned them that cruising will not be tolerated by the police and that all companies will be required to observe strictly the city ordinances governing taxicab operations.

The cut-rate companies plan to operate on the basis of 25 cents for the first mile and 20 cents a mile thereafter. The old rate is 25 cents for the flag throw and 10 cents for each two-fifths of a mile thereafter.

The day following the announcement of the cut-rate cab invasion, the Yellow Cab Company posted notices authorizing customers to deduct as high as $1 from the fare shown by the meters.

Another Bus Line for Hartford

The Connecticut Company, Hartford, Conn., will operate a bus line from Gold Street, Hartford, to reservoir No. 4, a distance of 10 miles, as a part of its Hartford recreational system. The fare in each direction will be 25 cents, and the line will follow as nearly as possible the route of the Hartford-New Britain bus line. The Public Utilities Commission has granted the petition. For the present three trips will be made daily.

Fatal Bus Accident Causes Demand for Regulation

Immediate legislation for control of interstate bus operation is needed. This is the belief of Frank W. Matson of the Minnesota Railroad & Warehouse Commission in charge of bus transportation hearings, following an accident on Aug. 20, 4 miles north of Red Wing, Minn., in which four passengers were burned to death, four sent to hospitals and from which the driver has since died.

The accident occurred on a curve. The bus, running at 40 m.p.h., struck a state fisheries truck. The bus driver is said to have been at the wheel nearly fifteen hours.

The bus, operated by the Interstate Travel Bureau, doing no intrastate business, was not under regulatory control. It bore Minnesota and Wisconsin license tags. Chairman O. P. B. Jacobson of the commission said.

The commission nominally has control, but there are no teeth in the law. We need remedial legislation on this matter.

Mr. Matson said if it is found Minnesota bus operators are working their men long hours, rules will be promulgated limiting the time, as in the case of railroads.

E. F. Zelle, president of the Minnesota Motor Bus Association, said that in twelve years of bus operation there has never been loss of life on any buses operated by its members.

Extension of Bus Service in Massachusetts City

The Transportation Board at Springfield, Mass., has granted the petition of the Springfield Street Railway for a bus line to take the place of present car service. The action includes permission to extend the route from the terminal at Bay and Princeton Streets to take in Burr and Cambridge Streets and Oak Grove Avenue by means of a loop.

Financial and Corporate

Merger Before Commission

Approval sought of deal under which sixteen companies in Indiana, including Terre Haute, Indianapolis & Eastern would be brought together

A PETITION for the proposed $70,000,000 merger of sixteen electric power and transportation companies in Indiana under the Indiana Electric Corporation, was filed Aug. 28 with the Indiana Public Service Commission. The companies, with total outstanding securities of $77,554,542 include the Central Indiana Power Company and several subsidiaries, all controlled by the Insull interests, and the properties of the Terre Haute, Indianapolis & Eastern Traction Company.

Case Assigned to Commissioner Harmon

No statement was made by Frank Singleton, chairman of the Public Service Commission, as to whether a complete appraisal by the commission engineers and an audit by commission accountants will be made, but he said that the commission will study the petition closely before taking final action. He assigned the case to Harvey Harmon.

Halsey, Stuart & Company, of Chicago, are consolidation managers for the merger. They have acted as agents for the last two years in arranging the terms of exchanges between the stockholders of the present companies and the promoters of the new corporation. This has been a long process since factions holding many different views had to be reconciled.

No mention of the Indianapolis Street Railway as a party to the merger is made in the petition except that all of the common stock of the city company is owned by the Terre Haute, Indianapolis & Eastern.

One paragraph of the petition explains that an agreement has been reached by owners of more than three-fourths the voting stock of the two merging companies to combine all under one ownership, except the electric interurban railroad lines extending from Indianapolis to Martinsville, Richmond, Lafayette and Crawfordsville, the line from Crawfordsville to Lebanon and the line from Dunreith to Newcastle and the city lines in Richmond. The petition says:

Combination in the Public Interest

The proposed combination is in the public interest. The properties in question occupy in a large measure the same general territory in the central part of the state. These controlled by the Central Indiana Power Company are so interconnected as to form at the present time a single operating unit. Those controlled by the Terre Haute, Indianapolis & Eastern are similarly interconnected among themselves. Physical connections of the two groups of properties already exist at Indianapolis, Terre Haute, Greencastle and at other intermediate points. The bringing of all these properties under one ownership will make available at all times to the railroad properties and to the electric property in Terre Haute the large electrical production facilities existing in the Central Indiana power group.

The petition proposes to organize a corporation under the name of the Indiana Central Rapid Transit Company, which shall acquire from the Terre Haute, Indianapolis & Eastern Traction Company, the electric interurban railroad from Indianapolis to Richmond, including the Dunreith-Newcastle branch and the Richmond city lines. This property is to be acquired subject to the mortgage of the Terre Haute, Indianapolis & Eastern securing its present outstanding first and second mortgage bonds, in consideration of the issuance to the Terre Haute, Indianapolis & Eastern of the entire capital stock of 50,000 shares of the common stock without par value of the said Indiana Central Rapid Transit Company.

The terms of the proposed merger have been reviewed at length previously in Electric Railway Journal.

Preferred Dividend Cut in Kansas City

Directors of the Kansas City Public Service Company, Kansas City, Mo., on Aug. 23, decided to reduce the preferred stock dividend, due on Oct. 1, from $1.75 to $1 a share. Powell C. Groner, president, said the decline in earnings caused by decreased business made the action advisable.

According to figures submitted by the directors, the cars carried approximately 124,000,000 passengers in 1926 and, at the present rate of use, will carry approximately 108,000,000 this year. This explains the decrease in revenue.

Operating expenses in 1928 were about $1,000,000 less than in 1926, Mr. Groner said, but the decline in earnings offset that saving. He called attention to the fact that in 1927 all net earnings except two dividends on the preferred stock were put back into improving the property.

The 1928 estimate is for net earnings of approximately $1,550,000. Of this amount $850,000 will be for bond interest; $371,000 for preferred stock dividends and $329,000 will be available to be put back into the property.

This last amount could be taken by the stockholders, Mr. Groner observed, but the attitude is to put every dollar possible back into improvements and additions that will aid service.

Net Profit in Brisbane

Tramway earnings without consideration of bus operation realized £17,313. Falling off in passengers carried

AFTER paying interest on the capital and 1 per cent to the sinking fund and making full provision for depreciation, there was a working profit in 1927 of £17,313 on the tramways operated by the Brisbane City Council, Brisbane, Australia. Against this, however, the loss on the working of the buses was £9,099. The loss of capital on the sale of them was £5,062. This total bus loss of £14,161 can all be extinguished out of the tramway earnings and leave a net profit of £3,152 for the year. With this introduction, G. R. Steer submits the tenth annual report of the Brisbane Tramways for the year ended Dec. 31, 1927.

The true position with regard to the working of the tramways, eliminating the figures for buses, which were sold in November, is disclosed in the following table.

The tramway earnings were		£814,312
Less operating expenses		613,285
Net revenue (equal to a return of 9.81 per cent on the capital)		£201,027
Less interest on loans	£98,932	
Less sinking fund payments	20,000	
Less depreciation account	57,782	
Less amortization account	7,000	
		183,714
Leaving a net profit of		£17,313

This result has been attained during a period of financial stress and instead of traffic increasing with the growing population there was a considerable decrease in the number of passengers during the latter part of the year. The number of passengers carried decreased from 81,802,945 in 1926 to 78,057,620 in 1927, and although this is partly due to the increase in the minimum fare from 1 penny to 2 pennies and the extension of the system of issuing 4-penny and 5-penny tickets for a through journey where formerly two tickets were issued, business also fell off in the last five months of the year when the sections and tickets were exactly the same as in the corresponding period of 1926. The position has been met by the exercise of many economies and the better state of the tracks, road surfaces, overhead structures, electric motors, car bodies and trucks enabled a substantial saving.

The number of miles run in 1927 was 6,535,833, an increase of 234,707 over the preceding year, or an average of 643 additional miles daily. Compared with five years ago the increase in the distance run last year was equal to an average of 3,927 miles per day.

The loss on tramway and bus operation brought forward from 1926 was £23,071, and the profit of £3,152 for 1927 leaves a debit balance of £19,919 to be carried forward to 1928. This is almost wholly due to £19,792 lost on the buses in two years and on the vehicles at their sales.

STATISTICS OF THE TRAMWAY IN BRISBANE

	1922	1923	1924	1925	1926	1927
Revenue	£596,285	£628,841	£663,747	£706,520	£767,708	£814,312
Working expenses	434,064	443,885	536,989	563,604	588,262	623,285
Net revenue	162,221	184,956	126,758	142,916	179,446	201,027
Proportion of working expenses to revenue, per cent	72.79	70.59	80.90	79.77	76.63	75.31
Passengers carried	71,529,033	74,721,594	78,367,194	82,514,979	81,802,945	78,057,620
Car miles run	5,102,524	5,212,971	5,457,800	5,915,844	6,301,126	6,535,833

The comparison between the working results for 1927 (excluding buses) and previous years is shown in the accompanying table.

A partial increase in fare operated from Aug. 1, 1926 and the earnings for 1927 would have been higher if there had not been a reduction of £5,978 in miscellaneous earnings, principally due to the fact that in 1926 the Department had funds producing interest. Another important figure is the proportion which the excess of revenue over working expenses bears to capital expenditure, which stands at £2,050,155, excluding buses and allowing for depreciation. The tramways net earnings were £201,027, which is equal to 9.81 per cent of the capital. Mr. Steer then compares these results with tramways in other places and says that the operating ratio compares favorably with many of the larger systems.

Thirteen new drop-center cars were placed in service in 1927, bringing the total number of cars up to 260. At the end of the year fifteen new cars were being delivered, but more will be required before long to replace obsolete vehicles. All new cars are being fitted with windscreens for the motormen and the floors are being covered with rubber, which is easier to clean and more hygienic than wooden laths. In 1927 orders were placed for 40 tramway motors of Australian manufacture.

Under public ownership 11 miles of new lines have been built (equal to 14¾ track miles), 7¾ miles of single track have been converted into double lines, and 27 miles of old track have been rebuilt with new materials, making a total length of 49½ miles of line laid within the last five years, which represents 53 per cent of the total track mileage of 93 miles.

Buses continued to operate on three routes until November, 1927, when nine of the vehicles were sold and the services were transferred to private enterprise. The remaining two buses were converted into trucks for general use by the Tramways Department. Up to the time of sale the buses carried 1,332,940 passengers last year for a revenue of £15,318, and the working expenses were £19,649. In addition to this shortage, depreciation and interest absorbed £4,768, making a loss of £9,099 for the year. The loss on the buses in two years has been £19,792, so that financially, Mr. Steer said, the venture proved unfortunate. The loss could not be taken as an indication, he maintained, that less expensive buses could not be successfully operated under more favorable conditions, but the depreciation averaged nearly £8 a bus per week and tire renewals averaged £5 12s. a bus per week.

General Manager Steer referred to the interest that had been taken by the staff in submitting suggestions for the more efficient and economical working of the department and the results that amply justify the creation of the board. During 1927 final consideration was given to 77 separate suggestions and fourteen of them were adopted and put into operation.

Suburban Road in Massachusetts to Discontinue

Electric railway service between Milford and North Grafton, Mass., will be discontinued at midnight on Aug. 31. The line passes through Hopedale, Upton, West Upton and Grafton Center. It has been operated by the Milford, Framingham, Hopedale & Uxbridge Street Railway, but between Hopedale and North Grafton the cars pass over the rails of the Grafton & Upton Railroad. The abandonment of service between Milford and Hopedale also is under consideration.

In this connection representatives of the Boston, Worcester & New York Street Railway have been checking traffic on the Framingham to Uxbridge Coach Line with the idea of negotiating for its purchase as it would enable them to operate buses from Milford to Saxonville and there connect with Boston and Worcester buses.

Announcement of the abandonment of the Milford and North Grafton line has been followed by talk of organization of bus service between Milford and Worcester to pass through Hopedale and along the Milford and Worcester highway, giving better service to the patrons in Upton and West Upton. In the Uptons the buses would traverse Main Street, whereas for nearly ten years the trolley operated over the railroad some distance from the main thoroughfare. The Grafton & Upton Railroad, an independent concern controlled by the Draper interests of Hopedale, will continue to operate freight service between Hopedale and North Grafton.

Joseph Gordon, a director, says that since his company took over the Milford & Uxbridge Street Railway on May 4 the Grafton and Upton branch has been losing money, although the Grafton & Upton Railroad paid his concern a reasonable amount in an effort to offset these losses. Figures compiled by Mr. Gordon and his associates indicate a loss of from $1,000 to $1,200 a month on the 14 miles of track between Hopedale and North Grafton.

The company has been willing to continue operating cars if it could secure a guarantee from some source to meet expenses. The operators of the Grafton & Upton Railroad, however, could not see how they could contribute a larger sum to keep the cars running over their line and agreed to the abandonment. On the Grafton and Upton division the cars have been making nine round trips daily.

No decision has yet been reached by the Milford, Framingham, Hopedale & Uxbridge Street Railway about abandoning the Milford to Hopedale trolley line. Only three round trips on five days a week are being made on this line, operated principally to accommodate Draper Corporation workmen who live in Milford.

Trolley service between Milford and North Grafton has been maintained since June, 1902. The Grafton & Upton Railroad has been used largely for the movement of freight for the Draper Corporation at Hopedale and the William Knowlton & Sons hat plant at West Upton and for the conveyance of their employees who live in surrounding towns.

Valuation Case Returned to Tennessee Commission

A revaluation of the properties of the Tennessee Eastern Electric Company and the Johnson City Traction Company by the Tennessee Railroad & Public Utilities Commission has been ordered by Judge A. B. Neil in circuit court in his opinion handed down in the case of the companies against the commission.

The companies contended that the valuation of $225,000 placed on the Johnson City Traction Company and the $2,500,000 as placed on the Tennessee Eastern Electric Company would force those companies to charge rates which would practically mean confiscation of their properties. Judge Neil upheld the commission in its sole right to set the value, but remanded the case on account of errors of detail.

The case resulted from the valuation placed on the properties of the two companies in 1926 and the subsequent petition of the companies for a trial before the state court. The commission set the value of the properties at $2,725,000, to which the companies replied that their value was $6,659,878. The petitioners alleged that the commission acted contrary to law in "determining value based upon the testimony of witnesses F. G. Proutt, McGregor Smith and W. H. Corddry, because of their lack of experience and lack of knowledge of the matters about which they testified." The court said:

For this court to try this case *de novo* would mean an emasculation of the law creating the commission and would destroy its power and authority. Any person or corporation interested in any proceedings before the commission could treat it with contempt and choose for himself another tribunal in which to try the cause.

Public System Reports Profit for Three Months

The Greenfield & Montague Transportation Area, Greenfield, Mass., reports net income of $8,308 for the three months ended June 30. Operating revenue was $45,483; other revenue, $338; gross income, $45,822. Expenditures for maintenance were $7,131; equipment, $6,827; power, $8,656; transportation, $9,801; miscellaneous, $5,095; total, $37,513.

N.O.P. Quits Massillon

Legislation is now before the City Council of Massillon, Ohio, granting the Northern Ohio Power & Light Company the right to abandon its city lines in Massillon. It permits retention of the interurban line. The Massillon franchise has approximately four years to run. The company has been losing $50,000 a year on its Massillon city operation. It feels it cannot continue this loss. The interurban line extending south of Massillon is also losing money and some action relative to this situation may be taken within the next few months. The East Greenville suburban line is to be discontinued at the same time. Bus service is now being given along this line between Massillon and Wooster.

The present Massillon City contract was passed in 1907. The new ordinance proposes a relief from that contract for the balance of its term. It provides that upon the discontinuance of the lines the company will relay the pavement on that portion of the street from which tracks are removed so it will be as good as the balance of pavement upon the street. All tracks abandoned will be removed in case the city decides to repave the streets.

The company agrees, under the ordinance, to relay its tracks on East Main Street from Mill to Pine and pave between tracks and 18 in. outside of each rail. Tracks on North Mill from East Main to the freight house are to be maintained unless the freight house is moved to a new location. The company also agrees to grade the unpaved portion of Wooster Avenue upon which its tracks are located between the old and the new corporation line of the city at the time service there is discontinued. All poles and wires not in use are also to be removed. Discontinuance, under the ordinance, is to be approved by the Public Utilities Commission.

The City Council of Massillon several months ago gave a bus company a franchise and it is presumed this company will operate buses into those sections of the city now served by the car lines. Buses have been getting a 10-cent fare.

The Massillon city system was constructed more than a quarter of a century ago. The East Greenville line was built a few years later, but even that line has been in operation nearly 25 years. The system never really made any money and of late years the losses have become heavier and heavier.

The Northern Ohio Power & Light Company long ago decided it would be better off without the Massillon and other non-paying lines. The company has felt, however, that it did not want to work a hardship upon the public and for that reason has delayed action until the people of that city could find some other method of transportation. It feels that method is now available.

Mississippi Interurban to Continue

At a special meeting of the Mayor and Board of Aldermen of Ellisville, Miss., an ordinance was passed repealing the ordinance accepting the proposal of the Mississippi Power Company to give the city $23,000 for permission to abandon operation of its interurban railway. At its meeting on Aug. 10 the board passed an ordinance accepting the proposal, conditioned on approval at an election which was to be held on Aug. 13, but after the proposal was withdrawn, the board, at the request of the power company, repealed the ordinance of acceptance and abandoned the selection.

Phoenix Park Sold by Jacksonville Traction Company

Sale of Phoenix Park, formerly an amusement park, by the Jacksonville Traction Company, Jacksonville, Fla., to the Asiatic Petroleum Company, Inc., for $165,000, is announced. Final details of the transaction, which has been in progress for several weeks, were discussed during a conference between representatives of the traction company and James & Paxon, local agents for the Asiatic corporation. It is understood that the Asiatic company will establish a local concentration point similar to that placed here by other large oil companies. The property consists of about 40 acres of desirable river front, easily accessible and with adequate transportation facilities.

Minnesota Road Resold

The St. Paul Southern Electric Railway, Hastings, Minn., was resold on Aug. 23 for $34,200, or $1,700 more than the price deemed too low at a previous sale by the Dakota County District Court. The purchaser was Paper, Calmenson & Company, 975 East Seventh Street, St. Paul, distributors of iron, steel and other metal products. The line will be scrapped if the Minnesota Railroad & Warehouse Commission permits.

Out of 51 bidders the competition dwindled to three. The previous bid by C. Rieger, St. Paul, which was declared by Judge Albert Johnson to be too low, was $32,500. The court will now pass upon the sale.

The St. Paul Southern has operated part of the way to St. Paul over rails of the St. Paul City Railway. Application to abandon the road was made on Aug. 13 to the state commission. The application is under advisement until arrangements are made with the St. Paul City Railway to operate cars to Inver Grove, the first station on the Southern line, a suburb of St. Paul.

A Dictator Suggested

Maurice R. Scharff finds fault with public utility management, especially fees paid to holding companies. In the *Atlantic Monthly* for September Mr. Scharff, formerly chief engineer of the Pittsburgh branch of the Byllesby Engineering & Management Corporation, discusses "The Public and Their Utilities: Finance, Engineering and Management."

He acknowledges the real accomplishment of holding companies in extending and improving public utility service, but says that "serious abuses have established themselves." A hypothetical holding company is followed in a series of suppositious transactions to financial disaster, and then he takes up such elements as the question of high fees to operating subsidiaries for managing and engineering expenses, and the other profits taken from the public utility industry through exercise of voting control, the alleged impossibility of ascertaining from the reports of holding companies the proportion of earnings received from stocks of operating subsidiaries, and the proportion from fees charged the subsidiaries, citing "the lack of any established standard for reasonable charges, the extreme variation in such charges by different controlling groups, and the obvious unreasonableness of some of the charges that are made."

Because of anticipated public condemnation of practices of this kind by the Federal Trade Commission Mr. Scharff holds the duty of the public utility industry is clear. It should "at once add to its already expensive organization a dictatorship in the integrity and independence of which the public can have absolute confidence." Under the leadership of this dictator "the industry should develop standards, in harmony with its professed ideals of public service, for reasonable charges for all kinds of services, customarily rendered by one affiliated company to another, and it should exert the full influence of the leadership of the industry either to bring the practices of all member companies into harmony with such standards, or else to cast out the companies refusing to conform, for the public condemnation and destruction which they deserve, and will no doubt receive."

Alluding to government ownership and operations, "than which no greater public calamity can be imagined," Mr. Scharff mentions three types of legislation which he thinks present themselves as possible of embodiment in state or federal statutes. Two of these types he condemns, but he seems inclined to favor prohibiting all profits on transactions between the public utility companies and affiliated non-utility companies. He thinks that regulation by Public Service Commission has suffered a "partial breakdown."

Legal Notes

ALABAMA—*Criterion for Employment Under Workman's Compensation Law.*

Whether work being done by an employee, when injured, was reasonably necessary in proper performance of his ordinary duties, or reasonably related thereto, and done in good faith in furtherance of employer's business, is the test for determining whether the injury is one arising out of employment within the Workman's Compensation Law. An injury to a car cleaner while constructing a tool box for his own tools and clothing in the company's carpenter shop, where his duties did not require his presence, does not come within the scope of the law, particularly in view of the employer's statement that the employee could not have a locker until one became vacant. [Vickers vs. Alabama P. Co., 117 So., 650.]

CALIFORNIA — *Test of "Last Clear Chance Doctrine" Defined.*

An automobile was negligently driven into a narrow space between a parked car and a street railway track, and in this position it was struck by a trolley car. The company was held responsible under the "last clear chance doctrine." The test of this doctrine, when two persons have been guilty of negligence and one has ceased to have any power to prevent an accident, is whether the other still has the power of preventing it by the exercise of ordinary care. [Nicolai vs. P. E. R. Co., 267 P., 758.]

MASSACHUSETTS — *Unregistered Automobile Is a Nuisance on the Street.*

It is unlawful to operate an unregistered automobile upon a highway. Such a vehicle is a nuisance and an outlaw. Its operation is evidence of negligence, as a matter of law. Everything in the conduct of the operator that enters into the propulsion of the vehicle is under the ban of law. Where a trolley car collided with such an unregistered automobile, it was held that if the operation of the automobile "had any casual connection with the collision, the plaintiff cannot recover." [MacDonald vs. Boston E. R., 160 N.E., 327.]

MASSACHUSETTS — *Passenger After Alighting Struck by Overhang of Car.*

At the end of a line a passenger alighted from a car, and to avoid a puddle between the point of alighting and the sidewalk stepped near the track, where she was struck by the overhang of the car as it passed around a curve leading to the car yard. The court held she was not a passenger at the time and the company was not responsible for the accident as there was no evidence that the conductor or motorman knew, or should have known, of the danger. [Noonan vs. Boston E. R. Co., 160 N.E. 811.]

NEW JERSEY—*Duties of Street Railway Operating Under Steam Railroad Charter.*

Where a street railway operated under a steam railroad charter but did not notify the public of this fact and did not perform the duties imposed on railroad companies at highway crossings, a person attempting to cross the right-of-way of the company at a street intersection was justified in assuming that the tracks were those of a street railway company, relative to the question of contributory negligence in failing to accord the trolley car the right of way.—[Freihon vs. Public Service R. Co., 142 A., 452.]

NEW YORK—*Overpayment of Franchise Tax, Resulting From City Comptroller's Error, Held "Not Voluntary."*

A railway's right to cross a bridge was included in the value of its franchise when its tax was assessed, but the bridge tolls paid by it should have been used to reduce the tax. During one year the company overpaid because the city comptroller made a mistake in computing the tax, and the railway accepted his computation. This overpayment was held not "voluntary" in the sense that it would deprive the person from having the over-payment returned to him. [B. Q. C. & S. R. Co. et al. vs. City of New York, 229 N.Y.S., 9.]

NEW YORK — *Conditions Under Which "Last Clear Chance" Does Not Apply.*

Where a person discovers another in a position of danger in time to avoid an accident and fails to do so, he may be liable under the "last clear chance doctrine," but he is not liable because of his failure to discover the person in such a position. In this case, the motorman did all in his power to avoid an accident after discovering a person near the tracks on a bridge, but recovery could not be had on the theory that he should have discovered the situation earlier. [Wright vs. Union R., 229 N.Y. Supp., 162.]

OHIO—*City Has Power to Restrict Bus Service Within Its Territory.*

A city passed an ordinance prohibiting interurban buses carrying passengers from one point to another within the city limits without securing a permit from the City Council and no permits were granted where the route was over streets occupied by a street railway line. The validity of this ordinance was upheld by the Supreme Court. [Sylvania Buses vs. City of Toledo, 160 N.E., 675.]

OHIO—*Failure to Comply with Provisions of Law for Safeguard of Passengers Warrants Revocation of Certificate.*

Where a motor transportation company fails to comply with the provisions of the law, or the rules of the Public Utilities Commission, for the safety of the public, the commission is warranted in revoking the certificate of the company.—[Minerva-Canton T. Co., vs. P. U. Comm., of Ohio, 162 N.E., 34.]

OHIO—*Certificate May Be Revoked for Sale of Motor Bus Line Without Consent of Commission.*

After a certificate of convenience and necessity was issued to the operators of a motor bus line, their interest in it was sold to other parties without application for permission to make this sale from the commission. The power of the commission to revoke the certificate for this cause was upheld by the Supreme Court. [Oyster et al. vs. P. U. Comm., 160 N.E., 701.]

OHIO—*Hearing by Commission Necessary When Common Carrier Increases Equipment.*

The Public Utility Commission issued a certificate to operate an eighteen-passenger bus between two points. Three months later it issued a second certificate to the same operator to operate an additional bus without notice to other carriers in the same district and without public hearing. The Supreme Court held that a hearing was necessary before the certificate could be valid. [Stark E. R. Co., vs. P. U. Comm., 160 N.E., 699.]

OHIO—*Power of Public Utility Commission to Change Its Records by "Nunc Pro Tunc" Order.*

The function of a *nunc pro tunc* order is to correct a clerical error, not a mistake in judgment. It must further appear that no intervening right will be prejudiced. Hence, an order of the commission in 1927, changing to a regular certificate one which was granted in 1923 for a different kind of operation must be reversed. [Helle v. P.U. Comn. and L.S. Elec. Ry. vs. Same, (two cases) 161 N.E., 282.]

PENNSYLVANIA — *State Taking Over Highway Assumes Supervision of It.*

An electric railway agreed with a township to maintain passageway across a certain highway on which it had tracks. Later the state took over the highway. Still later, the township brought suit against the railway company to compel it to maintain the passageways, as agreed, but the court held this is a matter purely between the state and the company. [Cheltenham vs. P. R. T. Co., 141 A., 259.]

VIRGINIA—*Meaning of Right of Way at Crossings.*

A city ordinance declared that at street crossings pedestrians shall have the right of way over vehicles, except where traffic officers are stationed. This was held not to relieve pedestrians of the duty of exercising ordinary care to protect themselves from injury at such point, but in general to mean that at street intersections the drivers of vehicles shall not unreasonably impede the passage of pedestrians.—[Gordon vs. Virginia E. & P. Co., 143 S.E., 681.]

Personal Items

Hale Holden With Southern Pacific

Hale Holden, president of the Chicago, Burlington & Quincy, will take an important executive position with the Southern Pacific Company about the first of the year. William Sproule, president of the Southern Pacific, is expected to retire from railroad service and it is accepted in railroad circles that Paul Shoup, now executive vice-president, will be his successor. Mr. Shoup is also president of the Pacific Electric Railway and second vice-president of the American Electric Railway Association.

Mr. Holden's office with the Southern Pacific in all probability will be that of vice chairman of the executive committee. This title is now held by A. D. McDonald, who is also president of the Texas & Louisiana lines of the system and will presumably retain the latter position. Henry W. deForest, chairman of the executive committee, will retain his present post.

That the president of the Burlington, which road is controlled by the Northern Pacific and Great Northern, should become an active executive officer of the Southern Pacific, evidently reflects, according to the *Wall Street Journal*, the fact that Arthur Curtiss James is a very large stockholder in the two northern lines and also in the Southern Pacific. Mr. James acquired his interest in Southern Pacific in 1924 when he and his associates turned over control of the El Paso & Southwestern, receiving in part payment $28,000,000 par value of Southern Pacific stock, and $29,400,000 bonds.

If, as the selection of Mr. Holden for one of the highest posts in the Southern Pacific organization indicates, Mr. James has begun to exert his influence in the Southern Pacific management, the latter's opposition to Western Pacific expansion may, according to the *Wall Street Journal*, be expected to subside. Railroad men are inclined to see in Mr. Holden's selection something of a peace treaty between the Northern Pacific-Great Northern-Burlington group on the one hand and the Southern Pacific interests on the other for the co-operative development of California traffic.

W. G. Fullen Resigns from New York City Commission

William G. Fullen, chief counsel for the Board of Transportation, New York City, since 1924, has resigned to enter the private practice of law as a member of the firm of Baar, Bennett & Fullen. He has been engaged in state and city service on transit matters for the past twenty years, coming to the Board of Transportation from the Transit Commission, whose chief counsel he was in 1923 and 1924. He began his service as a junior clerk in the legal division of the old Public Service Commission.

Mr. Fullen for years represented the Transit Commission and later the Board of Transportation at meetings of the Board of Estimate. He was active in assisting in the preparation of transit legislation and played an important part in preparing the city's side of the transit inquiry held three years ago by Justice John V. McAvoy. Mr. Fullen, has served under 34 commissioners and deputy-commissioners in five different forms of transit authority.

Dan Jackson on Illinois Commission

Dan Jackson, a colored Republican committeeman of the second ward of Chicago, has been appointed a member of the Illinois Commerce Commission by Gov. Len Small. Mr. Jackson succeeds Edward H. Wright, also colored, who has resigned on account of poor health. Mr. Wright was the first negro ever to be a member of the state utility commission. His resignation took place Aug. 31 and Mr. Jackson succeeded him on Sept. 1.

Changes in Division Personnel in Brooklyn

John O. Williams is the new division superintendent at the 58th Street depot of the Brooklyn City Railroad, Brooklyn, N. Y., succeeding the late William J. Roome. Mr. Williams' transfer to 58th Street depot from Halsey Street depot was announced by C. E. Morgan, vice-president and general manager. To succeed Mr. Williams at Halsey Street depot, Wallace W. Brendel was appointed division superintendent.

Mr. Williams has been a division superintendent since Nov. 15, 1924, when he was placed in charge of Halsey Street depot to succeed R. A. Masters when the latter took charge of Fresh Pond depot. Mr. Williams has worked his way up through the ranks, having started his street railway career on April 1, 1893, as a conductor on the Bushwick Avenue line.

Mr. Brendel is a new member of the group of division superintendents and a recent recruit to the B. C. R. R. operating staff. His electric railway experience, however, covers a period of twenty years. Mr. Brendel was born and reared on a farm 22 miles northwest of Indianapolis, Ind. He started in the electric railway industry on June 5, 1908, as a motorman at Anderson, Ind., on the Indiana Union Traction system. In June, 1916, he joined the staff of the Michigan Electric Railway Lines. He served as cashier and chief train dispatcher of the Grand Rapids, Holland and Chicago branch of the Michigan lines with his headquarters at Holland, Mich., for a year and then was located at Battle Creek, Mich., for three years on the Camp Custer division and later as chief train dispatcher of the southern division of the Michigan Lines. In May, 1920, he was promoted to the post of trainmaster of the southern division and the following year was made superintendent of the interurban lines of the Michigan Electric Company. He remained in the latter post until April 22, 1928, when he went to Brooklyn.

Obituary

Judge Alexander Pope Humphrey

Judge Alexander Pope Humphrey, 80 years old, dean of attorneys of Kentucky, scholar, and known nationally for his attainments in law and for his hospitality, died on Aug. 19 after an illness lasting almost two years.

Judge Humphrey was long an officer of the Louisville Railway. For nearly 60 years he had been a dominant figure before the bar of Louisville. He appeared before the Supreme Court of the United States innumerable times and numbered its justices among his intimate acquaintances. He was adept in federal law practice.

Judge Humphrey was general solicitor for the Southern Railway, vice-president and general counsel for the Kentucky & Indiana Terminal Railroad; president and general counsel for the Louisville & Jeffersonville Bridge Company; counsel for the Big Four Railroad; counsel for the Chesapeake & Ohio Railroad and until recently he was general counsel for the Louisville Railway. Three times Judge Humphrey was honored signally by the attorneys of the nation, state and city. He was elected president of the American Bar Association, the State Bar Association and the Louisville Bar Association, something said by his associates to be unusual in Louisville.

Judge Humphrey was born in Louisville, Jan. 26, 1848, the son of the Rev. Dr. Edward Porter Humphrey and Martha Ann Pope, members of pioneer Louisville families. He was educated in private schools and attended Centre College from which he was graduated in 1866 with an A.B. degree. He then attended the University of Virginia and was graduated with an LL.B. degree when he was 22 years old.

CHARLES WOODSON BATES, prominent St. Louis attorney, former city counselor and general counsel for Rolla Wells during his administration as receiver for the United Railways, St. Louis, died at Pasadena, Cal., on July 31. Mr. Bates was city counselor for St. Louis from 1902 to 1909 under Mayor Rolla Wells. He was admitted to the bar in 1885.

ROBERT H. SOUTHARD, connected with the legal staff of the Public Service Railway, Newark, N. J., died on Aug. 5. He joined the staff of the New Jersey company in 1917. Mr. Southard was graduated from Princeton in 1899, and the Columbia School of Law, in 1902. He was 50 years old.

Manufactures and the Markets

Seattle Elevated Changes Recommended

In a recent communication to the Council, A. W. Furse, superintendent of street railway maintenance, Seattle Municipal Street Railway, Seattle, Wash., recommended that the West Seattle elevated line on Whatcom Avenue and Washington Street be abandoned and the structure on West Spokane Street connected with tracks on First Avenue South at a cost of $97,789. His recommendation was made in a recent report on the expenditures necessary to put the elevated in safe condition. He reports that the elevated is now in need of repairs and that a 100 per cent removal of ties will be necessary Oct. 1 to maintain it in safe condition. This removal will necessitate planking of tracks and other repairs to render it safe until March 1, 1929.

British Columbia Substation Improvements

Expenditure of approximately $270,000 on substation construction will be undertaken by the British Columbia Electric Railway in the immediate future, according to estimates approved by the company's officials. This amount includes about $30,000 worth of equipment which will be transferred to these jobs from stock, the balance of the amount is for construction work, and for the purchasing of new equipment for installation in the stations.

The major development is the enlarging of the existing substation at Point Grey. Two 6,000-kw. transformer banks and four high-tension oil circuit breakers together with a number of induction feeder regulators will be installed in this station. The work is estimated to cost $140,000.

It is proposed to considerably alter the appearance of the Trimble Street substation by the erection of a wall which will give the station the appearance of a suburban residence. The present 250-kw. transformers will be replaced by three 500-kw. transformers. This work will cost $13,000.

Work will also be started on the West Vancouver substation during the next few weeks. This station will be of brick construction and will cost $22,000. Considerable additions are at present being made to the Chilliwack substation. The 300-kw. rotary is at present being taken from the Chilliwack substation and erected in the Sumas substation, while a 500-kw. rotary is being installed in the Chilliwack station. This involves the expenditure of $20,000 on the Chilliwack work and $21,000 at Sumas.

Installation of a second rotary at the Bodwell Road substation is also about to be commenced by the company, and will augment the capacity of that plant. New transformer banks are being erected in the Horne Payne substation at a cost of $35,000.

Seven New Simplification Suggestions Accepted

Ray M. Hudson, assistant director in charge of the commercial standards group of the Bureau of Standards, of which the Division of Simplified Practice is a part, has just rendered a report, covering the activities for the quarter ending June 30, 1928.

In answer to the inquiry, "What's ahead for business the next six months?" as recently asked of Mr. Hudson, he said:

While I appreciate the hazards and pitfalls of prognostication, I believe this period will be marked by an increasing interest in, and application of, the principles of simplified practice. Because of keen competition, rising costs of doing business, and shrinking profit margins, both manufacturers and merchants are studying their inventories, the costs of carrying them, their relative rates of turnover, and similar pertinent factors, more intensively than heretofore. The resulting concentration of manufacturing and selling effort on stocks thus simplified is yielding tangible benefits, such as smaller inventory investments, better turnover, lower costs, better service, and better profits. Distributors, wholesale and retail, are finding they can apply sim-

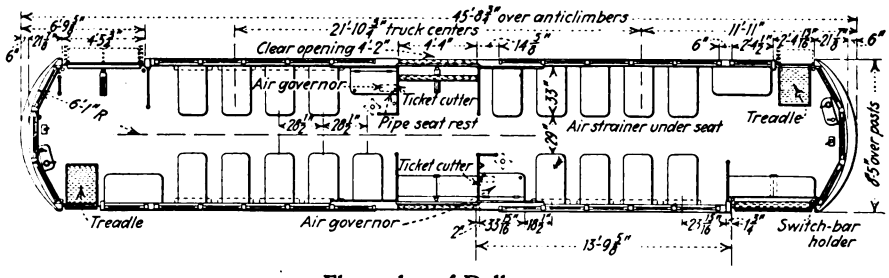
Detroit Will Receive Bids on 100 Cars

DETROIT Department of Street Railways, Detroit, Mich., will receive bids up to Sept. 13 for furnishing the city of Detroit with 50 or 100 Peter Witt type street cars, built according to the department's specifications.

Specifications on Seventeen Dallas Cars

Seventeen two-man, motor, passenger cars have been ordered by the Dallas Railway & Terminal Company, Dallas, Tex., from the St. Louis Car Company as mentioned in the Aug. 4 issue of ELECTRIC RAILWAY JOURNAL. They are of the double-end, double-truck, Peter Witt city type and seat 42 passengers, exclusive of the four Admore seats, one of which is across each side door and front door.

The cars are 45 ft. 8½ in. long, 8 ft. 5 in. wide and weigh 39,300 lb. The bodies are semi-steel construction with arch roofs and both center and end doors. The center side doors are sliding and the end doors are folding type, the rear exit doors being treadle operated. The cars are finished in green and ivory enamel with interior trim in mahogany. Each truck is equipped with two inside-hung motors and 26-in. steel wheels. Plain armature and journal bearings are used. Delivery is expected in October. Additional information is given in the accompanying specifications.



Floor plan of Dallas cars

Weights:	
Car body	19,300 lb.
Trucks	10,000 lb.
Equipment	10,000 lb.
Total	39,300 lb.
Bolster centers	21 ft. 10¾ in.
Length over all	45 ft. 8¾ in.
Length over body posts	32 ft.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	10 ft. 7¼ in.
Window post spacing	28¼ in.
Body	Semi-steel
Roof	Arch
Air brakes	General Electric
Armature bearings	Plain
Axles	Heat-treated
Car signal system	Faraday buzzer
Compressors	CP 27-B
Conduit	Flexible
Control	General Electric K-35-J.J.
Couplers	Shackle bar
Curtain fixtures	Curtain Supply Company
Curtain material	Curtain Supply Company Wyndasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding end—Sliding side
Fare boxes	Johnson
Finish	Enamel
Gears and pinions	Grade B. A-1
Glass	A A
Hand brakes	Drop handle
Hand straps	Buffalo light weight
Heaters	Consolidated double coil Truss plank
Headlights	Golden Glow
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Cast steel—St. Louis Car Company
Motors	Four GE-265, inside hung
Painting scheme	Green & ivory
Roof material	Poplar
Sash fixtures	Curtain Supply Company
Seats	Reversible wood
Seat spacing	28¼ in.
Seating material	Wood slats
Steps	Folding end—stationary side
Step treads	End "Safkar," side, Feralun
Trolley catchers	Keystone
Trolley wheels	More-Jones
Trucks	St. Louis EIB
Ventilators	Utility honey comb
Wheels, type	Steel, diameter 26 in.
Wheelguards	H.B.

Digitized by Google

plification to their own stocks, as manufacturers have been doing for some years past, and with similar benefit.

Interest among consumer groups is also developing at a fairly rapid rate. As might be expected, industrial purchasing agents and stores department supervisors have been quick to realize on their opportunities afforded them through simplification, to more effectively control the expenditures for which they are held responsible. Several of the larger manufacturing corporations, and the railroads especially, have already made substantial savings through simplification. Its application is now spreading among the smaller firms, also among city, county, and state purchasing agents.

To Survey Purchasing Agents On Invoice Forms

A survey among members of the National Association of Purchasing Agents to determine the degree of adherence accorded simplification of commercial forms, and what per cent of invoice forms now in use conform with the simplified arrangement, has been instituted by Ray M. Hudson, assistant director in charge of the commercial standards group of the Bureau of Standards, U. S. Department of Commerce.

In discussing this phase of the simplification movement, Mr. Hudson pointed out that an investigation, concluded by a special committee of nine department heads of the Great Northern Railroad, had resulted in a $55,000 reduction in that road's expenditures for stationery. This committee, which carried on its investigation for eighteen months, examined 3,689 forms of stationery. Of this number, 379 were found to be obsolete; 651 were consolidated, and 1,980 were revised, leaving only 679 forms which were not altered. Savings were made by standardizing sizes, reducing varieties and cheapening the quality of the paper stock wherever possible.

The Western Maryland Railway, by standardizing its stationery and printing, reduced the stationery and printing bill of the road from $110,000 to $65,000 per year. As the returns from the survey being made are received from the membership of the National Association of Purchasing Agents, the Division of Simplified Practice expects to release a monthly tabulation.

Trend of Profits Upward

Profits of general business corporations for the first six months are somewhat higher than in the first six months of 1927, according to the National Bank of Commerce, New York, N. Y.

The statements now available for 310 companies show this increase to be 8 per cent. It is reduced to 6 per cent, however, when the earnings of the United States Steel and the General Motors Corporations are deducted. Of these 310 companies, 190 have had larger incomes in the past half-year than in the similar period a year ago, while 120 reported smaller earnings. Substantial increases occurred in the copper, motor and motor accessory fields and in the general miscellaneous group. Although only a small number of returns are available in the leather and rayon groups, sizable gains are also indicated in these industries.

That the second quarter of the current year registered marked improvement over the first is indicated by a comparison of each quarter with the corresponding period of 1927. The earnings of 213 industrial companies exclusive of United States Steel and General Motors were the same as last year in the first quarter, whereas in the second quarter there was an increase of 19 per cent. The number of companies reporting increases of income over the same period of 1927 was larger in the second quarter of this year than in the first.

Earnings of 32 public utility corporations during the first six months this year were 12 per cent greater than in the first half of 1927. Excluding the American Telephone & Telegraph Company, whose profits showed a 7 per cent gain, the increase of the 31 companies is raised to 16 per cent. The continued upward trend is disclosed by a comparison of the first and second quarter earnings with the corresponding periods a year ago. The second quarter's gain over 1927 was 13 per cent, compared with a gain of 11 per cent in the first quarter.

TRADE NOTES

F. C. Millhoff, formerly general sales manager of the Miller Rubber Company, New York, N. Y.; for sixteen years, and more recently manager of Car & Truck Manufacturers Sales, announced his resignation from the company to take a long needed rest before announcing his new plans.

Universal Crane Company has removed its general sales office from Cleveland, Ohio, to 28th and Fulton Streets, Lorain, Ohio.

Turpentine (bbl. lots), N. Y., per gal	$0.5625

National Electrical Manufacturers Association, New York, N. Y., will hold its fall meeting during the week of Oct. 29, 1928, at Briarcliff Lodge, Briarcliff, N. Y.

Linde Air Products Company, New York, N. Y., has recently completed four new plants, one at 631 South Seventeenth Street, Harrisburg, Pa., another plant at Seventeenth and West Lawrence Streets, Allentown, Pa., another at Shreveport, La., located at Foster and Thomas Streets, and another at First Avenue and B Street, South Charleston, W. Va.

Wagner Electric Corporation, St. Louis, Mo., announces the addition of Charles J. Arthur to its Philadelphia office as a salesman. Mr. Arthur was until recently sales engineer for the A. R. Amos, Jr. Company of Philadelphia.

Perfex Corporation, Milwaukee, Wis., announces that at the last directors meeting, Roger Birdsell, sales manager of the corporation, was elected to the directorate and made vice-president.

Nelson R. Brownyer, engineer-railway department of the Timken-Detroit Axle Company, Detroit, Mich., is now in Europe studying electric railway drives, brakes and other equipment in use in England and on the continent. Mr. Brownyer joined the Timken-Detroit Axle Company in November, 1926, and has been working since that time on the development of the Timken worm drive.

Eustace C. Soares, manufacturing and markets editor of *Electrical World*, resigned his position Sept. 1 to become an officer of the R. B. Engineering Corporation, 11 West 42nd Street, New York, N. Y. Mr. Soares has served on the editorial staff of *Electrical World* for nearly five years and is now returning to old associates in the consulting engineering field.

ADVERTISING LITERATURE

J. F. Prettyman & Sons wood preserving plant, Charleston, S. C., has issued four bulletins entitled, "The Foundation of Steady Service, Prettyman Creosoted Poles," "Strength-Toughness-Long Life-Prettyman Creosoted Cross Ties," "What Every Bridge Builder Should Know," and "From Order to Delivery in Sixteen Hours."

Superheater Company, New York, has issued a booklet entitled, "Steam Tables." This booklet gives the properties of saturated and superheated steam from 0.0886 to 3,300 lb. absolute pressure and includes a convenient heat-entropy diagram.

Pennrich & Company, New York, has published a booklet descriptive of Torfoleum, a heat insulating material which is at present manufactured in Europe and stocked in this country.

Selling *Better Transportation* Better

"SELLING BETTER TRANSPORTATION BETTER" expresses the keynote of the industry's present thinking. Last year the theme was "Meeting the Demand for Better Transportation." Two years ago it was "Making Transportation Pay." In this development of thought there has been progress from the general discussion of difficulties to the formulation of specific suggestions for overcoming them. Long since, the industry recognized the *why* of its difficulties. Today, it understands thoroughly the need for improvement of its service. It is now trying to learn *how* to meet the changed conditions which it has been called upon to face.

Theoretically a monopoly, and subject to regulation as a monopoly, transportation today, because of the widespread ownership of the automobile, is a highly competitive business. The industry has come to realize, therefore, the need for adopting the methods of competitive merchandising to the sale of its product—transportation. This process divides itself into two principal phases; first, continuation of the effort to develop and improve its service, and, second, more intensive promotion of the use of public transportation through modern selling methods.

Improved service is made up of many elements. New cars alone are not the only requirement. Smooth track alone will not suffice. Regularity, speed and frequency of service, though exceedingly important in themselves, must be accompanied by convenience, comfort and courtesy. All these factors and many more go to make up the character of the service; they are necessary in the development of better transportation. Each of them, furthermore, may be broken down into many parts. It is not enough to have new cars; they must be better cars—cars that will look better, ride better, run quieter, accelerate faster, stop smoother, and cost less to operate.

SIMILARLY, better selling comprises the collective results of several forms of activity, all more or less new to the public transportation business. It is not enough that employees be well trained in handling equipment and in the efficient discharge of their routine duties; they must be trained, as well, in dealing with the public on a new

Digitized by Google

basis. Then there is the price at which the product is sold. This is recognized among transportation men as an increasingly important factor in selling.

The need for a really scientific fare structure is occupying serious attention. Finally comes market analysis, the most recent question to be injected into this discussion. It involves the determination of the travel habits of present patrons, and of those who do not use public transportation service. Its purpose is to discover the reasons for loss of business, the potential sources of new business, and the measures needed to increase the number of riders on public transportation vehicles.

DESPITE the growing realization on their part of the need for meeting automobile competition by improvement of service and merchandising effort, transportation men have as yet failed fully to recognize the great opportunity which is opened to them by growing traffic congestion. To sit back while the community vainly struggles to find a solution, or merely to foster measures which will restrict the individual vehicle and force more people to use public transportation service is a negative attitude. And a negative attitude usually is harmful.

Intelligent merchandising dictates that a definite effort be made to assist public officials in working out sound transportation and traffic policies in the best interest of the present and future development of their communities. The suggestion of doing away with street cars on the ground that they are out of date and interfere with other traffic comes mostly in localities where the management has failed to recognize the need for keeping pace with the times or where it has been hopelessly handicapped by arbitrary fare restrictions, by unwise traffic regulations or by a hostile public.

APPROXIMATELY 75 per cent of those who travel in the larger centers of population still use public transportation service. This proportion decreases as the size of the community decreases, until it reaches about 50 per cent in the smaller cities. The variation is attributable to the relatively greater inadequacy of the street space in the large community compared with the smaller city. In the larger cities, also, fewer people can afford to use individual cars. Inadequacy of available street space has made the way easy for bringing to the attention of the public and of public officials the necessity for giving preference to the majority who travel in public conveyances. Even the retail merchant, whose primary interest is that of making it convenient for the greatest possible number of people to reach his store, can be brought to realize the need for the restriction of parking. The parked car in congested areas keeps away more customers than it brings. And this has been abundantly proved to the retail merchant whenever he has consented to an impartial study of the facts.

Transportation men know that it would be fatal to attempt to dispense with the public transportation vehicle. They know that street widening is enormously expensive. They know that the provision of additional space for individual vehicles serves only comparatively few people at excessive cost to the city. Too few of them, however, have succeeded in improving the quality of their service sufficiently to increase its popularity. But by that means only may they expect to win public approval for those measures that are necessary to permit public transportation to fill its rightful place in urban life.

PUBLIC recognition of the economic advantages to the community of organized mass travel will follow only as the companies succeed in the present effort to make their service attractive and popular. To that end, this issue of the JOURNAL is dedicated. It presents a series of articles which search deeply into the many phases of local transportation management and operation. They are written by men who have helped to bring about the changes in methods which have made it possible for many companies successfully to meet new conditions. Better selling and better service are approached from many angles—teamwork, safety, convenience, friendliness, advertising, car improvement, traffic regulation, use of the bus, the trackless trolley, rate making, track, power and maintenance—all considered from the standpoint of building revenue. The human as well as the material factors in transportation service are considered.

Taken as a whole, this issue of ELECTRIC RAILWAY JOURNAL represents a climax to several years of rapid change in the point of view of transportation executives. Its purpose is to help the men of the industry to broaden their conception of the part played by each department in the task of selling better transportation better.

The Need for

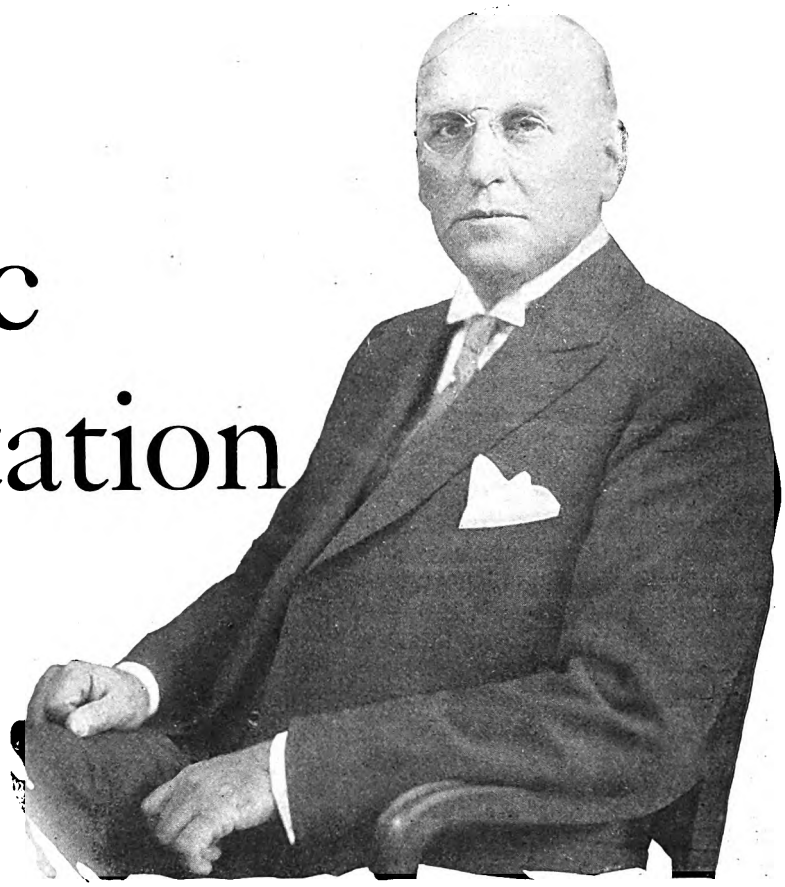
Public Transportation

Is Assured

BY

R. P. STEVENS

President
American Electric Railway Association



R. P. Stevens

"WHERE there is a will there is a way" was never more clearly demonstrated than in the local transportation industry at the present time. The immediate past was more or less shrouded in uncertainty and we have been groping in the dark, due to lack of experience in dealing with the fundamental changes in the conditions which we have been called upon to meet. These changes have followed a long succession of economic problems that all but engulfed us in an avalanche of seemingly insurmountable difficulties.

We had permitted ourselves complacently to accept the principle of a fixed rate of fare. We had with short foresight stood by while more and more arbitrary and inflexible provisions were written into street railway franchises. We failed to see the danger in the steady spread of city boundaries, with a resulting increased average length of lines for a given fare. We kept to our own councils; we gave little attention to the public except to make sure it paid its fare, and we assumed that with the right to lay our tracks in the street we had acquired competition-free assurance of regular dividends without the need for any further attention to the public's views or opinions. All of these dangerous conditions were permitted to grow up in our industry. We failed to recognize the difficulties ahead until we found ourselves bound by them when we were called upon suddenly to face skyrocketing labor and material costs and increased taxes. Then, when we turned to the public for relief, we discovered, all too late, the high cost of our former aloofness.

Then what did we do? We trimmed costs and then trimmed them again to meet the rise in every column of our books except income. We curtailed service and permitted our properties to depreciate. We began to talk poor and to look poor, while again failing to recognize another and an even greater menace growing all about us—competition! The automobile grew from a mechanical novelty to a practical, low-priced, fleet and attractive means of transportation. Before we realized its full possibilities we found ourselves, already impoverished and handicapped by awkward and inflexible franchises, beset by a literal swarm of irresponsible jitneys. No sooner had some relief been obtained from that plague, than the jitney grew to a more pretentious vehicle and took form as a bus.

Is there any wonder that many electric railways found themselves in desperate circumstances and that some executives were bewildered in contemplating the future? The most impressive fact that stands out of all this is that the industry survived at all! Only an industry which supplies

EXPERIENCE during the past decade has proved that there is an undiminished need for public transportation. Many obstacles that seemed insurmountable have been overcome. There remains ahead the task of meeting with more attractive service and more intensive merchandising the changed conditions that have been brought about by the private automobile.

Digitized by Google

a basic necessity to the life of the community could have survived this unprecedented and cumulative series of economic and operating difficulties. The outline here suggested falls far short of reciting all of them; street traffic congestion added another trouble and the loss of credit in turn made physical improvement of run-down properties extremely difficult.

But despite all of these things, what is the situation today? The industry has faced about. It has stopped pleading poverty and has started to merchandise the value of its service. It is gradually re-winning public confidence and is endeavoring to adjust its service and the point of view of its personnel to meet the changed conditions as it finds them. The fixed 5-cent fare has been shaken off in practically all important cities except New York, which was also one of the last to abandon horse cars. Service-at-cost franchises with indeterminate terms are rapidly taking the place of former inflexible grants that strangled development and adjustment to changed conditions. The jitney is practically extinct and the bus has become a complement to the industry instead of a destructive competitor. All of this has taken place within only a few years, and yet there are some who question the future of the local transportation industry!

IS THERE any wonder that many electric railways found themselves in desperate circumstances and that some executives were bewildered in contemplating the future? The most impressive fact that stands out of all this is that the industry survived at all! Only an industry which supplies a basic necessity to the life of the community could have survived this unprecedented, cumulative series of economic and operating difficulties.

This issue of the JOURNAL is devoted to the general subject of "Selling better transportation better." That is a happy way of expressing the great pressing job before the industry today; the final phase of its metamorphosis that must be worked out before the full significance of the great change which is taking place in the status of the industry will become apparent to the casual observer. The job is only started when street cars are made available to the public, the fare collected and a proper accounting made. The immediate task before us is to provide better facilities than we have ever had before. The day has passed when we can afford to let the public take the entire initiative in using these facilities.

Today the local transportation industry must go much further. It must offer a service that will attract passengers in competition with other forms of transportation and that will deliver them to their destinations under conditions that will cause them to want to use our service again whenever they have occasion to travel and even when they have a choice of several agencies. We must go even further. The advantages of this service must be kept constantly before the public, through every available means of contact; through the man on the platform, through advertising and other forms of sales promotion, and through the part which the transportation company plays and the reputation which it establishes in the community.

We are in the midst of an intense merchandising era. On every hand, business is engaged in creating a demand for its products. In the past we assumed that we were immune to the need for stimulating business. We were content to accept only that patronage which was offered voluntarily or because certain people had no other means of getting about. Consequently our patronage became limited largely to necessity riding only. While the habit of moving about grew from year to year with the improvement of the automobile, our most profitable class of business—that in the non-rush periods—dwindled, while rush-hour volume grew with increases in population and industrial activity. Continuation of this trend over several years gives us now an exceedingly inefficient load factor and an income overly sensitive to slight changes in industrial activity.

Summarized then, there is no mystery about the causes of the difficulties under which the local transportation industry has been laboring during this past decade. Many of these causes, particularly the fundamental difficulties of inflexible fares and franchises, public distrust and unfriendliness, have been removed. The industry is on a more secure foundation than ever before and today faces the one great remaining problem of adjusting its point of view and its methods to meet the changed conditions under which it is required to do business. The essential nature of the service rendered by the street car has been repeatedly demonstrated, and community after community that was misled into the assumption that the usefulness of the electric railway was ended, has been glad to make many concessions to get street cars back again.

There is a very definite and pronouncedly favorable trend on the part of the public toward electric railway transportation. The growing problem of street congestion is causing people to see more clearly the economic importance of the part played by public transportation facilities. Witness the situation in Cincinnati, for instance, where street car traffic increased 7,500,000 passengers in 1927, compared with 1926. Witness conditions in almost any medium-size city, where the newspapers a few years ago were declaring that the day of the street car was gone, but where they now are objecting to the discontinuance or curtailment of street car service and are declaring, quite properly, that the services rendered by the electric railways are necessary, essential, indispensable.

It is our responsibility to keep the facts before the public. We can expect the necessary co-operation in working out the current problems of local transportation only when the public has a full understanding of the situation. We can expect co-operation from public officials only if it is backed by the people themselves. But there are examples from the stern school of experience that give increasing evidence of the secure foundation of public necessity upon which our industry rests. Phoenix, Ariz., with 26,000 population found that electric railway transportation could not be dispensed with. After having failed to understand the need for co-operation with a private company, the city itself was forced to provide this service when the private company gave up the effort to win out under impossible conditions. Ashtabula, Ohio; Athol, Mass., with only 10,000 people; Greenfield in the same state, with a population of only 15,500, and many other cities furnish examples not only of medium-size communities, but of smaller cities as well, that after trying to get along without street railway transportation

Digitized by Google

were ultimately compelled to provide these facilities themselves at an increased cost.

The trend toward higher fares has been definite, but that is only one of the ways in which communities can and will co-operate to permit us to give better service, providing that we do our full part in the improvement of facilities and in putting the facts of the situation clearly before the people. Many forms of indirect taxes on the car rider, and many unnecessary service requirements founded upon customs and practices of the past can and should be eliminated.

So it seems to me that there is good ground for optimism regarding the outlook for the local transportation industry. There is, however, no ground for self-complacency or for unwise over-confidence. The automobile has taught the public that it is possible to move swiftly, comfortably and conveniently, and a public accustomed to that kind of transportation will not accept the brand of public transportation that we were giving a decade ago, and that some of us are still giving today. That is why the industry is today concentrating its primary attention upon modernization, not alone of equipment, but of its point of view and its methods of conducting its business.

THE improvement of our product and application of merchandising methods are the two great problems before us today. We have much to learn, but the will to learn is half the battle. I am satisfied that the industry has the necessary determination.—I look forward to its future, therefore, with the utmost confidence.

We have a better balanced and practical view of the bus question. We have stopped deluding ourselves about a mystic rubber urge, and are figuring closely what business we should attempt to handle with buses and where the street car is more advantageous. The bus no longer represents a serious problem or a threat to existing local transportation. We know more about its limitations as well as its advantages than we did even a couple of years ago. It has been adequately demonstrated that this new vehicle serves best and functions most advantageously when it is co-ordinated with existing transportation agencies.

All of this is in the direction of progress, and it all places our industry upon a more secure foundation than it has been in years. The path ahead is clearer than it has been at any time within a decade, and we have found the way through or over the many obstacles that seemed for a time to be insurmountable and that threatened destruction. The continued need for public transportation has been demonstrated by its ability to surmount these many difficulties which would long ago have completely wrecked a less essential industry. But though the path ahead is clearer it leads through the strange fields of competition and merchandising. The industry faces the very definite responsibility of fitting itself to meet these new conditions.

We must go further than merely to provide what in our opinion is good service. We must provide a class of service that will attract patronage and hold its own in attractiveness, price considered, of course, in comparison with other available forms of transportation. That means that we must improve the appearance and performance of our equipment. It has been said many times that our cars constitute our place of business, and that the public will not permanently tolerate anything which has the earmarks of obsolescence. It may be true that many of our existing cars are sturdy and serviceable. But by comparison with sleek, quiet, racy-looking automobiles they are out of style and reminiscent of pre-flapper days. Being out of date the public considers them no longer useful. Therefore an immediate task before us is to build modern-looking cars. In carrying out that task we have been slow. It is to that job therefore that we must bend our energy if we are to take full advantage of the opportunity that exists for the industry.

During the past two years much has been accomplished in changing our conception of the proper appearance and performance of a street car. Many of the designs that we considered freakish at last year's convention seem quite the thing today, and we are looking forward to still further departures from our old ideas at this coming convention. This is one of the most promising of the trends during the year. In some instances operating companies, impatient to find a type of car that would meet the demand of the times, have taken the initiative in experimental work to find out the practical limitations in suggested new ideas.

The primary responsibility of equipment development rests with the manufacturers. But upon the operating companies there is an equal responsibility for encouraging and supporting this needed activity. There is reason to believe that the interest in new design ideas has so slowed up buying of equipment of more conventional and proved designs as to have brought about a very critical trade situation which threatens to check the very developments in which we are interested. Replacements of obsolete and inefficient cars are lagging. The number of new cars purchased each year has been steadily decreasing for several years. The industry is paying a heavy price in excessive operating costs for cars that have long ago outlived their economic usefulness. Properties that have proceeded with replacement of obsolete equipment, using cars of more or less conventional type, but of lighter weight, greater comfort, more efficient equipment and higher speed, have almost universally found the investment more than justified, and have effected savings that prove that the rest of the industry is paying a heavy price for its delay in car buying. This year the committee on electric railway finance has opened the door toward easier terms for new car purchases so that cars may be financed out of earnings and may be paid for out of the actual savings which they effect. It is imperative that we proceed with the improvement of equipment in service. A serious situation will be created if we continue to postpone needed replacements.

Just as we are still in the process of working out types of cars to meet the changed conditions under which our business must be conducted, so also are we endeavoring to revise our methods of conducting our business by applying sales promotion ideas to increase patronage. This improvement of our product and application of merchandising methods are the two great problems before us today. We have much to learn, but the will to learn is half the battle. I am satisfied that the industry has the necessary determination. It has in the past mastered far more difficult and more discouraging problems and has survived. I look forward to its future, therefore, with the utmost confidence.

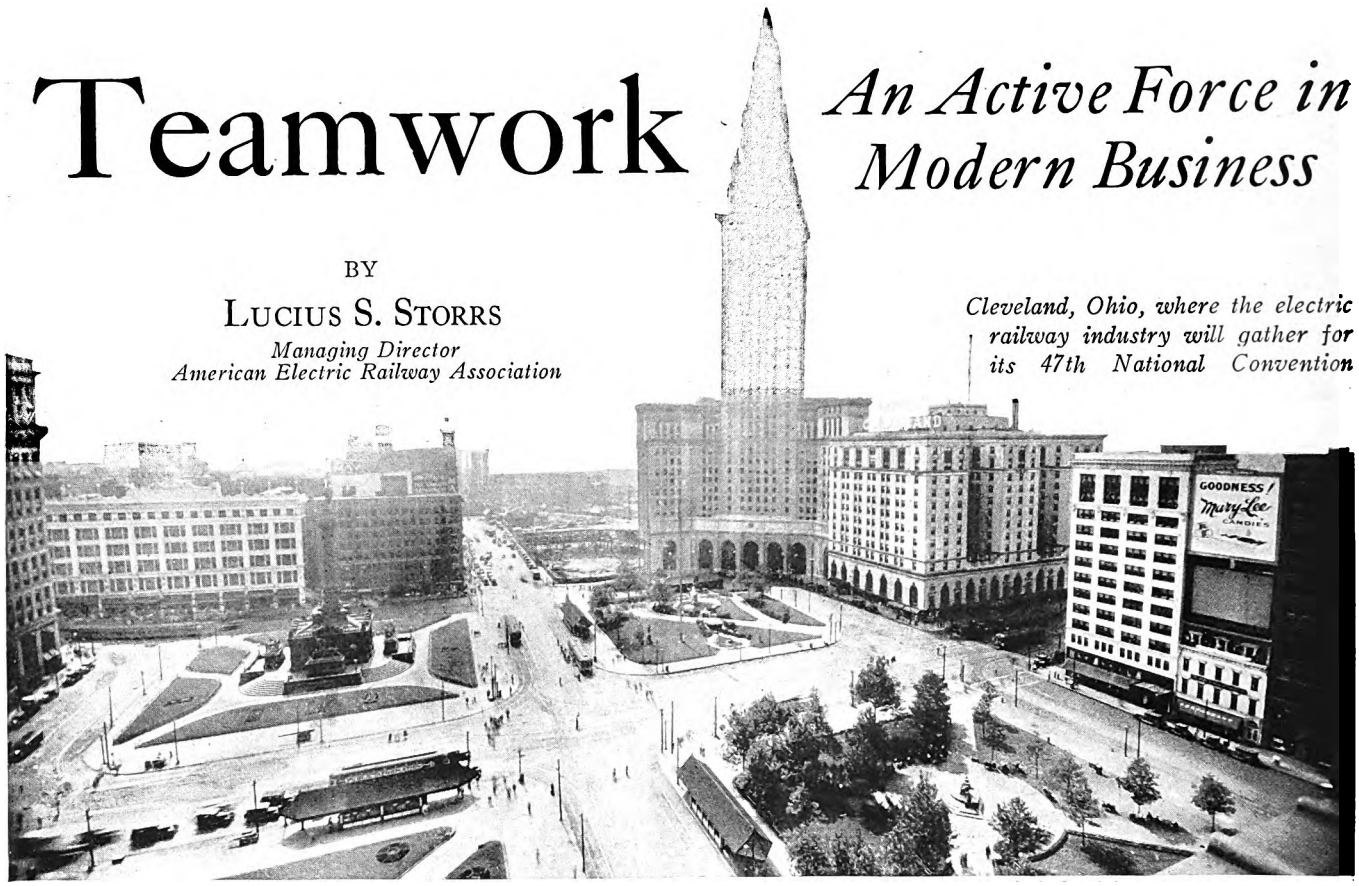
Teamwork

An Active Force in Modern Business

BY

LUCIUS S. STORRS

Managing Director
American Electric Railway Association



Cleveland, Ohio, where the electric railway industry will gather for its 47th National Convention

Steering out of familiar channels into the wide expanse of merchandising activity, the transportation industry has greater need than ever before for collective thinking

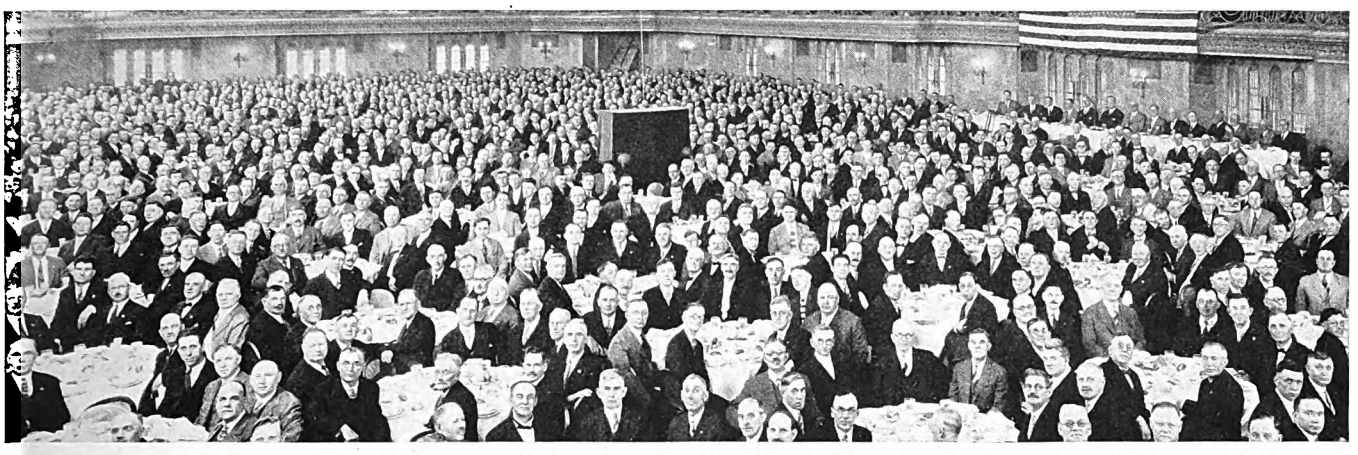
IN BUSINESS today, as never before, the power of teamwork is being recognized. American business rapidly is passing completely out of its former status, where the effort of a single individual determined the success or failure of a given enterprise. The vast power of organized effort has been demonstrated in America, and the rapid strides which have made American enterprise and business accomplishment the wonder of the entire world are entirely attributable to the substitution of organized effort for individual endeavor. Even in the last great stronghold of individual enterprise—retail trade—the chain store has become established. It represents the final extension of the organization for the individual and completes the cycle throughout the entire range of raw material production, manufacture and distribution.

American business today is entering or has entered upon what might be considered its second great phase of development. The first phase, that outlined above, might be termed the substitution of organization for individual enterprise in a particular business undertaking. There the power of the team over the individual has been more than demonstrated. The second great phase is represented by teamwork within an entire industry. Just as a well-organized team has shown its ability to outdistance the individual in any given business enterprise, so can the various companies within an industry find themselves in a better position to advance their own interests, by associating themselves for the advancement of the industry of which they are a part. Here again, teamwork —the most vital force in American business today—is showing its power.

The individual electric railway management finds itself at this stage of the industry's progress emerging from a decade of heroic struggle against what seemed to many to be overpowering odds. Some of the difficulties which arose and some of the problems that had to be met seem to have been almost inevitable, growing out of changed economic conditions, and beyond the power of human foresight to anticipate. But the burden which each management was called upon to carry individually could probably have been relieved had there been closer contacts between individual groups within the industry and a greater tendency to profit from the other fellow's experience, and to co-operate in attacking jointly problems common to many individual companies. Situations which developed first in one section of the country were of little interest to many railways in other sections until they themselves were engulfed in a great common situation which had swept the entire country. A little more co-operative thinking, a little more teamwork, in the early stages of some of these problems might have saved many electric railways untold cost and difficulty later. In some instances managements have been content to attack some of these situations individually when they were encountered, instead of availing themselves of the experience of other railways. Certain franchise situations, rate structure cases, the jitney, the one-man car and the motor bus are examples of the many common problems in which greater collective effort and more teamwork would have worked to the advantage of the entire industry.

All this is not to say or even to intimate that the industry has failed entirely to get together for the attack of common problems or for the exchange of information. In fact, one of the most constructive tendencies of recent years has been the growing inclination on the part

Digitized by Google



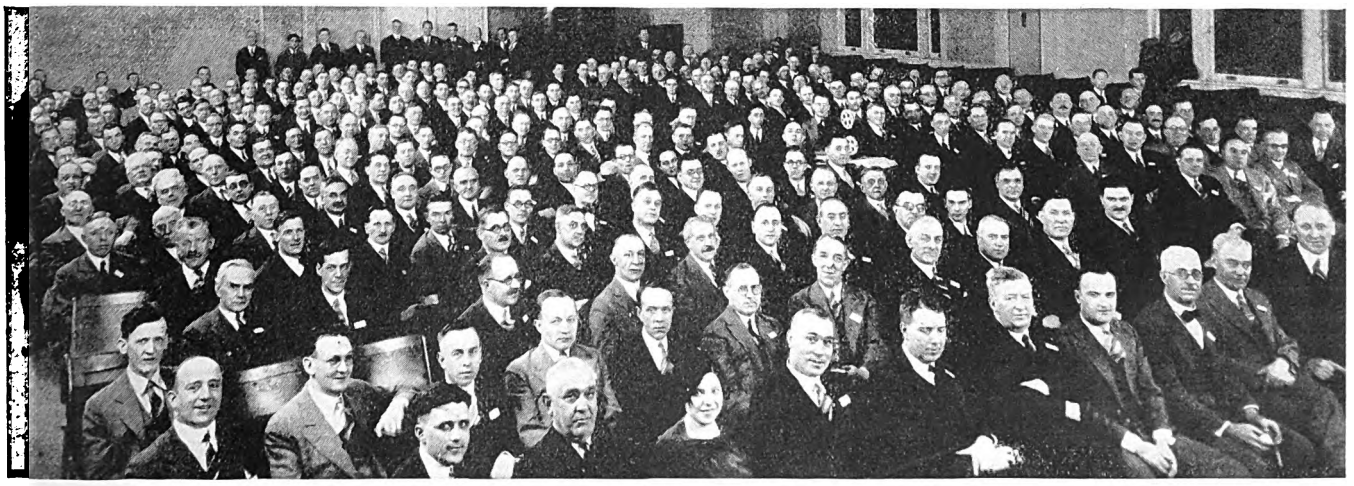
Accident prevention banquet of the Chicago Surface Lines, held at the Hotel Stevens on May 3 of this year. Company gatherings of this kind create and further the spirit of teamwork, so necessary among all departments and all ranks

of progressive managements not only to send their principal executives to visit other companies for the comparison of practices, and to committee meetings and conventions for the interchange of ideas, but also to send department heads and minor executives beyond the confines of their individual jobs to get a fresh point of view and a broader perspective of their work. The growth of interest in the annual convention, the increased participation in committee work and the development of sectional associations and organizations directed to the improvement of the work of a given department, like the Association of Equipment Men, Southern Properties, are all evidences of this greater interest in getting a broader point of view, in the exchange of experience and in the collective attack on common problems.

Teamwork, which has been so vital a force in all business as we know it today, is needed to a greater degree than ever in the transportation industry. Our industry might well adopt as its own the slogan of the last annual meeting of the National Chamber of Commerce in Washington—"Teamwork for Prosperity." We need more teamwork, not only among the electric railways, but also among the manufacturers serving the industry and between the operator and the manufacturer. We need a keener realization that promotion of the industry's welfare promotes the interest of every transportation company and of every manufacturer selling to the field. We need a freer exchange of ideas and a franker discussion of conditions within the industry that militate against its progress. We need greater participation by individual managements in the collective attack which is made through the association on national problems, which though they affect every operator and every manufacturer, are so broad in their scope that they cannot be coped with effectively by any single company.

If managements do not show their interest in the improvement of cars and buses through whole-hearted co-operation in experimental work, developments direly needed by the entire industry are bound to lag. Unless railways in need of new equipment proceed with purchases instead of waiting the executives of the manufacturing enterprises will find their volume of business in the electric railway field shrinking to the danger point and will draw tight the purse strings on the very developments which the industry needs so badly and upon which all other service improvement and merchandising activity is contingent. On the other hand, those manufacturers who are content to sit back while the other fellow spends the money and carries the burden, are following a policy inimical to the industry's best interests and to their own part in its future progress. They face an inevitable loss in recognition, prestige and volume of business in the field.

More frank discussion of the conditions under which business is carried on within the industry is needed. Our national association has for many years been in the happy position of recognizing the manufacturer as an active part of the industry, with equal right to representation



Transportation companies serving more than 7,000,000 people in and near New York City are represented in the Metropolitan Section of the A.E.R.A. The meetings of this section are made interesting and valuable by carefully-prepared programs

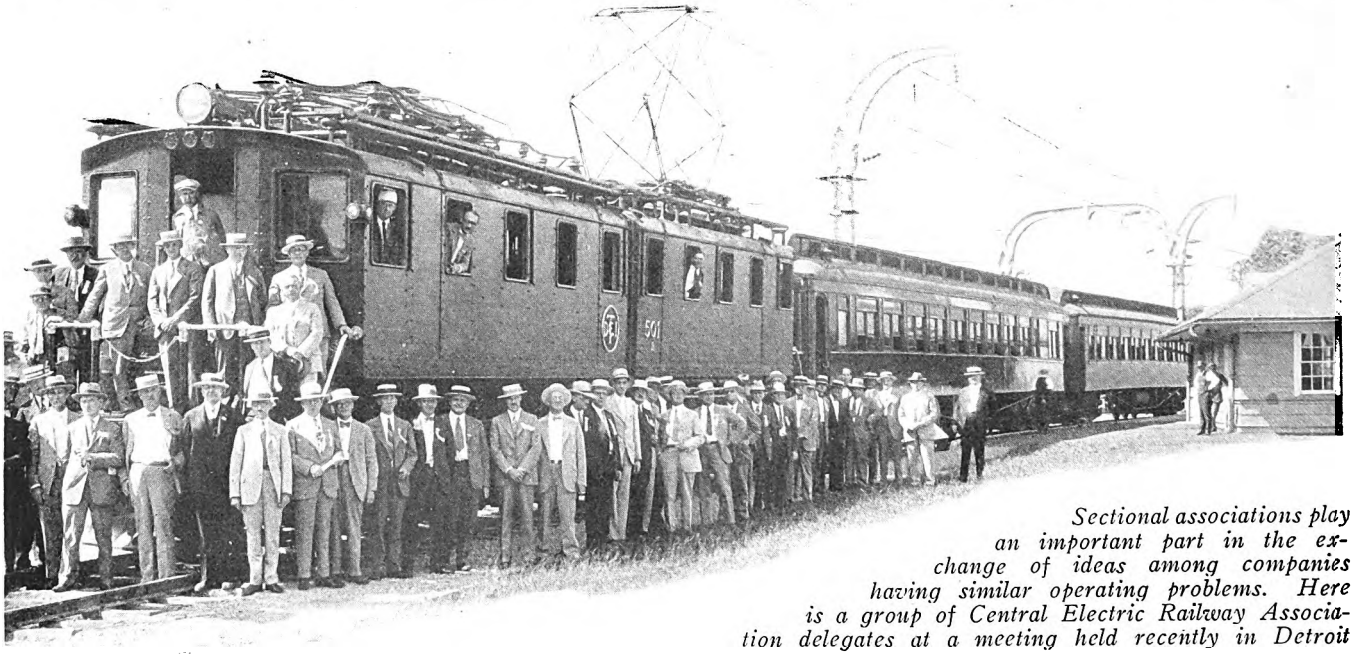
Digitized by Google

on its executive committee. This is unquestionably a wise policy and makes it possible for the kind of co-operation and teamwork which is needed. But there has been an absence of the frank discussion of trade conditions within the industry that concern the manufacturer as the seller of products which the operators buy and must have. No one manufacturer can afford to jeopardize his trade relations by taking issue with practices of his customers, even though he knows them to be inimical to the industry's best interests. But through collective action in committees and through the association's executive committee the manufacturer has a voice and should utilize the opportunity which is given to help in pointing out the way toward progress.

Considering now the work of the American Association and its affiliated bodies, we have all of the organization and mechanism needed for effective teamwork. Great strides in the solution of various phases of the transportation problem have been made by individual railways, but few, if any, of them have adopted all the measures which have proved effective in meeting present-day conditions. In other words, great progress has been made throughout the transportation industry in working out ways to increase revenue or reduce costs, but the adoption of ideas which have proved successful on one property to the many properties where they would likewise prove beneficial has at best been slow. Perhaps local pride is in some instances accountable. But one needs only to peruse the pages of the industry's technical press, or the briefs filed annually in the Coffin Award contest, to realize the great inertia which holds back the application of improvement methods which have already proved successful on one or more properties. It is through contacts in association committees, discussions at meetings and conventions that a strong stimulus toward the spread of progressive practices is obtained.

The problems before the industry have been so complex and so baffling that many minds are needed to find the solutions. Association activity provides the groundwork for this collective thinking. But it goes further. Behind the day-to-day problems of the individual property are broad economic trends of which the conditions encountered on the individual property are merely a phase. Analysis of the statistics of the industry as a whole provides a reference point from which to judge the trends in any given locality. The collection and analysis of these general statistics and the study of these broad economic trends are usually beyond the resources of the individual management, pressed as it is with the mass of problems incident to daily operation. Group activity and teamwork make it possible to follow these broad economic changes and to make the information available for the guidance of each individual management.

There is another element in teamwork that is sometimes overlooked, and that is the spirit and courage that is developed through association in a mutual enterprise. In athletics, team spirit, pride and courage frequently achieve amazing results under seemingly impossible handicaps. Likewise this is true in business. In the local transportation business changes have been coming so fast and the departures which are demanded from more than 40 years of precedent are so wide and in some instances so radical that collective action, the power of example and the spirit of teamwork engendered by mutual interest in a great common undertaking, are essential to effective progress.



Sectional associations play an important part in the exchange of ideas among companies having similar operating problems. Here is a group of Central Electric Railway Association delegates at a meeting held recently in Detroit

Now that the industry is committed to the wide and—to the transportation man—uncharted sea of merchandising, the need for teamwork is greater than ever before. We are undergoing a complete change in point of view and in our conception of the nature of the business in which we are engaged. As we steer our course out of the familiar channels of operation into the wide expanse of merchandising activity we have need for greater collective thinking than ever before; need for the freer exchange of experience; for greater co-operation and for more of the spirit of teamwork in the attack on great common problems. Let us take this theme of "Selling Better Transportation Better" as our business objective. Let us concentrate on understanding better the concrete application to the transportation business of the many measures which it demands in our daily operations. Then let us unite in a great co-operative drive toward the solution of our common problems, and all the burdens of the past or the future cannot prevent us from achieving for our industry its rightful place in the sun.

This sign, at the Michigan Central Station in Detroit, calls the attention of all persons leaving the station to the direct service to the hotel district given by the street cars and buses

Smoothing the Way for the RIDE PROSPECT

STIMULATING signs, clear route indications, timetables, loading platforms and convenient fare schedules are among the many car and bus rider aids that assist in selling the service

"ONE-THIRD of the traffic is the daily, compulsory movement between home and job; one-third comes from fairly frequent shoppers and theater-goers; the remaining third is 'the movement of the human anthill,' that spur-of-the-moment travel which is made by the occasion or the weather." Frank Pick, managing director of the London Underground Railways, so summarized conditions in a paper on London traffic some years ago.

Research by experts in American travel data, indicates that not much more than one-third of the travel in cities of 100,000 or greater is of the compulsory kind. This deduction comes from studies of the weekly pass and permit card, both of which are intended to segregate the patrons who have a daily riding habit as a matter of necessity.

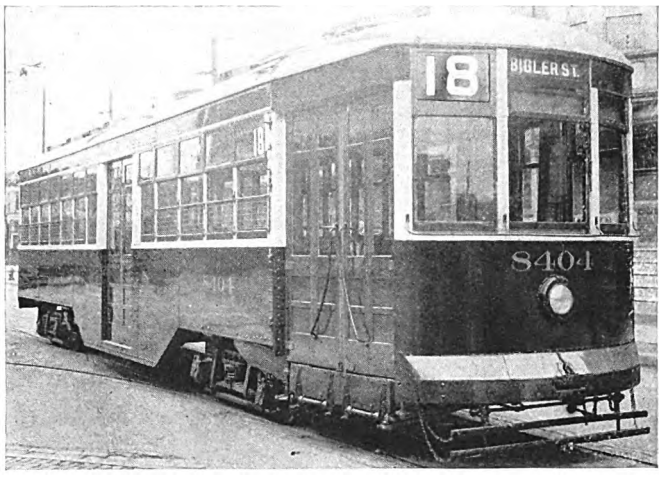
The casual or unstable proportion of our patronage averages between 20 and 30 per cent of the total, so it is evident that we have a large dividend-meaning fraction to deal with. These are the people who need our service least, and therefore require persuasion most. The regular rider may know all about the service, but not so with the auto-owning woman who hasn't been on the trolley for weeks and who is indignantly unaware of the fact that blue-front cars load at the front or that the route marker for the Gimlet Avenue line is an "E" instead of the expected "G." Why should we expect our arbitrary designations to remain in the memory of a public distracted by new sensations every day?

Let us analyze briefly what means can be taken and are being taken on at least some properties to smooth the way for the ride prospect.

How to Reach a Car

If he is a stranger arriving by railroad, his first thought is how to reach the street car and which one will carry him to his destination. The first question may be answered by signs, as in Denver or Detroit. The Denver

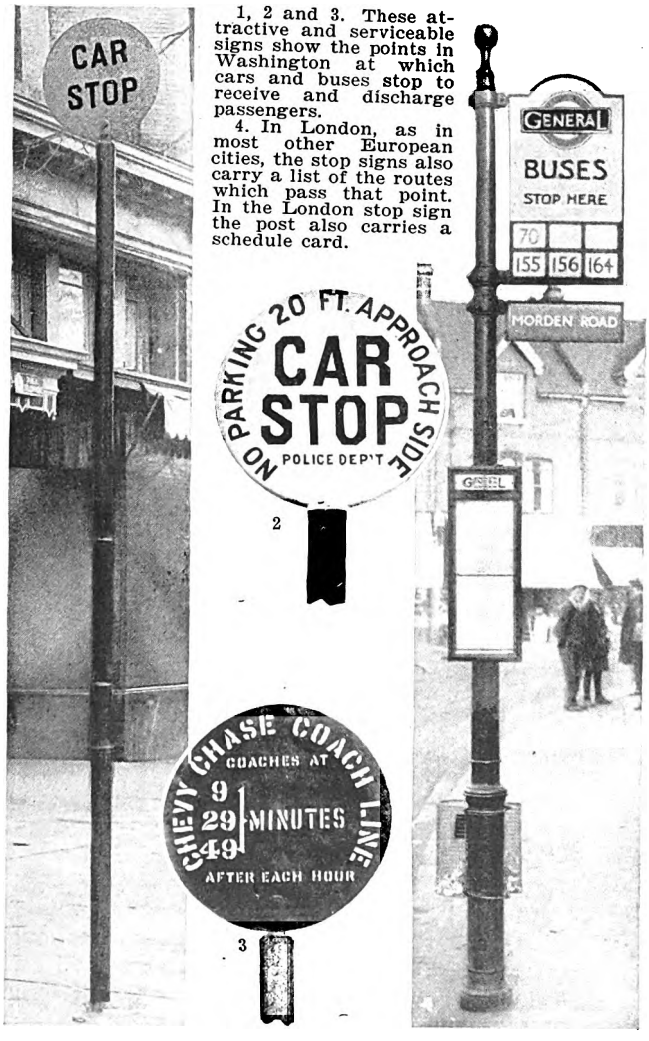
Digitized by Google



In Philadelphia the route name is carried at the top of the center vestibule sash, and the route number both on the side vestibule sash and in the upper side sash of the car

sign is 16x4 ft., and the lettering is of opal glass. It is placed at an elevation of 20 ft. directly in front of the passenger exit at the Union Station in Denver, a point from which street cars or tracks are not visible. The illustration on page 377 shows the sign at night when it is illuminated.

The Detroit signs illustrated are at the Michigan Central Depot. Here the signs "To the Street Cars" are posted where they first meet the eye of the traveler.



1, 2 and 3. These attractive and serviceable signs show the points in Washington at which cars and buses stop to receive and discharge passengers.

4. In London, as in most other European cities, the stop signs also carry a list of the routes which pass that point. In the London stop sign the post also carries a schedule card.

Then as he emerges from the station, his attention is attracted by the illuminated sign, an illustration of which is shown at the head of this article, which mentions the destinations of the cars and buses and the rates of fare on each.

Other companies find the possibilities of securing traffic at railroad stations so great as to warrant them in having a representative there to direct passengers to the cars, at least part of the time. This practice is followed at Allentown, Pa., by the Lehigh Valley Transit Company. As railroad passengers arrive the "greeter" calls

Notices in service and fare changes

Where cars have to be temporarily rerouted in Boston, they carry a short or diverted route sign like that shown at the left.

The poster at the right is a notice on fares carried in Baltimore cars for some time after a change in fare schedules.

their attention to the fact that such and such a street car is waiting outside. He also acts as a bureau of information, answering queries concerning the streets and principal buildings. He explains how to reach various points in the city by street car and also answers questions about interurban schedules.

Possibilities on the dissemination of schedule information by American electric railway companies have not been confined to signs and "greeters" at railroad stations. The more common means of supplying this information where it is most needed are information booths, maps and time-tables. The maps and time-tables can be posted or issued in small size and distributed.

Information booths have long been a feature at Kansas City, where the local authorities gave the railway company permission to place such booths on the sidewalks of downtown streets. Railway companies in some other cities install and man information booths at times when large numbers of strangers are expected in the city, as during conventions. This is the practice in Birmingham where the booth attendants wear neat uniforms with "Street Car Information" lettered in gold braid on their caps.

The plan of posting and issuing maps and giving out time-tables of the lines is followed more generally. Where large scale maps are used, they usually are framed and distributed to hotels for display in their lobbies, to railroads to be hung in the railroad stations, to the Y.M.C.A., Chamber of Commerce, etc., where they can be consulted. It is customary in such cases to mark in red the point where the map is displayed, so the stranger can quickly orient himself and then see where the nearest car line is which will take him to his destination.

Some Effective Ways of Informing Patrons of the Service

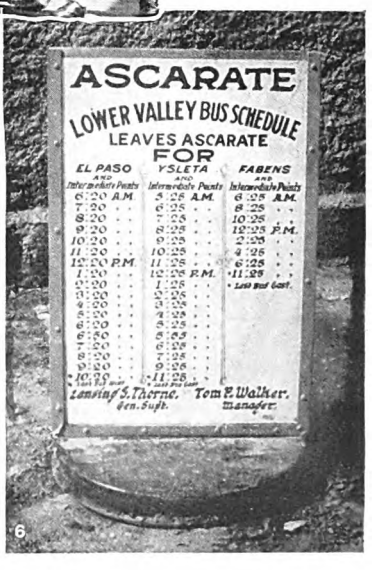
1. Strangers cannot miss seeing this sign at the Union Station at Denver.

2 and 3. These signs in Detroit, at the Michigan Central Station, point the way to the street cars.

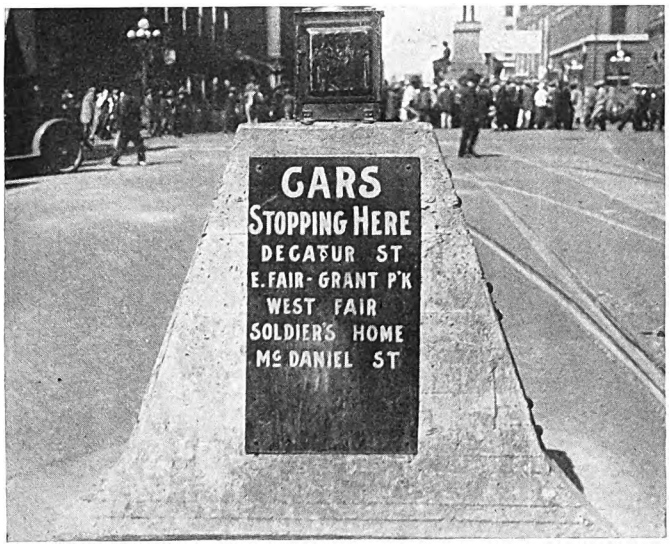
4. The "greeter" of the Lehigh Valley Transit Company is shown meeting visitors to Allentown and directing them which car to take.

5. The conductor of an Aberdeen bus turns the hands on a clock dial to indicate when the next bus leaves the terminal on that route for downtown.

6. A schedule board like this, posted at stopping points, is a great help to the bus or trolley passenger. It is usd in El Paso, Tex.



Digitized by Google



Atlanta combines a stop sign with a loading platform. The sign gives the names of the routes passing that point

Where the maps of the various routes are pocket-size for general distribution, usually a nominal charge is made for them to prevent waste by the public. Usually, also, the map is combined with other data, such as places of sight-seeing interest, schedules of the different routes, etc. Even in such a large city as Philadelphia, the local transportation company has issued maps of its routes at a nominal sum, the proceeds being turned over to the Employees' Helping Hand Fund. Washington, D. C., Montreal, Denver, El Paso, Tex. and Portland, Ore., are other cities which issue maps and data of this kind.

Car schedules may be posted at important points, as well as distributed in book form. The former practice is quite common in Germany and Austria. It is not used in this country to much extent, though it is a convenience which would be greatly appreciated by the traveler, especially on suburban railway and bus lines which run under long headways. An example is shown by the poster illustrated, used by the El Paso Electric Company, concerning the schedule of its Ascarate Valley buses. The schedule is on a large piece of sheet metal. A modification of this plan is that followed by the Houghton County Traction Company, whose posted schedules are in the form of large clock dials with pointers showing the passing times of the cars in minutes after the hour. Schedules of three different routes are shown on as many different dials. A variation of this plan is that illustrated in the view from Aberdeen, Scotland, where the conductor turns the hands placed in front of a clock face, to show when the next bus leaves the outer terminal.

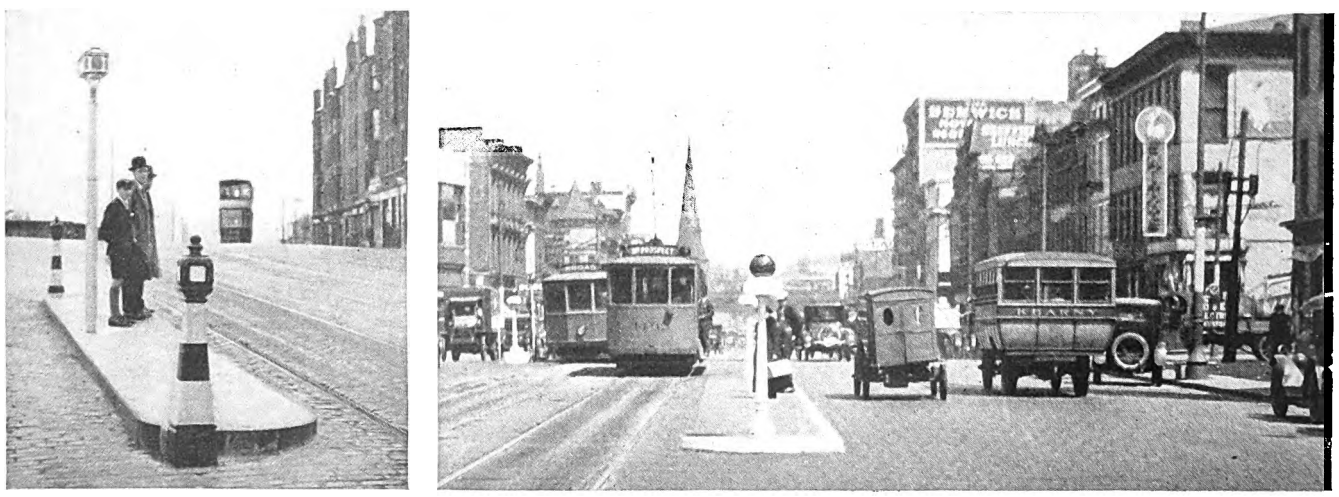
Information Concerning Stops

It may now be assumed that the intending passenger has reached the street on which the car he wants to board passes. He still needs to know where the car stops. If he is a stranger, he may not know whether it stops at the near or far corner, or it may skip some streets. It is to answer questions like these that the "car stop" sign is essential.

Car stop signs vary all the way from bands of white paint on a trolley pole to neatly lettered enameled signs. Some companies don't use any. Obviously, a conventional sign like a band on a pole may be of help to the resident who already has been initiated into its meaning, but it possesses no significance to the stranger. Of little more help are the words "Cars Stop Here" when painted on the sides of poles. Usually they are in letters so small that they can be read only at a short distance, even when freshly painted. Within a year or more, when the pole has become exposed to the weather and, if of wood, becomes scarred by the climbing spikes of linemen, the lettering often becomes almost illegible.

A stop sign should not only be sufficiently legible to be read even at some distance, but should be in a conspicuous position and preferably on the sidewalk exactly opposite the point where the cars stop. This is one reason why stop signs attached to the span poles or hung from span wires are not as satisfactory as those which have their own supports. Accompanying illustrations show three typical stop signs used in Washington, D. C., two for cars and one for buses. They are circular, from 10 to 12 in. in diameter, and supported on a pipe pole set in concrete. The bus sign has the additional feature of giving the leaving time of buses at that point. Sometimes the car stop sign is combined with the island platform, as in Atlanta. One of these is shown in an accompanying view.

Few, if any, American companies use stop signs which give also the numbers of the routes stopping at that point. This, however, is common, almost universal, in Europe.

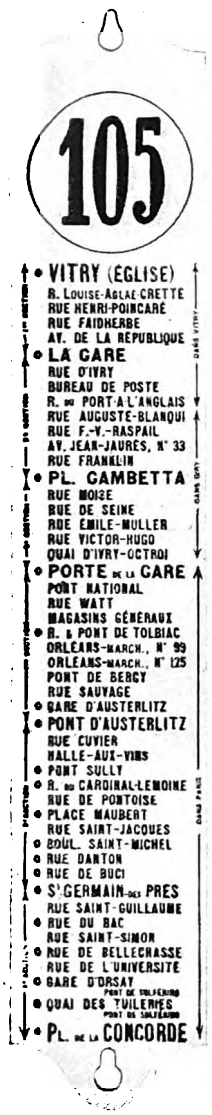


Typical island platforms in Edinburgh, Scotland, and Newark, N. J. The former is shown primarily to illustrate the method of marking the platforms by striped posts at each end and by an elevated red light in the middle

Digitized by Google

To explain how it is done, such a route sign of the London General Omnibus Company is included in the views.

Car route signs supplement car stop signs. After the potential passenger has reached the point where he is to board his car, the signs tell him which car to take. Car route signs have shown a great advance in design during the last ten years. The roller sign is coming into more general use and shows not only the route but also the route number or letter. A typical modern car sign from Philadelphia is illustrated. The Boston Elevated goes a step farther and carries special signs on its cars when operating them over a "diverted" or short route. One of these signs is reproduced.



Paris Route Plaque

A plaque like this listing the principal points on the route is carried on each surface car in Paris. The points marked "O" are obligatory stops. The number at the top is the number of the route.

The intending passenger has now found his car and the place where it will stop. He now must be helped to board it. This can best be done by an island platform. The island platform should be used much more than it is, especially in these days when streets are crowded with traffic. On a busy thoroughfare, many people are deterred from taking cars because they have to run the risk of being run down by passing automobiles. A safety zone formed by painted lines on the street simply invites intrusion by cars, and one surrounded by movable posts is not much more of a protection. The loading platform also is a great help to anyone carrying a package or suitcase.

Fifteen years ago San Francisco was the only city having any considerable number of these platforms. They are coming into much more general use now, although this country is still far behind Europe in their installation. Views are given of two typical installations, one in Newark, N. J., the other in Edinburgh, Scotland.

Questions Answered on Boarding

The first information which the passenger needs after boarding is the rate of fare. It is curious how many companies seem to think this is common knowledge. It usually is known to residents but not to strangers. Where both a cash and a token fare are charged, it is especially desirable to let the stranger know about the token fare, because by the sale of some to him he may be made into a regular rider during his stay in the city. Passengers with children also are often uncertain as to the age limit for free transportation or half fare. Some companies have used a poster of this kind when fares have been changed, but their permanent use is not common. One of the temporary posters, that used in Baltimore for a short time after the fare increase of Feb. 12, 1928, is reproduced.

In Toronto, disputes as to the age of children near the maximum limit for half fare are avoided by having a height limit, instead of an age limit. The height limit is 51 in., and a mark is painted at that distance above the floor on the bulkhead near the entrance to each car. This enables a one-man operator to determine whether the child should pay half or full fare.

Park Street Station in the Tremont subway, Boston, with the annunciator which shows the waiting passengers the destinations of the cars on the several lines which pass this station

In paying of fare it is desirable to have as little change-making as possible. Change-making is wasteful of time, both for the passenger and the operator. Tokens, when sold for lots for some multiple of 5 cents, are a help, but the greatest time saver is the weekly pass or permit card. These make car riding for their owners much more convenient.

The final transaction in the payment of fare is the issue of a transfer to the passenger if he asks for one. Here also there have been great improvements during the last few years in smoothing the way for the passenger. In Boston the time limit is now indicated by a plain printed line at the end of a series of tear-off coupons for successive hours.

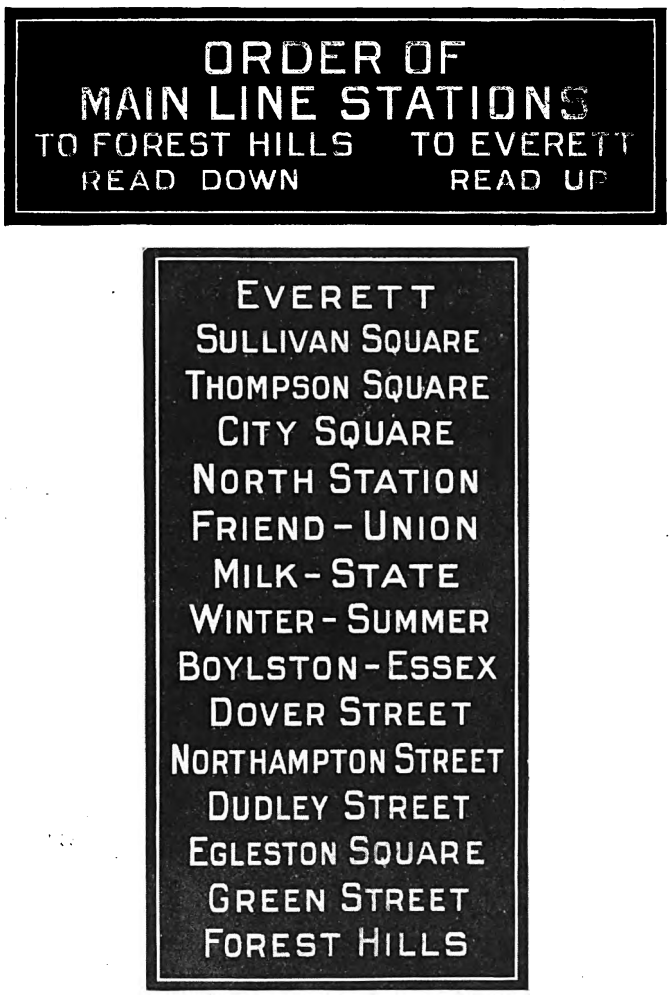
When finally on the car, the information needed by the passenger, especially the stranger, is where to get off. For this he requires a map or printed list of principal points passed en route. Some of the rapid transit lines, as will be mentioned later, have done considerable along these lines, but no surface line has gone as far as the one in Paris where every car carries not only a map of the route traveled, but also a plaque on metal giving a list of all principal streets passed. The map was reproduced on page 1153 of the issue of Electric Railway Journal for Dec. 24, 1927. A reproduction of the plaque appears on this page.

The final service to the passenger is to provide an easy and comfortable exit. This is helped, especially when cars are crowded, by permitting him to leave by the rear platform, avoiding conflict with the stream of passengers entering by the front platform. This is now being accomplished on many roads with one-man cars by treadle operation of the rear platform door, so arranged that the door does not open until the car comes to a stop.

Buses Demand Extra Ride-Selling Effort

In a manner of speaking, a trolley line is a permanent advertisement of service. The rails, poles, wires and distinctive sounds of an electric car are a reminder that

Digitized by Google



Rapid transit cars in Boston carry a list of stations at which they stop

a public transport is available. On the other hand, a survey of a city of 30,000 failed to reveal any invitations to use the bus successor to the trolley, outside of a few schedule cards in store windows. One could walk block after block without receiving the slightest intimation that buses were being run. If the prospect were walking there was nothing distinctive in the sound of the bus by which he can distinguish it from any other large automotive vehicle.

The long established London General Omnibus Company finds it desirable to put up standards, as already mentioned, showing routes available at given places. Some interurban operators, like the Penn-Ohio system, have put up attractive signs, and simple "Buses Stop Here" standards are not uncommon among experienced bus operators, like the Fifth Avenue Coach Company. What is needed, however, is something to create a desire to use the public service. It may be true, as some managers assert, that "everybody knows about the service." Even so, a prospect walking along the street is more likely to ride if he passes a series of signs which suggest the use of the buses and tell when they are available.

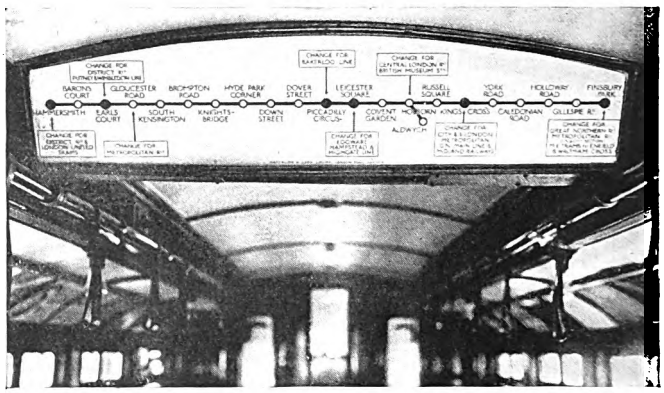
The Berlin Street Railways use for route and schedule information a system of porcelain-like illuminated posts which are even better adapted to a bus company than to a railway. A sign not illuminated is only half-effective. Therefore, bus signs should be located in well-lighted spots if it is not economical to have company illumination.

An effort also should be made to give the buses a horn signal as distinctive as a street car gong, so that the prospective rider can signal it to stop before it has gone by.

What has been written so far deals with the problems of surface lines. When we enter the realm of elevated and subway transit, we reach the size of city where the resident himself needs help when in new territory. It was lack of imagination which led one rapid transit executive to exclaim at a commission hearing: "Why, everybody knows that a red and green lamp at the front of a train means a Crowdus Avenue local, and that a blue and yellow combination means a Jam Street express." Unfortunately, the "everybody" did not include the customers.

Unlike the many-tongued crowds of our cities, practically all the passengers of the London Underground Railways speak one language and know the customs of the land. Yet the management takes nothing for granted. It has a specialist whose chief duty is to devise the simplest possible signs. In one instance, where passengers had a rather long and tortuous walk between two tubes, a sign about three-quarters of the way said encouragingly: "Only one more turning to the station."

Boston probably offers the best example of American practice. Illuminated signs over the station name the next train or car, so there is no needless edging to the front of the platform. When the patron enters the



Skeletonized route maps posted in London underground cars

train he will find an "order of stations" posted on a panel, so he can read in peace with no fear of passing his station.

Maps are finding increasing use on practically all rapid transit systems, both at the stations and in the cars. Skeletonized maps are better for car use than the more elaborate kind because the reader usually is seeking only a route and station name. One from London is shown above.

American electric railways have not as yet adopted the London practice of showing enlarged wall maps of the neighborhood around a station and of using illuminated boxes across the car ceiling bearing skeletonized maps on which important interchange stations receive special emphasis. London also was the first to use names instead of mystic headlamp combinations for destination indicators on trains; also arrows inside the train to show the direction of movement.

All this is reassuring to the rider new to the route. Aids like this are exceptionally helpful on Sundays and holidays when all the family are traveling together to unusual objectives. They should be ready to repeat the trip instead of complaining: "Never again!" Sunday business is voluntary business and should be coddled.

The Louisville Railway received the highest honor for safety work among electric railways for 1926, the Anthony N. Brady Memorial Medal

Safety

A Strong Appeal to Employee and Passenger

BY

J. P. BARNES

President Louisville Railway, Louisville, Ky.

Between the lines of this intensely human account of the part which safety plays in the operation of the Louisville Railway there is suggested a comparatively undeveloped foundation upon which to build teamwork and interest in selling rides

LET'S begin with a commencement: The Louisville Railway's new post-graduate school in trainmanship recently graduated 135 men who took the July course. Twenty-eight of these men made grades of over 90 per cent. There were only seven failures in the class.

What has this to do with safety?

Just this: These men took our post-graduate course on their own time! In other words, the company's safety program has been successful in making the men want to become more skillful operators of street cars and able to give safer and better service to their community.

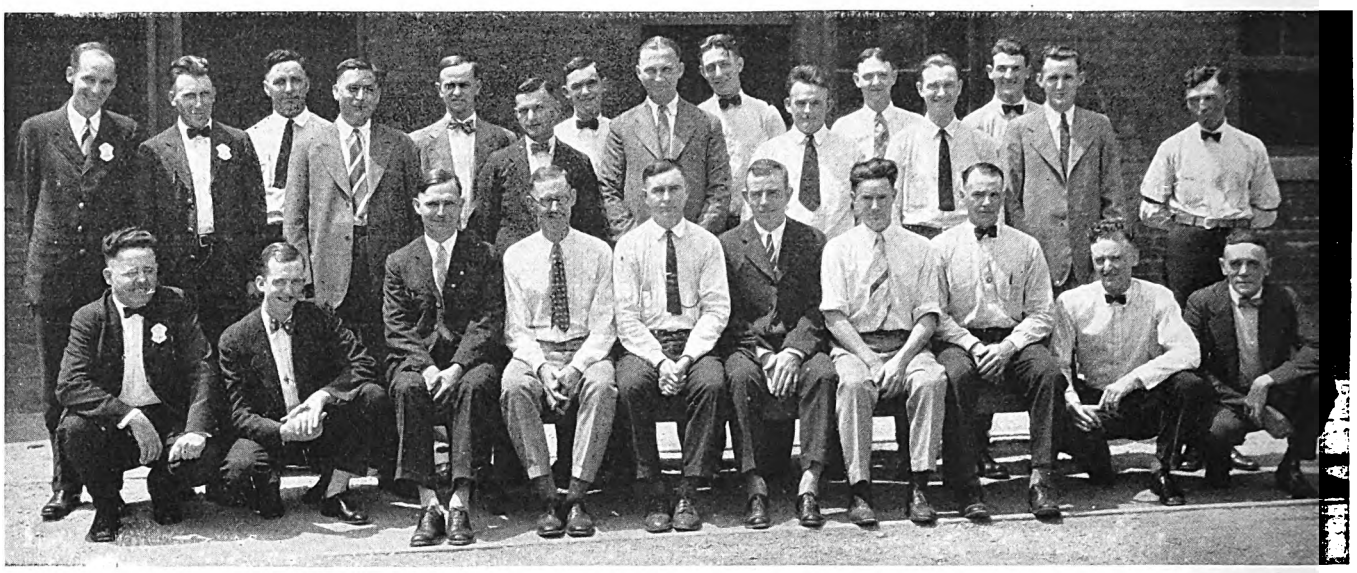
Like Christian, we have come a long, hard way, having gone through our Sloughs of Despond; but unlike Christian, we have yet to see any shining towers of success, with the exception of the Brady Safety Award for 1926, which may rate as a very fair sort of tower, however. At least, we think so!

Shortly after a large turnover of labor caused by a hard-fought strike in 1919, we had to build up an entirely new organization. During this reorganization the question arose: How were we to get our men to co-operate with us in a real safety program?

Some hard-bitten executive is likely to arise from his pew at this juncture and inquire: "How in Sheol are you going to interest hard-boiled railway employees in such abstract, pretty-sounding things as courtesy, service, humanitarianism and safety?"

Now, in the first place, I do not accept the premise that trainmen are necessarily "hard-boiled" and difficult to interest in such a broad humanitarian movement as safety. Most of these men have come into rougher contact with life than have the average executive or college man. They know better than most of us what it means to lose a day's pay, and how hard it is sometimes to pay the doctor's bill. They've been up against it, and the safety appeal gets down to where they live. We have

Digitized by Google



Honor group of graduates of the new post-graduate school in trainmanship conducted by the Louisville Railway. All of these men made grades of over 90 per cent on the final examination

won the whole-hearted co-operation of our men by enlisting their support in the safety movement, not on a basis of dollars and cents merely, but by showing them how to help themselves, their families and their fellows lead safer, and therefore happier, lives, and to prevent unnecessary suffering and the tears of women and children. If that is sentimentality, this company is willing to use more of it!

We are fortunate in being far from the immigration centers and in being able to employ as platform men and shop men an almost wholly Anglo-Saxon body of men (No, I'm not a 100 per cent Nordic shouter!) most of whom have come from the back country and hills of "Old Kaintuck" where even yet much of the speech retains the savor of the times of good Queen Bess. Our men have readily responded to the humane side of safety, in a work which gives every employee, no matter how humble, a chance to help his company, improve the lot of his fellow-employees, and make his town a better place to live in.

Now, I don't want to give the impression that we embarked on a semi-religious crusade, with the officials of the company enacting the part of fervid evangelists exhorting the faithful. There was nothing solemn about it. Gilbert K. Chesterton, in one of his paradoxical moments, says that most men will be very serious about such a momentous affair as selecting a necktie, but that they are inclined to be frivolous about a really serious matter, such as hanging a bishop! We have made a game of safety by having a monthly accident elimination contest between the carhouses, with a dinner being given to the carhouse which operates the greatest number of car-miles per chargeable accident. The winning safety captain is given a new suit of clothes. Each carhouse organizes a safety committee and each man is given the opportunity in time to be a safety captain and to be brought into first-hand contact with safety work. Do the men like it? They fairly eat it up! The interest of every man on the property was caught, and soon good-natured challenges between the carhouses were broadcast, and accidents began to decrease. *Q.E.D.!*

Safety programs, like Rome, are not built in a day. From the very beginning, all of our officials have taken a deep and sincere interest in safety work. We have worked shoulder to shoulder with the men, attending the dinners and conferences, and have convinced them that their part in the program is more important than ours, because while we do only the talking, they are the boys who stand on the firing step and do the real work of cutting down accidents.

Since January, 1925, regular weekly meetings of heads of all departments have been held for the discussion of safety methods as well as to iron out the usual routine matters of operation. Any fault-finding or casting of stones takes place right at the table, and as the talk is definite and frank, alibis do not thrive. A better understanding between departments has led to better maintenance of equipment and service, which in turn has resulted in increased safety, since safe operation is of course predicated upon men and materials and the use made of them. It's useless to talk safety when brakes are not properly adjusted.

In December, 1926, regular monthly conferences of all foremen were instituted. Some of the subjects discussed were Co-operation, Carelessness on the Job, Importance of Reporting All Accidents and Injuries, How the Various Departments Can Be of Service to Each Other, How Best to Impress the Men with the Fact that They Represent the Company Before the Community, Service, First Aid and Politeness.

These foremen's conferences have proved extremely valuable. They have eliminated a great deal of "backbiting" and have helped to make possible more teamwork between the departments and the creation of the spirit of "The Three Musketeers": "All for one and one for all."

Our safety dinners began in 1921 and have now been continuing without a break for seven years. The attendance at the July dinner was the best in the history of the safety dinners, and since the food, which is good and plain, is very much the same as usual one can only deduce that the interest of the men is increasing steadily.

The fact that the men really are interested may be shown in many ways. Recently the case of a very careless motorman came up. This man had had several accidents, and the trainmen at his carhouse had talked with him in a kindly way in an effort to help him. His in-

Digitized by Google

spector also tried to make the man see the light, but nothing came of it. Rather than have their safety record ruined, the men at his carhouse appointed a committee which came to the superintendent of transportation and explained the situation to him, saying that while they liked the man his lack of interest in safety made him a liability on the property. This man was released.

Another promising sign of interest lies in the rallies that the men themselves get up at the various carhouses. The men contribute 25 cents apiece and their wives prepare a Dutch supper. Speakers among the men are arranged for, and the officers of the company are invited to attend. In 1927, six of these impromptu rallies were held.

In recent years the Mayo Clinic has become famous throughout the country. Here in Louisville we have what we call our "Trouble Clinic." We believe that no one can run a street car efficiently if he is worried about home affairs or money troubles. Therefore, each carhouse foreman instructs his men to discuss with our safety department any trouble concerning which we may be of service. We believe that worry, generally over some trifle that can readily be adjusted by someone having legal experience, is the cause of at least 30 per cent of all accidents; mental hazards play fully as great a part in safety work as in golf. If a man's wages are being garnisheed, or if he is separated from his wife because of some petty quarrel, these things will prey upon his mind and he will not be able to do his work as efficiently as though he had no worries. We have succeeded in building up in our employees the feeling that we are anxious to help them in every way possible, and in innumerable instances our safety department has straightened out various troubles and minor legal complications for the men, keeping them in their homes and preventing them from falling into the hands of loan sharks.

Safety work without satisfied men is a contradiction in terms. The office must establish intimate and personal relationship with the rank and file of the men, who must be made to feel that they are a part of the official family. In Louisville we have tried to do away with the awful chasm which existed formerly between the officials and the men by mixing freely with them at the dinners and various conferences, and by being as pleasant and courteous to the men as we expect the platform men to be to the street car riders. The office of a public utility company should not be like a frowning castle set upon a hill, approached reluctantly and infrequently by the men only when they come up for employment, or for reprimand, suspension or dismissal. Before the safety movement, a man rarely saw the officers unless he was hailed before them for the purpose of discipline. Now, the safety movement has given both officials and men opportunities to meet as man to man in a democratic way in a work that appeals equally to everybody. There has resulted a very real spirit of camaraderie and fellowship.

The posting of bulletins with safety slogans accomplishes little or nothing, we find. The men won't read them. There is no substitute for the personal contact of the men and the officers at the group meetings and rallies. Sometimes we have as many as 40 meetings a month between men and officers. One very interesting result of these meetings is that we frequently drift away from the discussion of safety and take up other questions of local interest, such as loan sharks, the civic duty of voting, etc. These discussions are informal and bring the men and officers closer together. We have never believed in giving the men a money bonus for doing well the work they are already paid to do. We do believe, however, in giving them all sorts of recognition, such as publicity, medals, dinners and trips to conventions. To give a man a bonus for safety work would be like giving Sergeant York $10 for every German he killed during the World War, instead of giving him the Congressional Medal!

Our safety inspection committee, with representation from each department, meets each month with the safety director and the secretary of the Co-operative Association, the men's welfare organization, and makes an inspection of every part of the property for sanitation, safety and morale. These men go into the carhouses,

Safety dinner given in January, 1928, in celebration of the Brady Award, and in honor of the December city average of 37,490 miles operated per accident. Every carhouse was represented at this dinner because of having operated over 25,000 miles per accident in December

Digitized by Google

power plants and shops, and ask: "What do you fellows need that will make working conditions safer for you? Let us know and we'll get it for you! Don't wait to get hurt!"

We are also firm believers in the psychology of cleanliness and see that the men's quarters are neat and clean. If a man works in dirty places he will be slovenly and careless on the road. We try to flood our shops with sunshine, hoping that the men will absorb some of it.

Each unit of the property also selects a safety committee composed of three men, who in turn elect a chairman. Once a month these men meet at the office with the safety director and the secretary of the Co-operative Association. These men are given office for three months and are entrusted with the responsibility for safety conditions on their property. They are the "head" men when it comes to safety and can order a bad car off the line or institute any other safety measure whatsoever. At all times they are free to discuss safety matters with the safety department and to give suggestions on safety and sanitation. There are at least 300 valuable safety suggestions given us each year by the men.

In our employee publication, *Trolley Topics,* which is issued twice a month, the men frequently contribute articles on safety which are given a prominent place in the paper, and on the first of each month, *Trolley Topics* carries on the front page a list of the safety captains of the carhouses. We give this extra publicity to the carhouse men because we feel that they are the shock troops, fighting the traffic battles with which the shop men, power house employees and others do not contend.

Yearly Average Miles per Accident

1921	2,004
1922	3,323
1923	3,404
1924	6,390
1925	7,146
1926	10,354
1927	13,399

The accompanying chart shows that the Louisville Railway, beginning with 2,004 miles operated per chargeable accident as a city average in 1921, has been able by its safety work to lift this average to 13,399 miles operated per chargeable accident in 1927, a distance of over half way around the world.

In January, 1928, every carhouse attended the safety dinner, when the city average for December was 37,490 miles per accident. The qualified attendance was so large that we could not hold this mammoth dinner at Safety Hall, but were forced to turn our paint shops into a banqueting hall. It was a proud moment for us all when Mayor William B. Harrison congratulated us on the recognition that had come to our company and our city through the award of the Brady Memorial medal.

Chicago "Daily News" Building, the first building in Chicago using the air rights over a railway terminal yard

Skill and *Foresight* Needed to Meet the Pressure of Competition

BY

E. J. McILRAITH

Staff Engineer
Chicago Surface Lines, Chicago, Ill.

NEARLY all businesses face keen competition and a constant struggle for survival. The transportation business is not excepted, and the need for studied, continuous effort to shape policies to meet changing economic conditions is not diminishing. Competition in business forces sales development or failure. But the pressure of shifting conditions offers to strong men an opportunity for self analysis and self improvement; it brings out the qualities of clear thinking and leadership. Conversely, under these conditions, weakness and lack of vision ultimately undermine prestige and give way before the inexorable law of the survival of the fittest.

The need for real leadership is particularly pressing in the public transportation business. The attack comes on all fronts and failure to recognize the causes and effects of any one of the several factors that are at work will lead inevitably to further difficulty, if not, perhaps, to ultimate disaster.

Street congestion has become one of the most serious problems confronting both railway managements and the communities which they serve. Unfortunately, few railway organizations have developed an expert knowledge of the fundamentals of traffic control or have taken an active leadership in helping to relieve the traffic troubles that have arisen. The railway business is conducted on the streets. It is absolutely vital to transportation companies, therefore, that the streets function up to their capacity for moving traffic. From a purely selfish standpoint there is a responsibility upon railway managements to do everything in their power to aid in the development of effective traffic control. There is at the same time an admirable opportunity for transportation men to render an outstanding community service in aiding perplexed city officials to meet one of their most baffling problems. Traffic control has not been very well handled in most cities. The principles do not seem to be understood, and mere complaining criticism is worse than useless. Public officials welcome constructive suggestions that are effectively presented by persons or organizations which show themselves competent.

The Marshall Field Merchandise Mart when complete will be the largest building in the world. It uses the air rights over a freight terminal immediately adjacent to the Chicago central business district. It is another evidence of the tendency toward concentration of business activity

American cities will continue to concentrate in their central business districts those forms of activity which belong in the heart of the community. It is evident that there should be decentralization of manufacturing or the selling of such commodities as staples and foodstuffs. Outlying community centers are necessary and thoroughly desirable; but the great business interests of a city which have to do with the trade of large tributary areas and which are in reality the basis for the existence of the city, must continue to grow and concentrate in a central area.

It is economically sound to have high land values and intensive building development in a small area. It is more efficient for the business that is to be conducted, more desirable from the standpoint of the city development, and can be served by suitable, convenient transportation in a more satisfactory way than if the business district is more widely dispersed. The necessary traffic and transportation to such a center can be kept adequate and convenient with expenditures quite within reason, provided proper use is made of existing street facilities; and provided further, that the economic relation between transportation and property values is recognized in planning and financing facilities to meet increasing population density. Although in most cities streets were laid out for communities of small size and to fit the theories of transportation and traffic of 100 or more years ago, it is entirely possible for all cities to have reasonable traffic and transportation conditions without limitation of building development and excessive fares or tax burdens.

The coming report of the committee on street traffic economics to the American Electric Railway Association at the annual convention in Cleveland this month will present some of the causes of present traffic conditions in large cities. The increasing problem of street congestion is attributable to faulty traffic control, imperfect arrangement of routes of travel and extreme waste of available street space. The present conditions are not at all indicative of the maximum traffic capacity of even existing street facilities. Further increase in density of traffic to and from the central districts will not necessarily be a cause of serious difficulty as a city grows in size, if reasonably appropriate regulations and expansions of facilities are undertaken.

Railway managements must not only have a better knowledge of the fundamentals of traffic control, but also a thorough understanding of city planning and the relation of transportation to community development as well, if they are to serve their companies and their communities effectively. Cities should grow in their central districts in whatever way provides the greatest efficiency for the conduct of business. Transportation should be provided to permit such development rather than to have transportation limitations dictate the conditions under which business can be conducted. The term "business" as used here does not necessarily include local merchandising. Definite and substantial efforts are being made to study the social and economic trends and needs of city life. Some faulty principles of control are in effect. Zoning, decentralization and the traffic and transportation problems are intimately related and the principles which govern their relation are much confused. Local transportation as a business is vitally concerned with the adoption of sound community policies with respect to these several factors. Its executives and personnel must, therefore, take an active and competent part in the study, discussion and solution of the broad problem.

We all know that political persecution has been a serious handicap to all public utilities, and that it certainly has been a major factor in creating some of the discredit attached to railways. But this persecution seems to be wearing off. Recognition of the economic necessity for public transportation is growing in the public mind and is therefore affecting the attitude of political officials. While the railways were in the throes of their greatest difficulties and while the fare question was a popular political battle cry political persecution was merciless. But street railways have proved to be a necessity to the community. The fare question has become quite secondary where satisfactory service is rendered, and it seems almost certain that within the next few years the industry will again achieve its proper place both in public esteem and in the confidence of investors. This will be assured more and more as the railways proceed to

Digitized by Google

build into their service the quality and convenience that measure up with modern standards of living. In this there is a great obligation that rests upon the railway manager.

During this past decade, evolution of public wants and revolution in individual purchasing power have taken from the railways their former dominating position, and they in turn have been all too slow in adjusting to meet these great changes. There is an inherent stability in public transportation because it is a public necessity. Business has been thrust upon many companies even when their service and policies were inadequate and shortsighted. It has been difficult to kill the business, but certainly the course followed in many places has been almost ruinous.

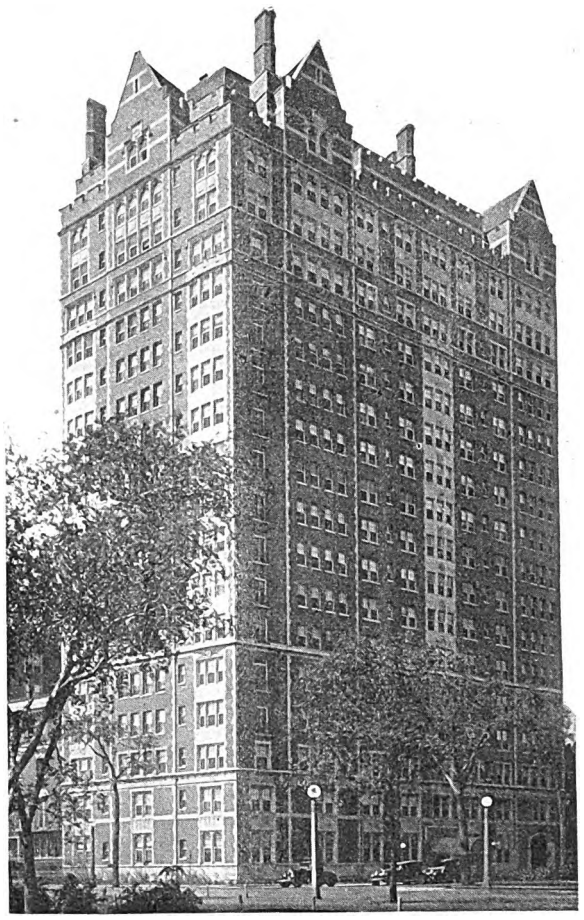
While the measuring stick of gross revenue for successive years is a common way of determining the general trend of the transportation industry's fortunes, this does not always prove conclusive in individual cases. Sometimes unemployment in a particular city creates greater losses in riding than the increases attributable to natural growth in population or to the effort made by the property to attract business. But this cannot account for successive decreases year by year, and in only one of the eight largest cities in this country is the number of revenue passengers for 1927 greater than for 1923.

There is little mystery about the actual cause. While the automobile was being improved in performance and reduced in cost at an amazing rate, the railways were standing still in development, and that meant nothing less than becoming obsolete, out of date, below the standard of comfort and quality to which the great and rapid evolution in the standard of living had brought the public mind. It is not that the electric car is obsolete, but the standards of performance are not adequate nor are they yet changing rapidly enough to meet present conditions. There are far too many old, unsightly, ill-painted cars with inadequate motors, slow brakes, small doors and platforms, narrow aisles, uncomfortable seats, dull or unpleasant interiors and faded painting that are rattling noisily over corrugated track that has loose joints and battered special work.

Of what use is advertising or effort toward building up good will if the cars operated are hideous and a noisy nuisance both to passengers and to all on or near the street?

Car improvements are very actively under way, although the number of new, better cars actually bought is very small. The new lines, paint schemes and simple, cheerful interiors are most encouraging. The new developments in trucks and brakes promise outstanding improvements over the older types, and are headed toward quieter, better operation and a better standard of maintenance. Perhaps the new seating arrangement as recently placed in service with sample cars in St. Louis and Pittsburgh offers the greatest advance in comfort and relief from public jostling that has yet been built into street cars. The car has along each side one row of single seats set at an angle so each passenger is in a seat by himself. This leaves wide, comfortable aisles. The seating capacity is probably as high as can well be used on most lines, except for part of the rush trip, provided the cars are operated on such a close headway as to attract riders because of the short time spacing between them. Many of the older but reasonably modern cars could be given an appearance and quality similar to new equipment by slight remodeling.

Competition is best met by improving the quality of the ride. Advertising is undoubtedly of value, but it is the constant reminder of the quality that comes from satisfaction with the service rendered that really sells more rides. Present competition is most intense from private automobiles and largely because the comfort of street car riding has not improved much in twenty years. The standard has been to provide cheap rides in "serviceable" cars. That type carries only those who feel they must ride street cars.



Modern housing tends also to run to high buildings and intensive use of city land. Such tendencies require a thorough transportation system

R. P. Stevens, president of the American Electric Railway Association, stated recently in an address:

"New designs of street cars, while incorporating electrical and mechanical innovations to give more efficient performance, should tend toward greater beauty of lines and appointments—toward more 'class.' It is the public's verdict. Not only must we have efficient vehicles, but we must make them look up-to-date. We are in the bobbed-hair, silk-stocking, short-skirt era. It will not do to continue offering the public street cars that remind it of bustles and dragging skirts, with shot sewed in the hems, lest a vagrant breeze expose a cotton stocking and a petticoat. These things smack of antiquity, and the public refuses to be old-fashioned."

Of course, costs have grown so rapidly during this period of change covering fifteen years that it is difficult to assume added charges. Using as an illustration one of the largest companies, trainmen's wages are now three times as high as in 1914, while the prices of materials are substantially 1½ times as high. However, improved methods have resulted in lowering the costs of operation from what they would have been under such striking

Digitized by Google

rises in labor and materials. In 1914, the operating expense, exclusive of taxes and renewal fund, required 51 cents out of each dollar of income, under a 5-cent fare. In 1927, under a 7-cent fare, it required 65 cents out of each dollar of income. This brings the rate of operating expense to 1.8 times what it was in 1914. In cities where one-man operation has been possible, marked reductions in cost have been effected, but there are decided limitations on the use and economy of one-man cars in the larger cities.

However, the cost of operation is not the sole question of interest. If properly planned increased expenses can develop greater gross and more net income, then such operation is decidedly good strategy. Slow operation, for example, may decrease the cost for electrical energy more than it increases the cost of trainmen's wages on lines with the longer headways, but it surely drives away customers.

In too many instances there are still great possibilities for skilled scheduling to produce better service with lower cost or equally good service with less expense. More money should be spent by all companies in obtaining or developing such thoroughly competent attention to the planning and analysis of operation that will insure the greatest sales value in service rendered and the best net return. Insistence on lowered costs in all departments is not necessarily sound policy. Railways need the most skilled men who can be obtained for the management and planning departments, for the problems encountered are intricate and difficult.

In a large city it is impracticable for a company to give with mass transportation vehicles service to fit all routes of travel within the city. There are districts that cannot possibly justify public transportation. There are lines of travel which must be served only by private conveyances because of the small number who could be served by public carriers if they were available. It is also an advantage to have part of the people travel by private carriers in the period of the greatest demand for service. The company cannot hope and should not attempt to duplicate the convenience of private vehicle service, but should carefully provide all reasonable needs for public carrier operation. Attention should be concentrated on giving better service, considering headways, quality of ride, and better distribution of routes, even at a higher cost.

Giving poorer service because of increased costs is not the way to develop increased profits or produce the fare needed for profit. Cheapening of the product is neither the way to attract business or to meet competition. Street railway riding has fallen off because of the poorer quality of the service rendered in comparison to what people have learned to demand through experience with their automobiles.

James H. Collins writes very pointedly in *Manufacturers' News* for July, 1928:

> You may be aware of some case in which an eclipsed business has come back through lowering quality to meet the situation. I know none. But there are plenty of instances in which the public responded when competition was put on the plan of better value for more money.

L. D. Rutherford is quoted in the same magazine:

> Quality, consistent with cost, is sought by everyone of our hundred million American buyers, and the sooner trade in general assimilates that fact and conforms its business to it the better will be all industry.
>
> The sole means to the end of better profits is quality. Quality products and quality merchandising. The manufacturer who, regardless of product, can keep one step ahead of the cycle of public preference and demand and uphold a high standard of quality—his is the manufacturing business that will grow and his is the product that will establish the standard for the public.

Management is presumably responsible for the success of business. As business conditions change management must be prepared to adjust, and by previous planning be ready to continue without too serious shrinkage in resources. Street railways have been less seriously hurt in this last ten years than the cotton manufacturer, the retail store or the phonograph maker. None of us are interested in the other fellow's troubles. We mercilessly turn from our old habits to the new and let the other fellow do his own worrying as to the adjustment. So it is the railway managements' own job to develop ways and means with which to restore the prestige of the railway business.

It is not merely a question of getting suitable equipment, track, shops, organization and fare. Those are management problems of complex difficulties indeed. But the "follow-through" on the details of daily routine is equally important for creating a successful standard of service and a satisfactory net return. If the organization is really completely concerned and unitedly driving daily to give more regular, dependable, speedy, safe and appropriately frequent service, there is little doubt of a growing success. But each man needs constant encouragement, training, supervision and support. Only when the management itself puts real effort into each day's performance can there be the steady improvement that is needed. Too often there is discouragement, lassitude and lack of vision and enthusiasm at the top of railway organizations. Sometimes the responsibility goes beyond the management to those who hold the purse strings. All too frequently the men doing important work are not adequately skilled. The quality of men or training needed to cope with the intricate problems of transportation, scheduling, and maintenance, are not being sufficiently developed. Many of the best men have been inducted into the more lucrative field of power. Yet transportation needs even more skill and foresight because of the greater dependence of the business upon the factor of personnel.

It is mismanagement to build an organization that tries to function without constantly keeping the pressure of work foremost, without having sympathetic but active supervision continuously proving that the details are being cared for, and without knowing that each man of the organization is being trained and encouraged to do his work better. Good management builds success through the combined efforts of a trained organization even under great handicaps because of careful attention to detail that is encouraged by the policy of the management in seeing that detail is delegated effectively and followed through intimately by competent men.

The spirit within an organization and the good will of the public for an organization and its service are created principally because of the ability of the executive head to keep his staff actively training, supervising and encouraging the organization. The higher the position that a man holds the more actively should he attend to the business of the company. When the leader in an organization is not sufficiently active the quality of the company's service is seriously affected. The quality of management is more important than any other factor, both because it is the mental attitude of the entire group of workers that determines the product of the organization and because alert management, when the business fills a real public need, will find ways of correcting all other handicaps.

A Friendly Public Is the

Principal Asset

and the Chief Executive Must Play His Part in Developing It

BY

WALTER A. DRAPER

President Cincinnati Street Railway, Cincinnati, Ohio

Walter A. Draper

PERHAPS the most important step in "Selling better transportation better" is that of developing and maintaining a friendly public. Only through an honest desire on the part of everyone in the company, from the executive on down to the lowest in rank, to please the public, can this be accomplished. The rôle to be played by the executive and what he can contribute are brought out in this extremely intimate discussion by a man who practices what he preaches in public relations.—EDITOR.

IF ONE were to select some subject in connection with electric railway matters to talk about, "Depreciation and Obsolescence," "The Extent of Public Control Under a Service-at-Cost Franchise," "The Best Type of Equipment with Which to Meet Competition" or some similar subject probably would be chosen, for there is room for discussion and difference of opinion in talking about topics of this kind. But on the "Need For a Friendly Public" there is no room for argument. A friendly public *is* the principal asset and that is all there is to it.

Still, although we can't argue about the fact, we can and do pay a great deal of attention to it and I sometimes wonder whether the public is conscious of how much public utility operators do desire to have a friendly contact with it. Possibly it is just as well, because if both the public and ourselves were conscious that we were striving to secure friendly recognition it would be harder to bring about.

The endeavor merely to create a friendly atmosphere without the real solidity of good and dependable service behind it would result in a condition very much like a puffball in the woods, which, when put to the test of real pressure, sends forth a little cloud of smoke and collapses. It is all right for us to open the door to the public and show in every way we can that we are human and desirous of receiving criticism and complaints, but unless we have the real solid background of giving full measure of service our friendly public will soon fade away or be metamorphosed into an unfriendly one.

One man's observation on the subject of public relations probably is not worth much to another. I always have doubted the advisability of trying to lay down a fixed rule in anything but mathematics or some exact science. Every man must follow his own method, worked out of his own personality and temperament. One man can't play his best game with another man's golf clubs. Furthermore, methods must be adapted to local conditions.

THE ENDEAVOR merely to create a friendly atmosphere without the real solidity of good and dependable service behind it would result in a condition very much like a puffball in the woods, which, when put to the test of real pressure, sends forth a little cloud of smoke and collapses.

What will work in one city might be a tremendous mistake in another. A story of what you have done in your city might be interesting but not very helpful to me, while the fact that I may have succeeded with some policy doesn't mean that you can use it in some situation that is facing you. You must go out and get your own friendly public, because it cannot be made to order nor can it be created by following the rules in some textbook.

"Friendly public" with us means about the same as "good will" to a manufacturing or merchandising concern. There is one big difference, however. An individual, a firm or a company in ordinary business may capitalize and issue stock against good will, but commissions, courts and municipal authorities for years have been insistent that out of our capital structure there be pruned or exuded every trace of good will. Our business is different from the soap business or the soft-drink business or the automobile business, in that whatever we can earn on our good will can't be paid out in dividends to our stockholders but must be given in the way of service, comfort or convenience to the public which has extended this good will toward us. We might liken this good-will stock of ours to the ultra-violet rays which the spectrum doesn't show but which we know are present. So we know that while not convertible into money or tangible enough to be segregated and weighed, nevertheless there is this good-will stock divided equitably between the public and the company. On it dividends are paid in courtesy and service to the public, and friendly criticism, thoughtful suggestion and constructive complaints to the company.

IT IS ALL RIGHT for us to open the door to the public and show in every way we can that we are human and desirous of pleasing and receiving criticism and complaints, but unless we have the real solid background of giving a full measure of service, our friendly public will soon fade away or be metamorphosed into an unfriendly one.

If we realize how futile it is to cultivate a friendly public artificially without having the good rich earth of adequate service and courtesy in which to grow it, then we must be willing to expend time and thought and give every care to the growing plant. I recently had a striking personal illustration of the amount of attention that can be paid to one customer. I was riding on the front seat of a street car with a neighbor, one branch of whose business consists of repairing broken and battered silverware and bric-a-brac. He drew from his pocket something wrapped up in a paper. It was a hollow mosaic egg, which had been shattered badly. He explained that the egg had been brought to him by an old lady with the request that it be repaired. No one in his establishment had been able to do it. He himself, therefore, had taken the egg home to work on as if it were a glorified jigsaw puzzle and he finally had succeeded in getting it together. I asked him why he took all this trouble to please somebody who would never give him any business and from whom he certainly would take no pay no matter how successful he might be in putting "Humpty Dumpty" together again. He turned and looked at me and then pointed to the poster we had put inside our cars, quoting a little commendatory expression we had received from a car rider just to let the public know that we appreciated a kind word and that the door was open for such expression, kind or critical.

"I worked on this busted egg," replied my friend, "for the same reason you put up that poster. Don't you know that a friendly lot of customers is the biggest asset I have?"

Substitute "public" for "customers" and the same statement is true for the electric railway industry. The only difference is that the whole public comprises our customers, where my friend's customers are limited. Not only did this observation by my friend give me the parallel between his business and mine, but it also served to confirm me in the belief that our publicity methods do reach the public.

When I reached my office I began to think over the various ways in which we can reach the public and how necessary it is to have things organized so that advantage can be taken of the very many opportunities for friendly contacts. It is quite obvious that no executive himself can see every man, woman or child with a complaint or a suggestion, but the better one is known in his community the more often opportunities present themselves to relieve a tense situation, to satisfy a complaint, to explain a bothersome condition or to receive and act upon a valuable suggestion. Most of these must be taken care of by a proper department. Many of them are presented to such a department through intelligent and thoughtful consideration on the part of the public itself. Nevertheless, many do come to the attention of the executive, and I have in mind many instances in which I have worked just as hard as my friend in putting the mosaic egg together again in trying to increase our assets by adding to the number of people who might be included in the friendly public.

In one instance I spent the better part of an hour trying to explain to a woman in her eighties why the company couldn't buy from her the two shares of its stock that she owned. She finally got the point. My thoughts still go back to the cold winter morning that my telephone bell rang at half past two and an indignant voice wanted to know why the night owl stopped just six squares short of the place where he wanted to get off. It was hard to keep my temper, but I think he was more ashamed than indignant when he hung up. On another occasion, I spent what seemed to me the better part of an afternoon trying to explain to the minister of a downtown church why we couldn't advertise on the outside of our cars his own particular Easter service, and he finally agreed with us.

Some pleasanter things have happened, as, for example, when at the request of a woman whose husband was seriously ill I was able to have the sprinkling car wash away the dust in front of her residence. The dust which came from newly-laid paving gathered in the throat of the groove rail and increased the noise of our cars, causing considerable disturbance to the patient.

Another time a woman who was chairman of a committee of a large organization called a meeting of her committee to discuss a proposed change in route on one of our lines and was humiliated to find that the notice had gone out wrong and that she and I were the only two present. I explained the proposition fully and made as good a public speech as if I had had an audience of a thousand. The result was that she had a meeting of her

Digitized by Google

committee later at which she herself fully explained the situation and got a unanimous vote in favor of our plan.

Another change of route so incensed the neighborhood that some residents threatened to burn down one of our carhouses and I remember the many weary hours I spent discussing the change with members of the Council and other city officials. The argument continued for two or three months, but I had the satisfaction a few months after the change had been made of having the leader of the malcontents come to me and say that I was right and they were wrong and that they wouldn't change back again for any money.

One hot summer afternoon I was inveigled into visiting a remote section on a suburban line to meet a committee that desired a waiting station erected. Although I had to cancel an important engagement in my office to be there I was repaid by the enthusiasm with which the whole community turned out some time later to celebrate the erection of a little shed at the cost of $100.

THERE ARE many tense situations that can be relieved and many cases that might develop into trouble that can be handled best by an executive who speaks with authority, and when they come the executive should take the time to handle them.

On another occasion considerable trouble was caused by a man who felt that municipal ownership was the only cure for all transportation ills. I deluged him with literature, wore him out with talk and tired him with many inspection trips. After we had been operating under our present plan for a year or so, I was gratified at hearing him say that with conscientious operation under a service-at-cost franchise the public would have all of the blessings without any of the drawbacks of municipal ownership.

All of these things have taken time and are probably not in the field of work that should be undertaken by anyone except the public relations man. However, I have found it a pastime or relief from the consideration of strenuous operating problems to listen to these complaints and suggestions and to try to solve them and satisfy the people who make them. There are many tense situations that can be relieved and many cases that might develop into trouble that can be handled best by an executive who speaks with authority, and when they come the executive should take the time to handle them. It is as satisfactory and as interesting to make this friendly feeling grow as it is to plant the seed of a rare flower, to watch for the first sign of its head pushing above the soil, and then to water and nurture it until it grows to a beautiful and productive plant.

It is not merely a satisfaction to help bring about this good feeling, but it is one of the necessary things to be done. I am not one of those who believe that public good will can be procured either by purchase or hard work and then counted on to remain as firm and unchanging as the rocks of the hills. The public is a fickle friend. Try as we may we cannot have everyone understand every situation, and there will always be an opportunity for the politician and vote getter to turn our mistakes against us or to stir up trouble when we are unable to meet some unreasonable suggestion.

Consistent fairness, honesty, frankness and friendliness on our part must be accompanied by equally consistent firmness, whether in carrying out something that is agreed to or whether in refusing to support some policy that is unsound and impossible. Persistency pays. We cannot forget, however, that building up a friendly public cannot be used as the smoke screen to cover inadequate service, nor can the effort to secure good will be carried to the extreme of doing what is economically unsound or impossible of continuance.

Good Will Pays Dividends

"FRIENDLY PUBLIC" with us means about the same as "good will" to a manufacturing or merchandising concern. There is one big difference, however; the electric railway cannot capitalize and issue stock against its good will. . . . Nevertheless there is this good will stock divided equitably between the public and the company. On it dividends are paid in courtesy and service to the public, and friendly criticism, thoughtful suggestions and constructive complaints to the company. —W. A. DRAPER.

Determining the PROPER PRICE for the Transportation Product

BY

RICHARD SACHSE
Consulting Engineer, Los Angeles, Cal.

THERE ARE three distinct steps in any merchandising program—manufacturing a salable product, fixing the proper price at which to sell it and the actual selling. The second step, that of fixing the price, is a very important part of transportation merchandising. Mr. Sachse herein approaches the question of rate-making from a very unusual angle and emphasizes some of the factors which have been badly neglected both by transportation executives and regulatory commissions.—EDITOR.

Richard Sachse

FIXING and collecting the right price for the product manufactured—mass transportation—is the all-important problem of the urban and interurban mass transportation systems. Such transportation must be sold at a price the buyer is willing to pay, and the price must be high enough to pay for the cost of a service the buyer is willing to use. Rate-making, that is, the power to determine what that price shall be, within economic limits, is in the hands of the regulating commissions. The courts can, at best, only prevent long continuing and glaring confiscation; but a price that merely meets the confiscation test with no margin above does not and can not cover the full cost of good service and will not, in the long run, hold the riders.

There is no doubt that to a very great extent the weal or woe of these utilities is in the hands of the commissions. Neither is there doubt that, generally, the commissions are willing to deal as fairly with the utilities as with the public from which their power flows, and as a rule they are possessed, using the language of the Supreme Court of the United States in a recent rate decision, "of that acute appreciation of justice which should characterize a tribunal charged with the delicate and important duty of regulating the rates of a public utility with fairness to its patrons, but with a hand quick to preserve it from confiscation."

How does a regulating commission fix transportation rates? In the electric railway field where rate increases during the last ten years have been the rule, the initiative generally is taken by the company. An application is filed; an investigation conducted; an official record made. Upon that record the commission under the law must base its decision. The commissions have their own staff of experts: attorneys, engineers, accountants, service inspectors. It is to be expected that as a rule a commission will place reliance mainly on the testimony of their own employees and be inclined to accept their recommendations. If a case goes to court the court will give every benefit of doubt to the findings and rulings of the commissions.

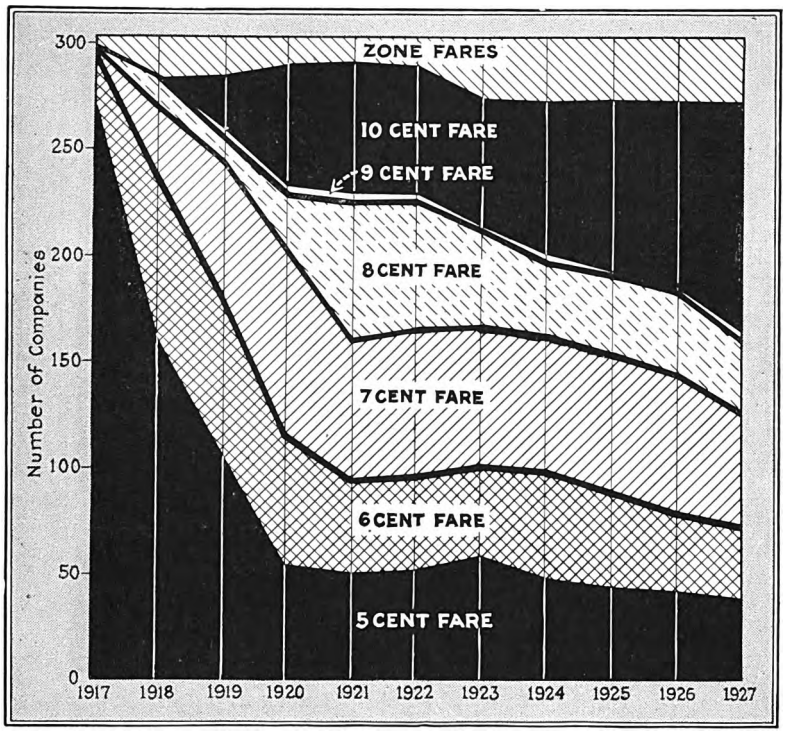
COMMISSIONS HOLD OPPOSED OPINIONS ON RATES

A superficial analysis even of the records and decisions in recent rate proceedings very clearly shows that different commissions and their staffs are holding diametrically opposed opinions on some of the most vital matters connected with rates and the making of rates. Reference here is not to such controversial legal matters as valuation methods, the treatment of depreciation, rate of return, matters slowly and cautiously being passed upon by the United States Supreme Court, but to matters subject to determination by experiment and established fact. Do rate increases produce increased or decreased gross and net revenue? What has been the effect of rate decreases on gross and net income? Does riding correspondingly increase and decrease with rate changes? Is there a peculiar virtue in the nickel fare? Can any conclusions be drawn from the long-

Digitized by Google

continued and widespread use of the so-called multi-coin fares? Which is the more important factor: lowest possible rate or best possible service? Are the mass transportation utilities engaged in a declining and hopeless business—are they standing still, stagnating or are they going forward? Is it true or is it not true that even if a commission is willing to allow them a fair rate the companies will not be able to collect it?

To all these and to other equally fundamental questions the responsible managing officers of the electric railways throughout the country believe that definite and reliable answers can be given, but such belief is not shared by the majority of the commissions and their experts. There is no lack of inclination on the part of the regulating authorities to give to the transportation utilities less of a square deal than is given to other utilities such as electric, gas, water, telephone and telegraph. If, nevertheless, it is true that the electric railways have found it more and more difficult and in some cases impossible to secure rates permitting their healthy existence, the causes of that condition cannot be found in any ill will of the public or any ill will of the public's official representatives. Nor is it true that the mass transportation utilities have fallen upon evil days because their functions have become obsolete, or because they furnish a service no longer needed or wanted. The opposite is true. The changes in the mass transportation industry within a space of less than one generation have been nothing short of revolutionary and it is a fact, of course, that the automobile was and still is the immediate and ultimate cause of most of these changes.



Distribution and trend of cash fares, 1917-1927

This chart, prepared by the A.E.R.A., shows the rapid decline in the use of the 5-cent fare and the corresponding increase in the 10-cent fare and other rates.

It is still a question whether the modern system of mass transportation in competition with the public and private automobile will survive in the smaller cities and the moderately populated suburban and interurban communities of say 100,000 population and less. But no doubt whatever exists that electric and motor mass transportation is a more essential utility and is in greater demand than at any time in its history in the large cities of the country and in all densely populated communities. The managing officers of the mass transportation industry are in agreement that quality and character of service are controlling and of much greater importance to the public than a reasonable fluctuation in the cost of a ride. The correctness and soundness of this conclusion are challenged by some of the rate-making authorities. Almost all of the commissions are governed in the fixing of rates by more or less standardized considerations of valuation, depreciation, past operating expenses according to prescribed accounting classifications, rate of return and similar factors, all of them legal concepts to quite an extent.

Rate Schedules Should Consider Classes of Service

The value of the different kinds and classes of service provided for the buyer, his ability to pay, his status as a wholesale or retail, an occasional or regular rider, a peak or off-peak consumer—such factors and differentiations have had much less influence on the rate structure of street railway mass transportation than they have had in the tariffs of utilities selling gas, water, electric power and light, and telephone and telegraph service. One of the urgent tasks of the industry as a whole, and a special task for many of its individual units, is a study and a determination of the best possible rate structure for our mass transportation systems under their different classes of service and operation in the light of the present-day conditions confronting the industry. And when this task is approached it must be with the acute realization of the great changes in the industry within the last few years. Our manufacturing methods in shop and power plant have largely adjusted themselves to the new conditions of the present day or are still in the process of adjustment. In comparison there has been but little change in the methods of selling the product, and rate-making in our industry is essentially the same as it was before the advent of the automobile.

Increasingly large numbers of people to whom the proper functioning of our mass transportation utilities is of vital concern are being convinced that a new and better technique than the present one, a better method of dealing with the problem, is needed. This conclusion is forcing itself not only upon the managers and owners of the electric railways but also upon city officials, upon business and property organizations, upon the regulating commissions and upon the average man and woman struggling with the growing congestion of our big cities. Under the law the commissions have nothing to say about street traffic conditions, about tax and paving burdens, about franchise conditions. Their function is as a rule confined to rates and securities and in some instances to a measure of control over service.

All political subdivisions of the state are extremely

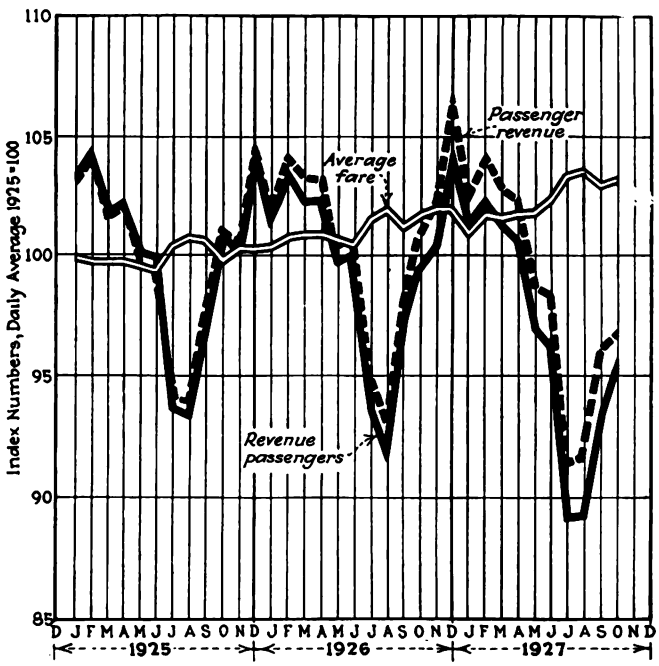
Digitized by Google

jealous of their home rule powers, and the tendency of the day in our large cities is to curtail the powers and functions of the state commissions in matters affecting the city's destiny. As a consequence we find in rate proceedings the city attorneys quite regularly opposing and fighting the transportation utility, and the commissions' decisions often represent a middle course between the claims of the company and those of the city. It is true that here and there we find a notable exception to this rule. In the Los Angeles street railway rate case the city attorney in the hearing before the Railroad Commission made this statement:

Certainly we have no desire to be put in the position of denying to the company anything to which it is validly entitled. It is true, Dr. Wilcox has frankly stated on the stand that in his opinion the company is entitled to approximately $1,000,000 additional revenue. If the commission thinks and its engineering staff feels that they have gone sufficiently into the operating expenses and all of the other elements going to make up a rate to agree that the company is now entitled to an additional revenue of $1,000,000 on an annual basis, then assuredly this company is entitled to relief. As to whether or not they are entitled to an interim rate it seems to me depends upon the question of how soon we may reasonably come to a final conclusion in the case. I think it is undesirable to have an interim rate if a final rate can be arrived at speedily. If it is going to take six months to arrive at a final conclusion in the case and if we agree that they are $1,000,000 per annum under a fair return, then we would be asking that they be mulcted in the sum of $500,000 if we object to an interim rate. We are not in that position.*

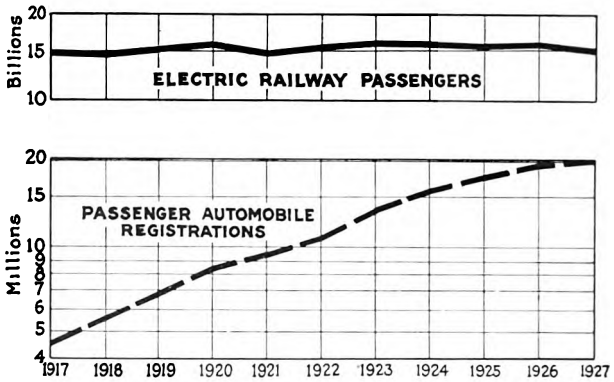
**This statement was made on May 28, 1927; the rate case is now in the federal court and the company has not yet been granted any rate increase above the old 5-cent fare.*

When the fact is kept in mind that the health, stability and growth of all kinds of business, of property values, of the convenience of almost the entire city's population and even of their safety and general well-being are so largely affected by the mass transportation service, it is difficult to understand any blind and unreasonable attitude of antagonism towards the agency providing this vital necessity and utility. If trouble is



Trend of traffic fares, revenue passengers and passenger revenue of 134 electric railways, 1925-1927

These curves, also prepared by the A.E.R.A., show that although average fares have increased steadily, passenger revenue has continued to decrease.



Electric railway traffic and passenger automobile registration trends, 1917-1927

Figures show that electric railway passenger traffic has not been affected materially by the enormous growth of automobile registrations.

taken to scratch the surface it will be found that such antagonism in fact does not exist. Where it appears it rests and fattens upon misunderstanding. It survives as a tradition from days that are dead and gone; days before there was such a thing as effective regulation.

The real interests of a big city and its transportation agency today coincide and are mutual, not antagonistic. This is a fact that must be made clear to the public and to the authorities, and the task is for the transportation utilities. Means should be created in all large cities to make it possible for such mutual interest to function properly. The provisions for joint investigation and joint hearings in the 1920 Interstate Commerce Commission's act, making it possible for state commissions and the Interstate Commerce Commission to act together in matters of joint jurisdiction and of joint concern of the nation and the states, may be taken as a pattern for the state and its subdivisions.

Fare Plans of America and Europe Differ Widely

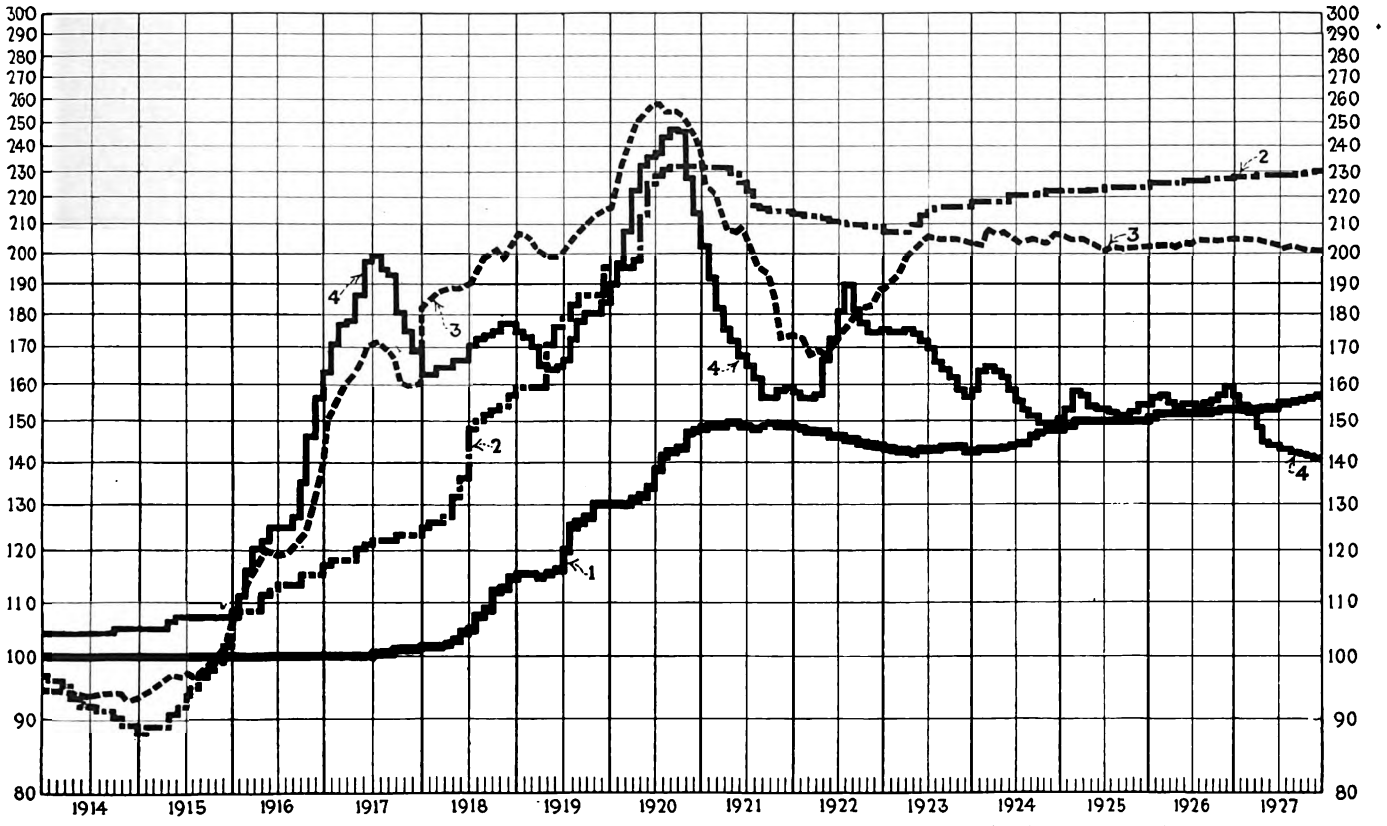
American cities and street railways have developed largely under the mass transportation program of a flat city-wide fare, and they have not as yet come to a general acceptance of the zone system that is the almost universal rule in European cities. There is, of course, nothing fundamentally wrong in either plan. Each scheme has its advantages and disadvantages. In any given case the plan best suited to the individual need should be adopted. It is not accident, however, that has led to the differing schemes of rate structure in the old world and the new. Conditions of living and of work and of business are not at all alike. No European city is as definitely divided between working quarters and living quarters and between business and home as are our large American cities. The differences between peak and off-peak traffic are not as great in European cities, and the peak hours are not as short and as clearly defined.

Subdivision and suburban development have not been nearly as pronounced and unhampered and rapid as with us, and home building, even before the war, was limited compared with American home building development and has always been a difficult undertaking for the European family of moderate income. A powerful influence has been exerted by these conditions upon the rate systems, and the tendency has been toward fares based on distance and towards numerous small zones.

In America the trend has been in the opposite direction, towards expansion, simple rate structure, no zones,

Digitized by Google

a city-wide flat fare. This general rate plan has great advantages from the public point of view. Judging the practical and the possible by the ideal, the most desirable scheme for the rider and the city would be unlimited transportation, free of cost, throughout the territory served by the system. The next best thing, cost being an unescapable evil, is unlimited transportation within the city at a very low cost. As long as the nickel fare was capable of meeting the cost, no one urged a division of a city into separate fare zones. Only as flat fares increased to 7, 8, 9, 10 cents did the advantages of a low fare zone system begin to outweigh the advantages of a higher flat rate schedule. A conclusion may



Trends of fares, wages and construction costs, 1913-1927 (1913-100)

1. Street railway fares in U. S. cities (Richey); 2. Electric railway wages (Richey); 3. Electric railway construction costs (A.E.R.A.) 4. Electric railway operating materials costs, including fuel for power (Richey)

be drawn from this state of facts: a small increase of a flat city-wide fare, such as from 5 to 6, or from 6 to 7 cents, is from the public standpoint preferable to a zone system. In theory it may appear as of little concern to a utility whether a needed amount of revenue is produced under one rate structure or another. The theory may prove fatal if put to the test. A tariff out of tune with the public's desire, convenience or need is bound to be destructive of the public's good will, regardless of the revenue it may at first produce.

Many Different Factors Affect Fare-Zone Systems

In a zone system of fares distance becomes the controlling factor. Distance and time in city mass transportation service are usually functions, one of the other The question is whether today these functions can and should control the rate schedule. It is certainly true that alongside of length of haul entirely different factors should today be considered, factors emphasized by present-day conditions; such as regular or intermittent use of service; wholesale or retail buying; peak-hour or off-peak demand; special sales. And it is possible that the new factors have grown to a size where they outweigh in importance the considerations of distance and time. In spite of the obvious and overwhelming evidence there is still a lack of appreciation of the profound effect of the automobile on mass transportation in American cities. The change has come overwhelmingly and suddenly. There was a time when everyone rode the street cars and when street car riders could be divided into two classes: those riding from choice and those riding from necessity. The proportion riding from choice, for pleasure mainly, was fairly large. One effect of the automobile has been that today there is no appreciable percentage of street car patrons who ride because they want to. People now ride because they have to. In other words, practically all mass transportation is now necessity riding. This fact, if it be a fact, is most important from the standpoint of the rate structure.

The necessity riders, certainly not less than 90 per cent of the total, are either regular riders or occasional riders. The regular riders constitute the financial backbone of the mass transportation business; they furnish by far the largest part of the revenue. The occasional rider is also a necessity rider and represents a considerable percentage of the total traffic, from 15 to 30 per cent perhaps, depending on conditions. When classified in this manner, in the larger cities (of more than 100,000 population), we may safely estimate on the basis of 60 to 80 per cent being regular necessity riders, 15 to 30 per cent occasional necessity riders and 5 to 10 per cent riders from choice.

The question is whether there is soundness and fair-

Digitized by Google

ness in a rate structure that charges to each of these riders the same price for a similar haul as far as distance, time and accommodation are concerned. In electric light and power, water, gas and telephone rate making it is a cardinal principle that the service rendered is twofold: the readiness to serve and the product itself. The service charge with these utilities is so definite and recognized as fair that in one form or another it is without question incorporated and accepted in all rate schedules. It is obvious that in communication or in water service there has been a cost incurred, a service rendered and value delivered as soon as the necessary equipment is installed and ready for the potential customer to use, whether he makes actual use of that equipment or not. The house would not be liveable and would not sell without water service, even though the house stands empty. The apartment would not rent, the business would go bankrupt without lighting, without telephone facilities. But if much water is used, much telephoning done, great quantities of power consumed, the cost per unit drops and so does the charge, the rate. The standby charge where reasonably large use takes place may become insignificant and almost disappear in the bill, but it is there. And that is as it should be and accords with equity and fact.

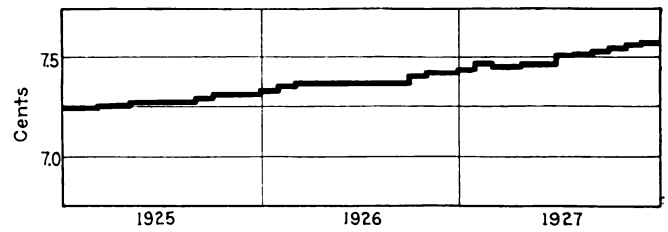
Wherein does mass transportation service differ in this respect from the other utility services? It does not differ. The standby and ready-to-serve portion of the total service is, if anything, more pronounced and more valuable. Much has been said of the effect of availability or non-availability of mass transportation on business, land and building values in our large cities. However much may be said, the effect is likely to be underestimated. In addition there is the effect on the earning power and well-being of every individual in every large city; the effect on time and on space. Truly is it said that the mass transportation system is to a city what the circulatory system is to the human body.

The obvious conclusion to be drawn for this state of things would seem to be this: It is unsound and unfair to put almost the entire burden of the cost of this readiness to serve the entire city and its entire population at all times upon the regular necessity rider and let the occasional rider and the rider from choice to go scot-free. And this is what our present rate structures come to in the majority of cases. The situation is aggravated, from the point of view of the city's economic and social interest, when the fact is kept in mind that the regular necessity rider in the main represents the part of population least able to bear any extra financial burdens and most in need of the safest, speediest and most comfortable mass transportation service and least likely to get that kind of service because he must, of necessity, ride during peak hours.

Relation of Customer to Seller True Basis for Rate Structure

The argument of this article, based on the considerations merely touched upon, is that today's rate structures of mass transportation utilities should be based primarily not on distance, nor time, nor approximations of cost of various services, but on the relation, in regard to service taken and received, of the customer to the seller. If the buyer be a regular, wholesale, dependable customer, making possible the city-wide regular service available to all, then he should benefit accordingly and a rate structure should be devised, if possible, giving him the best possible service at the absolute minimum of cost. On the other hand, the irregular, retail, occasional patron, nevertheless a buyer not from choice but from occasional necessity and whom the transportation utility stands ever ready to serve, should pay for the service he demands and receive not the lowest, but the highest possible rate, the upper limit being an economic one and calling for a rate that will still be advantageous for the occasional rider to pay. There need be no discrimination and the occasional rider should always have the opportunity to avail himself of the lowest rate on the same terms as the preferred regular customer.

In a number of communities throughout the United States rate plans and experiments have been proposed by transportation utilities reflecting such considerations. The commissions have only rarely been willing to permit a full test of a rate schedule on such a basis. As a rule an "intermediate rate" is ordered into the tariff, wiping out a clear distinction between the lowest possible rate for the regular rider and the highest possible rate for the occasional rider. Such intermediate rates not only prevent the possibility of a fair test, but also take away any incentive on the part of an occasional rider to transfer himself into the low-fare group of the regular riders. And so to a large extent the second main purpose of such a rate plan is defeated: the possibility of "selling wholesale low-cost transportation" to every potential rider and to bring the use of the mass transportation system to its maximum capacity and efficiency.



Average street railway fares steadily climbed through 1925, 1926 and 1927. In 1913 the average fare was 4.8425 cents; at the end of 1927 it was 7.57 cents

Attempts to put into effect rate schedules built squarely on such basis are still comparatively rare. However, three important electric railway rate proceedings, dealing with rate structures, have for a year or more been before the California Railroad Commission. They concern the rates of the largest urban and interurban mass transportation utilities of the state: the Pacific Electric Railway, the Los Angeles Railway and the Key System Transit Company. In all three cases the question of the rate structure was a major issue and the problems of zone systems versus city-wide fare, regular and occasional patron versus no differentiation in riders, peak versus off-peak riders, flat rate versus reduced rate and weekly and monthly pass, distance commutation ticket versus flat commuter rate, were before the commission for decision. Exhibits, testimony and discussion on the part of utilities, cities and commission experts was extensive and protracted. The California Commission in its several decisions reached certain conclusions and made certain pronouncements which may be interesting and of value to the entire industry and, whether there be agreement or disagreement, may assist in pointing the way. Accordingly, the decisions in these three rate cases will be reviewed in a subsequent article to appear in an early issue of the JOURNAL.

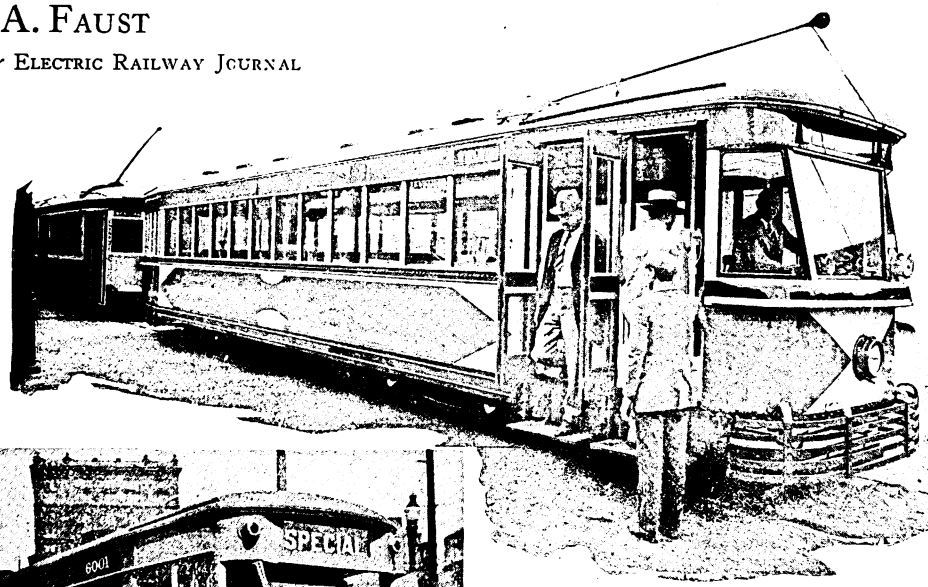
Recent Steps in Car Development

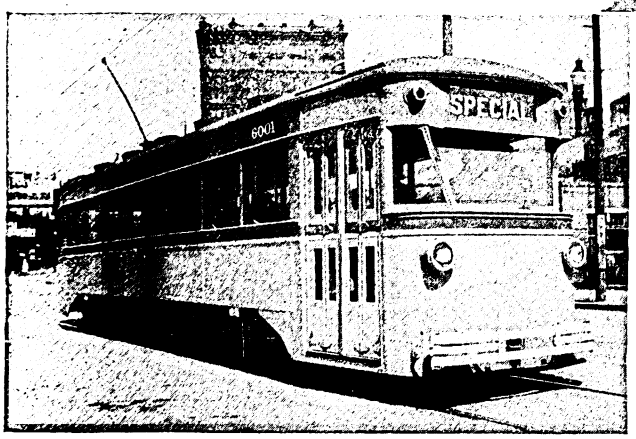
Where Are They Heading?

BY
CLIFFORD A. FAUST
Assistant Editor ELECTRIC RAILWAY JOURNAL



The sloping front window and the spring bumpers on both front and rear of the cars built for the East St. Louis & Suburban Railway show the influence of the automobile.

The latest cars to appear with many radical departures from conventional design were the two Pittsburgh experimental units shown at left.



ACTUAL developments in recent cars indicate a decided trend toward the creation of speedier and more comfortable vehicles designed to attract electric railway patronage

DYNAMIC braking, regenerative heating, remote control, roller bearing axles, automotive drive, high-speed motors, deep-cushioned, bucket-type seats, inclosed vestibule cabinets, sloping windshields; these and many other radical ideas in electric railway cars have made their appearance in such a comparatively recent period and have been presented in such rapid order that many railway men have lost trace of the important changes. It would be well, then, to analyze the developments, gain a picture of what has happened recently and determine just where these developments are heading.

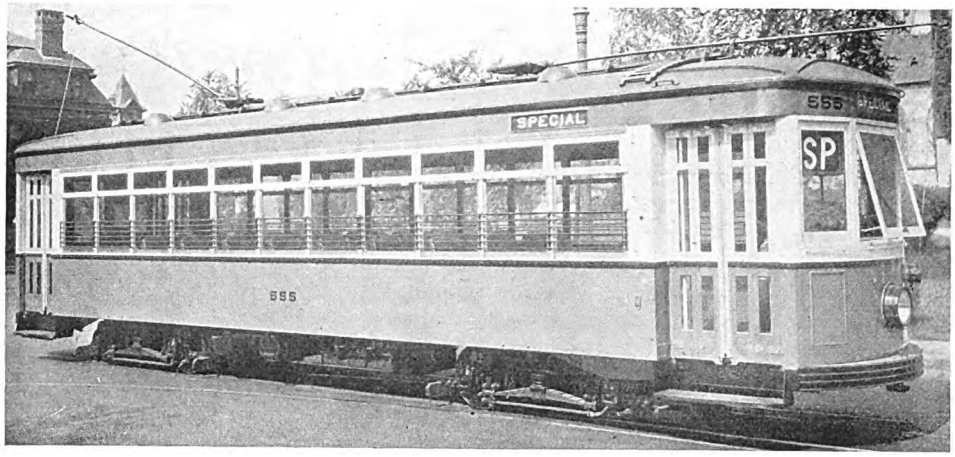
The list of recent cars showing important departures from conventional practice is a long one. It includes the Grand Rapids cars, the high-speed interurbans built by the Cincinnati Car Company, the Springfield and the Chicago & Joliet experimental cars, the Cleveland Railway aluminum unit, the Houston interurbans and the cars for the Houston Electric Company, the East St. Louis rail sedans, the Brill 1928 model, the Pittsburgh experimental cars and the sample car of the Osgood Bradley Car Company for 1929. These have appeared in such rapid succession that it has been difficult to follow the distinctive trends. Each car had several outstanding new features of design and some of them incorporated many ideas never tried before in electric railway equipment.

Both city and interurban cars have shared in this development and some of the present models are radical departures from their predecessors. The chief objective in all of the new cars was to increase their attractiveness to passengers with an ultimate view toward greater revenue. They were built to operate economically, but more attention was paid to making them attractive, comfortable and sturdy vehicles to meet present-day competition and to attract more riders. This represents a definite move by the industry to regain its lost patronage and to meet the competition of the automobile. The industry has taken very definite steps to improve its product and present indications are that this progress is to continue.

Before venturing any speculation as to what the cars of the future may be, it is well to review briefly the individual developments in the recent cars that have contributed toward the creation of a more salable transportation product.

Perhaps the most desirable characteristic of any transportation vehicle is speed. In this day, when people

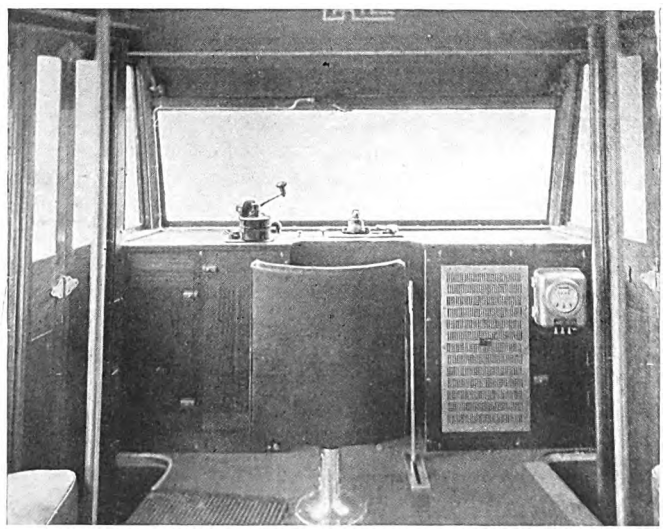
Digitized by Google



In the Springfield-Worcester cars, manufactured by the Wason Manufacturing Company and the Osgood Bradley Car Company, particular attention was paid to obtaining a streamline effect in the body design and color scheme

figure the time required to get from home to office down to the minute, it is necessary to provide an unusually fast service to retain and attract riders. In almost every new car that has made its appearance speed has received particular attention. Rates of acceleration and braking have been increased considerably and cars have been made lighter by using high-speed motors of less weight and by using aluminum and duralumin in the bodies. The aluminum body car of the Cleveland Railway weighs only 30,300 lb., which is 12,900 lb. less than the company's standard car of the same dimensions. A six-wheel unit, using aluminum extensively in the frame, was developed by the Versare Corporation and was placed in service in Grand Rapids. Only recently the St. Louis Public Service Company acquired a number of cars with duralumin frames.

For many years little was done to increase the acceleration of cars. In recent design, however, much attention has been paid to getting higher acceleration and braking rates, and as a result many changes have been made. Lighter weight for given motor capacity, of course, has contributed toward higher acceleration. But the most significant move has been the development of the high-speed motor and automotive-type drive.



It has been possible by the use of remote control fully to inclose all platform equipment. This view of the vestibule of the Brill 1928 car shows the neat effect obtained

The method of suspending this type of motor permitted the use of higher armature speed and therefore gave materially lower weight for a given capacity. This equipment also made possible the use of smaller diameter wheels.

Fully as important as the acceleration rate in giving a higher average speed is the retardation or braking rate. Many entirely new types of brakes have been tried on the recent car models. One of these is the internal expanding automotive-type brake developed by the Timken-Detroit Axle Company and used on the new type trucks of that company. Automotive-type brake diaphragms, actuating conventional brakeshoes on the wheels, were used on one of the two Pittsburgh experimental cars and on the Osgood Bradley sample car.

Dynamic braking is being tried on the Chicago & Joliet car. It also is included on the Pittsburgh experimental units. In addition, a number of the recent brake equipments are electro-pneumatic, to eliminate piping in the vestibule and to eliminate time lag in application. The variable load device of the Westinghouse Company, though not classified as one of the more recent developments, has nevertheless been included on many of the new cars to permit more uniform braking and consequently faster braking rates.

Combination air and magnetic track brakes of the Cincinnati Car Company are used under some of the light-weight, high-speed interurbans developed by that company and also under city equipment, notably in Lexington, Ky. Although the idea of track brakes is not new, this application in combination with air brakes and the safety car brake equipment is distinctive. The magnetic shoes are actuated directly from the trolley and controlled through the M-28 brake valve in combination with the air brakes. The stopping distance has been decreased in tests from 21 to 46 per cent in comparison with air brakes alone.

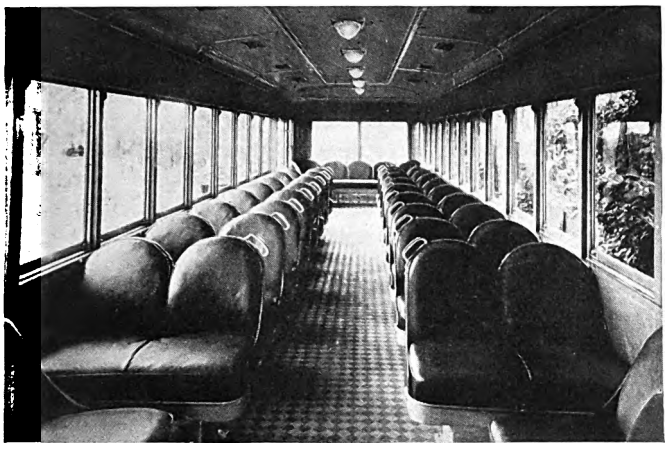
Steps to Increase Passenger Comfort

Many refinements have been included in recent cars to give a more comfortable ride. Most of the recent cars incorporate deep-spring, leather or plush upholstered seats of the bucket or semi-bucket type. These are in sharp contrast with the types of seats which were standard for many years.

Aside from improvements in the seats themselves, there have been some radical changes in seating arrangements. The Pittsburgh Railways has been experimenting for some time with seating arrangments and, in its two most recent cars, located the bucket type seats in single rows along the sides of the cars at an angle of 45 deg. A similar plan is being tried by the St. Louis Public Service Company. This arrangement gives a greater degree of individuality and provides wide aisles for handling passengers in the rush hours.

Other important factors in securing comfort are good heating and ventilation. Although car heating and venti-

Digitized by Google



Twin, leather-upholstered seats, a wide aisle and bowl illumination give the interior of the Joliet car manufactured by the Cummings Car & Coach Company a restful atmosphere of comfort and dignity

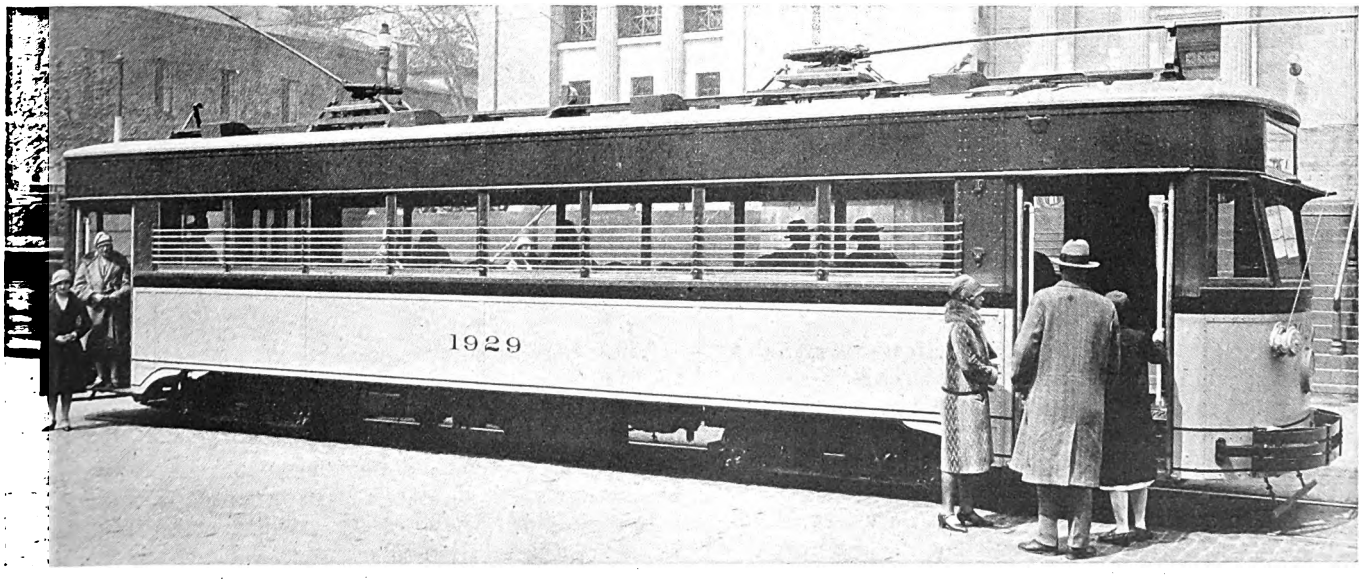
Bucket-type seats in the two Pittsburgh experimental cars are arranged in two single rows at an angle with the car side, giving the passengers an air of individuality. The long side windows are another innovation

lation have been developed to a high standard of performance for a number of years, the most recent step is the utilization of the heat available from the starting resistors. In some of the recent cars these are located within the body and in a number of instances, as for example in the Joliet and Pittsburgh cars, the energy from dynamic braking also is utilized for heating.

Noise always has been associated closely with the old-type street cars. It was not until the private automobile became popular that this subject began to attract serious attention. The demand for more quiet cars has resulted in the use of many noise absorbing and reducing devices and designs.

Perhaps the most significant step in noise reduction has been the design of trucks using high-speed motors and the several new types of drive. On these the motors have been suspended from the truck frame instead of from the axle. This has produced a considerable reduction in noise, particularly over special work and joints. Rubber shock insulators are being used for the elimination of many incidental noises. Springs of different design and considerably longer than the usual type also have contributed to easy riding and reduced noise. Chattering brakes and clanking brake rigging have always been very annoying. Many changes from conventional brake design have been tried with a view toward reducing noises. The most important of these are perhaps the several designs of automotive-type brakes and special brakeshoe materials. The use of brake diaphragms directly connected to the operating mechanism in place of the conventional cylinder and foundation brake rigging has eliminated many of the sources of noise in rods, levers and pins.

Gears, wheel flanges and trolley wheels are other sources of objectionable noises. Mounting the trolley bases on springs largely eliminated the trolley wheel noises within the two Pittsburgh experimental cars. Gear ringing has been reduced by the use of asphaltum pads bolted to the web sides, rubber pads bolted to cast-steel wheels through cored holes in the webs, and filling hollow webs with special material. A recent development by the Tool Steel Gear & Pinion Company includes the use of sound-deadening metal poured into grooves cut in the steel gear.

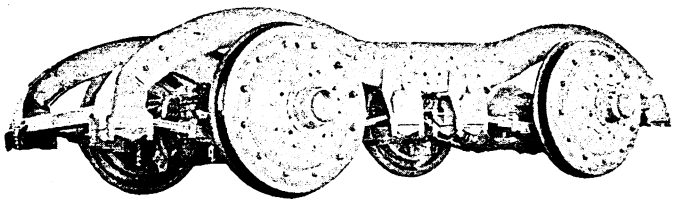


Pleasing appearance, quiet operation, rugged construction and low maintenance cost were objectives of the Osgood Bradley Car Company in the design of its sample car to meet 1929 transportation requirements

Digitized by Google

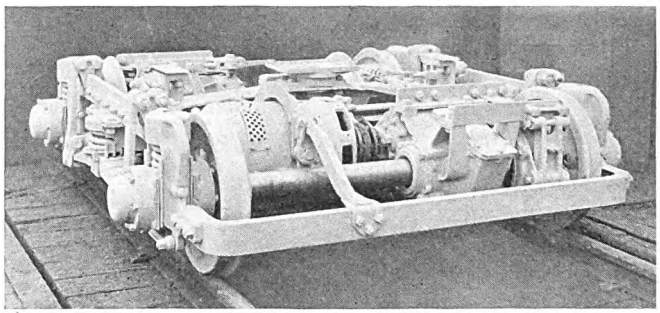
In addition to reducing the noises underneath the car floor, special materials are being used to insulate the car interior from truck and rail noises. Several materials have proved effective for this purpose.

Making the cars more convenient to use is an important part of the industry's general merchandising program. Special attention has been given to destination signs in many of the newer models, an excellent move in securing new patronage. Although low floors have been an objective of the designer for many years, the previous limits have been dropped even further through the use of high-speed motors with new types of drive. The Brill 1928 car with 22-in. wheels has a floor height of 28¾ in.



The Chicago & Joliet car trucks, developed by the Timken-Detroit Axle Company, have semi-elliptic springs, high-speed motors and automatic-type drive. Spring-suspended motors, less noise and less weight are advantages of this design

and requires only two steps. In other models where three steps have been necesary, the first step has been made as low as possible. Automatic, treadle-operated doors have been almost universally adopted on recent cars. This is because most of the experimental cars are arranged for one-man operation.



Spring suspended motors, small wheel diameter and quiet, oil-inclosed gearing are obtained with the Westinghouse W-N drive as shown here on a Brill truck

Within the cars, several improvements have been made for the convenience of the passengers. Windows that do not open easily are a frequent source of annoyance to passengers. To obviate this, in one of the new cars, balancing springs to counteract the weight of the window were installed.

Car Appearance Has Been Greatly Improved

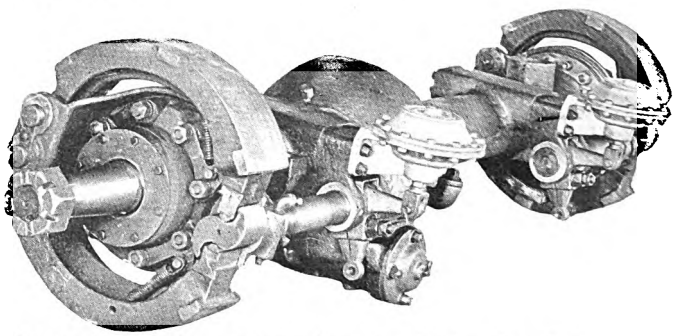
The previous discussion has dealt particularly with the developments that have contributed toward greater speed, comfort and convenience. Realizing that most people "judge a book by its cover" recent car designs also have given particular attention to improving the exterior appearance. In general the cars have been made lower and more racy, with fewer sharp angles and curves and more attractive color schemes. The effect has been increased by painting the cars to accentuate streamlines, and by using long windows and lower-arched roofs.

Many traces of automobile design are found in the new street cars. This is particularly true of the car fronts with their two headlights, spring bumpers, sloping and large, one-piece windshields, window wipers and sun visors. The general effect represents a considerable departure from previous street car standards. The use of gaudy colors on the car exteriors is gradually giving way to more harmonious color schemes.

Car interiors, for many years given only passing attention, are now receiving intensive study. They have been made more pleasing by the use of dome lights, attractive finish and colors, long side windows, floor materials of inviting design and leather and plush upholstered seats.

Remote control of both motors and brakes have eliminated much of the bulky equipment formerly carried on the car platforms. In most of the new models the remaining equipment has been inclosed in very neat cabinets so that the vestibules are fully as attractive as the remainder of the car. The substitution of copper and aluminum tubing for piping not only has decreased the labor of piping installation and repair, but also has made it possible to eliminate much of the exposed piping.

There are many other developments that have not been mentioned. From those that have been included, however, it is not difficult to analyze the present trend in car design. Car operators are seeking worthy rivals for the automobile. Recent progress indicates that street cars can be successfully developed to compete in comfort with the automotive vehicle. They are seeking speedy cars with which to meet the public's demand for rapid transportation. Faster schedules are easily made with some of the more recent models. They are seeking quieter cars. Present progress indicates that quietness is not incompatible with speed and operating efficiency. They are seeking better appearing cars. Present progress indicates the possibility of including beauty in the car designer's art. More comfort, faster operation, quietness and appeal to passengers; these are the objectives of present trends—to say nothing of increased efficiency and economy.



Internal expanding automotive-type brakes installed on the Springfield experimental car. The brake shoes are of special bronze composition and are actuated by a cam shaft

The progress so far made whets the imagination of transportation men. The street car is undergoing a metamorphosis from an ugly and noisy thing of utility to a beautiful and quiet transportation vehicle in keeping with its surroundings. The coming convention promises to develop even more startling evidence of this trend than is provided by those cars now available. The trend is toward the creation of a more salable product. The modernization era is paving the way for the merchandising era which is just getting well under way.

Selling the Car Rider *In Print*

BY

LABERT ST. CLAIR

Director of Advertising
American Electric Railway Association

Modernization in the electric railway industry is not being confined solely to cars. There also is a marked modernization movement in transportation advertising and selling

STRIPPED of all mystery and bunk, advertising is simply selling goods on paper. Fortunately for the local transportation industry, real salesmanship rapidly is replacing mere institutional or good-will advertising in local transportation copy. Local advertising managers are striving earnestly to induce the public to

Induce the public to climb on electric cars and buses

climb on electric cars and buses rather than to climb on the public utility good-will band wagon.

The foregoing must not be taken as a criticism of good-will advertising. Certainly it has a very definite place in the scheme of selling. There was a time, some eight or ten years ago, when it very properly dominated all local transportation advertising copy. The reason for this was that the industry had not been an advertiser, had suffered many reverses which the public did not understand, was giving a poor quality of service and therefore was in no position to try to sell rides. The initial problem was to get the public in a favorable frame of mind. To accomplish this it was absolutely necessary to devote at least nine-tenths of advertising space to informational or good-will advertising.

Now that the public understands the industry's problems quite thoroughly, improved service is being given generally and the problem is to get the people on the cars, the ratio of sales advertising to good will might well be reversed. Nine times as much copy for selling as for good will seems to be about the proper ratio.

When I speak of copy I use the term in the broadest meaning. This refers not only to newspaper space but also to company mediums, billboards and other channels. The idea that you are not advertising unless you are paying a high rate in some daily newspaper is erroneous. While the advertising section of the American Electric Railway Association thoroughly indorses newspaper advertising and believes that the proper sort of copy used in the daily press will bring returns, it also urges all companies to make the best use of their own channels.

Before discussing in detail current changes in copy styles, I want to go behind the prepared copy and note the encouraging change in organizations with respect to co-operative selling effort. The fact that the industry as a whole is recognizing the necessity for co-ordinating the efforts of all departments in any selling campaign and not depending on advertising alone to bring out success is a definite sign of progress.

Time was, and not so many years ago, when the advertising department of many an electric railway was regarded as a none too beautiful stepchild; in truth, advertising was looked on in many organizations as a rather necessary evil which might possibly bring in some returns, or a left-handed job for somebody to take care of when there was no such important thing as buying the correct grade of gravel to be disposed of. I recall very distinctly having gone to the Middle West some six years

A none too beautiful step child

ago to aid a company on the verge of bankruptcy in preparing an advertising campaign and being unable to obtain more than a few minutes of the general manager's time because he was busily engaged in buying a couple wagonloads of gravel. He argued over the gravel for something like half a day and devoted a few minutes at lunch time to his advertising problem. Later there was a change in management and the new head of the property thought it worth while to come to New York and spend two days looking over all the electric railway advertising that the association had gathered in recent

Digitized by Google

years. Fortunately, the former sort of a manager is not much in evidence nowadays.

It should be obvious to everyone in the industry that traffic cannot be increased unless the selling effort is co-ordinated from scrubwomen to presidents. Any sales campaign will be just as weak as its weakest link.

Back of all selling, of course, must be good service as well as co-ordinated personnel management. This is proved in other lines every day. It is being proved right now in the national political campaign. If you recall, one of the first things that the heads of the two outstanding national committees announced was that they would try to sell their political goods on merit and not by knocking the other fellow's products. It remains to be seen how far they will go in carrying out these promises, but undoubtedly the theory is good. In selling anything, whether it is candidates for political office, pumpkin pie or electric railway or bus rides, the best sort of salesmanship is to sell your own service and not try to run down the other fellow's. This paragraph is injected at this point purposely to discourage in the beginning all types of "knock" advertising. There has been entirely too much of it in the local transportation business. The sooner it is killed off altogether, the quicker business will begin to grow.

Advertising Is on the Increase

The volume of local transportation advertising is increasing greatly. Only recently the association obtained reports from some 400 of the largest cities in the United States in regard to advertising and non-advertising companies and the growth was appreciable. It is impossible now to tell just how much is being spent actually for advertising and selling, but a year ago the annual expenditure was about $6,000,000. That represented a growth of about $1,000,000 a year during the last six years, and it is the advertising section's belief that the growth during the last year has been up to that of former years. If this is true, it is probable that about $7,000,000 was spent

Kill off the "knock" advertising

for all forms of local transportation advertising during the last year.

A request made several months ago for samples of advertising material to put in the association's loose-leaf folder brought about 10,000 pieces of local transportation advertising to A.E.R.A. headquarters. Some 2,500 pieces of copy were selected and reproduced in the loose-leaf folder. This supplement to the original folder of 2,500 pieces of copy now has been sent out. As a result, there is today in the hands of every electric railway company in the United States a folder containing some 5,000 pieces of copy. The most casual glance through this recent copy will show that the managements are stressing the three big sales points—safety, comfort and economy.

The stressing of the safety feature of electric railway riding has been notable during the past year. This is good business, and has been aided by several outside influences. For instance, motor car accidents are constantly on the increase. The national death toll is now about 25,000 a year and nobody knows how large the accident toll is. The result is that people generally are talking of the dangers of motor car riding, as well as the inconveniences, and it is good business to draw to their attention the fact that riding on street cars is safe. This sort of advertising also is productive of much

The comforts of electric car riding in contrast to driving an automobile

school riding. Parents want to see their children reach school in safety and, say what you please, the women of this country do have confidence in electric railway conductors.

It was interesting to note that out of several hundred pieces of copy submitted to the Public Utility Advertising Association's contest for the best piece of railway copy produced in the country last year, one referring to the services of conductors won first prize. While Mr. Storrs and myself sat on that committee, we purposely refrained from expressing any opinion as to what was the best piece of electric railway copy. The other men on the committees were representatives of power and gas organizations and advertising agencies. They were unanimous in selecting the piece of copy that stressed the safety of car riding and the personal service of conductors.

National publicity given to the fact that only one passenger out of 155,000,000 was killed by electric railways during the year preceding the granting of the Anthony N. Brady Award also was of great supplemental assistance to this type of advertising.

The comforts of electric car and bus riding in contrast to driving a private automobile in traffic have been strongly emphasized in copy. Here is a type of copy which illustrates the point made earlier in this article about selling your own goods on merit rather than knocking the other fellow. It is much easier, of course, to write copy pointing out the grief that comes to the motor car driver, but isn't it much better salesmanship to point out the comfort and happiness that comes to the user of electric railways? I do not mean by this that the discomforts of driving a private car in congested streets should be entirely ignored. In fact, one series of posters prepared by the advertising section this year dealt with that very subject. But one should not devote his entire time to hammering his keenest competitor, the private automobile.

Several million words have been used in discussion of whether it pays to advertise the economy of using public transportation. Personally, I believe that it is the weakest of the three arguments. Of course a penny

Digitized by Google

additional fare means a great deal when it is proposed to raise street car fares in any city, but a few pennies make very little difference to the fellow who owns a motor car. The fact that he has bought a motor car shows he is willing to go in for luxury. Economy of riding should be stressed only when it can be tied in with a definite selling campaign, such as books of tickets or tokens in

Locate sales stations in cigar stores

quantities. General dissertations on the economy of electric car riding are not of great value.

Right in connection with this phase of the situation it should be pointed out that local transportation companies are notably weak in supplementing their advertising with direct sales of tokens and tickets. There may be half a dozen street car or bus companies in this country that are thoroughly covering their territory in a sales effort to get tickets into the hands of their customers in quantities, but the number does not exceed that. Sporadic attempts have been made on a few occasions to make house-to-house canvasses, but this fertile field remains greatly neglected. We are still hopeful that some day companies will give their men, or members of their men's families, an opportunity to sell tickets and tokens on a commission basis and thoroughly organize their towns for this sort of persistent and regular salesmanship.

The least that companies could do would be to locate numerous sales stations in cigar stores and other convenient places. While some effort has been made along this line, the number of managements which have well-established, clearly-indicated and well-advertised sales stations for tickets or tokens is few indeed.

Consistent Efforts Will Win Recognition

The consistency with which companies are advertising is cause for congratulation. The only kind of advertising which really pays is regular advertising. This has been a difficult point to register with the industry, but it is getting over at last. Far too many companies have continued the old practice of using full pages when they were in trouble and nothing when they were on "Easy Street." The tendency is growing, however, for companies to change their copy regularly and to make it interesting. This is especially true in the use of car posters and company leaflets. Most of the companies using these mediums nowadays change them on a regular schedule. Newspaper copy also is being used more frequently. The old type of huge electric railway advertisement which was mostly white space and large type is disappearing. For this everyone should be profoundly grateful. Likewise, the illustration which had nothing whatever to do with the text has passed out also. A great many companies are making good use of their local artists and advertising agencies in the preparation of real selling copy which is well displayed typographically and which has illustrations that fit the text.

A striking illustration of this point is found on a mid-Western property which is trying to sell the token idea. Some genius on the property in looking a token full in the face recognized the fact that the corners of its mouth turned up. Therefore he began to use the slogan, "Even the Token Smiles at You." This kind of advertising is mighty hard to beat. The great trouble is that on too few properties do the men care who are writing the copy, or the executives who are passing on it look about with clear eyes to see what they can sloganize or dress up with a local appeal. There is something on practically every property which will lend itself to such treatment. The way to find it is to look around. Nobody at national headquarters, or no one in an adjoining town or state, can see the thing on a local property which will attract attention, but the man who is sitting on the lid can if he will just look carefully.

Fewer words are being used in copy than formerly, a distinct evidence of progress. The advertising man who can get one idea across in a single advertisement has done a good day's work, and there are very few single ideas that cannot be expressed in a hundred words. Many of them can be expressed in less than that. The writer got a genuine thrill during the year in having a hand in one campaign of 25 pieces of copy none of which carried more than ten words. The illustrations and a few words told the whole story. And, fortunately, the management for which the copy was being written was willing that the copy writers should stop when the story was told.

One reason why it was possible to write this campaign in so few words was that the management selected one man to pass finally on the copy and stood by his selection. Two heads may be better than one in a great many things, but few things are worse than a hydra-headed copy committee. It is no wonder that many copy writers prefer jumping into the river and ending it all

Even the token smiles at you

rather than submitting their efforts to eight or ten different men on a property.

A new departure is the use of the rotogravure section. This is very expensive advertising, but is good, especially if you have a de luxe proposition to offer. In the introduction of new coaches or buses, the opening of a new line or anything else that smacks of a classy improvement, the rotogravure sections are very good indeed. They are not recommended for use in connection with the discussion of your current tax problems, or similar weighty subjects.

Experiments with the radio for advertising purposes have been somewhat broad during the last year, about a score of companies using it. Opinions differ on the value. About a dozen companies believe that the radio is worth while; the remainder are not sure. It is a notable fact

Digitized by Google

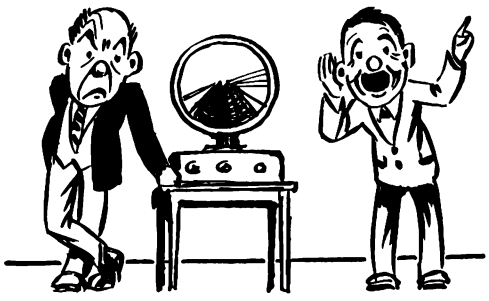
that the largest electric railway broadcasting station, WEBJ, conducted by the Third Avenue Railway, was discontinued recently on the company's own initiative. The company felt that it received good value for its money, but it was not disinclined to give up the radio when there appeared a public need for its space. A very enlightening and interesting article on this subject was

Few things are worse than a hydra-headed copy committee

written by Miss Mary A. Burke of the association staff and printed in the July issue of *Aera*. In it she dealt in detail with the different stations. It would be worth while for anyone interested in radio advertising to read this article.

Generally speaking, it is the writer's opinion that for local transportation company purposes the regular use of the radio as an advertising medium does not warrant the exceedingly high cost. This does not mean that the radio does not have advertising value in many lines, but local transportation companies, with limited advertising appropriations, probably could use their money more advantageously in other ways.

While on this subject of economical use of advertising appropriations, it might be worth while to suggest a survey of every electric railway to determine if all company channels are being used to the utmost. This form of advertising is the cheapest and best possible. Window signs, leaflets and company publications, signboards and other mediums cost very little in comparison to newspaper, radio and billboard advertising and they yield mighty big returns. The grass in the other fellow's pasture always looks mighty interesting, but frequently we are trampling clover filled with sustenance under foot when we are gazing across the landscape. Watch your own channels.



Opinions differ on the value of radio

Real progress is being made in the use of movies and still pictures. Movie development has been slow in the industry and there has been a good reason for it. For a long time it was almost impossible to get a constructive suggestion from a movie man regarding anything that would be helpful to the industry. I remember on one occasion when a widely-known director came to association headquarters and suggested the expenditure of $8,000 on a film built around a scenario with a very deep love plot and which he regarded as a knockout. The high point of the scenario, as I now recall it, came where the hero motorman defeated the purpose of the wealthy street car magnate to get a franchise for nothing, and in addition, carried away his starry-eyed daughter and married her before a prominent justice of the peace. Other scenarios were equally bad.

During the last year, however, some commendable pictures have been made. The Chicago Surface Lines has produced three excellent films, and, with its usual generosity, has permitted the association to take prints of them for distribution throughout the industry. Likewise, the United Railways of Providence, the Birmingham Electric Company and the Chicago Rapid Transit Lines have been exceedingly helpful in aiding the advertising section to start a motion picture program. Thanks to this co-operation, the association at a very small cost has assembled about 25 different films, dealing with safety, the readiness of the industry to serve, traffic congestion, the comfort of street car riding, and taxation. These films have been offered to the industry at a low rental and have been shown more than 700 times since the last A.E.R.A. convention.

A large number of companies also have produced local

Every company should have a few films of local scenes

films which were helpful in their communities, but which could not be used nationally. Every company should have a few films containing local scenes. They are not expensive if care is used in the production of them. The best plan is to write a scenario on your own property, employ a local commercial movie man to make your picture and then cut it to suit yourself. Calling in an outsider to help you on a scenario usually is a waste of time and money, because he will get so much extraneous matter in it that you will have to do the job yourself anyhow. The best plan is to think out a simple story that you want to tell and then tell it in the fewest possible pictures. Don't make the mistake of trying to cover more than one subject in a picture, and confine your story to about 1,000 ft., or one reel of film. This will run from ten to twelve minutes, and that is about long enough for a propaganda picture.

There has not been the demand for still projection pictures which the association had hoped for. An arrangement was worked out whereby still films could be produced cheaply, but, for some reason, the industry did not accept it. Information regarding still picture production is on hand at association headquarters and will be furnished gladly.

Summarized, the year has been an encouraging one from an advertising and a selling standpoint. Better work is being done in many directions. The chief need is closer co-operation between all departments in unified selling.

Bus loading stand of the Penn-Ohio System at Central Square, Youngstown

Fact, Not Fancy

Must Guide in the

Use of the Bus

BY

R. N. GRAHAM

Manager of Railways
Penn-Ohio System, Youngstown, Ohio

ESTABLISHED transportation companies accepted the motor bus as a definite factor in city transportation eight years ago. The way for the new vehicle apparently had been blazed by the jitney, which originated on the Pacific Coast in 1913 and which within a few years spread over the entire country. The use of the jitneys, however, was a self-limited disease, as it violated fundamental economic laws. It was not economically sound for a community to support two transportation agencies performing the same work, nor was it sound to support the agency furnishing transportation to the smallest number of people.

Nevertheless, the jitney in the United States at least blazed the way for automotive mass transportation. The war produced a great development in the manufacture and riding qualities of motor trucks. As a direct consequence, with the close of the war some automobile and truck manufacturers pushed the use of buses and they soon became recognized transportation units.

In the beginning, the bus was looked upon in a great many quarters as the successor to the street car. The logic of those that took this view was simple and easy to follow. They argued that just as the electric car had succeeded the horse car, so would the motor bus supplant the street car.

Somewhat to the surprise of the unthinking public, there was no serious effort on the part of the established street railway companies to discourage the use of the motor bus. When the electric car superseded the horse car, it was not through the development of new transportation companies whose competition destroyed existing horse car companies; the same corporate organizations that had started their business venture with the

Digitized by Google

use of the animal-drawn vehicle gladly availed themselves of the new development. Similarly, the manufacturers of motor buses early found that the largest customers for the new vehicles were the established street car companies.

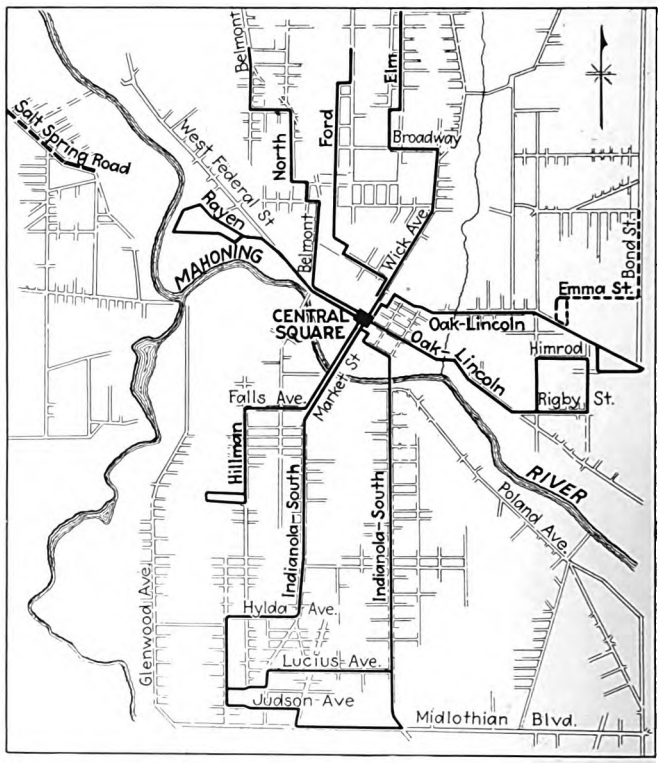
However, after eight years intensive development of the motor bus, it seems fairly certain that the bus is in no sense a successor to the electric car. There are many uses for the bus in urban transportation, but the day is distant and probably will never come when mass transportation can be given by the agency of the motor bus alone.

Today, practically every urban transportation company will find in its system a field for the bus and a field for the street car. To understand the proper use of each of these transportation mediums, it is necessary to devote a little attention to the changes that have come over the transportation business within the past decade and then to examine closely the characteristics of each of the vehicles available.

As late as ten years ago, for all except short distances, the vehicle of practically all inhabitants for carriage to and from their homes either for work, pleasure or business, was the street car. At the present day, a very large proportion of the families formerly so dependent upon public methods of transportation are supplied with private automobiles. The use of the private automobile by these families has not eliminated the need for public transportation agencies; it has simply altered the characteristics of these agencies.

Formerly the population of any given transportation line could be considered as dependent upon that line for their carriage. As the use of the automobile increased, the ratio of rides for each member of the population so served by a given line, decreased, so that the net effect of the increased use of the automobile is, as far as the transportation given is concerned, a thinning out or decreasing of potential customers on the line. This being the effect of the private automobile, let us see under what conditions the bus can best be used and under what conditions the street car can best be used.

There have been enough companies seriously engaged in the use of buses to determine with a fair degree of accuracy what costs may be expected of the two classes of vehicles. The use to be made of each type may be determined by these costs, unless there is a substantial difference in the number of passengers that would be attracted by the use of one as compared with the other.



Seven bus routes of the Penn-Ohio System are now serving the city of Youngstown, Ohio. The Emma Street and Salt Spring Road routes, shown by broken lines on the map, have been discontinued

Operating costs are definite and certain. If the use of the street car as compared with the bus in given situations depends upon these costs, the test can be made very simply. If there is a substantial difference in the number of passengers that will be attracted, it will not be as easy a matter to draw conclusions, as the question of attractiveness is more vague to reduce to specific figures than the question of cost. It certainly would simplify the problem of picking the place to use the bus and the place to use the street car if this question of attracting customers could be dismissed. It is my opinion, based upon years of what I believe to be close observation, that this consideration can be dismissed.

In the city of Youngstown in the year 1927, we op-

Queue loading of buses at Rayen High School

Digitized by Google

erated 3,663,680 street railway miles on nine lines and 2,129,217 bus miles on seven lines. Each of the lines extends to the center of the city and nowhere is any line competitive. On this property we also have a number of suburban street railway lines and suburban bus lines. In some cases the bus lines serve the same suburbs as the street railway lines.

After using the bus for six years, there is not one single factor that indicates that, the service being equal, there is any substantial preference on the part of the public of Youngstown for either the bus or the street car.

In the experience with our suburban lines, during the same period, there have been indications of marked preference, but in every case, when analysis is made, it is found that the preference arises from some quality in the service that is not peculiar either to the bus or street car and that there is nothing inherent in either the bus or street car that forbids this quality.

There are installations in cities in this country in which a double service is given over the same streets by buses and street cars and in which higher fare is charged on buses and they are being well patronized. However, even in these instances there are differences in service which are not necessarily inherent. Let us examine some of these differences:

1. As a general rule buses have been equipped with better seats and have been decorated a little more handsomely inside and outside than street cars. I believe it will be conceded that there is nothing in the dimensions or shape of the bus that makes it inevitable that it should have more comfortable seats or be finished in better quality than the street car. On the other hand, I believe it will be conceded that it is possible to equip street cars with very much more comfortable seats than it is possible to have on a bus and that they can be made as pleasing in external and internal appearance.

2. In some cases it has been found desirable to schedule buses at a higher rate of speed than street cars engaged on routes covering the same streets. Again, it will be conceded that the higher speed is not an inherent quality of the motor vehicle. With properly designed equipment and proper personnel, it is just as possible to acquire quick schedules on street cars as on buses.

On the Youngstown property, we have had every obstacle to a reasonable speed to be found on a city property; narrow streets, grade crossings, bridges, congested centers, experimental traffic regulations and all the other phenomena of this character so familiar to railway managers. In the year 1926 our buses had an average schedule speed of 9.3448 m.p.h.; our street cars for the same period had an average schedule speed of 9.0942 m.p.h. A considerable part of our equipment is Birney cars, which are not well adapted for use on certain lines. The substitution of modern, light-weight, quick accelerating cars for these Birney cars will bring the average railway speed up to the average bus speed.

Typical street car type buses at the loading stand in front of the Court House on Market Street

We have had on this property for the past year a splendid opportunity to test out fully just what the "rubber urge" really means when street cars and buses are competing under entirely similar conditions. The city of Struthers is situated 4 miles from Youngstown. The street railway line from Youngstown to Struthers is double track the greater portion of the distance. Service is given with modern, light-weight cars, one of which was on exhibition at the A.E.R.A. convention in 1926. These cars have rubber floors, dome lighting and comfortable leather seats, are operated on a snappy schedule and have been kept in good condition inside and out. The street railway fare is 10 cents, six tickets for 50 cents

Digitized by Google

or $1.50 for a weekly pass. The company also has a modern 29-passenger bus giving service between Youngstown and Struthers. The bus has the same type of seats, the same character of lights and the same general interior finish as the street cars on this line. As happens from the very nature of the bus, it is not as roomy as the street car; passengers are more crowded and while it rides well for a bus, it certainly does not ride as smoothly as the modern street cars. The bus makes the trip in slightly less time. The fare is 10 cents without transfer or ticket reduction. This differential in fare on the 4-mile trip produces the result that there is scarcely any riding on the bus. The number of passengers carried per day on the bus line is 105.4. The number of passengers carried per day on the car line is 3,000. Of course, this bus does not pay expenses. It is kept in service because the street car line crosses the Mahoning River on a bridge which some people claim is too light for such traffic and for this reason a certificate was given to a bus line some years ago, which certificate has since been acquired by this company.

Such an instance as this does not, in itself, condemn the whole theory of bus attractiveness, but it is the accumulation of such testimony as this that gives a definite indication that while there may be differences, and are differences, in service given by buses and by street cars in various places, there is no single fact connected with bus transportation that makes it inherently more attractive as a transportation medium than the street car and that it possesses no quality which can not be possessed in equal measure by the street car.

If the above argument is correct, the selection of the field for these two vehicles immediately is narrowed down to a merely economic consideration. The question then leaves the field of conjecture and is to be measured and decided by considerations on which, at this time, there ought not to be any real difference of opinion.

To afford anything like an equivalent basis of comparison, it must be assumed that the street car in every case is one-man operated. Transportation vehicle expenses are classified usually as direct operating expenses, depreciation, interest on investment and taxes. The direct operating expenses consist of maintenance of way and structures, maintenance of equipment, power, transportation and traffic, and general and miscellaneous. To make a proper rule for comparison, I will devise a classification that does not exist but which can easily be built up, as follows:

A

Maintenance of equipment.
Power.
Transportation and traffic.
Interest on investment, equipment.
General and miscellaneous.
Depreciation, equipment.
Taxes other than tax on way and structures.

B

Maintenance of way and structures.
Interest on investment, way and structures.
Depreciation, way and structures.
Taxes, way and structures.

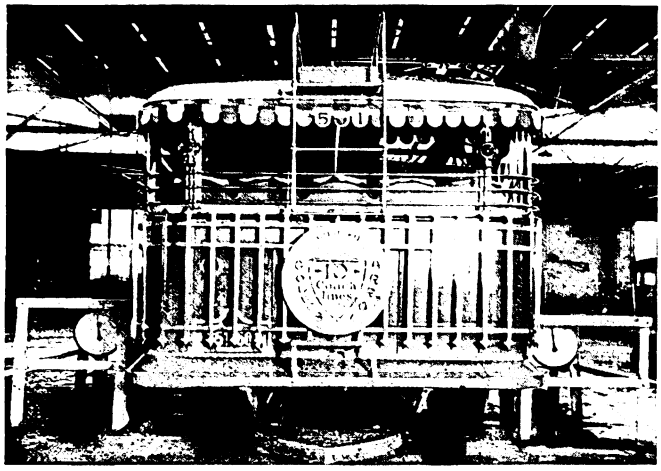
It will be seen that I have inserted in group A all of the expenses that are common to street cars and buses and in group B all expenses that are inherent in street cars alone. Examining the former, I believe it will be the testimony of all street railway managers who have had any length of experience with both buses and street cars, that the cost per mile of any bus large enough to be a factor in urban traffic, properly operated and maintained, is greater than the corresponding cost per street car mile.

Typical interurban coach of the system, used for limited service between Cleveland and Youngstown

Manifestly, with one-man vehicles, transportation expense, as represented by wages of operators, will be the same. The inspection expense of buses will be greater. The expense of maintenance of equipment will be greater in the bus than in the street car. The expense of power, as represented by gasoline when compared with electric power, will be approximately equal. Where there is a gas tax, the expense of tax on equipment will be greater. There is no reason for any difference in the general and miscellaneous item.

However, offsetting this fact, we have in the second group an expense that is not shared at all by buses. Before considering the effect of these expense items upon our transportation, we must take into consideration the further facts that the conventional, normal bus for which we have years of performance figures, seats only 29 passengers and that the normal, conventional one-man car

Digitized by Google



Rear of one of the interurban coaches having brakes tested before starting on a trip

seats 44 passengers; that the loaded capacity of the bus is never in excess of 50 passengers and that in any condition of peak-hour traffic, the street car can handle 100 passengers.

The elements of this acrostic may now be set together. The group A costs of the bus are greater than the group A costs of the street car; the group B costs of the street car are not dependent upon the number of cars upon a line but are fixed at the time the line is built, the only variation being the very small variation produced in the item maintenance of way and structures. Therefore, every additional car-mile on any given line decreases the unit cost of the group B expense per mile. It is manifest, therefore, that the group A expense being heavier in the case of the bus than for the street car, on existing transportation routes with headways of two minutes to five minutes, or in some cases even ten minutes, the group B expense per mile becomes so small as not to equal the differential in group A expense between the bus and street car.

A decade ago in the average city there were street railway routes 1½ or 2 miles in length that supported fairly frequent headways. Every such route should be given the closest scrutiny when need for rebuilding arises, as in a great many cases it will be found that present headways on such short lines, due to the use of the automobile, are fixed not by traffic demands but by minimum headways felt necessary to preserve any sort of riding. On these lines with, say, twenty-minute headways, the number of car-miles will be so small that the group B expense will be high enough to make the bus the more economical unit.

In many cases it will be found that even with headways as short as ten minutes it would be advisable not to rebuild the lines but to use buses. Particularly is this true if the line is single track, with passing sidings contributing to low schedule speed, or if any obstacles exist on the street car line that can be avoided by a bus line serving the same general territory.

Again, existing street car lines between 2 and 3 miles in length, in which conditions do not warrant extensions, are debatable ground when need for rebuilding arises. When a demand for a new line exists, which must be fulfilled, in almost every case short of this 3-mile limit it will be found that the present bus is the more economical vehicle.

A careful analysis of present street car records will indicate that in almost every case where a line is more than 3 miles in length and the standard Birney car is being used, the line is unprofitable. If the headway of the Birney cars is fixed by traffic demands at an interval of less than ten minutes, the line will be rendered more profitable by the substitution of larger equipment at a longer interval. If the headway on the line is fixed, not by traffic demands, but at an interval of ten minutes or greater, the same being considered the minimum interval to attract traffic, in all probability the substitution of larger equipment at very long spaces would produce a reduction in riding.

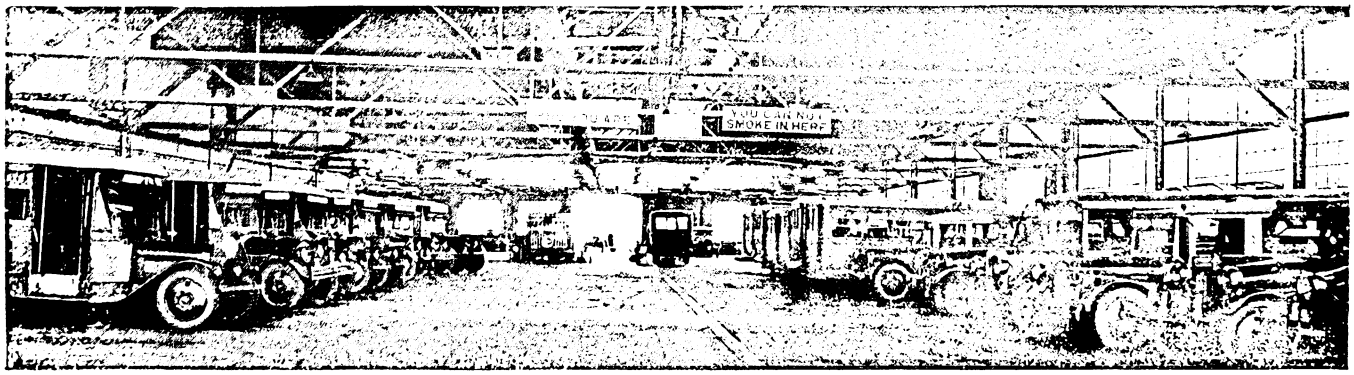
Therefore, for lines of more than 3 miles, where operation can be rendered profitable by the substitution of larger equipment, the bus cannot be a substitute for the street car under present conditions. If the line, however, shows best results with Birney cars at long intervals, then, while the line is unprofitable, no more unfavorable results would be shown by the use of buses.

These theoretical calculations have been demonstrated thoroughly in Youngstown. In the accompanying table are given the results for the year 1927 on four typical bus lines, with length of line, headway and earnings per bus-mile.

Headway, Length of Line and Earnings for 1927 of Four Bus Lines

	Headway Minutes	Length of Line Miles	Earnings (Cents) per Bus-Mile
Hillman Street	9	2.05	33.17
North Avenue	8	2.25	31.47
South Avenue	10	3.40	26.62
Indianola Avenue	10	3.60	25.83

Repeated checks have shown that the traffic density on buses, the proportion of seats occupied by passengers, are practically the same on all four lines. The long lines, South Avenue and Indianola Avenue, pay operating



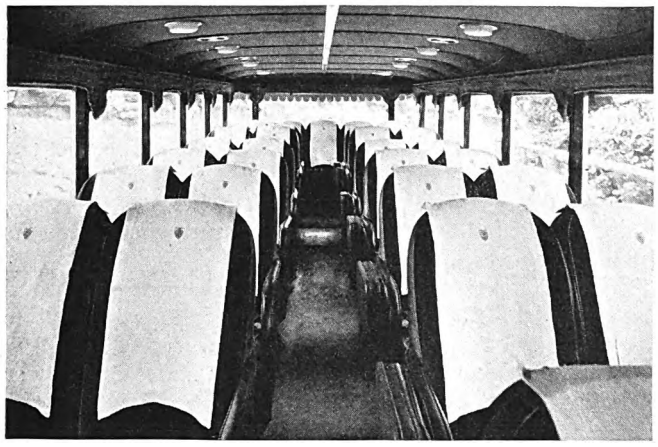
Interior of the Penn-Ohio System garage in Youngstown

Digitized by Google

expenses but do not earn depreciation and interest. The short lines are profitable. The two short lines, manifestly, are more profitable than street railway lines would be under the same circumstances. As a matter of fact, the North Avenue bus line was substituted for a street railway line covering almost exactly the same route. If the two long lines were street railway lines, practically the same service as given at present by buses would be given with Birney cars on ten-minute intervals. The riding probably would not suffer with larger cars on fifteen-minute intervals. However, with such low car mileage, the cost of group B expense per car-mile would be so great as to prevent a profit.

Penetrating the same general section of the city as these two long bus lines is the Park and Falls car line with a length of 3.8 miles, a headway of five minutes and with cars seating 60 people. This car line returns 44 cents per mile. It requires no deftness of calculation to show that with the standard city bus the substitution of bus service for this car line would be extreme folly.

In Youngstown, therefore, and this probably would be typical of the average American city, the field for the bus is the short line less than 3 miles in length under



Coach interior showing emblem of the Penn-Ohio Coach Lines on the seat covers. Note also the folding seats in the aisles

almost any condition and the line longer than 3 miles whose present or prospective traffic does not warrant headways shorter than ten minutes with small units. Aside from these two fields, we have found no use for the bus in city service. However, within its field the bus is certainly a tremendous asset and advantage to the entire system. Particularly has it been of advantage in trying out new routings. Four lines have been operated for varying periods at the request of citizens in widely separated localities. Each of these lines has been installed in good faith with widely advertised notice to the people that the service was being rendered for a definite period for experimental purposes to determine if the traffic would pay. In the case of the Emma Street, Bond Street and Salt Springs Road lines, the attempt showed conclusively that the available traffic, which the citizens sincerely thought would support the bus line, did not exist. The fact that the company made the attempt satisfied these citizens. In the case of the Rayen bus line, it was found that the traffic would support one bus on a 30-minute headway and this bus has been continued.

The development of the single-deck bus with a seating capacity of 40 people and standing capacity comparable to that of the street car would require an entirely new set of calculations and a complete revision of the field for the bus if the larger vehicle did not also require a complete change in the element of cost. Experiment has been made with this larger type vehicle in Youngstown but the experiment has not been prolonged sufficiently to enable us to form an opinion as to what the ultimate cost and success of the vehicle would be.

In the present state of transportation, I believe the standard bus is the conventional, single-deck bus with a seating capacity of 29 passengers. If the vehicle seating 40 passengers can be successful at not too great a differential in cost it will simply serve to lengthen by a comparatively moderate distance the field in which the bus is the preferable vehicle. It must not be forgotten that one-man street cars are not limited to a seating capacity of 40 or 44; that the vehicle with this moderate seating capacity is used simply because the moderate seating capacity takes care of a reasonable headway. There is no limitation, however, on a one-man car seating 60 or 70 passengers, so that while the size of the bus to be operated at moderate cost may be increased, there is still a long way to go before it can meet the street car on its own ground.

A great deal of attention has been attracted by bus lines supplementing street railway service at higher rates of fare. The higher rate of fare, of course, enlarges the radius of the profitable field of the bus. In viewing such experiments let us not lose sight of the fact that the customers for public transportation in any given built-up area have greatly decreased and not increased within recent years. Is it not a desperate measure then to provide duplicate service to a reduced market?

In the long run should not the effort be made to remove the obstacles to street car service that render it inferior to the duplicate bus service? Where there is a chance to remove such obstacles and actually to make a profit from the express bus service, of course there is no reason why the transportation company should not run such service, but the very fact that there is demand for such service should inevitably focus determined effort to build up the quality of the street car service rather than to take the patronage away from it and so reduce its value.

Due to the somewhat hysterical effort on the part of many communities to force the use of buses there have been instances where companies running interurban lines within city limits have been induced to abandon city cars and substitute buses. It appears to me that in almost every case this has been an uneconomic procedure. The group B expenses have not been eliminated and the bus, with its higher group A expenses, will produce less profit than would the continued use of street cars on such a line under any conditions that would be likely to obtain.

With the bus as it exists at present, our path in Youngstown is extremely well charted. Of our nine existing car lines, three short ones will not be rebuilt but will be substituted by buses. On the other hand, as the territory served by our long bus lines builds up, unless the ratio of street car riders to the total population should continue to decrease, in all probability they will be succeeded by rail lines. Unless there is a radical and unlooked-for development in the bus, there is no apparent reason for substituting bus lines for any of our trunk street railway lines and these lines are being rebuilt as such necessity arises.

The Power Department Plays an Important Part in

Selling Rides

BY

L. D. BALE

Superintendent of Power Cleveland Railway, Cleveland, Ohio

An example of an artistic automatic substation building and surroundings which would constitute an asset to almost any neighborhood

DURING the past few years there has been put forth a tremendous effort on the part of many electric railways to win back lost patronage. These efforts have evidenced themselves in most instances in the form of campaigns whereby, through the medium of advertising, the public has been informed principally of the economies and personal safety factor to be gained by riding the vehicles of an electric railway system.

Aside from, and in some cases in addition to, such advertising, certain properties have really attempted to make their facilities and service more attractive and more pleasant to use. The rolling stock division has designed new cars, and in some cases successfully revamped older types of equipment, giving consideration to appearance, comfort, riding qualities and noise reduction. The way department has been paying more and more attention to the maintenance of rail joints and roadbeds, and the transportation department, besides keeping the cars more sightly regarding cleanliness, has been training crews in courtesy and insisting upon neatness of appearance. In addition to involving the departments mentioned in this process of selling the company's service, new departments have been in some instances created where the relations between the company and the riding public are being carefully guided in an attempt to enhance the company's position by the creation of friendliness with its patrons.

IN THE CAMPAIGN of "Selling Better Transportation Better," the power engineer can contribute inestimably by realizing his responsibility to the public, furnishing a continuous power supply, encouraging intradepartmental and interdepartmental co-operation and reducing power costs to a minimum

The nature of these campaigns, their scope, the extent

Digitized by Google

to which many of the more important railways are exerting themselves along these lines, and the success being realized, are more or less known to everyone in the industry and need no comment here.

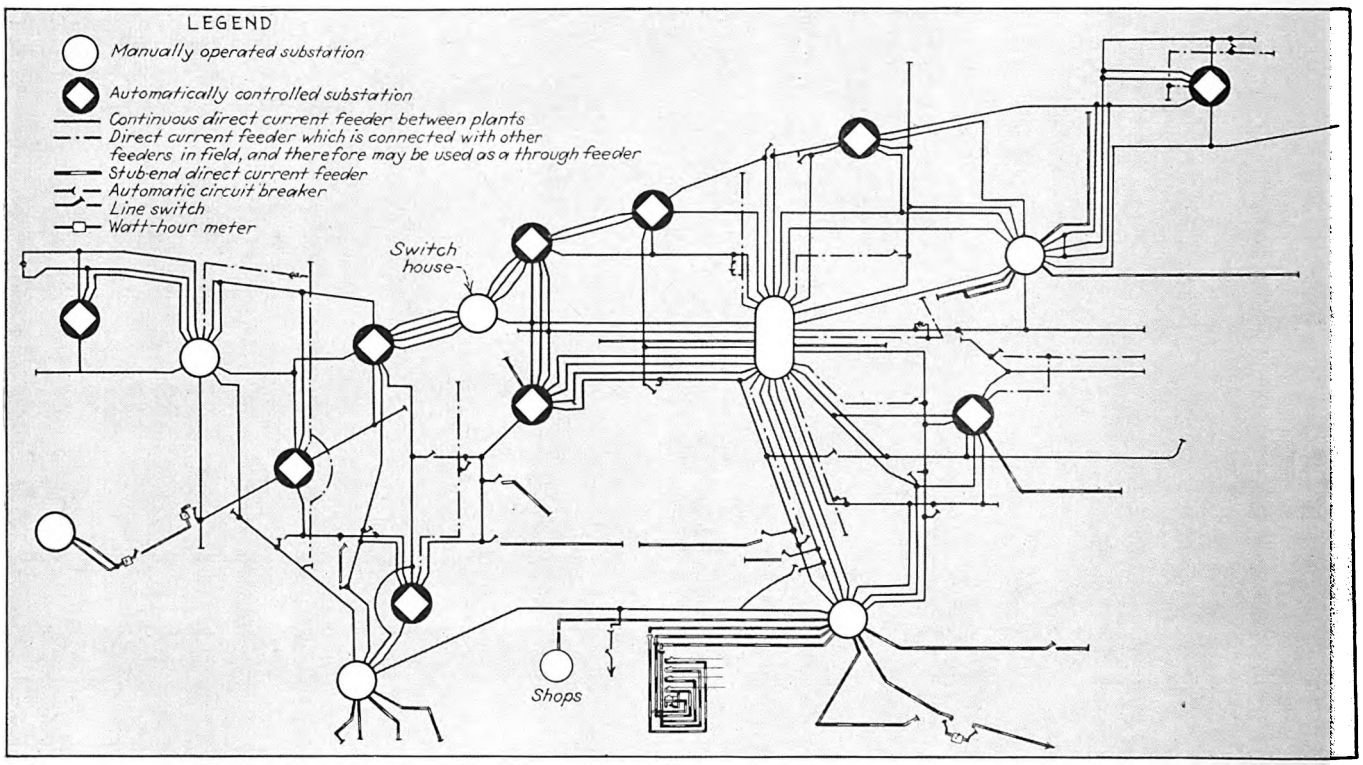
That the public utilities should utilize every method available to attract and hold patrons is not only right and proper, but constitutes good business. It is a policy which should be pursued regardless of whether the receipts are on the increase or on the decline. The question arises as to whether in numerous instances better service in general could not be rendered, and the company's position with the public considerably strengthened, if fuller advantage were taken of existing potentialities by utilizing more completely not only all the available material resources of the organization but the man power as well. For instance, the activities of the various departments of the company could be more closely co-ordinated and the members of each and every department or subdepartment made to feel that they were vital cogs in one large machine, rather than more or less inconsequential parts of individual and uncorrelated units.

In this connection, the engineer in particular, who has long been under the indictment of exclusiveness or of clannishness (an attribute which he has carried over from his private to his professional life), has been prone to function as a separate and detached part of the organization. He has been assigned certain prescribed duties and he desires to perform these without any outside interference whatsoever. He frequently feels that the department which he heads constitutes a separate and distinct organization, even to the extent that he has been known to make changes in the operation or in the equipment of his individual department without consulting other divisions of the same company which might be affected. He feels that so long as he is managing his department within the limits established, or to the apparent satisfaction of his immediate superiors, that further than that he is accountable to no one. In short, he does not consider the car-riding public as being primarily the individuals to whom he owes a responsibility.

This condemnation of the engineer's attitude must be qualified in some instances, for within the last two years those of the mechanical and way divisions, as previously noted, have begun to realize that their duty does not end with the performance of their own highly specialized task.

The power engineer, on the other hand, with few exceptions, is still possessed with the idea that his responsibility ends at the busbars of his plant, or at the contact system, depending upon the scope of his activity. He must come to see the light and appreciate the fact that it is just as much his task to popularize car riding and hold passengers as it is the task of the transportation, way, mechanical or any other department of the company. He should feel that anything which adds to the general welfare of the company, directly or indirectly, is his own private concern and personal responsibility.

He must realize that he, too, has an important contribution to make to the cause of salvaging the transportation business. This ranges all the way from artistic, clean and well-kept power station buildings and grounds (with as little noise and smoke as is practicable), pleas-



Direct-Current Distribution System

Arrangement of the distribution system constitutes a connected network under normal conditions which, however, may be broken up at an instant's notice into isolated feeders, sections or areas. The ability through arrangement of control and facilities to utilize the whole network or portions of it at will, for the transferring or rerouting of load, together with the availability of automatic substations and supervisory control, constitutes a scheme of conversion and distribution which enables delivery of operating potential to practically every portion of the property under all conditions, except in the event of total failure of primary energy.

Digitized by Google

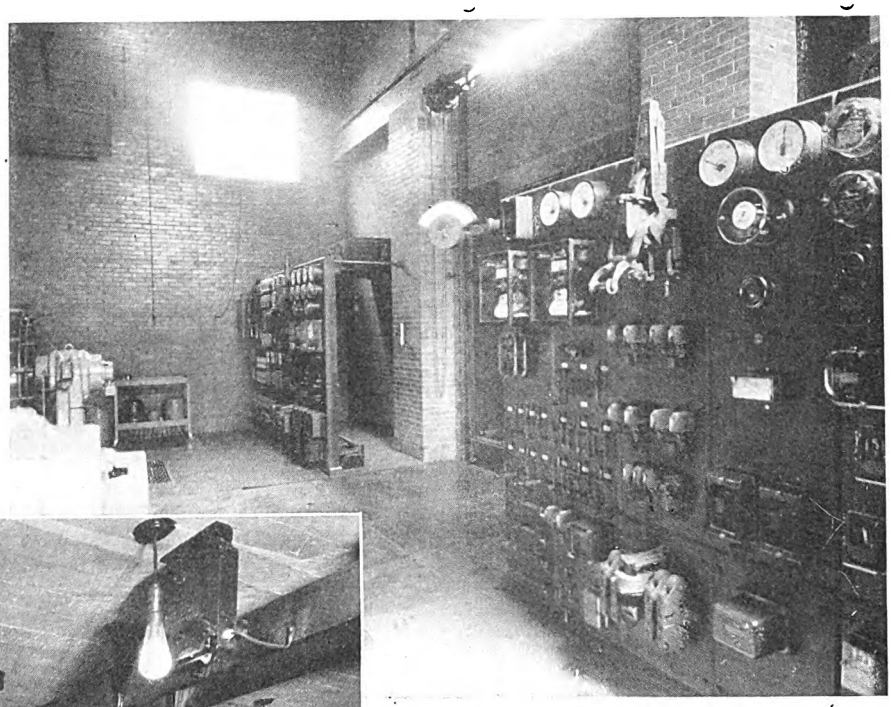
ingly symmetrical trolley poles and overhead construction not cluttered up with unsightly appurtenances, and considerate treatment of the public and their private property by maintenance and construction gangs, to the specific business and ultimate purpose of hauling street cars. It is a contribution which calls for a touch of the esthetic and involves a sense of moral obligation to the public in its indirect phases of activity, and one that demands, in its specific field, the essential economic factors of reliability of service, complete co-operation and low cost.

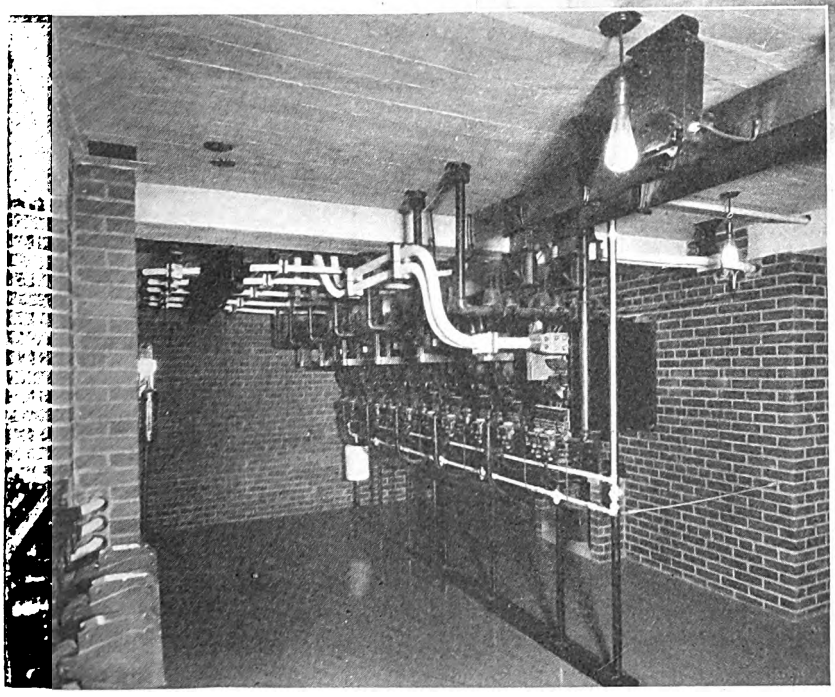
However, the power engineer's sense of exclusiveness and his attitude of narrowly circumscribed responsibility, though they may sometimes represent inherent characteristics, are in many instances the result of an extenuating circumstance—an over-economically minded management, be it so minded from choice or necessity.

The continual hammering for "more efficiency" and the never-ending cry of "cut the power costs" have tended to make of the engineer a paranoiac, and have distracted his attention and energy, as well as that of the economy-driving management, from the larger and more important job of helping to establish and maintain the general health of the transportation business, even though this goal involves the sacrifice of certain "pet" power economies. So much stress has been laid upon the possibility of saving a ten-thousandth of a cent in the production of a kilowatt-hour that the power engineer has become blinded to the probability of contingently losing $10,000 in the fare box.

This assertion, as to the minor rôle that power cost plays, may be the better appreciated when it is remembered that the total investment in the power producing, conversion and distribution facilities represents generally but 10 per cent of the total investment of the electric railway's entire property, with maintenance and operating costs running in about the same proportion, and that the fluctuations in these costs effected by the utilization of all possible operating economies are comparatively trivial. On the other hand, interruptions in service have the immediate effect of a 100 per cent loss to the company's treasury and the pocketbook of the passengers, and the far-reaching, psychological effect of creating in the minds of the car-riding public a distrust in car schedules and a weakening of faith in the ability of the management.

Generally speaking, a system which is well designed, constructed and maintained is also, in the final analysis, most economical to operate. And with such objectives in view, the progressive power engineer, through study and experiment, has already acquainted himself with the various phases of the economies to be derived from high load factors, elimination of feeder and return circuit losses, utilization of car meters, proper training of employees, etc.





At left—Pole construction designed for joint use of two or more utilities so as to eliminate duplication of facilities and the necessity of undue cluttering up of thoroughfares.

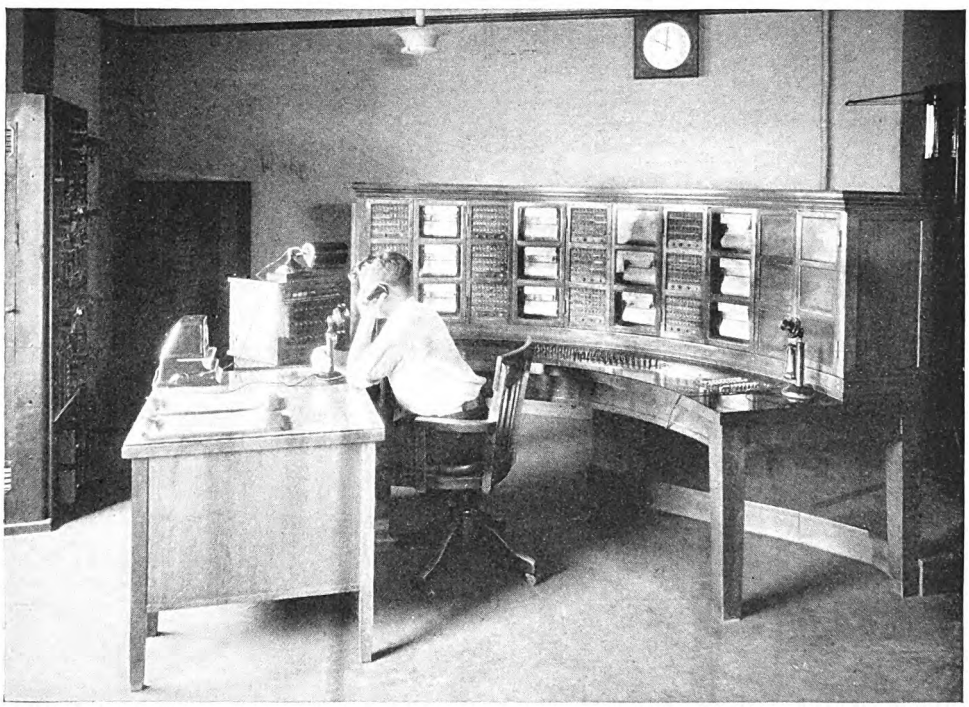
At right—Better and more economical power service may be rendered by the use of automatically controlled equipment.

Below—The flexibility during emergencies is best secured through the use of auxiliary buses and d.c. feeder contactors, in addition to the main buses, in each of the power centers.

Digitized by Google

But, there are other important items, however, that until comparatively recent years were not given consideration. One of the most pertinent of these, which affects the entire system, and a subject that, in so far as it pertains to congested areas, is at present being studied by the engineering committee of the A.E.R.E.A., is the question of proper voltage. There is, without question, a very distinct saving to be made by lowering the voltage in the downtown or congested areas, and similarly there are direct advantages obtainable by raising the potential in non-congested or free-running areas. The former expedient, of course, results in a saving of power, and the latter in reduction of transportation equipment and platform wages by requiring less cars and less trainmen to supply a given service.

This is but one example of a true economy that may be effected safely by a street railway power system. It represents a possibility for real saving and is in direct contrast to the many artificial economies that have been from time to time introduced which, while resulting in an apparent decrease of expenses, have in reality weakened the whole power producing and distributing structure.



The guiding hand of a trained dispatcher located at a supervisory desk is of immense value in the consummation of power production efficiency and continuity of power supply, a feature which cannot be secured in any other manner

Without doubt, there are many cases of just such harmful retrenchment, or of hazardous procedure, where it would be entirely reasonable and justifiable to increase, even materially, the total annual cost of producing and distributing a particular power requirement, as, for instance, where dangerous overloading or obsolescence exists, or where inadequate provision has been made for emergencies, or where the standard of maintenance is held on far too narrow a margin of safety. In other words, the cost of power is cheapest when it best subserves the interest of the utility as a whole, regardless of the ostentation of a specious departmental economy.

It may be stated unequivocally that the two outstanding factors entering into the strictly commercial side of the power end of electric railway operation are cost and reliability, and of the two the latter is of far greater importance and of more vital interest to the man who utilizes such transportation in his daily business and social life.

"All dressed up and no place to go" may represent an unfortunate predicament for a would-be traveler, but a trolley car "all filled up and no power to go" means a still more unpleasant situation for the car-rider and a serious business indeed for the electric railway company which happens to be in the unenviable position of having a car or car line "go dead" on its hands.

Similarly, from the standpoint of the power department of the public utility itself, the dependability of service is its strongest talking point in the selling, or "better selling," of "better transportation" to the man who uses it or to the prospective customer who may be induced to use it.

One of the prime essentials of such reliability of power supply—in fact, the connecting link between this and the item of cost—is an efficient departmental personnel. And this means not only individual training and experience of each employee but also smooth functioning of all integral units of the power department, including the operating, maintenance and construction divisions. Further, it is imperative that there be full and complete co-operation, not only among all these subdivisions but also between the department as a whole and all other co-ordinated parts of the system. Such co-operation, working together for the common good, will go far toward minimizing schedule interruptions, insuring rapid restoration of service in the event of breakdown, and through the medium of general cumulative experience and diagnostic forums do much to anticipate future exigencies and preclude their frequency and gravity of recurrence.

In a word, each man should feel keenly his responsibility to his immediate superior, to the organization as a whole and to the public at large, to perform his especial duty conscientiously, intelligently and with a strong feeling of pride in the growing prestige and efficiency of his particular utility.

Proper Facilities Guarantee Reliability

Getting away altogether from the human side to the material side, it is an axiomatic statement that reliability or continuity of service is the outcome of foresight in providing proper facilities for the production, conversion and distribution of power supply, both for normal conditions and for all possible contingencies that may develop. And among the more important guarantees of this factor of reliability may be mentioned:

Digitized by Google

1. Dependable source of generated or purchased primary energy, with sufficient reserve equipment or interconnections of generating plants with emergency sources of outside power.

2. Duplicate alternating-current feed to substations.

3. Adequate reserve equipment in conversion plants, or, preferably, arrangements to utilize reserve of system in event of emergencies.

4. Interconnection, under control, of low-tension side of conversion plants to enable shifting of load through distribution system for whatever exigencies may arise.

5. Frequent sectionalization of direct-current distribution system under control.

6. Arrangement of distribution system and contact system so that power may be supplied from more than one source.

7. Selection of conversion and control equipment with special reference to rendering satisfactory service under adverse conditions of power supply and load.

8. Utilization of automatically controlled plants, with proper spacing of same and arrangement of distribution system and control to insure continued operation of system in the event of loss of a complete plant. This substitution of the automatic for the manual substation minimizes the ever-present complication of the personal element, and obviates delays in service from slow and tedious manipulation of manual equipment and complete stoppage of service from strikes and labor troubles.

9. Utilization of supervisory control superimposed upon automatic control.

10. Maintenance of power production, conversion and distribution equipment, including that of the contact system, at the highest possible standard.

11. Maintenance of capable and efficient trouble or emergency crews to rectify expeditiously all unforeseen difficulties, failures and breakdowns at a moment's notice.

Cost of Improved Facilities More Than Warranted

To provide these various protections to continuity of service means, of course, an outlay of capital in many instances, and it is questioned in some quarters whether such investment for the precautions and refinements necessary to guarantee a continuous supply of motive power is justified for the street railway. In answer to this, one has but to review the history of other common carriers and industries, some of which have been subjected to as great a pressure as has been the street railway business during the past few years. Those organizations which are alive today and prospering have fully realized that to remain in business it was necessary not only to avail themselves of every economy practicable, but—of greater importance—so to arrange and improve their facilities as to offer a service or commodity better than that previously offered and equaling or even surpassing that of competitors.

The progressive street railways also are realizing this situation and have come to the conclusion that the erstwhile car rider, and the present intermittent user of the electric railway, having discovered greater comfort in his own private motor car with the certainty of a seat, a soft cushion and resilient springs, a faster schedule, and with equal and often greater dependability of service. (but at three times the cost), can only be weaned away from his new and more expensive means of locomotion by the attraction of similar traveling ease, speed and reliability at a fraction of the outlay.

To sum up this situation as it pertains particularly to the power department of the average street railway, there are four distinct duties which fall directly within the province of the head of that department—four phases of his activities which will contribute to the general rehabilitation of the company's property and its economic virility. Enumerating them in the order of their respective importance they are: First, realization of his responsibility to the public at large as well as to the company itself; second, continuity of power supply, even during emergencies; third, intradepartmental and interdepartmental co-operation; fourth, reduction of power costs to the lowest possible point consistent with proper maintenance of facilities and necessary safeguarding of equipment and service.

An interested and appreciative crowd more than filled this automatic substation when it was opened to the public for inspection

Smooth track is a big aid in making rides more salable, for the public of today is demanding riding comfort approaching that of the automobile

LOOK TO YOUR TRACK

It is the Foundation of Your Business

BY

A. B. PATERSON

Vice-President New Orleans Public Service, Inc., New Orleans, La.

FOREMOST of the worries that beset the electric railway executive today are those which have their roots in the very human craving for complete individual freedom of movement. America is a nation of individuals—not of masses; its entire economic structure is individualistic, and there is a universal striving for the attainment of individual freedom of action in all the ordinary affairs of life. Coupled with this is the high degree of individual economic independence which is the outgrowth of American resources and prosperity, yielding to the individual the means with which to gratify his reasonable desires. And so in this country, to a far greater extent than in any other part of the world, the individual has seized on the automobile as the almost complete fulfillment of his transportation needs and desires.

That the desire for individual transportation is very deeply rooted in human nature is attested by the almost incredible rapidity with which the number of automobiles has grown, and the tenacity with which people will cling to their cars even in times of adversity. We are deluding ourselves if we overlook the fact that the attractiveness of individual transportation is the principal reason so many people ride in automobiles. However, counteracting this powerful force are several drawbacks that are responsible for many users of public transportation vehicles not using private automobiles. Among these are the lack of ownership of an automobile, inability to obtain the use of the family car, economic limitations on the regular use of an auto, fear of driving in heavy traffic, disinclination to face the difficulty of finding a place to park, low speed of the automobile in dense traffic, or some other limitations in the

PROPERLY-CONSTRUCTED track gives the street car patron a smooth and quiet ride and that is what he has been educated to demand. Because of this demand the way engineer has a very definite part in selling transportation

Digitized by Google

automobile itself. But, in spite of all these drawbacks the individual car remains the standard of comparison in the minds of the average person.

Admitting this truth, we must bestir ourselves to hold our patronage by giving to our passengers the closet approximation that we can to the comfort they enjoy in "riding on rubber." If we don't, we may expect to see them drifting away in greater numbers all the time. Although we have perfected our schedules and have made our cars approach as closely as possible the comfort of the automobile, there still remains the track. Now the driver of an automobile is not confined to a fixed route as a street car is, but can and does choose his route to give the maximum degree of riding comfort. Even the regular patrons of the street cars ride frequently in the automobiles of other people, and they are just as well aware of the independence of motion of the automobile as the motorist is, and are also aware of the fact that almost all the time they are riding in an automobile they are rolling along smoothly and silently.

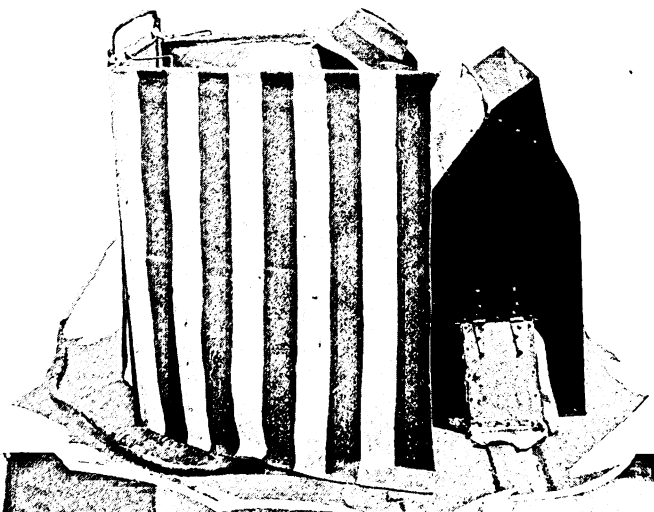
And that is just what everyone wants today—to roll along smoothly and silently, whether in an automobile, a bus or a street car. The automobile has created this desire, and if the street car can't give it, then the street car must suffer. Gone are the days when people were content to bump along in rattling, clanking, dilapidated old street cars, and likewise, gone are the days when they would tolerate uneven track, rough joints, poorly constructed switches that caused frequent derailments, or any of the other defects of cheaply constructed or poorly maintained track. These things prevent a street car ride from approximating the comfort and quiet of an automobile ride, and the riding public simply will not stand for them. The automobile and its attendant comfort constitute the yardstick by which all other forms of transportation are measured and, as the automobile has brought with it the smoothly paved street, so must the modern street car be provided with the smoothest, most permanent type of roadbed that engineering and construction skill can produce.

The electric street railway no longer has a monopoly of urban transportation, but, on the contrary, is faced with competition of the severest and most persistent kind. Therefore, like any other merchant in a competitive business, it must make its wares as attractive as possible. Of all the wares that the street railway merchant has to offer to his patrons, none is more closely examined than the track. Every passenger is aware of the existence of inferior track, and it brings into his mind at once the superior qualities of automobiles and paved streets. And so, from the strictly merchandising point of view, it seems clear that to make possible the successful selling of our transportation service we must look to our track, for it is, literally, the foundation of our business.

There is a second very important reason why we should give the closest attention to our track, its design, construction and maintenance. It is entirely true that we must do a first-class selling job if we are to thrive as purveyors of urban transportation, but it is equally true that after we have induced people to ride we must conserve the revenues which they pay us, so our properties may earn a fair return on the invested capital. This does not mean penny-pinching or starvation of maintenance, but it does mean design, construction and maintenance methods based upon a thorough understanding that the cheapest track is that which has the lowest total annual cost throughout its life. While this fact seems almost self-evident, it is true that only in recent years have street railway operators become fully conscious of it—and some have not realized it even at this late date.

When electric railway tracks first came into general use practically all of the track was constructed in unimproved streets. In general a slight modification of track structure evolved by the steam railroads was adopted. As time passed and the modernization of American cities produced improved hard surfaced streets, it became necessary for the track structure to meet new conditions. Instead of analyzing these new conditions and changing the track design to meet the requirements imposed by paved

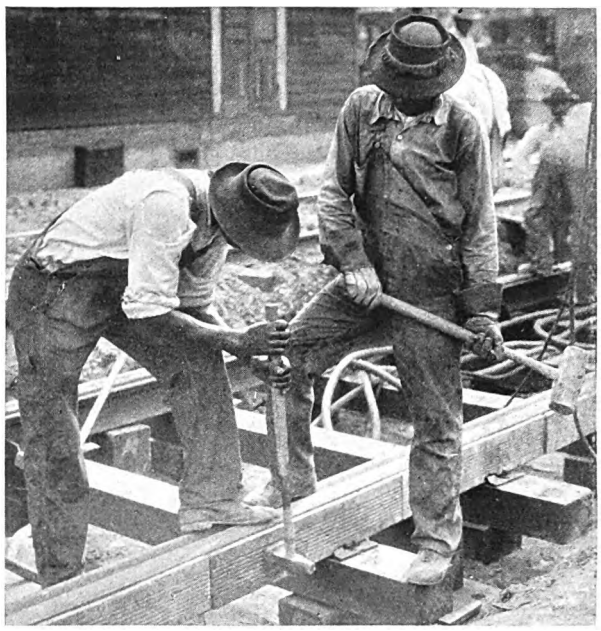
Welding can be done without harming the eyes of pedestrians if a glare shield similar to this one is used



At left—This joint is built for permanence. All parts are welded. At right—Tie plate welded to rail and screw plate welded to plate, giving a rigid track structure

Digitized by Google

streets, a general policy was followed of molding the paved street about the then existing track structure. The results almost universally have proved unsatisfactory and an excessive burden of maintenance cost has been thrown on both the track structure and the surrounding pavement. It is proverbial that hindsight is better than foresight, and our superior hindsight now enables us to see that a clearer understanding would have led to a consideration of the engineering fundamentals introduced by the paved street, and that this would have led in turn to redesign of the track structure to fit into these imposed conditions. Progress toward the modern type of co-ordinated track and paving structure has been painful, expensive and slow—and has not reached its final objective yet. There has not been developed as yet a recognized standard of track construction that meets the requirements of the ideal track, namely, maximum life with minimum maintenance cost. Most of the present-day tracks have been constructed so that component parts of the structure can be renewed without disturbing the remainder. This method should be contrasted with that of using materials so designed and so proportioned that all parts would have a uniform life.



Plastic rail filler helps prevent transmission of vibration between rail and pavement

The design of a railway track in a paved street is an engineering problem involving fundamentals that can be likened to the problem of building any form of foundation or structure. There is little indication, however, that the problem of track design has been given this type of attention. The industry has been content to accept the multitude of empirical ideas and more or less intelligent guesses that have evolved our present standards of construction. The result is that we see a great variety of so-called types or standards of construction, each justified and predicated upon certain local conditions. Now, experience has indicated quite definitely that the component materials utilized in track construction have a useful life of at least twenty years. Why then, is it not entirely logical to design and install these component parts to produce a track in paved street that will give a life of twenty years with no major maintenance at all? Certainly it is not unreasonable to hope for this and to suggest that until the standard of track design for any given locality is such that the parts do have uniform life, those responsible for the design have not made the proper uses of the engineering materials and knowledge available.

However, we still have to live with tracks of every vintage and type, and we must continue to maintain them. Because of consolidations, an absence of recognized standards of construction and other causes, the average operating company has acquired several different designs of track through its period of development. When the total maintenance cost is spread over the net mileage of such a varied track system it is impossible to determine the relationship between track design and the resulting maintenance costs. A general survey of track maintenance cost records and the lack of attention given to such records by operating executives leaves one with the impression that such expenditures have been accepted as an inescapable and irreducible necessity, and also suggests a further thought that a systematic, adaptable and usable cost record might well lead to a worthwhile reduction in operating expenditures.

That records do assist in lowering costs has been demonstrated by the roadway department in New Orleans, which has developed a system of track maintenance records that affords a means of sound and economical analysis of operating costs. The maximum value of these records and of the analyses made from them comes from the accumulation of cost data over a period of years. Results have shown that the effect upon the supervising personnel of seeing just where the money goes, and of the interest and enthusiasm that can be created by analyzing and following up the budget performance, are productive of efficiency. In passing, it is suggested that roadway executives, who will adopt the "foremen conference" plan in dealing with and interpreting the records of maintenance cost, will be amazed at the resulting increase in efficiency and reduction in costs. Excessive expenditures upon any length of track can be noted immediately and the value of each type of track design determined from the maintenance records.

Coincident with the need of detailed analysis of maintenance costs there exists the necessity of a system of maintenance procedure and methods that will fit in efficiently with the results of this analysis. A few basic factors, essential of observance in developing an efficient system, are appended here:

1. Troubles should be detected and corrected before potential failures occur.
2. The information furnished by inspection should be used as a basis for planning a schedule of maintenance work outlined to employ the minimum of forces.
3. A definite follow-up system should be instituted of checking the method of performing the work in relation to the cost, to develop the most economical methods.
4. There should be complete abandonment of the old "section gang" methods of track maintenance.
5. The opportunity to foster and maintain good public relations should never be lost sight of. Details like the protection of the eyes of passers-by from the glare of electric welders and the facilitation of traffic movement by the installation of temporary crossways when streets have to be opened, should never be neglected.

Certainly from the standpoint of selling our service, and equally from the standpoint of ultimate economy, we must look to our track—for it is the foundation of our business.

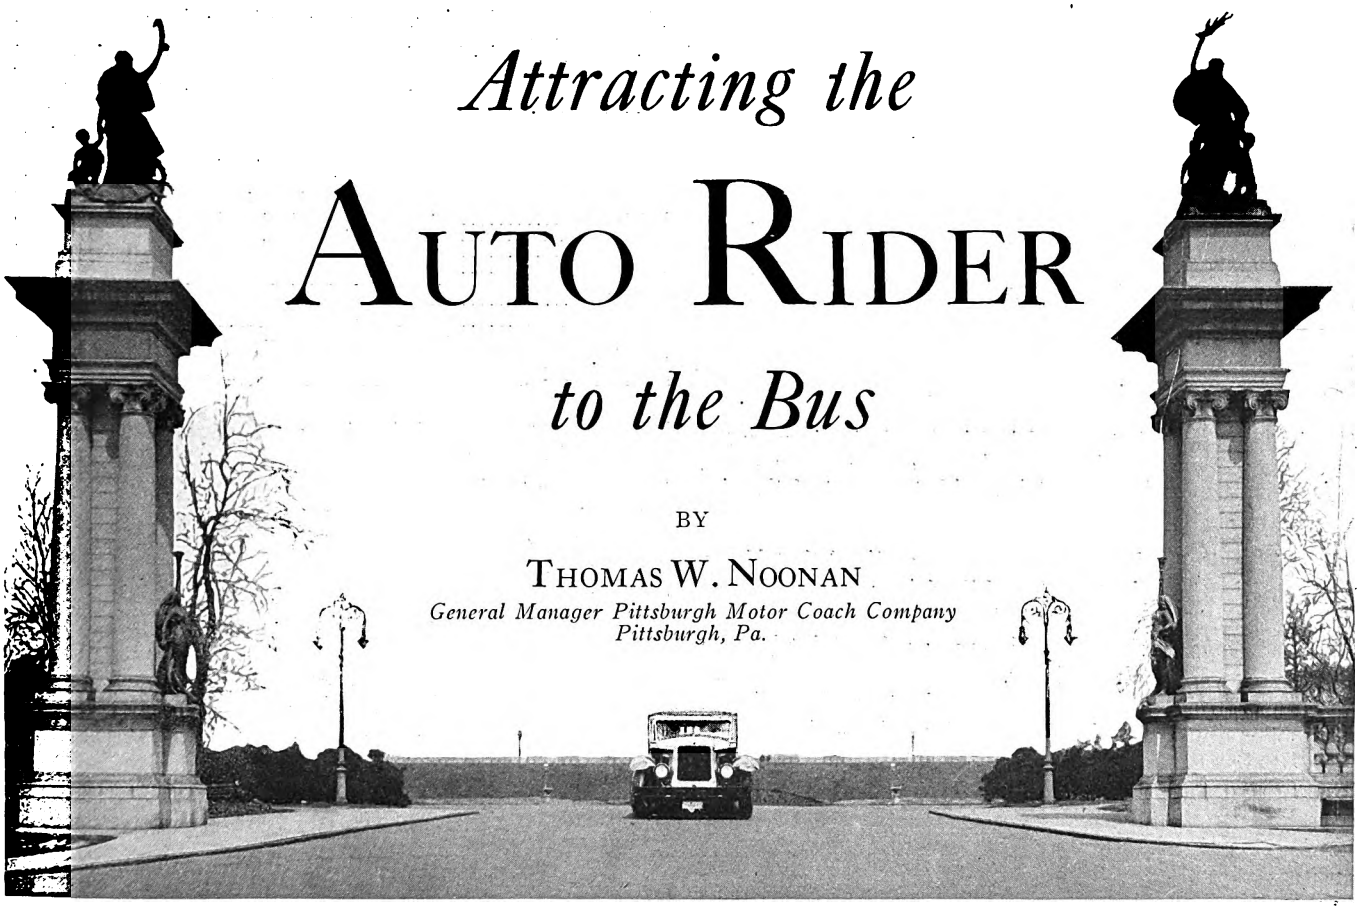
Attracting the AUTO RIDER *to the Bus*

BY

THOMAS W. NOONAN

General Manager Pittsburgh Motor Coach Company
Pittsburgh, Pa.



Five de luxe bus routes of the Pittsburgh Motor Coach Company serve a large number of persons in the suburban residential sections of the city

DE LUXE coach service at higher fares has opened up a new field of merchandising endeavor. It is offering an exclusive ride to a class of patrons accustomed to using private automobiles and it is to this class, living in the suburban residential sections, that the sales effort must be directed. That this type of service does appeal to the automobile user and can readily be sold to him is proven by the experience of the Pittsburgh Motor Coach Company over a period of three years.

The company entered the bus field by purchasing an independent line 5 miles in length between downtown Pittsburgh and the East Liberty district, the equipment involved in the purchase consisting of six double-deck and five 12-passenger buses. Two routes were established, the East Liberty and Squirrel Hill routes, the second being 5.7 miles in length. These two have since been supplemented with three additional routes, so that at present the company has 32.2 miles of one-way route. The fare on each route is 25 cents cash or nine tickets for $2. Previous to the introduction of the rate of nine tickets for $2, books of 21 for $5 were tried, but tickets collected after nine months trial represented only 2½ per cent of the total fares and their use was discontinued.

The ticket rate was established to encourage the use of coaches and to eliminate the delays accompanying change making. The increased use of the reduced rate ticket will, we believe, accomplish the purpose intended, for figures available after two weeks' use show an increase in off-peak riding and a gradual increase in the number of ticket users.

The scheduled route service is of the type that releases about 50 per cent of our coaches on Sundays for other special services, and to keep them in use a coach representative is employed to solicit private parties for Sundays as well as for evenings and mid-days. The chartered service has proved quite profitable. For the first six months of 1928, 395 special coaches were handled with a revenue of $13,767, as compared with 286 specials and revenue of $7,281 for the same six months of 1927.

During the early part of the summer of 1928 three special Sunday-holiday routes were established. Two of these connect downtown Pittsburgh with the newly established parks of the county, one route being 11 miles long and the other 14 miles long. The fare charged on these is 50 cents each way. The third route is a special scheduled service between Pittsburgh and the Willows Swimming Pool, a distance of 12 miles. On this route a combination ticket, good for transportation on the coaches and admission to the pool, is sold for $1.50. This route has proved profitable from the very first day.

In addition to the three park routes and private party services, the company also conducts the Gray Line sightseeing service in Pittsburgh. Because of these special services during the summer season the company is able to maintain a profitable operation during June, July, and August, when the regular traffic shows a decline. Our regular traffic, having been developed principally for the convenience of the auto rider, shows a falling off on account of the vacation period, theater closing and more general use of the private automobile during the summer months.

The original service was established with 29-passenger coaches on long headways, both during the peak and

Digitized by Google

Service, similar to that offered in Pittsburgh, is given by the Toronto Transportation Commission on a 4½-mile route, joining two residential districts with the heart of the city

off-peak periods. However, we soon realized that if we were to win the private automobile driver our headways must be closer. With this in mind our first experiment was made on what was then known as the Point Breeze route, now called Wilkinsburg.

This route has been on a fifteen-minute peak headway, a twenty-minute base headway and a thirty-minute evening headway, with 29-passenger street car type coaches, less than one year old. The substitution of the 19-passenger type X Yellow coach on a ten-minute peak headway and twelve-minute base headway resulted in an increase in gross revenue of 80 per cent, or 4.7 cents per coach-mile, and a reduction of approximately 7 cents per coach-mile in operating costs. The rapid increase of more than 100 per cent in passengers soon required a change in schedule providing a six-minute peak and a ten-minute base headway.

The Point Breeze line originally was 6½ miles in length. In December, 1927, it was extended a distance of 1 mile to Wilkinsburg, a community also served by trolleys and a steam railroad. The response to coach service was so great that we were unable to handle the traffic with a six-minute headway using 19-passenger coaches, so we placed in service 35-passenger coaches on a five-minute headway. The base schedule is being operated every six minutes with 19-passenger coaches.

Many Riders Former Automobile Users

A survey on this route showed that 68 per cent of our riders formerly were private car drivers, the balance having used trains, taxicabs and street cars. The information was secured by distributing double-faced stamped postcards among the passengers and requesting that they be filled in and returned by mail. The service on this route has become so popular that from 7 p.m. to midnight it is necessary to run the buses on a ten-minute schedule to handle the traffic.

Following the change of headway on the Wilkinsburg route, the same plan was followed on our Squirrel Hill line. The ten-minute peak headway, maintained with 29-passenger street car type coaches, was reduced to a six-minute headway, using 19-passenger coaches. This change caused an increase of 20 per cent gross revenue but, on account of increased mileage, revenues per coach mile were reduced 1 cent. There was a reduction of approximately 6 cents per mile in operating costs.

The substitution of close headways for long headways has been followed on the East Liberty and Mount Lebanon routes, and with the same results. On the East Liberty route the peak headway was shortened from ten minutes to four minutes and on the Mount Lebanon from ten minutes to six minutes.

Table I—Coach-miles, revenue and earnings per coach-mile of four routes of the Pittsburgh Motor Coach Company for corresponding six-month periods in 1928 and 1927.

	Coach-Miles		Total Revenue in Dollars		Earnings in Cents per Coach-Mile	
	1928	1927	1928	1927	1928	1927
Wilkinsburg	281,742	150,367	122,852	46,591	43.7	31.0
East Liberty	201,315	184,232	106,989	89,768	53.1	48.7
Squirrel Hill	180,664	125,726	57,502	47,021	32.0	37.4
Mount Lebanon*	128,479	73,367	32,348	18,149	25.2	24.7
Total	792,200	533,692	319,691	201,529	40.4	37.8
Increase	48.4 per cent		58.6 per cent		2.6 cents	

* Route established in March, 1927. Figures are for four months only in 1928 and 1927.

The increase in traffic on the first four routes established, for the first six months of 1928, as compared with the corresponding period of 1927, is shown in Table I. In Table II, the operating costs are given for corresponding periods of five months in 1928 and 1927.

The latest city de luxe line to be established extends to Highland Park by way of Schenley Farms and is 7.2 miles long. It serves two high-class residential sections in which are located practically all the apartment hotels in Pittsburgh. At a point approximately 1½ miles from the outer terminal it connects with the East Liberty route. Passengers wishing to reach the section of the downtown area served by the East Liberty route may change at this point. Likewise the Highland Park line receives passengers from the other line.

That this de luxe type of service appeals to the public is best evidenced by the number of requests received from other sections of the city for the establishment of similar service. At this time applications are pending with the Public Service Commission of Pennsylvania for the establishment of two additional city de luxe lines and one suburban de luxe line. All three are expected to be started this year.

In the establishment of these lines from the residential sections to the downtown district the routes have been laid out in so far as possible to reach the shopping and theater centers, for the greater number of our mid-day riders are the women shoppers who prefer the coaches to their own cars.

During the early days of coach operation, service was

Shoppers and theater-goers find the coaches a convenient and comfortable means of reaching the downtown district of Pittsburgh

Digitized by Google

terminated at 7 p.m., but experience with the frequent high speed service has shown that the public will ride the coaches to and from the theaters and for visiting in preference to their own cars and taxicabs. Evening service on all routes is now on a profitable basis.

With the establishment of a new route, direct mail advertising is used to acquaint the residents of the districts served with the new service. Our mailing list is secured from the customer list of the Duquesne Light Company, an affiliated electric light company serving this district. In territory where it is not possible to secure such a list, the street directory of the Bell Telephone Company is used.

All advertising matter other than our own weekly message is being gradually eliminated in all coaches. In addition to our weekly message, small schedules are distributed to all our patrons showing the leaving time of the coaches on each route. Billboards advertising private party and sight-seeing service also are used as well as newspaper advertising.

For mid-day and evening service, 19-passenger coaches of this type are used on all the Pittsburgh routes

Short Headways and High Speed Essential

To attract persons who are accustomed to having their own cars at the curb, it is essential to give short headways. Short headways generally imply the use of small vehicles, although on two lines at this time short headways during the peak hours require the use of large vehicles. To attract autoists it is necessary, further, to give them good running speed between terminals. Frequent stops would annoy them. The average scheduled speed of coaches on the various routes is 12.8 m.p.h. The use of boulevards on all routes helps in averaging this speed.

Our routes range from 5 to 7.5 miles in length. On only two routes do we enjoy two-way business. Most of the riders on all these routes are carried for the greater part of the run. There is, therefore, not enough short-haul traffic to justify a low rate of fare.

The rate necessarily is fixed by the relation between actual cost and possible income. A reduction in fare large enough to attract more patronage would either lower the standard of service or require the addition of more vehicles. With the present fare, the company is certain that the great mass of riders come from persons who have not been regular trolley patrons. The coach service is self-sustaining today without making a false showing through the taking of trolley patrons. All experiences to date point to 25 cents as a proper peak load fare with a slight reduction of price to obtain the advantage that tickets offer in speeding up passenger interchange.

There is no denying that the public is interested in travel by de luxe motor coaches. This fact is best evidenced by the demand for additional de luxe lines and the increase in traffic on all routes. The luxury of yesterday is the necessity of today. The standard Pullman is now patronized by people who formerly rode only in day coaches. The class who rode in standard Pullmans now seek compartments with beds instead of berths.

There would be no reason for attracting street car passengers to a rival service at equal or little higher fares. There is, however, a worthy field in building up a service offering speed, exclusiveness and quality, to attract persons now crowding the public highways with vehicles that use an inordinate amount of street area per rider.

Table II—Operating expenses of Pittsburgh Motor Coach Company for corresponding five-month periods in 1928 and 1927.

Operating Expense	Cents per Coach-Mile 1928	1927
Conducting transportation	12.8	14.3
Plant and equipment*	8.5	6.8
Traffic	0.6	0.4
General administrative	4.5	4.9
Depreciation	5.4	4.7
Taxes and licenses	1.6	1.3
Total	33.2	31.5

* Includes charge of 2 cents per coach-mile for general repairs during 1928 which is not included in 1927. This amount is reserved for major overhauls.

Bus Designers Seek

Lower Cost Per Passenger *and* Greater Reliability

BY
J. W. McCLOY
Assistant Editor
ELECTRIC RAILWAY JOURNAL

"CONSTANT improvements but no yearly models" has been the slogan and policy of a certain well-known manufacturer of automobiles. This may be said to fairly represent the present attitude of bus manufacturers. There is likewise a strong effort to maintain production efficiency through resistance to demands for special design features to meet the fancies of individual operators and the particular requirements of various service characteristics. Resistance to constant pressure for special design changes is in the interest of lower first cost, and the larger bus manufacturers know that they serve the interests of their customers better through the maintenance of production models than would result from acceding to constantly changing demands for special features. Experience is, of course, suggesting many improvements, chiefly in the direction of greater strength of parts and easier accessibility for inspection and maintenance. But often it is months or even years before a particular idea can be designed, engineered, tested, machined and finally put on the market with its maker's seal of approval upon it. During this process there is a continuity of progress that would be lost if the manufacturers were to embark upon a program of designing to meet the views of every individual customer, with the cost of buses mounting accordingly. A survey of the field indicates that there will undoubtedly be many minor refinements and probably a few major changes in bus design within the next year or two.

SEVERAL FACTORS AFFECT DIMENSIONS

Length, width and weight of buses have been the subjects of legislation in nearly every state in the Union, with a lack of uniformity that has been the despair of the designer. Attempts have been made from time to time by regulatory bodies of adjoining states to get together and standardize their rules, but the results have stopped far short of complete accord. Operators and manufacturers alike recognize the necessity of fixing

Digitized by Google

uniform maximum dimensions in such fundamentals as over-all length, width, overhang, etc., but are not hopeful for any general relief. There is an independence of thought and action among regulatory groups that apparently does not lend itself readily to standardization.

At the present stage of development there appears to be little likelihood of a requirement arising for a bus for general use of greater length than 35 ft. Grades, curves and the width of the road have imposed a limitation that needs no legislation to give it effect. Question arises in the matter of over-all width and there is some straining at the present controlling limits. Florida holds this down to 84 in. and a considerable number of states do not permit a greater width than 90 in. Passenger comfort on a long trip is dependent to a great extent upon the width and spacing of seats. Here there are two opposing forces at work: passenger comfort on the one hand and economical pressure for maximum carrying capacity on the other. When it is desired to put four seats in pairs, abreast, and to give to each one all the space that comfort demands, either the aisle must be reduced in width or the body of the bus must be widened. If designers were permitted a little more latitude in this respect they undoubtedly could produce a more commodious and comfortable vehicle.

Interior of a Mack de luxe coach with seats in pairs on one side of the aisle and single on the other. This arrangement gives more room for the passengers and adds to the comfort of the ride

But greater widths reduce road clearances, increase the accident hazard, slow down operation and make the bus unpopular in the eyes of other users of the highways. To let down the bars on width would produce ultimately a popular reaction that would result in extremely severe restrictions. The problem is further complicated by the fact that the long distance interstate lines have built up traffic by offering rates materially lower than steam road fares. Because of the lower fares they have increased their bus seating capacity so that sufficient passengers can be carried to make the lines pay. Comfort has been sacrificed in accommodating more passengers, but a trend in the opposite direction toward fewer seats is now in evidence. The clearance of existing overhead structures has limited the height of the bus. This will not prevent, however, the general adoption of full headroom on all buses intended for long-distance service, toward which there is an unquestionable trend.

There has been a spectacular growth in long-distance bus travel. Two distinct services from the Atlantic to the Pacific are now in operation and others are in the process of organization. There is every indication that the number of such routes will increase. This development of long-distance travel brings to the front with increased emphasis the question of seating. A seat that is comfortable for a few hours and endurable for a longer period becomes decidedly uncomfortable for an all-night ride. The Pacific Coast has supported over-night bus travel for several years; it is nothing uncommon for passengers to ride by bus continuously for several days and nights with little relief other than an occasional rest stop. To meet the requirements of this service several manufacturers have brought out the reclining type of seat which offers, however, a rather inferior accommodation for a weary traveler. Closely associated with passenger comfort is the question of tires. Designers, aware of this, have not been slow in adopting balloon tires for buses.

Most of the body manufacturers are inclined to hesitate in manufacturing buses with sleeping accommodations because of the doubtful marketing possibilities, but some of the operators are actually going ahead in this direction on their own initiative. The Pickwick Stages of California has produced a bus with sleeping accommodations for twenty-six people, convertible during the day time into a Pullman type coach. There is little doubt that this will be the forerunner of others of similar design, and if sufficient demand develops the body builders undoubtedly will take steps to meet it. Whether the most acceptable design will take the form of a convertible seating arrangement

The A.C.F. parlor observation coach provides ample storage capacity for baggage under seats at the rear of the body

Digitized by Google

Lang light-weight, street car type body on a Yellow chassis. The rear door for exit permits a more rapid exchange of passengers

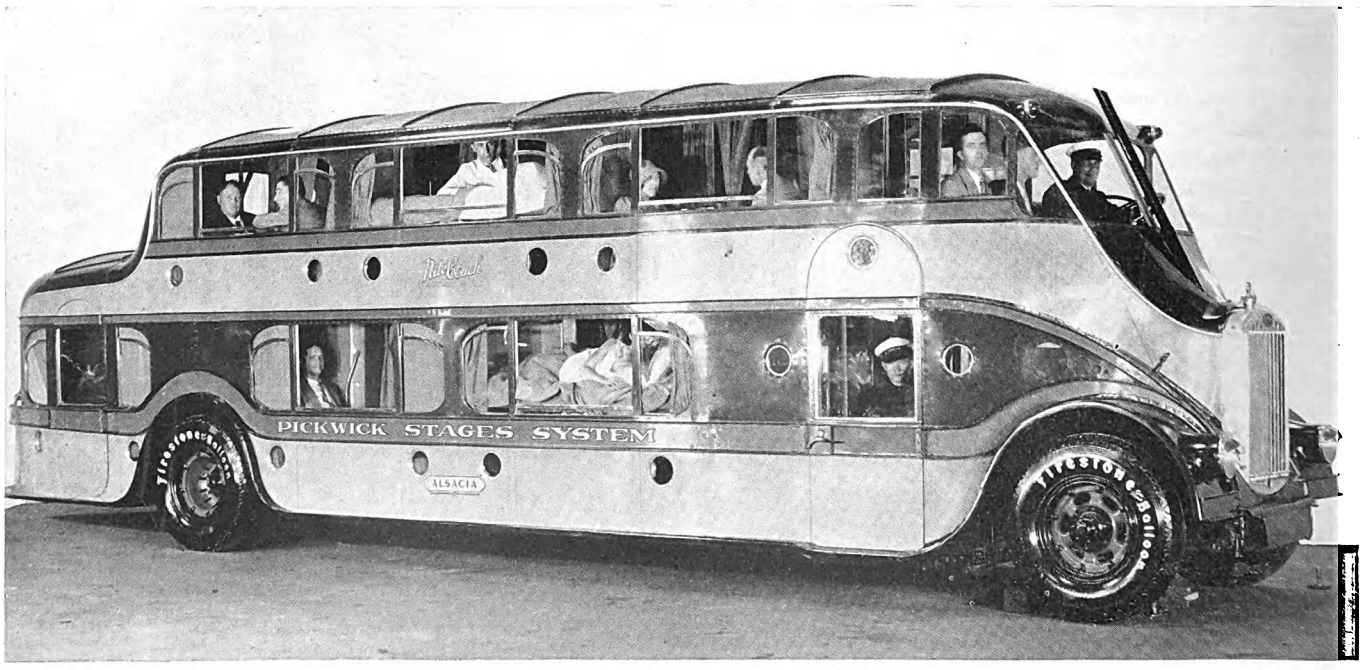
or a permanently made-up berth remains to be decided. If the capacity of the bus is to be reduced it naturally will follow that the cost of the ride will have to increase. A body with built-in berths certainly would offer the most in comfort and convenience but its use would be limited to night runs and as a consequence it would be idle more than half the time.

Baggage handling still presents a distinct problem in intercity service. While still used to some extent the early type of baggage rack, located just over the passenger's head, has been found inadequate and as a result baggage has been carried on the roofs. The present tendency is to eliminate this practice and a number of ingenious arrangements have been devised. Several years ago the Baker-Raulang Body Company designed a full headroom body for interurban service with a more commodious rack than had been provided before. More recently the Bender Body Company of Cleveland has developed a rack along similar lines and the Lang Body Company has provided commodious interior racks in some of its recent bodies. With such an arrangement the passenger stows his own baggage and is responsible for it to a greater degree than when it is intrusted to the care of the driver.

The parlor observation coach of the American Car & Foundry Company was designed to provide a weatherproof baggage compartment of ample storage capacity at the curb level. The compartment has a total space of 140 cu.ft., with 53 sq.ft. of floor space, with doors at the rear and at both sides sufficiently large to admit a good-sized steamer trunk or sample case. An incidental advantage of this arrangement is that the wheelhouse seating problem is avoided and a considerable portion of the passenger load can be isolated from engine noises. Other special designs for coaches include a good sized compartment taking up the entire rear section of the coach body, with a full length door either at the rear or side through which baggage can be deposited. This arrangement, of course, can only be effected at the sacrifice of seating space.

An owner of a large bus system, who still favors roof storage, has arranged a two-level platform at terminals and all principal stations. Baggage is checked and deposited on the higher level as it arrives at the station and is shifted directly to the roof of the bus while the passengers board. Some managers profess to see the possibility of separate trucks, scheduled the same as the passenger vehicles, to handle luggage and express packages exclusively.

Lavoratories and toilets of the chemical tank type are being installed on many of the later intercity models. Neither owners nor body builders favor them, however, and there is a question as to whether there is any real demand for them on the part of the public. They take up

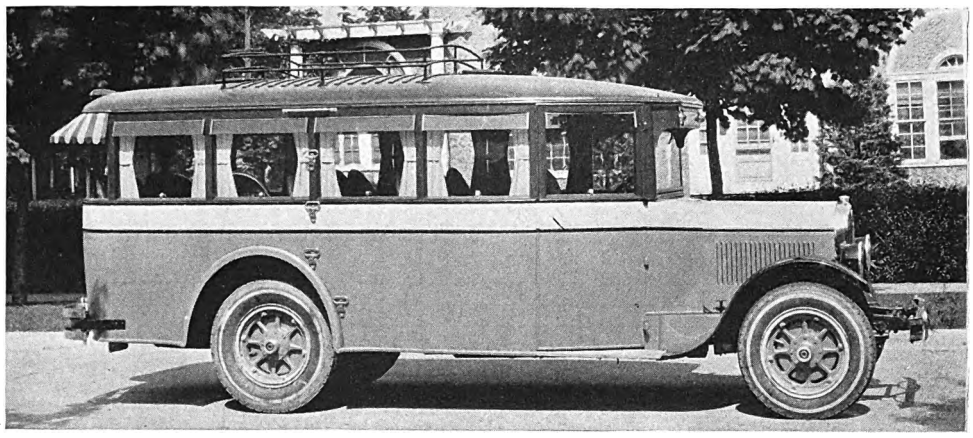


"The Nitecoach," a motor coach sleeper developed and built by the Pickwick Stages System for service on the Pacific Coast

Digitized by Google

space that might otherwise be used to good advantage, are unsanitary and are offensive to most persons. With rest stops properly arranged there should be little need for a toilet on a bus and the opinion that it may be dispensed with entirely is held by the majority of operators.

On a few of the Pacific Coast routes buses have been furnished with buffets. This is looked upon by most companies as a "billboard" or advertising feature. It is of doubtful value and the idea does not appear to be making much progress. While there is room for improvement in most of the lunch counters in bus terminals and at rest stops along the lines, the remedy does not appear to be in installing buffets in the buses.



Small capacity semi-de luxe body developed by FitzJohn Manufacturing Company for service where buses of larger capacity are not warranted

The body requirements of conventional city buses are well standardized and have changed but little in several years, with the notable exception of the 40-passenger units designed for mass transportation. Built for short hauls and frequent stops the principal features of the accepted designs are a low step, wide entrance, doors that can be opened and closed quickly and with little effort, as large a proportion of cross seats as practicable, space for standees and sufficient headroom to clear the hat of a tall person. Application of the circulating load principle of handling passengers by the use of an automatic rear exit seems to be gradually growing in popularity, particularly among those users who operate street cars. Usual practice is to have longitudinal seats over the wheel housings with a well for standees between. However, one of the largest fleet owners, the Public Service Co-ordinated Transport, with headquarters at Newark, N. J., locates the standing bay in the forward end of the bus. The use of individual bucket type seats in city buses is being extended.

The 29-33 passenger unit has established itself securely in city service where moderately heavy traffic is the rule. For feeder service the 21-passenger body is growing in favor and for handling mass loads the 40-passenger coach has in new territory supplanted the double-decker.

Although not a creation of the past year, strictly speaking, as the first models were on the streets shortly before the 1927 convention at Cleveland, the heavy capacity single-deck coach may be said to have come into its own within the past twelve months. Several manufacturers are now producing them, and the number in use is increasing steadily. Seating from 40 to 45 passengers with a high degree of comfort, the coaches are carrying peak loads of considerably more than 100 passengers. A number of electric railway executives, conservative in their attitude toward the conventional type of bus, lean toward the 40-passenger coach because it approaches more nearly their views of city service carrying capacity standards. It marks the arrival of the bus as a unit in the field of mass transportation. In carrying capacity alone

Digitized by Google

Studebaker 21-passenger street car type bus for city service where capacity requirements are light

it has little superiority over the double-decker, but from the standpoint of accessibility and time to load and unload it probably has a marked advantage. Its use is not confined to city service. It has been adopted for long intercity bus routes and an increasing number are being ordered for service of this character. Several manufacturers have developed variations in the large capacity design. The use of one large motor in the rear with gas-electric drive as in the Versare type of unit, being used by the Montreal Tramways and the Third Avenue Railway of New York City, represents one of the variations from the usual design to obtain larger capacity within limited over-all dimensions.

A departure from the general trend and one that will be watched with a great deal of interest is the development of the medium capacity body with semi de luxe appointments, mounted on a low chassis of long wheelbase, giving it an exceptionally pleasing general appearance. Generously dimensioned, well-upholstered seats, arranged in pairs on one side of the aisle and singly on the other, supply an atmosphere of comfort that is missing in the average bus of higher seating capacity. Approaching the private auto in speed, exclusiveness and general appearance and making a special appeal for patronage to the man who usually "drives his own," this type of bus should fit in exceptionally well in providing fast express service in cities, in serving as a feeder where the larger type of bus is not warranted, and in certain classes of intercity service. Because of its lighter weight a high-powered motor is not necessary; in fact, a stock engine as provided for the average high-class passenger automobile should be sufficient. Needless to say, this will be reflected in a lower first cost, which is an end in itself worthy of consideration.

Much as the designer and owner would like to avoid it there is a trend toward heavier buses. The preference for more powerful motors leads directly to greater weight, as do most of the other refinements and improvements which are being given attention. The trend toward more powerful motors for practically all sizes of buses is particularly to be observed in models intended for the long-distance runs. This is demanded to give quicker movement in traffic and a higher average speed through hilly country, and several manufacturers are preparing to turn out engines rating up to 150 hp. to meet this requirement. There will be better correlation between engine and drive and, quite probably, a reduction in gear ratio. In addition to increasing the weight this increase in power will call for higher initial investment, greater fuel consumption and higher maintenance expense. Compensating advantages on the long runs will be a higher average sustained speed, reducing the number of units required to maintain a given schedule. The six-cylinder engine is rapidly replacing the four in this class of service. Introduction by General Motors of a low capacity model equipped with an eight cylinder V-type engine represents a step in the direction of the eight-cylinder motors in buses. Magneto ignition to a considerable extent is being replaced by battery ignition.

Gas-electric drive, introduced several years ago, has won favor with several of the largest fleet owners and it is significant that this pattern appears to make its greatest appeal to those long engaged in electric railway management.

Bus manufacturers have given careful and particular attention to refinements of brake design, but despite all the progress that has been made in this direction too large a proportion of the difficulties encountered by drivers arises from brake troubles. The larger manufacturers are still divided in their preference for manual, air and vacuum booster installations, with much to be said in favor of each. The industry unquestionably has been aided by the manufacturers of electric railway and steam railroad brakes who have entered the field.

There seems to be a general impression among bus manufacturers that the cost of buses is going to increase. Development work has been expensive, sales expense is heavy and the market is by no means unlimited. There will be a steady and increasing demand for years to come but nothing to warrant mass production and the economies that accompany it. But a higher price for buses may mean better buses and that, after all, is what the industry is most interested in.

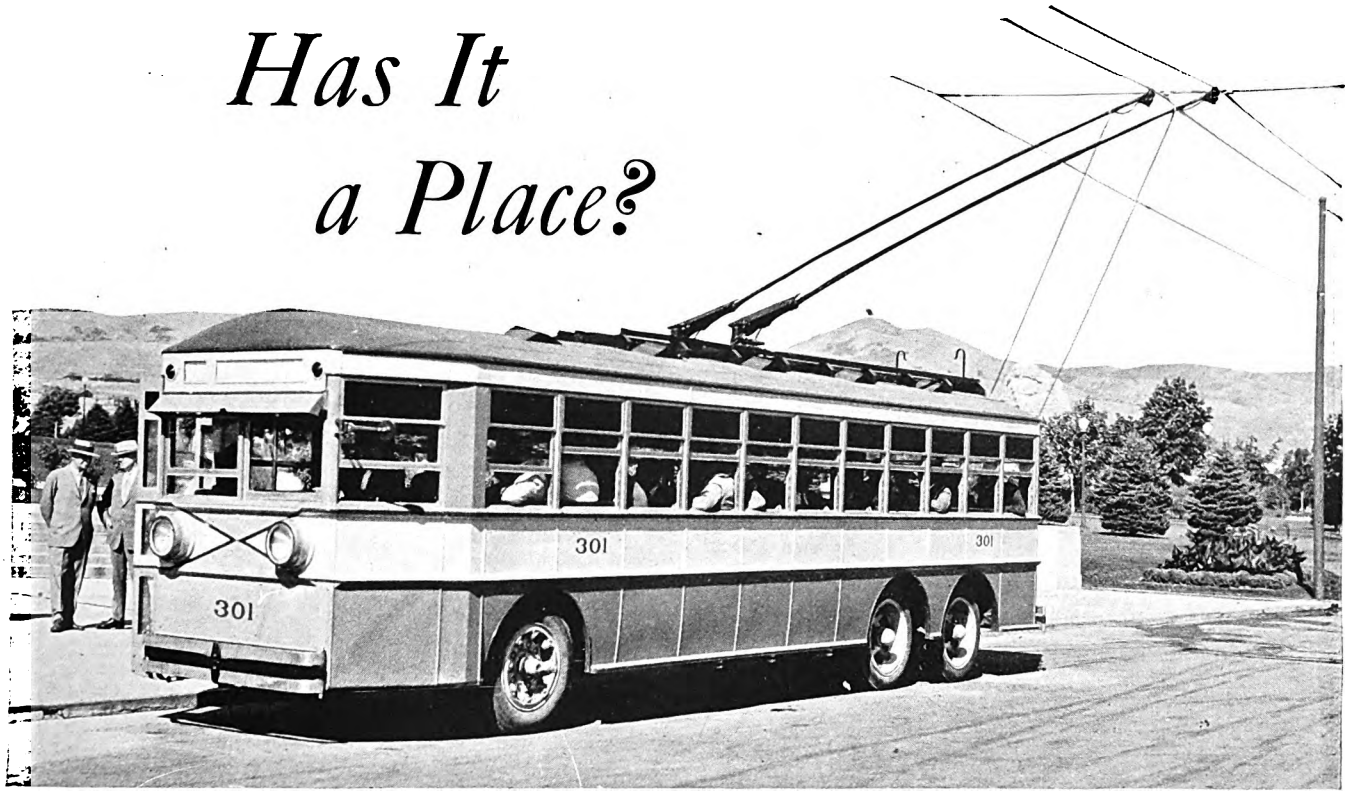
The TRACKLESS TROLLEY *Has It a Place?*



Patrons of one of the Utah Light & Traction Company's lines in Salt Lake City are now riding on a new type of vehicle—the electric coach

BY

EDWARD A. WEST
General Manager
Utah Light & Traction Company
Salt Lake City, Utah

New type trackless trolleys for Salt Lake City may solve many urban transportation problems. Low operating cost, light weight and high speed are important features

ROAD vehicles propelled by electric motors that obtain their energy through trolley poles from overhead wires are not new. This type of operation has proved practicable in European and other foreign countries and, as everyone in the street car business in this country knows, was worked out a number of years ago in America. There are several companies in this country that are operating trackless trolleys every day.

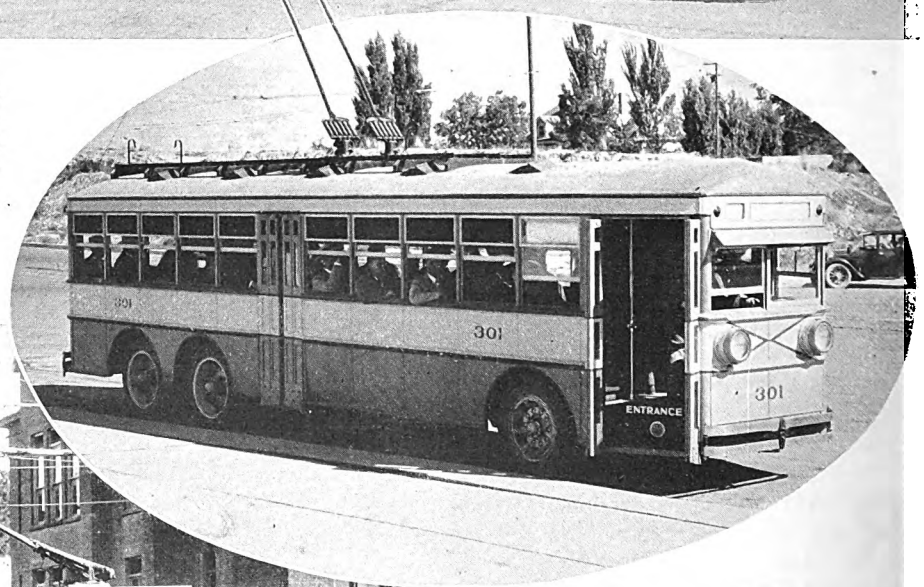
Whether due to the energy with which gasoline bus manufacturers have promoted their product or because of the ungainly, awkward, unattractive design and insufficient power of the early trackless trolleys, the fact is that the latter vehicles did not in general meet with much favor. The installation at Staten Island failed to interest street car men. However, another installation at Rochester, N. Y., is still going on satisfactorily, the writer is informed. The trolley buses in Albany also operate every day, doing their work efficiently. These examples were only the forerunners of something larger, speedier, more powerful and of more attractive design. We are indebted to the gasoline bus manufacturers for showing us the way to make our rolling stock better looking and more appealing.

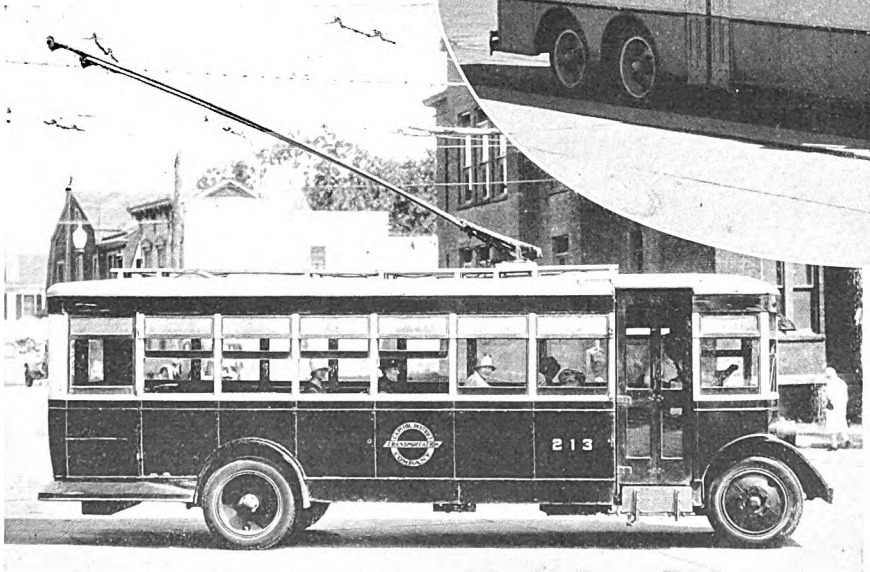
In Salt Lake City the street railway company has for many years given service over more miles of track than needed to meet the city's transportation requirements adequately. Deferred maintenance on tracks and pavement was piling up at a rate entirely beyond the earnings of the company. As a result, abandonments were resorted to through regular proceedings before the Public Utilities Commission of Utah, and the trackage was decreased steadily from 144 miles of single track on Jan. 1, 1925, to 116.5 miles on Jan. 1, 1928. Permission was obtained on March 23, 1928, to remove more than 9 miles of track that was paralleled on either side and but one block distant, so that, at the time of this writing, only 107 miles of single track are being operated.

After the trackage was thus reduced everything seemed to be going along satisfactorily until the company was faced with the necessity of reconstructing and repaving 4 miles of single track. Furthermore, there were attendant future paving liabilities which would have aggregated about $174,000. This particular line is well patronized. It serves a well built-up district where there is no paralleling car line on either side for more than a quarter of a mile. It is paying as well as any of the company's lines.

Digitized by Google

The Salt Lake City electric coaches are a radical departure from the first trackless trolleys built in this country in general appearance, design and attractiveness





A trial run of the Salt Lake City electric coach was made in the presence of state, city and railway officials on Aug. 20, and regular service started a few days later. Note how the vehicle can approach the curb for exchange of passengers

The Capitol District Transportation Company, Albany, N. Y., has been operating trolley buses of this type in Cohoes, since November, 1924

Therefore, abandonment of the route seemed to be out of the question. Considerable study was given to determine the most economical transportation medium with which to give the service. If the track were rehabilitated and paved, street car operation could be continued with the same rolling stock as that serving our patrons on other lines. The company's experience with gasoline propelled vehicles would indicate that this instance did not justify the substitution of available types of buses for the street cars. Sound transportation merchandising theory dictated the furnishing of something attractive, comfortable, safe and speedy. Could some type of transportation equipment be found that would not run on rails and yet would utilize the power plant, substations and overhead investment, the property write-off would be greatly reduced. Trolley buses seemed to be the logical answer.

Revival Suggested by Recent Bus Developments

At the last convention of the American Electric Railway Association several radical types of gas-electric buses were shown which suggested resurrection of the trackless trolley idea. A trolley bus seating 45 passengers, utilizing light-weight, high-speed, 50-hp. motors and with all the luxuriousness of the most modern and up-to-date city bus seemed to offer a number of economic and

Digitized by Google

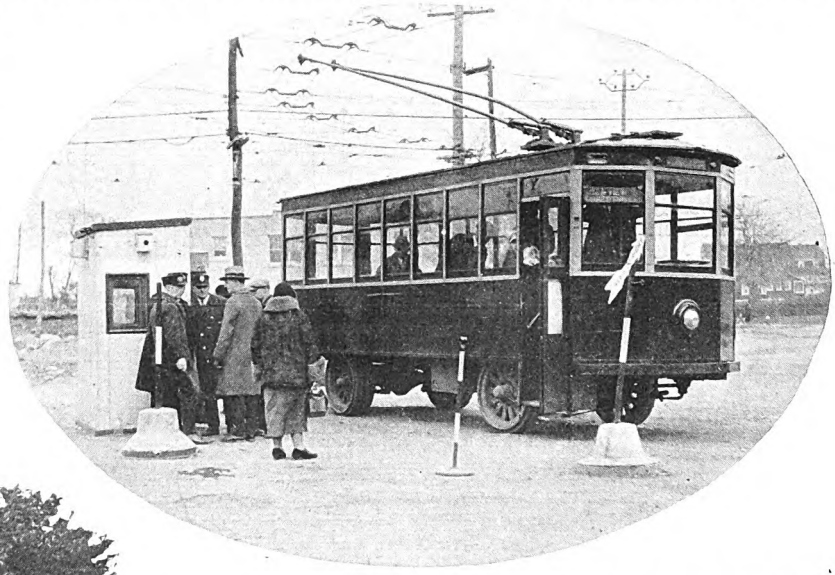
operating advantages. Estimates were prepared to cover the expense of installing this new type of trolley bus and it was found that the cost of the bus installation, including the construction of the necessary double trolley with all the special work, would be about the same as the cost of track and pavement for this route. Best of all, patrons would be furnished something modern, power investment would be conserved and future maintenance of track and pavement would be eliminated.

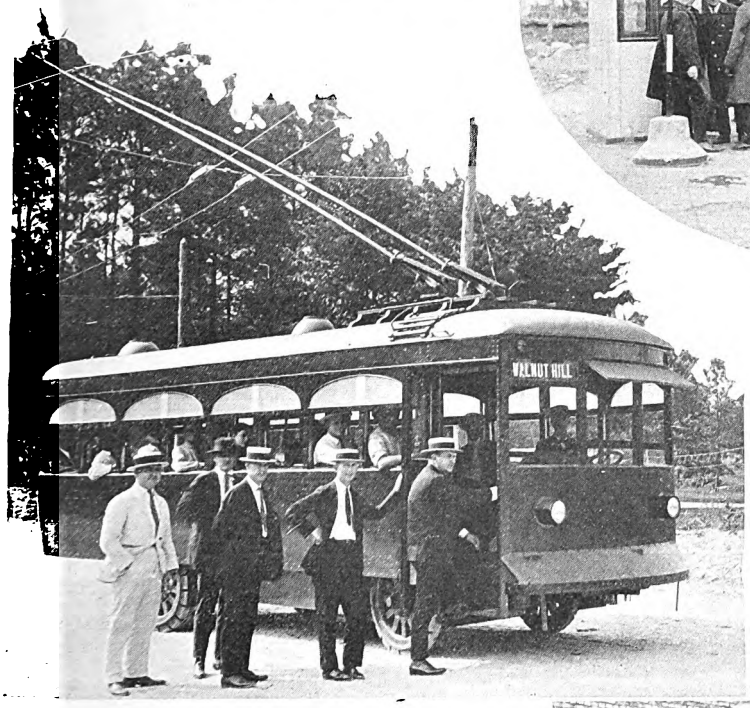
Certain difficulties now presented themselves. It was necessary to make application to the city commission for a franchise amendment permitting operation of electric coaches. Some of the city commissioners were rather hesitant about granting a franchise for this strange and foreign type of operation, as they were unable to grasp the idea of flexibility together with the appearance of double trolley over the streets. They were also fearful that the operation would not be practical. Inasmuch as it was impossible to demonstrate trolley bus operation to the commissioners, a hurry-up request was sent to the Eastman Kodak Company in Rochester, N. Y., and J. F. Uffert of the New York State Railways for a motion picture of Rochester's trolley buses. This seemed to be the only way to present the idea effectively to the city officials. On its receipt four days later the film was shown to the heads of the city government. City officials were quick to see the advantages of this mode of transportation and at a hearing held on the following day an amendment to the franchise was granted, permitting operation of electric coaches. An order was then placed for ten trackless trolleys, or as we call them, "Salt Lake City Electric Coaches."

There is as much difference between the new electric coach and its progenitor, the trackless trolley, as there is between the horse car and the latest electric street car. It embodies some of the best features of the gasoline bus, the gas-electric bus and the electric street car. The earlier trackless trolleys looked awkward and they were hard riding because of solid rubber or high-pressure pneumatic tires, poor spring design and short wheelbase. They were bulky and cumbersome because they were equipped with heavy railway motors, the only motors available at that time. This made floor heights unreasonable. Relatively low power limited the speed. Because of their height their appearance was exceedingly awkward and their lines were blunt and broken with sharp angles.

Trolley Bus Offers Attractive Economies

Aside from the operating features of the electric coach there are many other factors that had an important bearing upon the decision to take this revolutionary step. The gasoline bus did not receive serious consideration because its power costs were prohibitive, being in the neighborhood of $26,000 annually against $7,000 for the electric coaches for the route under consideration. In addition it was necessary to substitute a type of vehicle that was

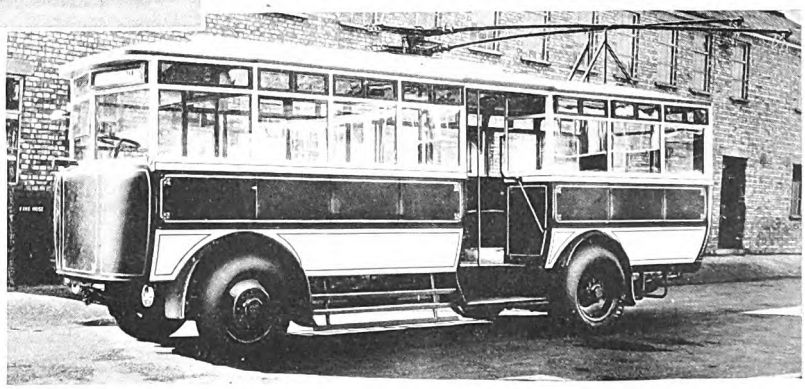




Upper view—Heavy railway motors in the Staten Island trackless trolleys made them sluggish in action. The motors also necessitated increased floor heights, giving the trolleys an awkward and ungainly appearance

At left—Type of vehicle used in Petersburg, Va., from June, 1923, to December, 1926. It was expensive to maintain and operate, and was hard-riding because of its solid rubber tires, its spring design and short wheelbase

Below—England has developed the trolley bus to a high degree and has adopted it in several cities. This bus with pneumatic tires, extra long springs, and seats of the semi-bucket type is one of 30 being used in Ipswich, England



Digitized by Google

reliable, quiet, free from odor, comfortable and that could be quickly stopped and started. In replacing street cars with another agency the latter had to be one that would prove more satisfactory and attractive to the public and cheaper to operate than the street car, while at the same time retaining street car seating capacity; otherwise there was little to be gained by making the change. The company's experience wih gasoline buses did not indicate that they effect the cure for street railway pains that has been claimed.

Double-deck trackless trolley of the Keighley Corporation Tramway, Keighley, England. Several British companies have adopted this type for use in city service

The industry has known that under certain conditions the trackless type of electric vehicle can be run at less cost than the street car or gasoline bus and it remained only for the elimination of the objectionable features of the older trackless trolleys to revive this type of transportation equipment. Comparative operating expenses for each, on the basis of 100 per cent as the operating cost of street cars are: electric coaches, 71 per cent; street cars, 100 per cent, and gasoline buses, 140 per cent. Costs for the electric coach were based on experience of the Utah Light & Traction Company with gasoline buses and data collected from trackless trolley operators.

Comparative operating costs of street cars and electric coaches over a sixteen-year period were computed from the information thus obtained. Revenues were decreased 5 per cent the first year and 3 per cent each year thereafter, assuming the entire transition from street cars to electric coaches as taking place during a five-year period. Computed on this basis and allowing for depreciation, at the end of sixteen years the system under street car operation will show a deficit of several times that which the electric coach system will show. If revenues decrease at the rate stated it is apparent that operating expenses may be decreased partly in proportion because a decrease in revenue of approximately 35 per cent would, without question, justify reduced service. Hence, the estimated deficits will not be as large as indicated, but the wide difference between the results of street car and electric coach operation remain unchanged and reflect the financial advantage of the one over the other for the sixteen-year period. Ample allowance being made for continued decreased patronage, it remains to be seen if electric coaches will not, on the other hand, stop the falling-off in passengers and attract new business. Assuming that the ten coaches will meet all expectations their adoption on certain lines in Salt Lake City will prove more beneficial than the continued use of street cars.

The trackless trolleys of the New York State Railways, Rochester, N. Y., are operated on a belt line through well built-up districts. Because of the frequent stops necessary the management considers these vehicles, being less noisy and quicker to accelerate, more desirable than street cars or gasoline buses

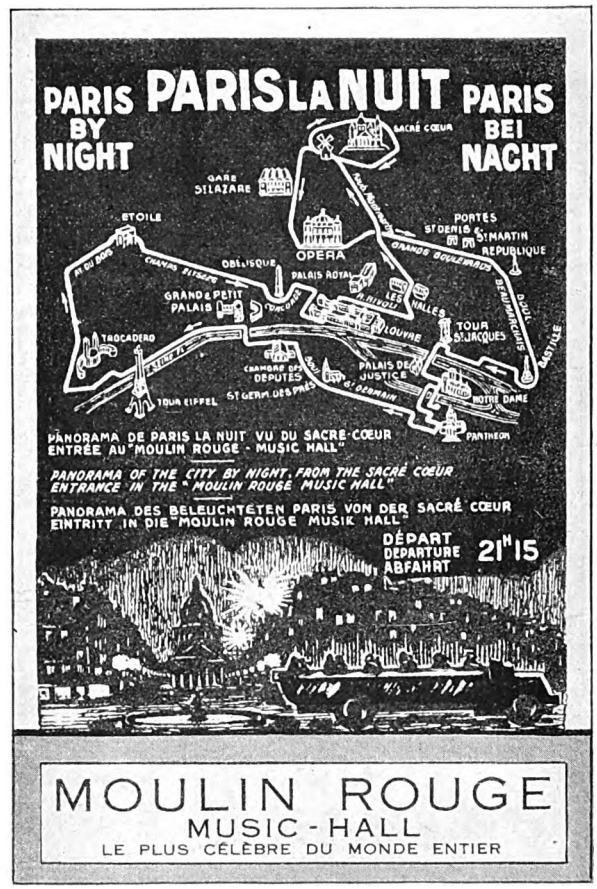
Maps Help to Sell Transportation *in Europe*

BY

HENRY W. BLAKE

Senior Editor

ELECTRIC RAILWAY JOURNAL



Bus tour circulars usually show a map of the route covered

MANY foreign electric railways and bus companies are paying much more attention to selling transportation by informing the public of their routes and service than are the electric railways of this country. They are using numerous maps, bulletins, direction signs and other devices in their cars and buses, in their stations and on the streets, to help the patrons use the service and to encourage travel. A conscious effort is being made by them, not only to assist the old residents of the cities, but also visitors and new residents. As a result many people who would otherwise travel by taxi, horse-drawn cab or automobile, ride the street cars or buses regularly. Several recent articles in ELECTRIC RAILWAY JOURNAL, particularly that entitled "Answering Questions Before They Are Asked," on page 1150 of the issue for Dec. 24, 1927, have given an account of the method usually employed in using street and station signs. Maps also are valuable for this purpose.

FOREIGN electric railways and bus companies use route maps liberally to encourage travel. These are distributed at a nominal charge or gratis. Maps specially designed for the convenience of passengers are mounted in cars and buses in several cities

The route map is a strong ally of the European street railway and bus traffic manager in gaining passengers. He displays it in all possible places. It is somewhat strange that American companies have used this method so little, because a great proportion of the American public, through automobile touring, has become very much accustomed to the use of maps. At present the customary way by which a potential passenger in America finds out where to take a street car or bus to a place, if he does not know where it is, is to ask at a store or of some person on the street. But often the directions which a stranger in an American city receives from such sources are as confusing and meaningless to him as a Chinese laundry ticket. Especially is this the case when the car line is some distance away and one or two transfers have to be made after the journey has been begun.

As a rule the rapid transit lines in this country have gone farther than the surface lines in the use of maps. With them, it is not uncommon to have in the cars and sometimes at the waiting stations framed maps showing all the routes operated.

Maps of this kind impart some information to the passenger and so are better than nothing, but they could easily be made more useful. Thus, the maps posted in the stations could be marked with a large arrow or in some other way to indicate the place on the map of that particular station. Similar maps, except perhaps on a larger scale, but marked in the same way, could be posted at each entrance to each rapid transit station. They would then be in a place where they could easily be consulted by the would-be passenger who would not have to climb up or down to the station platform and pay his fare to get on the platform before he could consult the map.

Large maps of this kind displayed at the entrances

Digitized by Google

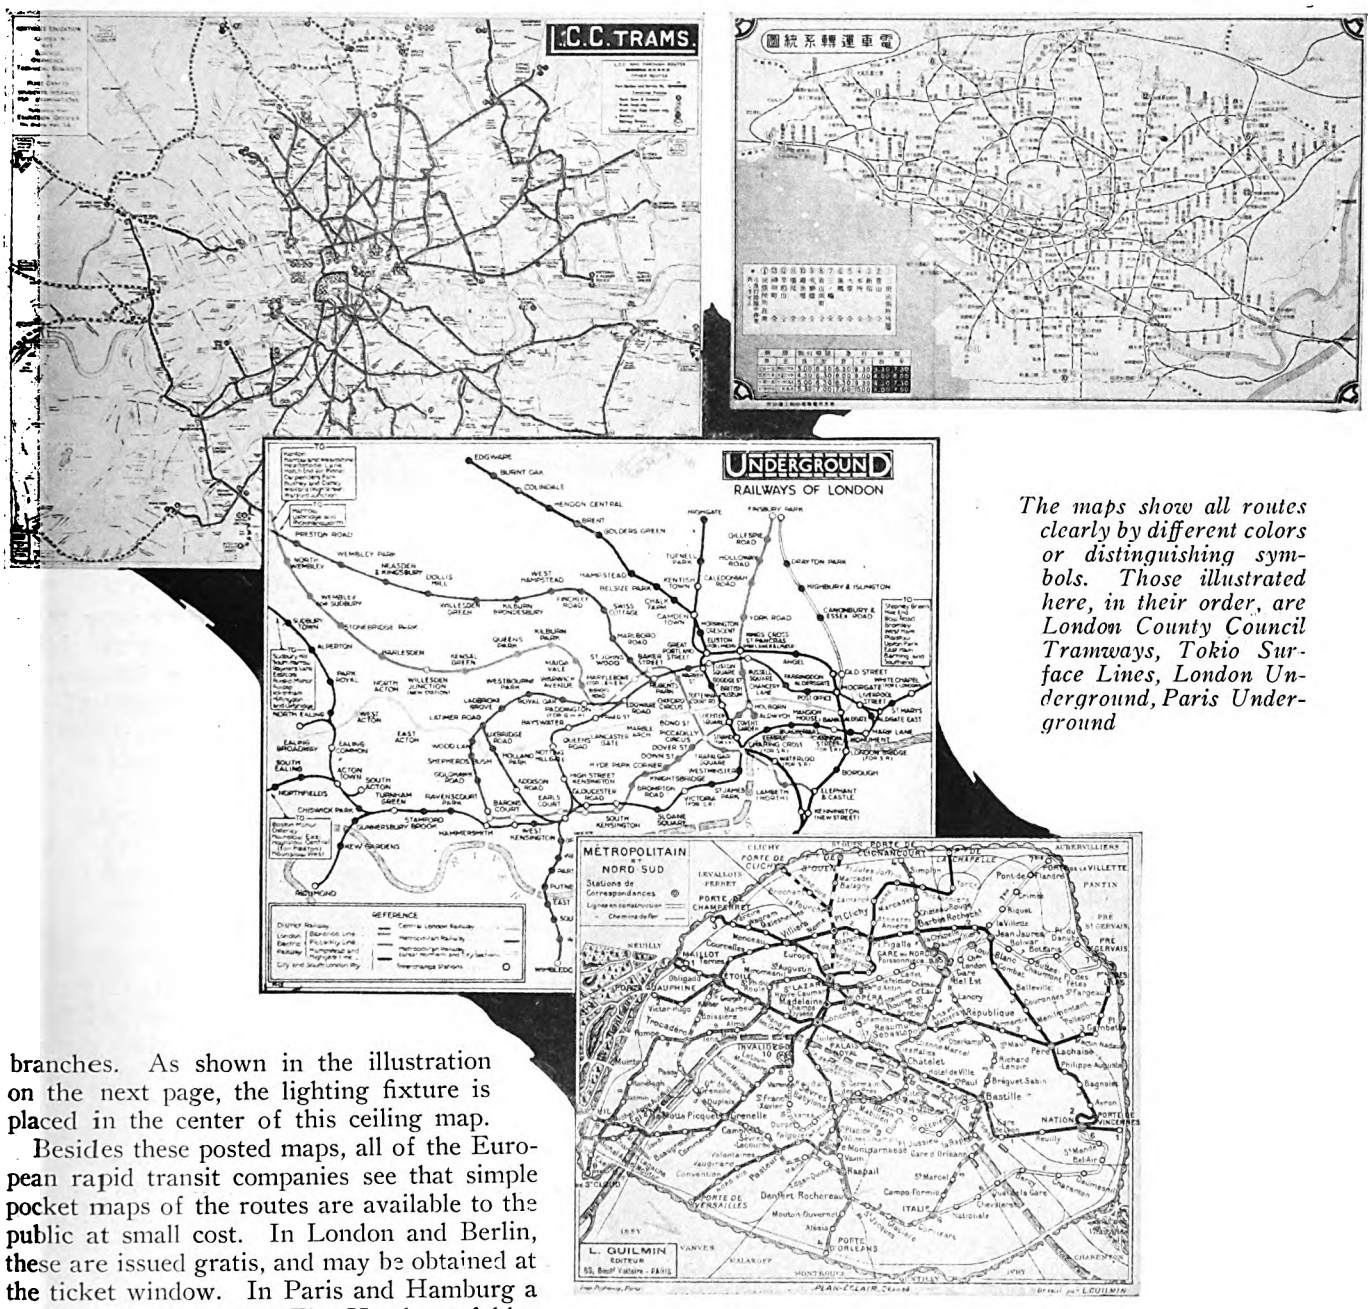
In nearly every large city abroad maps showing all the electric railway or bus routes can be obtained free or for a nominal charge. These are covers of maps issued by electric railway or bus systems

to the stations have been found by the rapid transit lines of London and Paris to be excellent advertisements for their service. They form a constant invitation, particularly to the stranger, to patronize the rapid transit lines, rather than a taxicab, in getting about town. The fact that each map is marked with a star or arrow indicating the point in the city where it is posted helps the stranger to orient himself. It also enables him to become familiar with the layout of the rapid transit lines. Such a map in London and Paris is often accompanied by printed data relating to train service, such as owl schedules.

The European rapid transit lines mentioned carry in their cars another kind of map equally well adapted to convey to the passenger the information which he needs. After he has taken his place on the car his need is no longer the same as it was before he boarded the train. He has learned from the station map the proper route to take, and his principal need now is to know when to get out. For this purpose a very simple map which shows only the stations on that particular route is most helpful. Such a map is carried in every rapid transit car in London and Paris. In the latter city it gives even further information. It shows not only all the stations and the junctions, like the London map, but also the names of the principal cross streets near each station, with their nearest house number. Such a map, used on the Paris Metropolitan Railway, was reproduced on page 1153 of the issue of ELECTRIC RAILWAY JOURNAL for Dec. 4, 1927.

Of course, where such a map is posted in a car, it has to be changed if the car operates over a different route. This means some complication, but the managements think the advantages are worth the trouble. On the Hamburg subways and elevated railways, a map is painted on the ceiling of each car. The rapid transit routes in Hamburg are somewhat like those in Chicago, that is, the system has a central loop with various

Digitized by Google



The maps show all routes clearly by different colors or distinguishing symbols. Those illustrated here, in their order, are London County Council Tramways, Tokio Surface Lines, London Underground, Paris Underground

branches. As shown in the illustration on the next page, the lighting fixture is placed in the center of this ceiling map.

Besides these posted maps, all of the European rapid transit companies see that simple pocket maps of the routes are available to the public at small cost. In London and Berlin, these are issued gratis, and may be obtained at the ticket window. In Paris and Hamburg a small charge is made. The Hamburg folder includes a map of the surface car routes, as both modes of transportation are activities of the same company.

Surface Railways Also Issue Maps

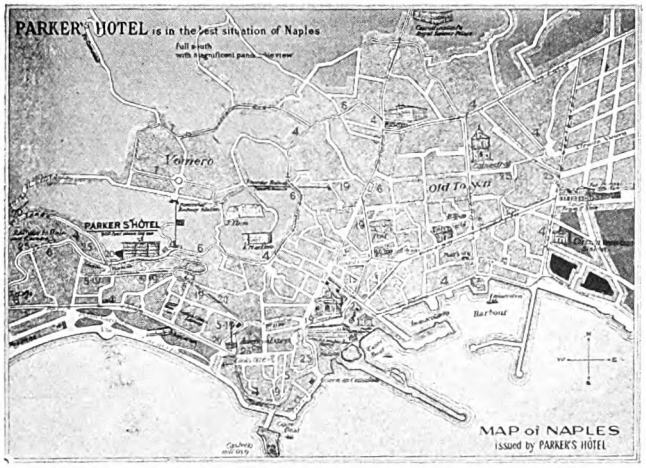
A few surface railways in the United States issue maps showing routes. Abroad the practice is almost universal, both with the railways and the bus lines in the larger cities. The maps are usually of pocket size and are given away or sold for a slight charge. The fact that each railway or bus route has a distinctive number carried in a conspicuous place on the hood helps the intending passenger to identify the routes on the map. Occasionally an enterprising hotel will publish a map of the city in which it is located, with the position of the hotel and the routes of all car lines passing the hotel printed in red upon the map. Such a map without the car lines is not uncommon here, but who ever heard of an American hotel getting out a special map showing the car lines passing the front door? Such a map in four colors issued by a hotel in Naples, Italy, is reproduced.

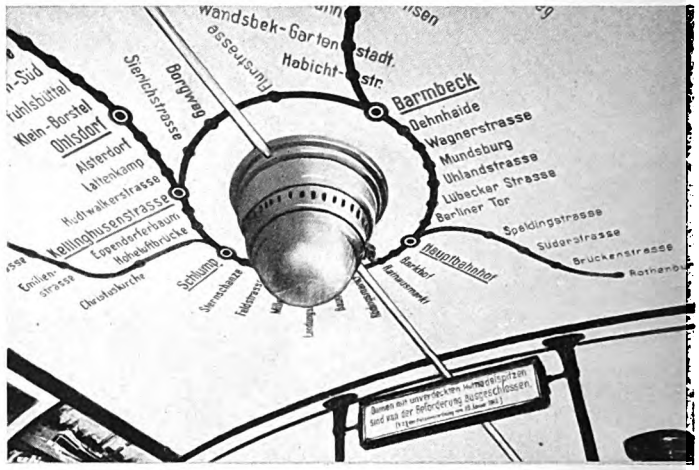
On all the maps issued, whether by the company or privately, the numbers of the several car routes are always printed close to the route lines, and in a corner of the map there is generally a key which gives the names of the termini and the principal points passed by each of the routes. This method is followed even as far away as Tokio, as may be seen from the accompanying reproduction of a map and time-table issued by the Tokio street railway system. Often another table gives the headways followed during periods of the day on the several routes. Frequently the map is combined with a leaflet or booklet giving complete time-tables and other data of all the routes, as in London, Paris, Rome and Hamburg.

Sometimes framed route maps are carried inside the bus or car, as already mentioned in connection with the rapid transit lines. This method is followed in Paris, and one of the maps so carried was reproduced on page 1153 of the issue of the Journal for Dec. 24, 1927.

Some surface line companies also follow the rapid transit plan of posting large maps of their routes at

Digitized by Google





At left, circular issued by hotel to show tramway routes passing its entrance. At right, the Hamburg Rapid Transit System paints a map of its routes on the ceilings of its cars

various points to help potential passengers to select their route. This is done in Paris and Dortmund. The London County Council goes even farther by the installation at several points of a large map equipped with an electrical device known as a "pathfinder." By pressure on the proper button a traveler can light a series of electric lamps which trace for him the shortest route from the place where he is standing to any desired point in London, if it is reached by any of the tram lines of the London County Council. He also is told the route number of the car which will take him there. A view of persons operating this device at a passenger waiting station on Victoria Embankment near Westminster Bridge was published on page 395 of the issue of this paper for Sept. 3, 1927. The station itself is shown below.

To show how general is the practice of publishing pocket maps with car routes on them and how similar in general appearance these maps are, whether they are for England, France, Germany, Italy or Japan, a number of them are reproduced. It should be understood, however, that all of them are in colors, usually three colors and often more, so that a black and white reproduction, in which the colors are not distinguished, does not do justice to their attractive typographical appearance.

So far but brief reference has been made to maps issued by bus companies, but where a considerable bus service is given, as in London and Paris, route maps are published similar to those mentioned for tramway companies. In addition, it is worthy of note that the sightseeing and touring buses, most of whose business is "new" business each trip, usually include maps of the routes traversed. A map issued by a "Seeing-Paris-by-Night" bus company is reproduced at the head of this article.

Since the development of the touring bus, many personally conducted trips of from one day to two weeks or more have been established by the larger tourist agencies, like Cook and American Express, as well as by smaller agencies and individual bus companies. These trips are attracting the patronage of a continuously larger number of tourists who find in them an unrivaled way of seeing the country through which they pass and of being relieved of the inconveniences of attending to baggage and of engaging hotel accommodations for the night. These details are cared for by the conductor of the tour.

With these tours also, maps of the trips available form an important part of the traffic literature. Thus the circular descriptive of the motor tours in Great Britain offered by Thomas Cook & Son in 1927 contained fourteen separate maps and the same number of individual maps is found in their corresponding pamphlet on "How to See the Riviera" by motor bus. When concerns with the long experience in traffic solicitation of Cook & Son place so much emphasis on the map as a factor in traffic promotion there must be something in the idea.

At this passenger waiting station of the London County Council persons can learn what car to take to a desired destination by pressing a button

Ten storage-battery tractors pay big dividends in the Coney Island shops of the Brooklyn-Manhattan Transit Corporation

Better Maintenance Equipment

INSURES BETTER SERVICE

The need for modernization is not limited to cars, track and line. Substitution of machine work for hand labor in maintenance produces higher standards and economies that may be utilized to build revenue

BY

CLARENCE W. SQUIER
Associate Editor ELECTRIC RAILWAY JOURNAL

CUSTOMERS of electric railways must be pleased. Service is the first consideration, and to give good service improved tools must be used by all departments. That means modernization of equipment, better cars and roadbeds, higher speed and greater comfort to passengers. These are the things that the public seeks. But back of it all there must be efficient methods and improved shop equipment for maintaining cars, track and line. There are many practices that are now coming into use by electric railways that are proving profitable investments in addition to insuring better service. There are many examples reported by electric railways of tools paying for themselves in from six months' to a year's time. Surely these tools can be considered profitable investments.

Electric trucks are used by many electric railways for handling all classes of shop materials economically and speedily. The properties using them find a multitude of operations to which they can be applied advantageously to reduce handling costs, increase storage space and speed up the transfer of materials. The Cleveland Railway was one of the first to use storage-battery trucks in its shops. Milwaukee followed shortly and the Third Avenue Railway, New York, has found this type of truck equipped with a lifting platform to be an attractive investment. Probably the biggest user among electric railways is the Brooklyn-Manhattan Transit Corporation with a total of sixteen electric trucks in its various shops.

A careful record was kept of the operation of the first truck used by the Milwaukee Electric Railway & Light Company. It was found that the truck displaced six men who formerly were employed in moving material from one department to another. Brooklyn reports savings that indicate that its trucks will pay for themselves in a period of $1\frac{1}{3}$ years. The cost of these trucks varies from $2,300 to $5,000 each. Four trucks purchased by one railway at a total cost of approximately $14,000 included one derrick truck, one equipped with a raising platform and two with stationary platforms. With this equipment eight men formerly engaged in handling materials were displaced. It was estimated that the saving in labor alone paid for the entire equipment in 1.3 years.

Car wheels and axles are handled in the new Winton shops of the Cincinnati Street Railway with this 400-lb. lift truck

With trucks equipped with either cranes or lifting platforms, heavy parts and materials may be handled directly to shop machines. In some instances where heavy parts are to be handled, one man with an electric truck may displace from two to four men. With the lifting platform type of truck heavy parts can be taken from under cars and raised to machines or benches or lowered to the shop floor by one man. Ordinarily this work would require from two to six men, and the time consumed would be materially greater. Considerable heavy lifting is eliminated and the accident hazard is less. The platform can be lowered to run under the axle of the smallest pony wheels or lifted high enough to pick up the largest drivers for transportation about the shop, and for lifting directly into the wheel lathe or the wheel press. Similarly, with the crane-type trucks, heavy parts like wheels or motors may be picked up, transported and placed directly in the lathe or boring machine. Some shops, lacking overhead traveling cranes, are using electric trucks as a substitute, and with a very much lower investment.

Electric trucks also are useful in lifting, transporting and placing motor shells in position for reboring, in lifting shafts, armatures and other parts into lathes for turning, and in handling heavy castings to drill presses. The use of platform boxes, dump skids and roller platform skids facilitates the handling and transporting of small parts. Materials can be kept on platforms in the storeroom racks and can be taken out as each set of parts is required. Where space is at a premium various types of skids can be piled on one another and can be arranged so that these can be removed without disturbing the load in other parts of the pile. Storerooms using these trucks find that the properly-designed racks effect large economies in storage space.

Machine Washing and Cleaning Replacing Hand Labor

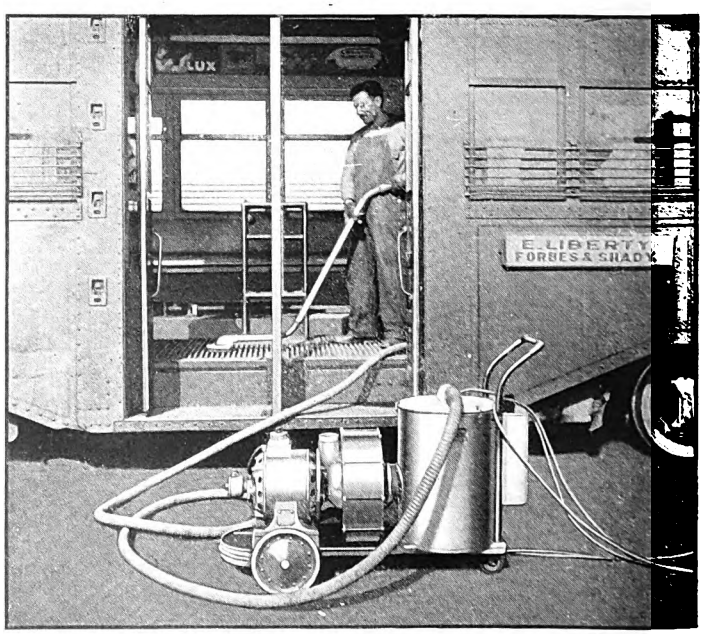
Clean cars are an important factor in keeping public good will and in attracting riders. During the past year some electric railways have materially reduced car cleaning costs by using special washing tracks and mechanical washing machines. The Pittsburgh Railways developed a mechanical car washing machine which was described in the issue of Electric Railway Journal for March 12, 1927. A monthly saving of more than $600 in the cost of car cleaning resulted from an installation which cost approximately $2,000. The mechanical washing was found to be more thorough than hand washing.

The principal advantage of the machine, however, is the reduction in time necessary to clean a single unit. This permits all of the cars to be washed more often, so that they present a better appearance. Cars are cleaned uniformly and dry without streaking or spotting. No wiping is required.

Mechanical cleaning equipment in Pittsburgh has reduced the amount of labor required to only a fraction of that needed for hand work. One man with the washing machine can keep as many as 100 cars washed on the outside under average conditions. A 50-ft. car is run through the machine in two minutes and about 100 gal. of water are used. Brushes are expected to last for 6,000 cleanings. The brush speed is about 300 r.p.m. A total of 1,400 cars are cleaned with a night and day force of 80 men, and the yearly cost is about $100,000.

Machines of this type also are being used by the St. Louis Public Service Company, the Pennsylvania Railroad and the Baltimore & Ohio Railroad, but the machine was developed primarily for washing electric railway cars. The Baltimore & Ohio Railroad installed its machine in August, 1927, and in 57 days 3,501 cars were washed. As many as 104 cars have been washed in an eight-hour day. Four men are used as a crew for this machine. Two men on one side apply a weak solution of oxalic acid with a long-handled brush to the window glass before the cars pass through the spray, and two additional men operate the water sprays and brushes. Each car is washed in an average of two minutes. Cars in trains may be passed through the machine. A seven-car train is washed in approximately fourteen minutes. This is less than one man-hour per train that formerly required 35 man-hours to clean. The railroad has reduced its washing force by six men, resulting in a saving of more than $600 monthly.

In Pittsburgh vacuum cleaners are used for cleaning car interiors. The schedule for interior cleaning interlocks with the car-washing period, which is every four days. Twenty-one heavy-duty portable vacuum cleaners



Cleaning a car of the Pittsburgh Railways with a vacuum cleaner

Digitized by Google

with auxiliary equipment, manufactured by the Invincible Vacuum Cleaner Company, are used. It has been found that two men with two equipments can clean satisfactorily 45 cars per day of eight hours.

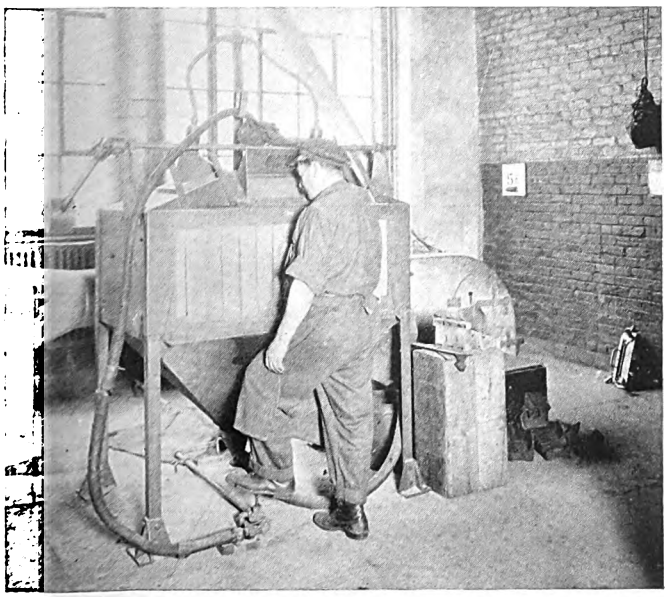
Vacuum cleaners may be used for cleaning curtains, seats, floors, ceilings, inaccessible corners, inside electrical equipment and other parts of the car. The attachments used in Pittsburgh include a special floor rod with 30 ft. of 1½-in. vacuum hose, a swivel wall brush, a triangular street car tool, a round bus floor tool, a plush seat tool and a radiator tool. The average cost of one vacuum cleaner complete with necessary equipment is $555. With this equipment the Pittsburgh Railways has found it possible to keep car interiors cleaner than formerly, and at the same time to make quite an appreciable saving in the man-hours for this work. Although actual figures on the reduction in cost are not yet available, officials of the company estimate that the vacuum cleaners will pay for themselves within a period of two years.

Using a vacuum cleaner and a swivel brush to remove dirt and dust from window ledges and curtains

Sandblast an Economical Cleaning Process

Sandblasts, once used by the electric railways for removing paint only, are now being used in numerous shops for cleaning various repair parts. Commercial equipment for this work can now be obtained for slightly less than $500. This includes the sandblast machine at a price of approximately $220, and a motor-driven fan with exhaust attachment at a cost of about $250. Two of these equipments have been installed in the shops of the Brooklyn-Manhattan Transit Corporation. It is reported that each machine saves the wages of three men previously employed to do the cleaning. The saving amounts to approximately $90 per week, or enough to pay for the equipment in a period of five or six weeks.

The Third Avenue Railway has cleaned various parts by sandblast for a number of years. The work is done in a room 10 ft. square by 15 ft. high, directly underneath a sand drying section. By this arrangement the cost of handling sand is reduced to a minimum. The parts are cleaned in a compartment having a window through which the blasting sand is directed. Holes below the window are provided for the operator's arms. Canvas sleeves, fastened to the steel partition, and provided with felt-lined cuffs through which the operator's hands protrude, keep the sand from blowing out into his face. The operator wears rubber gloves, which have been found more satisfactory than canvas.



This sandblast equipment, used for cleaning miscellaneous maintenance parts, paid for itself in five weeks

Controller drums, arc chutes, finger blocks, connection boards, circuit-breaker parts, brush-holders, commutators and bearings are successfully and economicaliy cleaned by sandblasting. The economy of this method of cleaning is quite pronounced. Commutators which formerly required half a day of one man's time for cleaning, are sandblasted in approximately five minutes. Controller drums are sandblasted in about three minutes; brush-holders and bearings in about two minutes. The cleaning is much more thorough by the sandblasting method. It has been found that babbitt for bearings sticks to the sandblasted surface better than to surfaces prepared by wiping and scraping. Thick accumulations of grease are not removed readily by the sandblast. A thin coating of oil or grease, however, is removed readily and much more effectively than by wiping. To avoid damage to insulation, these parts are covered with tape. Piecework prices of the Third Avenue Railway for sandblasting give a fair idea of the cost of cleaning by this method. These are as follows: Average size commutators, 10 cents each; controller drums, 8 cents each; controller arc deflectors complete, 8 cents; controller covers, 8 cents; controller connection boards complete, 8 cents; brush-holders, 2 cents; armature bearings, 1 cent; axle bearings (two halves), 1 cent.

More Thorough Cleaning at Less Cost with Chemical Vats

Chemical cleaning of dirty and greasy metal has been found to be economical and has been used by electric railways for a number of years. Many shops provide special tanks for cleaning small parts removed from cars and trucks. Motor frames and housings, bearings, gear cases, journal boxes, compressors, brake rigging parts, etc., are cleaned quickly and economically. Several electric railways have installed tanks of sufficient size to take a complete truck frame, and particular economies are reported for this kind of work.

Trucks due for overhaul are run in next to the vat. After the gear cases and motors are removed the frames are lifted from the wheels and are dropped within easy reach of a crane used to serve the hot chemical vat. The

Digitized by Google

whole frame is lowered into the hot solution and is allowed to remain from one to three hours. It is then transferred to the rinse stand, and washed with a hose. Since the metal has been raised to the temperature of the vat, the rinse water dries off quickly and the truck frame is turned over to the repair men, clean and perfectly dry. By inspection immediately after removal from the rinse stand, incipient cracks or fractures are easily located and repairs can be made with a portable welding outfit. When a truck is cleaned in this way as a preliminary to overhaul, a considerable saving in time occurs in making repairs and in reassembly.

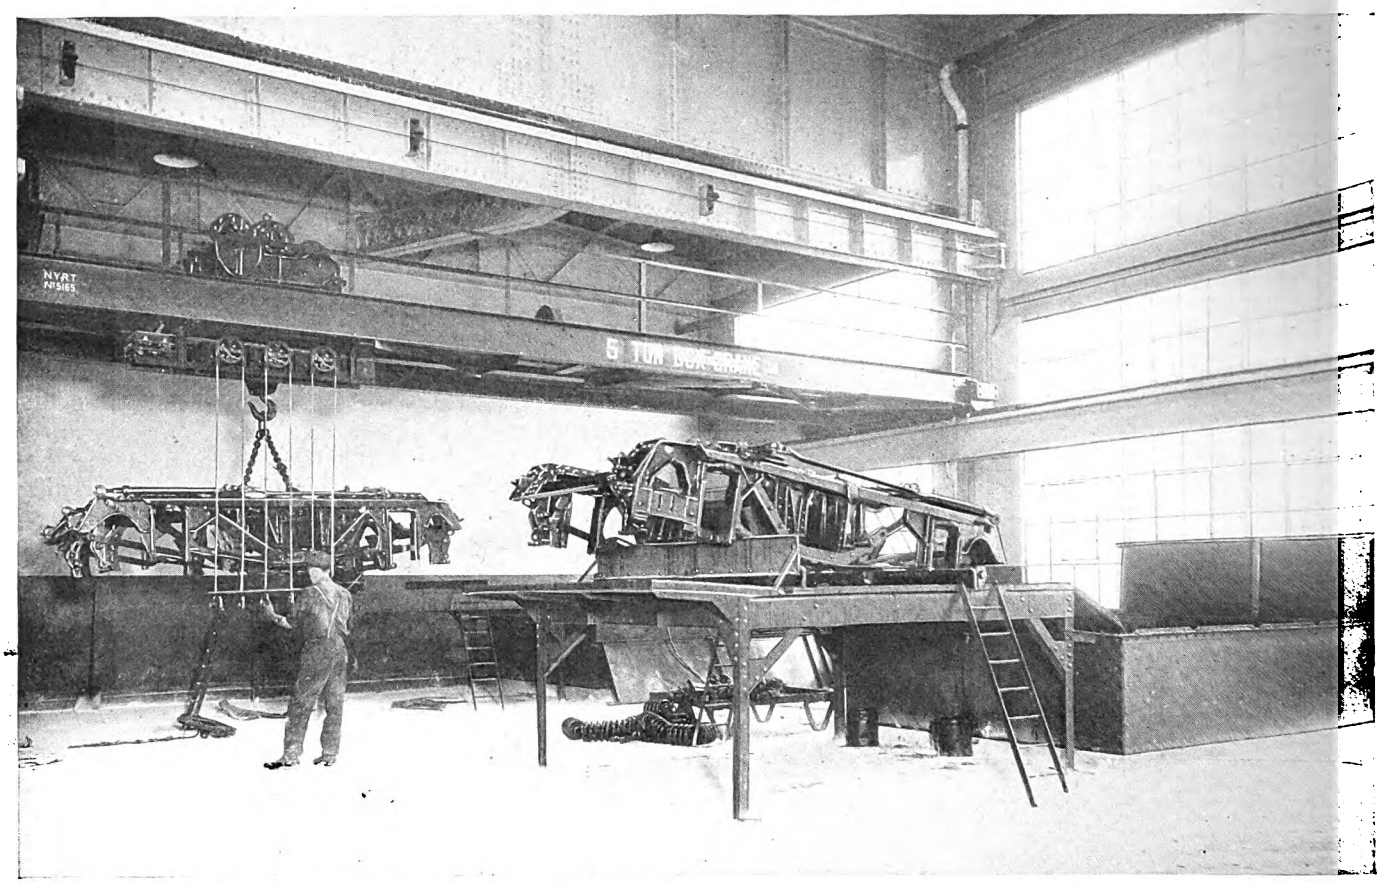
Usually the truck overhauling floor in most electric railway shops is a dirty place, but with a hot chemical vat much of the dirt and grease is eliminated. Most of it remains in the vat, from which it may be removed periodically. There are many cleaning solutions now on the market which are used quite extensively by electric railways, and manufacturers of these materials have prepared various designs of cleaning vats in several sizes.

Pot soldering of armatures, practiced by some electric railways, is another way of economizing. One road which does this work on a piecework basis reports that the former price for soldering an armature was $2.25. With the soldering pot the piecework price is 42 cents per armature, a saving of $1.83. The cost of a soldering pot equipment is about $1,100, so that on this system the soldering of 600 armatures paid for the new pot.

Another property allows 31 cents for soldering an average-sized street car armature in a soldering pot. Two men now do all the soldering, whereas twelve men were formerly engaged on this work. In this shop the armatures are suspended from a hook fastened to the pinion end so that they hang vertically with the commutator end down. A sheet metal ring over the soldering pot fits the commutator quite closely. Asbestos tape is wrapped on the commutator to within about 1 in. of the neck, to protect the surface from solder. The remaining space to the neck is painted with a mixture of whiting and alcohol to prevent the solder from adhering. While the commutator is immersed in the hot solder the neck is raked with a wire brush to insure good contact of the solder.

Modern Equipment Saves Track Construction Dollars

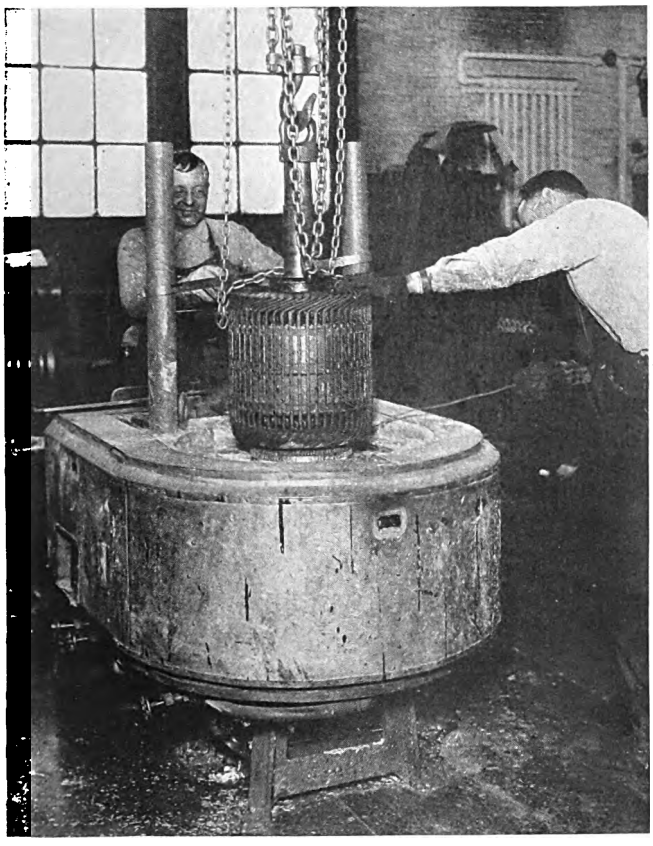
Track repairs and reconstruction work offer an attractive field for the use of labor-saving and material-handling equipment. The possibilities in the substitution of machine for hand labor in this class of work is illustrated by the startling contrast to yesterday's methods found in modern highway construction.



Assembled trucks are dipped in tanks of paint in the Coney Island shops of the Brooklyn-Manhattan Transit Corporation and are placed on the drain racks to dry

Many electric railways have made considerable progress in getting more value for their track dollars. The Denver Tramway Corporation mixes concrete aggregate in material yards provided with mechanical conveyors and elevators which take materials from pits under hopper-bottom gondola freight cars to elevated storage, from which it is dropped directly into narrow-gage batch cars of the end-dump type, carried on flat cars. Narrow-gage tracks on the flat cars permit the batch cars to be dumped directly into the mixer at the job. The time of only three men is chargeable against the handling of the concrete.

Digitized by Google



The pot method of soldering armatures has proved a time and money saver where there is sufficient volume of work

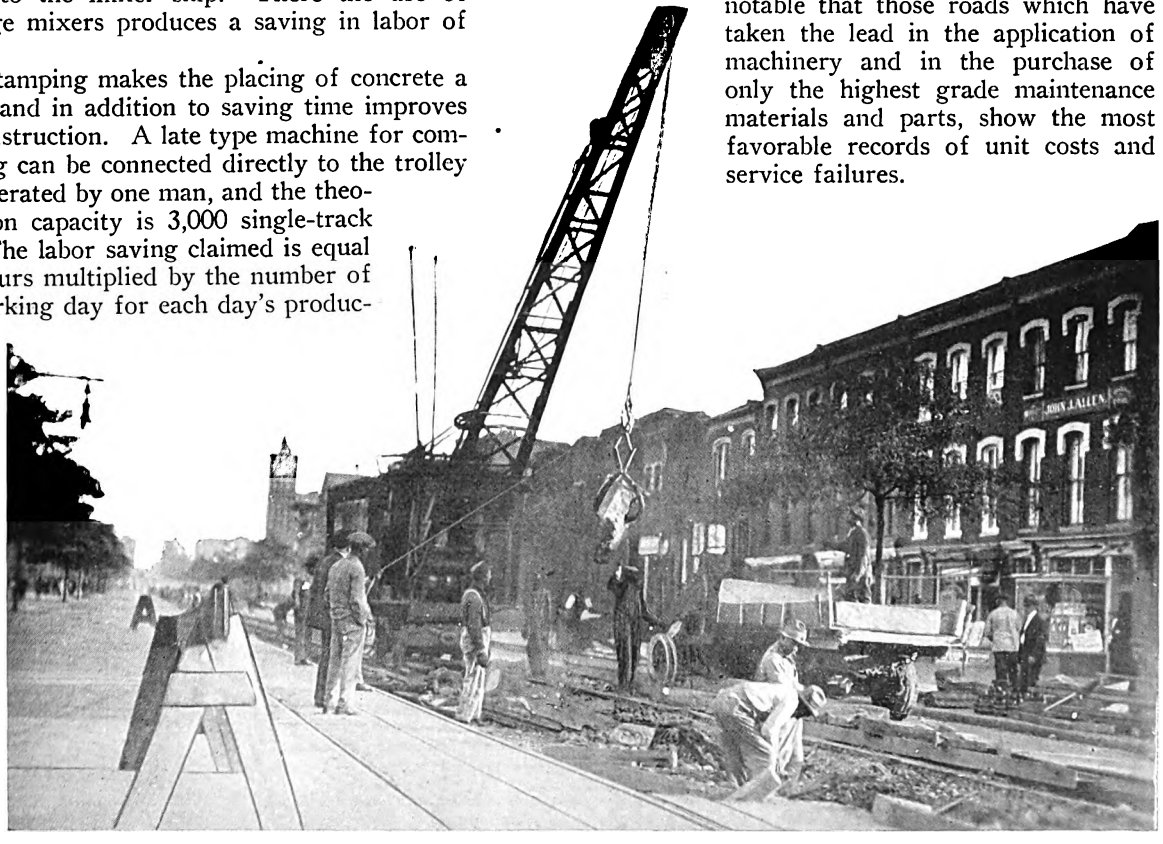
A modification of this method is used in Kansas City. In that city Differential dump cars are used to get the material out to the street, where it is handled by Haiss batch-bin type elevating loaders and light dump-body trucks directly to the mixer skip. There the use of loaders and large mixers produces a saving in labor of 51 per cent.

Compression tamping makes the placing of concrete a mechanical job, and in addition to saving time improves the resulting construction. A late type machine for compression tamping can be connected directly to the trolley circuit. It is operated by one man, and the theoretical production capacity is 3,000 single-track feet per day. The labor saving claimed is equal to three man-hours multiplied by the number of hours in the working day for each day's production. The use of pneumatic and electric tampers is so general that it may seem unnecessary to point out their advantages for tamping stone ballast in paved streets, yet many properties still use the hand pick and tamping bar method.

Safety alone dictates the use of mechanical equipment for handling rail, but in addition to safety large labor savings are possible on extensive work. Mechanical handling permits the setting of the rail in close alignment and approximately to surface, reducing the subsequent labor. Removal of old track and excavations for new construction offer similar opportunities for labor saving. Many improved devices have shown startling economies as compared with hand work. For instance, on one job concrete breakers used on old 6-in. concrete paving foundation, for one-half the devil strip between the rails of standard gage track and 1 ft. outside the rails, broke 45.8 single-track feet per man-hour. Hand methods with picks, shovels, chisels and sledges broke 3.48 single-track feet per man-hour.

Grinding rail corrugations and joints after repairs form a considerable item of track maintenance for most electric railways. Recently the United Railways & Electric Company of Baltimore developed a special car equipped with reciprocating grinders for this work, and during the first six months of 1928 as much rail was ground as was covered formerly in a year. The average cost per foot of rail for the work is about one-third of the cost of grinding by the former method. The car actually paid for itself the first six months it was in service.

Thus in practically every phase of electric railway maintenance pracitce there are opportunities for improving results and saving cost by the substitution of machine for hand labor. This subject is only beginning to receive the attention which its importance warrants. The experience on these properties which have invested in better maintenance equipment indicates that surprising savings can be made in costs. It is notable that those roads which have taken the lead in the application of machinery and in the purchase of only the highest grade maintenance materials and parts, show the most favorable records of unit costs and service failures.



In Washington, D. C., track construction equipment saves time and money during track reconstruction

News *of the* Industry

Private Right-of-Way Through East Chicago

Removal of the right-of-way of the Chicago, South Shore & South Bend Railroad in the city of East Chicago, Ind., from its present location in Chicago Avenue to a new private right-of-way paralleling the Grand Calumet River about 1 mile to the south will begin on Sept. 1, it was announced on Aug. 27 by Charles W. Chase, vice-president.

Agitation for the removal of the company's double-track line from the city's principal throughfare was initiated by East Chicago citizens about two years ago when the city decided to widen and repave the street. In the spring of 1927, the company, accordingly, purchased a 150-ft. right-of-way approximately 3¾ miles long, extending from Kline Avenue and the Calumet River in the northeast corner of Hammond, through the south portion of East Chicago, to a point near the intersection of Columbia and Chicago Avenues in Hammond.

In the meantime, city officials of East Chicago, fearing that the South Shore Line's service would be entirely lost to the community, undertook to obtain for the company an easement over the private right-of-way of the Baltimore & Ohio Railroad, which also operates through the downtown section of the city.

The city having failed in these negotiations to retain the operation of passenger trains through the central district, and being unwilling to meet certain other conditions imposed by the company, the South Shore Line tracks are to be removed immediately to the new location.

In commenting upon the company's action, Mr. Chase said:

It is absolutely necessary for us to get off Chicago Avenue, for our tracks there are in poor condition and need replacements and our freight traffic is becoming too heavy for speedy transfer through the heart of East Chicago's business district, where numerous traffic lights and railroad crossings delay our schedules.

Construction of the new right-of-way, which will be completed before the end of the year, involves the laying of double tracks, overhead wires and the erection of a new passenger station for East Chicago patrons. Three tentative sites for the station are now under consideration by officials of the company. The company proposes to provide a shuttle service with buses from the downtown section of East Chicago to the new depot.

Owing to the absence of street intersections and railroad crossings on the new right-of-way passenger schedules will be reduced between four and five minutes over the present schedules in the city streets, and a proportionate saving will be made in the running time of freight trains, Mr. Chase declared.

Wage Increase in Lynchburg

The Lynchburg Traction & Light Company, Lynchburg, Va., announced a 5 per cent raise in pay for motorman and conductors effective on Sept. 1. On Sept. 3 the company put into effect an increased fare. The fare was 5 cents, but the new rate goes to 7 cents, or four tokens for 25 cents.

Weekly Pass Popular in Roanoke

More than 2,500 weekly passes were sold by the Roanoke Railway & Electric Company, Roanoke, Va., and the Safety Motor Transit Corporation lines for the first week's operation under an increased street car fare there.

Franchise Changes Suggested in Tacoma

Mayor M. G. Tennant and Tacoma interests represented by Samuel M. Jackson concur in the plan to solve the Tacoma railway problem by granting a new franchise to a local company, which would take over the Tacoma Railway & Power Company and certain intertied property, writing out of the books a large part of the present valuation for rate-making purposes, and spending $500,000 for rehabilitation.

Attorney Scott A. Henderson, receiver for the Puget Sound Electric Company, is ready to co-operate to bring about the new financial set-up. In a letter to the Mayor he reviewed at some length the events which have transpired since the first of this year, when, after it became apparent that the City Council was going to stand back of the findings of the report of its statistical engineer, Kenneth Harlan, and insist upon elimination of intangible values considered to be excessive, it became likely the local companies would go into the hands of a receiver. The statement made by Mayor Tennant last January when he met with representatives of the bondholders of the Puget Sound Electric Company and of Stone & Webster, Inc., in New York, made possible the approach to a solution through the means now offered, in an opinion expressed by Mr. Henderson.

A Tacoma company should own not only the properties of the Tacoma Railway & Power Company, but also those of the Pacific Traction Company, which operates the American Lake and Steilacoom lines, and certain properties of the Puget Sound Electric Railway, operating the interurban line, it is declared.

The Puget Sound Electric properties are valued at $370,000 according to Attorney Henderson; those of the Tacoma Railway & Power Company at $6,352,250 and those of the Pacific Traction Company at $607,885, making a total value of $7,330,135, which the local interests would buy in. If properties could be secured by the new company at approximately 50 per cent of their book value, that value could be taken for a new rate base.

As the Puget Sound Electric Railway is the owner of all the capital stock of the Tacoma Railway & Power Company and the Pacific Traction Company, Attorney Henderson as receiver for the Puget Sound Electric Company is believed to be in a position to render very material aid to the plan. Stone & Webster control of the local companies has existed through a financial interdependence that comes down through the Puget Sound Power & Light Company, which owns the capital stock of the

Digitized by Google

Puget Sound Electric Railway. The entire matter of the relations of the companies with the city will be considered in a full meeting of the Council at the earliest possible date.

$87,000,000 Subway Opened in Philadelphia

With former Mayor W. Freeland Kendrick at the control lever, the first train officially to traverse the new $87,000,000 North Broad Street subway in Philadelphia pulled slowly out of the City Hall station on Sept. 1 and 23 minutes later arrived at the Olney Avenue terminal yards, 6 miles northward.

Seven-car trains were run throughout the day, carrying about 20,000 passengers to whom had been issued complimentary tickets for the first day's operation of the tube. The following morning the subway went into public operation.

Before Mr. Kendrick operated the first train in the subway, the construction of which was started in the first year of his Administration four years ago, brief ceremonies were held on Reyburn Plaza, near the subway entrance at City Hall.

Mayor Mackey paid tribute to the Kendrick Administration and regretted that the exercises could not have taken place before his predecessor left office.

Mr. Kendrick said he regarded the Broad Street subway as the foremost achievement of his administration.

The subway has four tracks, but only the local tracks will be used, it is expected, until the South Broad Street section between City Hall and South Street is ready for service, due to the congested condition in the loop around City Hall.

The tube will be operated by the Philadelphia Rapid Transit Company for a rental of $200,000 a month, over a contractual period of three months. At the end of that time sufficient data are expected upon which a permanent contract can be based. A commission will check these data to determine the basis for the new agreement.

A 7½-cent fare will be charged, but no free transfers or exchanges will be issued south of Spring Garden Street.

Decision Deferred in Baltimore Fare Case

A plea of the Maryland Public Service Commission for a stay from a decision of the Maryland Court of Appeals remanding the fare case of the United Railways & Electric Company, Baltimore, to the commission on a point involving the depreciation allowance issue, was heard on Aug. 30 by Justice Brandeis of the United States Supreme Court. Justice Brandeis expressed doubt that either side had the right under the circumstances to appeal to the United States Supreme Court and he deferred his decision on the petition filed by the commission pending an appeal to the Supreme Court on a writ of certiorari, until Sept. 11 or 12, when counsel for the commission was requested to file a brief to show that the Court of Appeals decision was not final.

"Car Financing" Luncheon on Thursday

SO THAT two subjects so closely allied as "Car Financing" and "New Cars," originally scheduled for the Round Table Luncheon Conference at the Hollenden Hotel at Cleveland on Wednesday, Sept. 26, shall not be discussed on the same day at the same time, the "Car Financing" luncheon has been put over on the program until Thursday at the same hour and the same place.

J. V. Sullivan a World's Fair Chairman

Joseph V. Sullivan, assistant to the vice-president of the Chicago Surface Lines, has been appointed World's Fair chairman for the public utilities industry to assist in furthering the enrollment campaign. Mr. Sullivan was selected for this work by Col. Stuyvesant Peabody, millionaire sportsman and head of the campaign, because of his long experience in the public utilities field.

After accepting his appointment, Mr. Sullivan immediately asked a number of men prominent in the Public Utility group to serve on a committee with him for the World's Fair. Those signifying their willingness to do so are: John G. Learned, vice-president of the Public Service Company of Illinois; H. M. Lytle, vice-president of the Chicago Rapid Transit Company; George B. Foster of the Commonwealth Edison Company; Herbert Brown, city superintendent of the Western Union Telegraph Company; B. J. Mullaney, vice-president of the Peoples' Gas, Light & Coke Company; Charles M. Wheeler, of the Illinois Power & Light Corporation; and A. E. Pierce, president of the Central Public Utilities Company; and G. T. Seeley, vice-president of the Chicago Motor Coach Company. Each one expresses the opinion that a 100 per cent enrollment will be achieved by various public utilities concerns, as public sentiment seems almost unanimous for the centennial. Mr. Sullivan said:

The purpose of carrying on this enrollment drive is to demonstrate the interest of Chicago people in a big celebration. With Chicagoans standing firmly for World's Fair, as they did for the Columbian Exposition of 1893, its success is assured.

Mr. Sullivan went on to say that the deferred payment plan originated by Col. Peabody is proving very effective in enrolling men and women employed. By it, a person may sign a pledge and agree to have the sum of 50 cents deducted from his salary each week for ten weeks, or until the $5 for a World's Fair membership has been paid in full. Already numerous firms have adopted this idea and have turned in a 100 per cent enrollment. In conclusion Mr. Sullivan said:

Chicago is now the center of transportation and commerce of the world and I believe firmly that the 1933 Centennial will go a long way toward making it the world's first city, instead of the third.

Storm Hits Minneapolis

For the first time in the history of the Twin City Rapid Transit Company, Minneapolis, Minn., the whole system went dead recently, for five hours, beginning at 4:45 p.m., when the peak load is almost reached. Meanwhile 1.44 in. of rain fell.

Lightning struck a cable near the transforming station at the headquarters building, Eleventh Street and Hennepin Avenue. It destroyed the telephone connections, burned 25 out of 26 2-in. cables, exploded a manhole cover 15 ft. into the air and started a fire in the tunnel which burned for an hour. The gas kept the repair crew out of the tunnel for another hour. It was necessary to cut off all power. T. Julian McGill, vice-president said:

Two hours after the lightning struck, service was installed on a few lines outside the loop, but it was nearly 9:30 before cars were operating again in the loop district. It was the worst tie-up due to a rainstorm the company has experienced in its entire history.

Owing to the rain and the time of day, buses and motor facilities were entirely inadequate to handle the traffic.

Paving Question Raised in Hammond

A petition asking that the franchise granted to the Hammond, Whiting & East Chicago Railway for operation of cars on the streets of Hammond, Ind., be revoked because of alleged failure to comply with the terms of its charter has been filed with the Public Service Commission of Indiana by Gerald Gillette, city attorney of Hammond.

According to Mayor Adrian Tinkham the city's complaint to the commission is based on the fact that the railway has refused to raise the level of the tracks on Hohman Street between Hoffman and Gostline Streets. He explained that Hohman has been paved early this year and was ready for opening to traffic in July, except for that portion of the street between the car tracks between Hoffman and Gostline Streets. Although required by its ordinance to improve its right-of-way to conform to public improvements the company has consistently refused in this case to raise the tracks 3 in. to permit completion of the paving and as a result it has been necessary to close the new road to traffic, the Mayor declared.

Counsel for the railway gave lack of funds as the reason for the company's failure to co-operate with the city and

Digitized by Google

attributed the company's present financial condition partly to the fact that in 1924 the city had granted to the Calumet Motor Coach Company the exclusive right to operate buses on the streets of Hammond, thereby seriously affecting the railway's revenue and causing it to operate at a loss. The petition filed by the city will be opposed by the company.

Boston Tunnel Line Extended

Another new section of the Boston rapid transit system was opened to the public on Sept. 1. It extends the Dorchester tunnel line to Peabody Square, and has two stations a little more than a mile apart. Shawmut is a by station, and Ashmont is the new terminal station where five lines of transportation converge. This new section covers an area of about 5 acres and for the present will accommodate four-car trains on a two-minute headway schedule during rush hours, and two-car trains during the ordinary traffic hours of the day. The platforms are long enough to handle six-car trains. One more section will complete this line. It will carry to Mattapan Square and establish rapid transit between Harvard Square, in Cambridge, to Mattapan on the opposite side of Boston. Like most of the other rapid transit lines in Boston it is financed and built by the city of Boston and leased and operated by the Boston Elevated Railway.

Inquiry Into St. Louis Fares

Under a ruling written by Commissioner John H. Porter the Missouri Public Service Commission on Aug. 30 ordered a general investigation of the rate zoning system in effect on the lines of the St. Louis Public Service Company in St. Louis and St. Louis County. This investigation will determine the reasonableness of the present arrangement and the likelihood of any discrimination in favor of certain sections of St. Louis County. The check up will also include the lines of the Missouri Electric Company operating between Wellston and St. Charles.

The ruling has the effect of consolidating a number of complaints concerning fares charged in St. Louis County. Both the company and the city of St. Louis has opposed any extension of the one-zone fare system to other parts of St. Louis County and have also asked that the commission revoke the concession previously granted to the University-Olive line.

Stops in Baltimore Approved

The United Railways & Electric Company, Baltimore, Md., has abandoned certain stops in the downtown section of the city as a means of speeding up traffic. The changes have been made at the request of the Police Department and have the approval of the Maryland Public Service Commission.

Recent Bus Developments

Galveston-Houston Service Started

Bus service between Galveston and Houston and intermediate points in Texas was started by the Texas Bus Lines, Inc., controlled by the Galveston Electric Company, on Aug. 15. The one-way fare is $1.75 and the round trip fare is $3. A daily schedule is maintained, buses leaving Galveston at 9 and 11 in the morning and at 3 and 7 in the afternoon. Buses leave Houston at 9 and 11 a.m. and 1 and 5 p.m., arriving at Galveston in one hour and forty-six minutes. R. G. Carroll is manager of the bus lines.

Milford Company Switches to Motor Coaches

Drums sounded and trumpets blared nearly 40 years ago when the power was turned on for the Milford, Framingham, Hopedale & Uxbridge Street Railway, a reception in contrast to the operation of the last trolley and the start of motor coach service on Sept. 1. The change carried out a plan adopted when the Milford & Uxbridge Street Railway was reorganized about a year ago. Three distinct cycles are to be noted in the development of transportation in the Massachusetts towns served since the old stage coaches were abandoned. The present rails were originally used by steam trains. Later trolley cars replaced them and now motor coaches replace the trolley cars.

The new motor coach service will supplant everything except two runs of trolley cars from Milford to Hopedale to accommodate workers in a manufacturing plant in Hopedale.

Walter L. Adams, superintendent, sees advancement and better financial prospects in the operation of motor coaches exclusively.

Expansion Continues in St. Louis Territory

A state permit has been issued by the Missouri Public Service Commission to the St. Louis-Alton Bus Company to operate a line of buses between St. Louis, Mo., and Alton, Ill., via two highway bridges spanning the Missouri River and the Mississippi River recently thrown open to traffic. This line will reduce the distance between Alton and St. Louis and will take passengers into the downtown section of St. Louis by a direct route.

The commission also authorized the Alton Railway to operate into St. Louis over the McKinley Bridge as an interstate motor carrier. The St. Louis terminus will be the Eads Bridge passenger station at Third Street and Washington Avenue, St. Louis. This company on Aug. 28 applied to the Illinois Commerce Commission at Springfield, Ill., for permission to discontinue its Brooklyn-Venice line between East St. Louis, Ill., and North Venice, Ill., and substitute buses.

On that date the Illinois commission denied a rehearing on the Illinois Traction System's petition to operate a bus line between East St. Louis, Ill., and Chicago, Ill.

Substitution in Greenville

W. B. Ellis, Jr., of the Southern Public Utilities Company, recently announced the schedule of buses to operate as far out Augusta Street at Greenville, S. C., as the first entrance to the Country Club. This service is being installed under permission granted by the South Carolina Railroad Commission to discontinue the Augusta Street trolley line.

Special Service Provided by Los Angeles Railway

A certificate of public convenience and necessity has been granted the Los Angeles Railway Corporation to operate auto passenger service between Inglewood and Mines Field, Cal. This service will be operated only on Saturdays, Sundays and holidays occurring when Mines Field is the scene of such special events as will require the operation of the service proposed to meet traffic demands.

Substitution of Bus Service Justified

The California Railroad Commission has reaffirmed its previous order, dated July 3, 1928, authorizing the Pacific Electric Railway, Los Angeles, to discontinue operation of electric railway service between Upland and Ontario in San Bernardino County, and to substitute motor coach service as a matter of operating economy.

Certain objections having been made to the commission against its action of July 3, the matter was reopened and hearings were conducted by Examiner Ira H. Rowell at Ontario. It was shown upon the reopening of the matter that the municipal authorities of both cities still favored the application of the company. Pacific Electric showed that it had operated the railway service at a loss of $3,869 during the year ended March 31, 1928, and that substitution of motor coach service would result in an annual saving of $9.600 a year. Upon such showing the commission has reaffirmed its previous action authorizing abandonment of railway service.

Financial *and* Corporate

Railway at Fort Smith to Be Segregated

Stockholders of the Fort Smith Light & Traction Company, Fort Smith, Ark., on Sept. 4 approved the sale of the company's electric and railway properties and its interest in the Mississippi Valley Power Company, a subsidiary, to the Standard Gas & Electric Company. The Standard company plans to operate the electric and the railway divisions as separate companies in the future. The electric properties will be operated by the Mississippi Valley Power Company, while the railway system will be operated by the Fort Smith Traction Company, a separate organization.

The principal reason given for this change is that no financing of the company has been possible on account of the poor earnings showing of the railway department of the old company. It is believed by Standard officials that the new arrangement will prove beneficial in this respect. A program of construction and expansion has already been outlined, the principal item of which will be the construction of an additional transmission line from Fort Smith to Ozark. An expenditure of $225,000 has been authorized for this purpose and materials ordered.

Accounting of New York Railways to Be Heard

Special meetings of stockholders of the Sixth Avenue Railroad, 42nd Street and Grand Street Ferry Railroad, 23rd Street Railway, 34th Street Crosstown Railway, Christopher & Tenth Street Railway and Bleecker Street & Fulton Ferry Railroad have been called for Sept. 14. Meetings are to accept the account of Hugh J. Sheeran as receiver of the New York Railways, filed on July 11, 1928, with the special master in the action known as the General Accounting Action, showing the allocation of the earnings of the receivership period; and to authorize an operating agreement between the respective companies and the New York Railways, to be dated as of Jan. 1, 1928, providing for operation of the property.

Commission Approves New Indiana Interurban Set Up

Formal approval of the transaction by which the Indianapolis & Southeastern Railroad headed by Charles T. De Hore, Indianapolis, takes over the old Indianapolis & Cincinnati Traction Company, has been given by the Indiana Public Service Commission. A certificate was granted the new company and it was authorized to issue approximately $1,700,000 in securities to finance the transaction. The actual change in management was made some time ago subject to the approval of the commission, when Mr. De Hore and others purchased the property at a receiver's sale at Rushville, Ind., for about $500,000.

In the order, the new company is authorized to issue $1,000,000 of 6 per cent, 25-year mortgage bonds at par, and 10,000 shares of common stock of no par value, shares of which are to be sold at $70. It was pointed out that in addition to the $500,000 price paid at the receiver's sale, a group of Car Trust Equipment Company property was bought for $325,000 and $25,000 was paid in for working capital. According to the order evidence showed new rolling stock valued at $185,000 comprising ten new interurban cars, now in operation. The commission, on a basis of taxable valuation of 80 per cent, found the fair value of the property to be $2,000,000.

Traffic, Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 220 companies to the American Electric Railway Association for July, 1928, compared with July, 1927, is as follows:

July, 1928	751,882,742
July, 1927	756,382,549
Decrease, per cent	0.60

The variation in the percentage decrease from the corresponding month of the previous year is very slight; in fact, in this respect traffic has been quite constant, there being a decrease of approximately 0.50 per cent each month this year from the corresponding month of the previous year. The slightly greater decrease shown for the month of July can be accounted for probably by the fact that there were only four Saturdays in July, 1928, wheras there were five in July, 1927. Saturday is, of course, the day of heaviest traffic on street railway lines.

Average cash fares in cities of 25,000 population and over were:

	Cents
Aug. 1, 1928	8.1883
July 1, 1928	8.1728
Aug. 1, 1927	8.0333

The increase in the average fare was produced by an increase in Harrisburg, Pa., from 6 cents to 7 cents, an increase in Sacramento, Cal., from 5 cents to 7 cents, and an increase in Stockton, Cal., from 6 cents to 7 cents.

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track are:

	Average Hourly Rate Cents	Index Number 1913=100 Per Cent
Aug. 1, 1928	57.48	210.94
July 1, 1928	57.48	210.94
Aug. 1, 1927	57.24	210.06

Common Dividend Passed by Twin City Company

Continued decline in revenue passengers carried may result in a petition by the Twin City Rapid Transit Company, Minneapolis, Minn., for an increase in the rate of fare, now 8 cents cash with six tokens for 40 cents. This fact transpires in connection with the decision of the board of directors to pass the present common stock quarterly dividend of 1 per cent. President Horace Lowry issued the following statement:

The Twin City Rapid Transit Company did not earn for the third quarter of this year a dividend on the common stock, and, therefore, in line with long established precedent, the directors passed this quarterly dividend.

The dividends paid on the common stock this year have totaled 2 per cent. Future dividends will be paid from time to time as net profits may warrant.

There has been a continuing decrease in passengers hauled since 1920, although the percentage reduction for this year, we are gratified to note, is less than former years.

The policy of the company in this period of decrease in passengers hauled has been to keep up to the highest operating standards all of its properties, and, therefore, while operating expenses have been markedly reduced since 1920, the condition of the property has been thoroughly maintained.

Except in a few instances where local conditions have been unusual, all of the street railways in the country have had a marked decrease in passengers hauled due to the competition of the privately owned automobile. Finally, parking problems and street congestion will control the number of private automobiles that can be used where the street cars would offer a similar service.

In this period there has been an increase in street car fares throughout the country. It is an obvious fact that there must be a substantial increase in the number of revenue passengers carried by this property, or an increased fare must ensue.

We feel optimistic about the future of the property, due to the constant and healthy growth of the Twin Cities.

For the first quarter of 1928 the gross was about $40,000 higher, but higher fixed charges made the net almost 12 per cent under 1927. For the first six months of 1928 the entire system showed a decrease of $170,000 in net income compared with 1927.

The St. Paul City Railway has a petition before the commission for an increase of fare in that city, which it has not pressed, having in April come to an agreement with the City Council on a program for paving between the tracks, calling for an expenditure of $1,000,000 in four years. Twice the voters have rejected charter amendments permitting the Council to relieve the railway of charges for cleaning the streets, paving, and sprinkling.

The usual 1¾ per cent dividend on the preferred stock was declared.

Dallas Company a Consistent Earner

The statement of earnings of the Dallas Railway & Terminal Company, which operates the electric railway service in Dallas and vicinity and owns and operates a modern terminal station and eight-story office building near the center of the business district of Dallas, as contained in the report of the Electric Power & Light Corporation and subsidiaries for 1927 follows:

EARNINGS OF DALLAS RAILWAY & TERMINAL COMPANY FOR THE YEAR ENDED DEC. 31, 1927

	1927	1926	1925	1924
Gross earnings from operation	$3,261,004	$3,454,409	$3,429,298	$3,322,215
Operating expenses, including taxes	2,434,900	2,639,259	2,578,079	2,547,246
Net earnings from operation	$826,104	$815,150	$851,219	$774,969
Interest on bonds	300,000	277,491	267,421	267,546
Other interest and deductions	25,471	72,898	73,688	62,261
Balance	$500,633	$464,761	$510,110	$445,162
Dividends on preferred stock	105,000	46,472	35,000	35,000
Balance	$395,633	$418,289	$475,110	$410,162
Renewal and replacement reserve	178,452	185,819	267,520	186,639
Balance	$217,181	$232,470	$207,590	$223,523

Statistics of passengers carried, and other operating data at Dallas follow:

	1927	1926	1925
Population served	235,000	235,000	230,000
Passengers carried during twelve months	58,604,913	62,962,307	64,242,643
Car-miles	9,875,016	9,872,698	9,433,677
Car-hours	1,032,110	1,058,884	1,005,138
Average number of cars operated	127	134	124
Miles of electric railway (single track equivalent)	118	115	114

Hearing on St. Louis Application Sept. 14

The Missouri Public Service Commission has set Sept. 14 to hear the application of the City Utilities Company for authority to acquire and hold more than 10 per cent of the capital stock of the St. Louis Public Service Company, St. Louis, Mo. The City Utilities Company, a holding corporation, was formed for the purpose of aiding the financing of the St. Louis railway system. Several months ago the application was filed. Judge J. S. Priest representing minority stockholders of the St. Louis Public Service Company, has opposed the application.

Ottawa Company Said to Be Doing Well Under Increase

Resumption of dividends by the Ottawa Traction Company, Ltd., Ottawa, Ont., is expected to occur early in the coming year. It will be recalled that in March dividends, which for a long while had been on a 4 per cent basis for the year, with an annual bonus of 1 per cent, were suspended owing to the exhaustion of the reserve fund used in this connection over the four previous years. On this account it was necessary to suspend payment of dividends until the earnings of the company should prove sufficient to warrant payments once more. Since the fare increase which went into effect on Aug. 13 riding has held up so well that dividend talk has been revived.

Receiver for Jersey Shore Line

The Atlantic & Suburban Railway, Atlantic City, N. J., founded in 1903, the first electric line across the meadows to the mainland, has gone into the hands of a receiver. The federal court on Aug. 31 announced that creditors of the company have until Oct. 2 to file claims. The trolley line, a single-track one, runs from Atlantic City to Absecon and Somers Point, paralleling the Shore Fast Line tracks. The assets of the company are about $100,000, and liabilities nearly $500,000.

Vote Scheduled on Public Control in Boston

Stockholders of the Eastern Massachusetts Street Railway will hold a special meeting in Boston, Mass., on Sept. 11 for the purpose of voting to accept or reject the new legislative statute continuing the public control of the railway five years more. If they vote to reject the act the road will return to the direct control of the owners on Jan. 15, 1929. There is a large block of opposition stock which continues the fight against continued public control, and will carry the fight into the stockholders' meeting; it is led by L. Sherman Adams, Boston.

Discontinuance at Chattanooga Approved

The State Railroad & Public Utilities Commission of Tennessee has approved the petition of the Chattanooga Traction Company to remove its tracks on the Red Bank division in order that the municipality of Red Bank may establish a park on the right-of-way of the transportation company. The traction company was granted the privilege recently of withdrawing its passenger service to Red Bank but continued freight service, which will also be discontinued with the establishment of the park. No protests were filed against the discontinuation of the freight service on the short line between the junction and Red Bank 1 mile away.

BOOK REVIEWS

Fundamental Principles of Electric and Magnetic Circuits

By Fred Alan Fish, professor electrical engineering department, Iowa State College. Published by McGraw-Hill Book Company, New York, N. Y, 212 pages. Price, $3.

This new record edition is a revision on the fundamental principles of electric and magnetic circuits. The book is intended as an introduction to the study of electric power machinery and transmission. It covers electromagnetism, electrostatic, non-harmonic waves and polyphase currents.

The Engineers

Published by Neo-Techni Research Corporation, New York, N. Y. 1,600 pages. Price, $25.

This combined directory is a compilation by authorities on engineering corporations, the products they manufacture, engineering personnel and technical information pertaining to mechanical, civil, electrical and metallurgical engineering. It lists more than 220,000 individual engineers representing the executive and buying staff of more than 38,000 different corporations.

Der Eisenbahn Electrotechniker—Part 1

By Ministerialrat A. D. W. Wechmann. Published by Verkehrswissenschaftlichen Lehrmittelgesellschaft der Deutschen Reichsbahn, Berlin. 46 pages. Price, 4 marks.

With the increased amount of track belonging to the German State Railway being changed to electric power, the management decided there should be a series of textbooks on electrical phenomena for the rank and file. These books are primers, and are accompanied by questions and problems to assist the student as he proceeds with the book. The present volume, on the elements of applied electrical engineering, is now in its second edition. Others by the same author include volumes on the power station, railway distribution system, alternating current electric locomotives, direct current electric locomotives, electric railway repair shops, etc. It is significant that the author of this series holds a high post in the engineering department of the State Railways.

Standards Year Book 1928

Prepared by the National Bureau of Standards, Department of Commerce, Washington, D. C. 400 pages. Price $1.

In addition to informing the manufacturer of the current standardization movements affecting his industry, this yearbook is a résumé of the standardization work of scientific and technical societies and trade associations. It stresses the international aspects and activities of standardization and also gives charts showing steps through which the national standards are made available to the ultimate users.

Personal Mention

E. W. Sweezy Heads Expanding System

Young officer of Ohio road has rounded out system with $17,000,000 capitalization and $4,000,000 annual earnings

Sent to Alliance, Ohio, as general manager of the Stark Electric Railroad following its purchase by eastern capitalists three years ago, Everett W. Sweezy now heads an Ohio utilities combine with a total capital placed at $17,000,000 and gross earnings at $4,000,000 annually.

Mr. Sweezy is president of the Suburban Light & Power Company, purchased a few months ago and moved to Alliance from Cleveland. This concern with its affiliated organizations, the General Light & Power, Alliance Power and the Stark Electric Railroad, is capitalized at $5,000,000 and has annual gross earnings of more than $1,000,000.

He is president of the new Utilities Service Company, which controls telephone systems in 65 Ohio cities and towns, and ice plants in four large Ohio cities. By a deal just made at Toledo he acquired the Citizens Necessities Company of Toledo, the Schory & Schellhase Ice Company, Canton, the Ice & Fuel Company at Youngstown and the Springfield Coal & Ice Company at Springfield for $2,000,000.

The Utilities Service Company, incorporated under Ohio laws, is capitalized at $12,000,000 and has gross earnings placed at $3,000,000. Headquarters of this and other companies controlled by Mr. Sweezy and his associates will be located at Alliance.

The telephone system which has been acquired within the last six months includes the Lima Telephone Company, Ada Telephone Company, Northwestern Telephone Company at Wauseon, Napoleon Telephone Company, Delphos Telephone Company, Riverside Telephone Company at McConnellsville, Waynesfield Telephone Company, the Northeastern Telephone Company at Warren and smaller systems in more than a score of Ohio rural communities. This system links 65 cities and has more than 28,000 customers.

Mr. Sweezy, since he assumed charge of the Stark Electric at Alliance nearly three years ago, has spent large sums rehabilitating the system and installing new rolling stock. One-man cars for both local and inter-city service replaced the antique two-man cars which were being used when the line was purchased by eastern financiers.

In extending the rail service to freight customers, Mr. Sweezy has completed negotiations with the Youngstown & Ohio River Railroad for service from Salem to East Liverpool, a distance of 28 miles, which nearly equals the trackage of the Stark Electric. This agreement gives customers along the Stark Electric an outlet to the Ohio River Valley which previously was tapped only by steam freight service.

Separate Claims Work by Brooklyn City Railroad

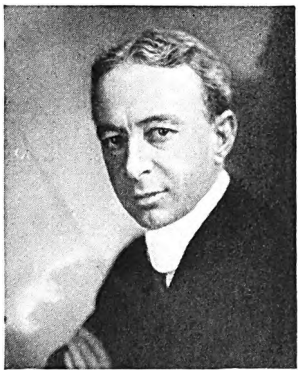
The Brooklyn City Railroad, Brooklyn, N. Y., has organized a separate unit in the claim department for the investigation and settlement, where reasonable, of claims for damages arising out of accidents on the Brooklyn City lines.

George D. Yeomans, vice-president and general counsel of the B.-M. T., and I. Isaacsen, general claim agent, will continue in charge of the claim activities of both the Brooklyn-Manhattan Transit and the Brooklyn City Railroad, as they have since the Brooklyn City Railroad resumed independent operation of its lines in October, 1919. At the head of the Brooklyn City Railroad unit and reporting to Mr. Isaacsen and Mr. Yeomans is J. J. Callaghan, whose title is chief adjuster. He has as his aide H. B. Aschoff, assistant adjuster.

OBITUARY

Melnotte McCants

Melnotte McCants, vice-president and general manager of the Market Street Railway, San Francisco, Cal., died on Sept. 4. As a citizen, his help was of great value in numerous community projects and he was in constant demand in this regard. Among the rank and file of the company at San Francisco Mr. McCants established himself as a broad-minded official, impartial in his decisions. His appointment to the post of general manager in 1923 afforded a striking illustration that preachment and practice are synonymous in meaning on the Market Street Railway, for employees entering the service of the company were reminded at the inception of the term of their employment that "the highest position in the gift of the company is open to the qualified employee." He has been very active in affairs of the American Electric Railway Association and his services have been sought by the various committees of the association such as the committee on education, the committee on merchandising transportation, etc.



Melnotte McCants

Mr. McCants was a native of Spartanburg, S. C. He entered the employment of the leading railroad of that district—the Southern—as a clerk. In addition to mastering his regular duties, he took up the study of stenography at night school; and it was his proficiency in this line that brought him to the United Railroads, the predecessor of the Market Street Railway, in 1906 as stenographer in the president's office.

In 1910 he was appointed chief clerk to the general manager. In March, 1918, he became assistant to the general manager. In August, 1919, he was promoted to assistant general manager. And in 1923 came his elevation to an executive post.

CHARLES H. BARRINGER superintendent of operations at the Salisbury branch of the Southern Public Utilities Company, died recently. When the Duke interests purchased the North Carolina Public Service properties at Salisbury about a year ago Mr. Barringer had reached the position of superintendent of operations. Manager Everest immediately made him superintendent of the combined properties. He was 32 years old.

WILLIAM J. ROOME, who was connected with the Brooklyn surface lines for more than 31 years, died recently after a short illness. Mr. Roome had been active in his duties as division superintendent until about a week before his death. His electric railway career in Brooklyn began in May, 1897, at the 58th Street depot of the Brooklyn Rapid Transit Company, the predecessor of the Brooklyn-Manhattan Transit Corporation, when he secured employment as a transfer agent. Seven years later, in April, 1904, he was promoted to the grade of inspector. In 1906, he was transferred from 58th Street depot to Canarsie depot to fill the position of day depot master and he remained at that depot more than four years. He then returned to 58th Street depot in the capacity of day depot master. As recently as May 1, 1927, he was appointed division superintendent at 58th Street depot to succeed the late Morton S. Cornell.

Manufactures *and the* Markets

Largest Electric Railway Exports to Canada

Out of $133,103 worth of railway signals, switches and attachments exported in the month of June, $104,026 worth of this equipment went to Canada. Exports of $51,709 worth of starting and control equipment for electric railway and vehicle motors were made in June, $39,697 worth of which was sent to Soviet Russia in Europe. Chile received most of the mining and industrial electric locomotives, $74,275 worth out of a total of $81,250 exported. Only one electric railway locomotive, at a cost of $4,552, was exported, and three railway motors, at a cost of $12,438. The value of the total exportation of the above mentioned equipment for the month of June reached $283,052.

Foreign Commerce Advisory Committee Appointed

William Butterworth, president of the Chamber of Commerce of the United States, has announced the new foreign commerce department advisory committee for the year 1928-1929. Charles W. Lonsdale, president, Simonds-Shields-Lonsdale Grain Company, Kansas City, Mo., will continue as chairman of the foreign commerce committee during the coming year. Walter M. Daniel, member of the board of directors representing foreign commerce, and also a director of the American Chamber of Commerce in Cuba, will continue as vice-chairman of the committee. Henry D. Sharpe, president of Brown & Sharpe Manufacturing Company, Providence, will also continue as a member of the foreign commerce committee.

Other members are:

Harry A. Black, president Black Hardware Company, Galveston, Tex.

E. A. Emerson, vice-president and general manager Armco International Corporation, Middletown, Ohio.

F. Abbot Goodhue, president International Acceptance Bank, New York City.

Julius Goslin, president, Joubert & Goslin Machine Foundry Company, Birmingham, Ala.

Henry H. Morse, sales export manager the Florence Stove Manufacturing Company, Boston, Mass.

G. R. Parker, Parker, Peebles & Company, Inc., New York City.

C. G. Pfeiffer, vice-president George Borgfeldt & Company, New York City.

William C. Redfield of New York City, formerly Secretary of Commerce.

H. H. Rice, assistant to the president General Motors Corporation, Detroit, Mich.

Harold F. Seymour, vice-president Columbian Vise & Manufacturing Company, Cleveland, Ohio.

Paul Shoup, executive vice-president of the Southern Pacific Railway Company, San Francisco, Cal., and vice-president of the Chamber of Commerce of the United States.

L. P. Thayer, vice-president of the International Harvester Company, Chicago, Ill.

Charles J. Webb, Charles J. Webb & Company, Philadelphia, Pa.

The first meeting of the new committee will be at Hot Springs, Ark., on Oct. 6, in connection with the Chamber's conference of national councillors and presidents and secretaries of organization members.

Substations for Northwestern Pacific

Two new power substations will be built by the Northwestern Pacific Railroad, San Francisco, Cal., one at Pine, near Sausalito, of 2,000 hp., and the other at Baltimore Park of 1,355 hp. The present power house at San Anselmo will be reconstructed with a capacity of 2,667 hp., for which the equipment has been ordered from the General Electric Company.

The steam generating plant at the Alto power house will be replaced with electric conversion apparatus with a capacity of 3,000 hp.

Accounting Consultant at Purchases and Stores Exhibit

W. V. Shoemaker, chief stores accountant of the Philadelphia Company, Pittsburgh, Pa., and subsidiary companies, will be at the exhibit booth of the Purchases and Stores Division of the American Electric Railway Engineering Association at the Cleveland Convention. He will explain the procedure and answer questions on the exhibit of forms and methods of stores accounting to be shown in the division's booth. Other features of this exhibit include a delineascope through which will be shown views of labor-saving devices for material handling and methods of material storage used in 34 different utilities. Everyone is invited to visit this exhibit and discuss their purchasing and stores problems with the members of the purchases and stores committee.

Metal, Coal and Material Prices F.o.b. Refinery

	Sept. 4, 1928
Metals—New York	
Copper, electrolytic, cents per lb	14.525
Copper wire, cents per lb	16.625
Lead, cents per lb	6.4
Zinc, cents per lb	6.60
Tin, Straits, cents per lb	47.9375
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$3.175
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1.8
Franklin, Ill., screenings, Chicago, net tons	1.50
Central, Ill., screenings, Chicago, net tons	1.475
Kansas screenings, Kansas City, net tons	2.175
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.3
Weatherproof wire base, N.Y., cents per lb.	17.125
Cement, Chicago net prices, without bags	$2.05
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.1
White lead in oil (100-lb. keg), N. Y., cents per lb	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.55

Model Municipal Traffic Ordinance Issued

The committee on municipal traffic ordinances and regulations of the National Conference on Street and Highway Safety has prepared and published a 92-page "Model Municipal Traffic Ordinance" aimed at as nearly nationwide uniformity in traffic regulations as compatible with local requirements. It is accompanied by an explanatory report and suggested drafts of the following three supplementary ordinances: (1) To create an official traffic commission; (2) to create a division of traffic engineering; (3) to control roadway and sidewalk obstructions.

Convention Open to Public

The exhibits at the American Electric Railway Association Convention will be open to the public Saturday, Sept. 22, in the afternoon from 1 to 5 p.m., and Sunday, Sept. 23, from 1 to 5 p.m., and from 7:30 to 10 p.m. On Tuesday evening, Sept. 25, the public will be admitted to the balcony only. The convention is open to the public under the auspices of the Cleveland convention committee. Director of Exhibits Fred Dell emphasizes the necessity for exhibitors to have representatives in their booths whenever the buildings are open to the public.

Bennett on N.E.M.A. Executive Committee

Election of I. A. Bennett to the executive committee of the National Electrical Manufacturers Association was announced at the recent convention of the policies division at Association Island, N. Y. Mr. Bennett is vice-president and general sales manager of the National Electric Products Corporation of Pittsburgh, Pa.

Trade Notes

Ideal Commutator Dresser Company, Sycamore, Ill., has appointed the Industrial Supply Company, 121 Motor Avenue, Salt Lake City, Utah, as its representative in the Rocky Mountain district.

Ford, Bacon & Davis, Inc., has changed its address to 39 Broadway, New York, N. Y.

Improved Equipment Company, New York, has merged with the Russell Engineering Company, St. Louis, Mo., according to an announcement by Henry L. Doherty & Company. The new organization will be known as the Improved Equipment-Russell Engineering Corporation. The combination was effected to meet more adequately the demand for efficient coal gas plants and modern carbonizing equipment.

Volume 72 New York, Saturday, September 15, 1928 *Number 11*

Making the Most of the Convention Exhibit

LITERALLY millions of dollars worth of electric railway equipment will be on display at the Cleveland convention beginning next Saturday, Sept. 22. There will be presented for the inspection of railway men for the first time many developments in standard apparatus and many new designs and devices intended to improve operation or reduce cost. More than 200 manufacturers will display products running into thousands of different items.

Even those who are so fortunate as to be able to go to the convention will scarce have the time to inspect carefully all of the exhibits in which they are interested. The much greater body of local transportation men who stay at home to keep the wheels of transportations turning for the millions who must be served rain or shine, week day or Sunday—convention or no convention—would in the ordinary course of events have no opportunity of studying this great display of equipment and apparatus.

To help those who go to Cleveland, and at the same time to take the exhibit to the man who must stay on the job, ELECTRIC RAILWAY JOURNAL has, with the co-operation of the association and of the manufacturers, translated this entire spectacle into type and pictures. The equipment and apparatus to be shown are grouped into a series of articles arranged for the convenience of the man interested in analyzing the progress made in any particular class of products.

All of this will be published in next week's issue of the JOURNAL and will be available in Cleveland on Saturday when the exhibit opens. Many new things are to be shown for the first time and several surprises are in store. By using that issue as a guide to the products in which they are most interested, delegates to the convention may make the most of their time at the show, and may be sure not to miss any of the developments which they ought to see. Copies of the A.E.R.A. Exhibit Issue will be available at the JOURNAL's booth, spaces 101-102—just inside the main entrance to the auditorium.

Noise Reduction Study Is Constructive

DETERMINATION of the sources of noises that develop in the movement of street cars is the first requisite to finding means for eliminating the noises themselves. While several electric railway men have worked on the problem and have gained some knowledge of the subject, one of the best organized projects is that of the Transportation Section of the Wisconsin Utilities Association. This body, some three years ago, established a fellowship at the University of Wisconsin for the purpose of developing methods of segregation and measurement of the various noises and then making tests on cars in actual service.

The apparatus designed the first year was somewhat crude and the tests were of comparatively little value. The second year was spent principally in redesigning the instruments, and the past year has been devoted to an actual study of the noise as found on street car lines in several Wisconsin cities. Silas B. Tobey, who was last year's fellow, made a report at the recent meeting of the Wisconsin Utilities Association. His findings were given in the issue of Sept. 1. The results are the fairly obvious ones that are more or less familiar to all railway men. It was found that the type of paving has a marked effect on the noise produced when a car runs over it. That was to be expected. The tests also showed that joints which will give a continuous running surface for the wheels are at least equal in importance to the use of the proper materials for subgrade, ballast and ties. Maintenance of the car so that squeaks and rattles are eliminated was found effective in reducing noise. A result not quite so obvious to the layman, although it might have been anticipated by the scientist, was that soft cushioned seats absorb much of the noise inside the car.

It is to be hoped that the investigation will be carried forward so that, more and more, the causes of noise will be located, measured and segregated. The beginning which has been made is good and points the way to a more serious study of the subject than has yet been made.

When the Automobile Customers Run Out

PREDICTIONS of approaching saturation of passenger automobiles have been made from time to time, but one after another the various statements that have been given out as the number of automobiles that the country will support have been found in error as the registration figures have passed by them. So it has been necessary to push the computed saturation point farther and farther away. The latest contributor to this series of estimates is Robert H. Whitten, who seems to have gone as far as it is possible to go. His estimate is given in some detail on page 337 in the Sept. 1 issue. Charts of registration of automobiles indicate that the increase in number of cars is following the same general course all over the country, although naturally it differs in the several states considered. That there is a nationwide trend he believes unmistakable.

Naturally the number of automobiles that can be used at any time cannot be taken into account apart from consideration of the population at that time, for even the most ambitious salesman would find it difficult to see a market in excess of the number of drivers—at least not at the present time. Based on the Pearl-Reed curve of population growth and the automobile registrations up to the present, Mr. Whitten, with the aid of well-known principles of analytic geometry, has calculated the number of automobiles to be anticipated in the United States at any time for the next 27 years. He finds that, while

Digitized by Google

the number of automobiles is increasing year by year, the rate of increase has fallen off somewhat year by year since 1923. Determining a mathematical equation for the curve, he predicts that the rate of increase will continue to fall off until in about ten years there will be virtual saturation. That is, the number of additional automobiles sold each year above replacements will be in direct proportion to the increase in population. By 1937, as he computes it, there will be some 260 automobiles for every 1,000 persons, or 3.8 persons per automobile. That, of course, presupposes that Mr. Ford or some other aggressive manufacturer does not bring out a new model. In 1955, the last year for which Mr. Whitten has extended his curve, there should be 43,687,000 automobiles for 160,850,000 people in the United States, or 3.7 persons per automobile.

Looking at it from today's viewpoint, this would seem to be just about the limit of cars that can be supported —or run—by the American public. It must be remembered that there are still children, aged persons and cripples who cannot drive. Then there always will be an element of the population whose occupation will be to drive automobiles or trucks for others, so they will not be good prospects even for the aggressive automobile salesman.

If the estimate is borne out, nearly everyone other than those mentioned will have a car of his own. How much of a field for public transportation there will be with this enormous number of automobiles in service is a matter of conjecture. That all these cars can be on the streets and highways of the country at once seems highly improbable, judging from what has taken place in the past. That enough parking space can be provided to care for all of them immediately adjacent to the heart of the business district is also absurd. It is likely that the supply of red cardboard for police "tickets" will be exhausted. Meanwhile, the public carriers should play their part by not losing courage, furnishing meanwhile a brand of transportation so attractive that it will induce the army of automobile owners to leave their cars in the garage and take the street cars—at least for part of their personal needs.

Opportunities for the Use of Light-Weight Metals

EMPLOYMENT of aluminum in railway distribution systems in this country is confined largely, if not entirely, to feeders. While more expensive per pound than copper, the cost per unit of conductivity of aluminum, as compared with copper, does not differ greatly. The early installations of overhead aluminum feeder cables were not particularly satisfactory, owing to the tendency of the cables on long spans to stretch and thus increase their sag. This objection has now been overcome by the introduction in the center of each cable of a steel wire to increase the tensile strength of the cable to the necessary amount.

Another use in the distribution system of aluminum, or rather aluminum alloys, being tried abroad, is in overhead fittings, as described in a recent issue. The purpose, of course, is to decrease the weight of the overhead system, partly to reduce the size and cost of the supporting structure but principally to reduce trolley wire breakage. It is thought that by lessening the weight and consequently the inertia of each cross span, there will be less tendency of the trolley wire to bend upward at the point where it enters the ear of a hanger or overhead part during the passage of a trolley wheel, and so less chance for it finally to become so weak as to break at this point.

For use in such hangers and other overhead parts, pure aluminum evidently is not suitable, owing to its softness, but certain aluminum alloys are. Among those being tried the best known in this country is duralumin. In this country duralumin has been used principally where tensile strength, combined with lightness, has been desired. Thus it is a favorite material in the construction of the framework of dirigibles. For overhead fittings it also has the merit of being readily forged. Altogether, the trial being conducted in Paris is worth watching.

It seems that in the electric railway field there should be more opportunity to use some of the various light-weight metals than is being done at present. Some twenty years ago a prominent engineer calculated that it costs from 5 to 7½ cents a year to haul every pound of material in a street car. If the cost then was from 5 to 7½ cents, it is probably at least 12 cents now. In other words, every pound by which the railway car can be lightened without decreasing its strength, capacity or life, saves 12 cents a year. If this sum is capitalized at 15 per cent a year, half for interest and half for depreciation, 80 cents a pound can be paid for such a saving, roughly speaking.

Articulated Units Increase in Popularity

UNUSUAL interest attaches to recent designs of articulated cars for service on routes of heavy traffic density in large cities. The latest instance of experiments with this type of equipment is afforded by the two articulated units recently completed for the Montreal Tramways described in detail in an article elsewhere in this issue. Two weeks ago, in the Sept. 1, 1928, issue of the JOURNAL, there was presented the complete design of the new articulated cars of the Cleveland Railway. Construction of 25 of these units followed operating tests of the sample unit completed just about a year ago, and shown at last year's convention.

Interest in the articulated type of car in this country dates back a number of years to the experiments undertaken by the Milwaukee Electric Railway & Light Company. Although these consisted of old car bodies joined to form articulated units for rush-hour service to take the place of motor cars and trailers, they have proved so successful that a large proportion of the heavier types of double-truck city cars formerly in service in that city have been converted to articulated units, and the use of this type of equipment has been extended to all-day service on some lines.

In the construction of the sample three-section, four-truck unit for Detroit by the Cincinnati Car Company a number of years ago, was featured the drum type of vestibule. Montreal now introduces a combination of the drum with diaphragms, which it is claimed offers special advantages. The Detroit car was, so far as is known, the first attempt in this country to extend the idea of articulation to units of more than two bodies. Subsequently, articulated construction was adopted for rapid transit service by the Brooklyn-Manhattan Transit Corporation. There the use of multiple body units was carried to its logical application for handling traffic of very heavy density. The articulated type of unit also spread to interurban service on lines where trains of more than one car are normally operated. The installations by the Washington, Baltimore & Annapolis Rail-

Digitized by Google

way, and by the Milwaukee Electric Railway & Light Company between Milwaukee and Watertown, afford two outstanding examples of this latter development.

Although differences of opinion exist regarding the relative advantages and limitations of articulated units for various classes of electric railway service, there seems to be a steady spread of the use of this type of equipment. It offers obvious economies in weight, in first cost and in operating costs due to reduction in excess platform labor required to handle a unit of given carrying capacity. By affording free communication between cars even when operating on short radius curves, articulated units permit more uniform distribution of passenger load, and therefore more comfortable and convenient service to the public. The primary limitation of this type of equipment is that it is useful only for handling traffic which is sufficiently dense to justify the operation of large units.

Obviously, the money which goes into new cars should provide equipment suitable for all-day operation. Only in that way is the full economy of car modernization obtained. From this point of view, the Milwaukee plan of constructing articulated units from its old cars, and putting new money into light-weight cars suitable for base schedule operation on most lines, seems to be a wise one. Whether or not traffic densities in Cleveland or Montreal are sufficiently heavy to justify operation of articulated units all day without producing excessively long headways in the non-rush hours is a matter that both of these properties undoubtedly considered carefully before going into this type of equipment. In the fact that both properties now operate a considerable proportion of two-car trains there is evidence that there was an opportunity for producing substantial operating economies with articulated equipment. But there is always the temptation in the industry to grasp the economy that results from larger units, without giving adequate weight to the effect of lengthened schedules upon patronage—particularly in the non-rush hours. There are some railway executives who lean to the opinion that the traffic densities on only a very few surface car lines in the country are sufficient to justify the operation of units of more than one car each.

Bringing the Shop to the Job

WORK such as maintenance repairs can be done much better if taken to the shop where proper facilities are available and where the workmen are specialists. While this is the universal opinion, in some of the recent electric railway shops there is a noteworthy tendency toward increased use of portable equipment so that repairs can be done speedily without the necessity for dismantling the parts. By this method much time is saved and still the advantages of using proper tools and having the work done by high-grade mechanics is retained.

Pneumatic chisels and riveters, along with portable rivet heating furnaces, lighten the work of truck repairs. Electric outlets of sufficient current capacity in each section where welding repairs are made permit the permanent installation of large welding equipment, and still the workmen can plug in and obtain the necessary current right on the job. Piping of oil to the point where it is used eliminates many trips of the workmen to the oil house. Electric outlets for testing, located right at the point where the work is done, and the provision of many light portable tools are included as part of the facilities in these most modern shops.

The same principles can be adopted for track and line maintenance with satisfactory results, and it is unnecessary to have new shops to use such equipment. Most of it is of a design that can be used most anywhere. The saving in time will often pay quickly for the new equipment.

New Jersey Modernizes Its Traffic Laws

PROVISIONS of particular significance to public transportation agencies are contained in a uniform traffic act which became effective throughout the state of New Jersey on the first of this month. The new law, which was passed after many legislative vicissitudes, closely follows the recommendations of the Conference on National Highway Safety and also those of the Committee on Municipal Traffic Regulation. Recommendations of the American Engineering Council were followed in regard to traffic signs and signals. The act covers not only those subjects commonly found in state traffic laws, but also matters ordinarily taken care of by municipal ordinances. An important provision is the restriction of municipalities from passing traffic ordinances not in accord with the new state law.

Bus operators undoubtedly will benefit by the liberalization of speed laws. Under the recently adopted regulations, traffic may travel at 40 m.p.h. in the open country, whereas the limit formerly was 30 m.p.h. This is clearly in line with progressive thinking on traffic regulation. Careless driving, not excessive speed, is responsible for most accidents. Progress in automotive design has produced a vehicle which today can be operated safely at 40 m.p.h. on an open road and common sense demands that this be permitted. The new regulation allowing a speed of 30 m.p.h. in municipalities where traffic is controlled by modern signal systems is equally reasonable.

An attempt will also be made to regulate pedestrian movement. At intersections controlled by a traffic officer or by a signal, pedestrians are prohibited from crossing against the red light. At other intersections the pedestrian may cross at will and has the right of way over vehicles. Under all circumstances, however, the pedestrian is expected to cross by a crosswalk or at right angles to the curb. Opinions differ as to the probable success of this provision. A somewhat similar regulation has been in effect for some time past at the busy intersection of Broad and Market Streets, Newark. This has worked very well and has speeded up the movement of vehicular traffic. Its enforcement has been difficult, however, and the possibility of extending the system throughout the entire state, particularly at intersections where there is only a traffic signal and no policeman, seems extremely doubtful.

A provision in the new law of interest to public transportation agencies is that which prohibits persons from standing in the roadway and soliciting rides from a passing private vehicle. Accident prevention was the underlying reason for the inclusion of this provision in the law, but motorists will rejoice also at their freedom from the annoyance which this practice has caused in the past. Whether or not any substantial amount of traffic will be gained on this account by the public transportation agencies it is obviously a step in the right direction and will meet with general approval.

Time will be required to determine the success of these new regulations. Opinion is not unanimous concerning the wisdom of certain provisions. In general, however, it is evident that New Jersey has taken a long step forward in modernizing its traffic laws.

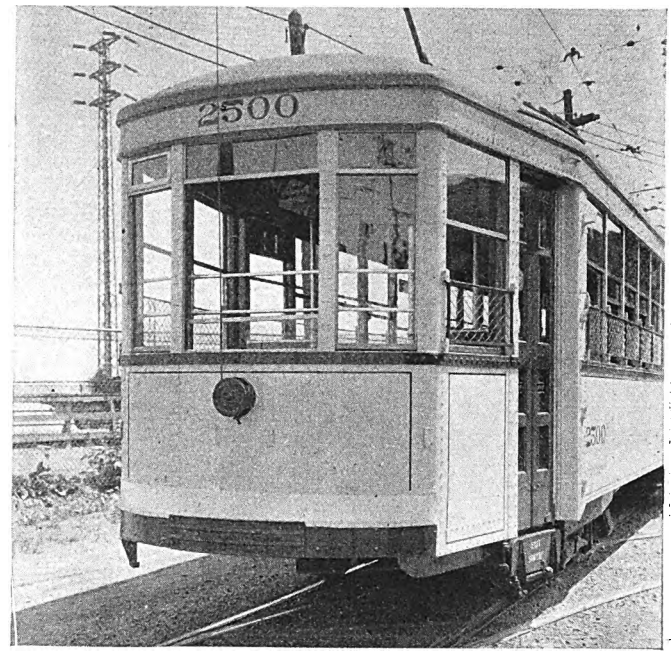
Combined Drum and Bellows Connection Features

Montreal's Articulated Car

Experimental units recently put in service combine the two types to maintain a wide opening between the two bodies at all times. The cars are designed for rush-hour service only, although they are suitable for all-day service



The trolley is at the rear end of the unit

WITHIN the past few weeks two articulated units of a new design have been placed in service on the lines of the Montreal Tramways, Montreal, Canada. The general features of these cars were designed by the officials of the Tramways company, the details being developed by the builders, the Canadian Car & Foundry Company of Montreal. The car embodies several departures from previous designs of this type of equipment. The result is a noiseless and practically air-tight articulation. This consists in a combination of drum and bellows, one or the other of which has previously been used alone in articulated units.

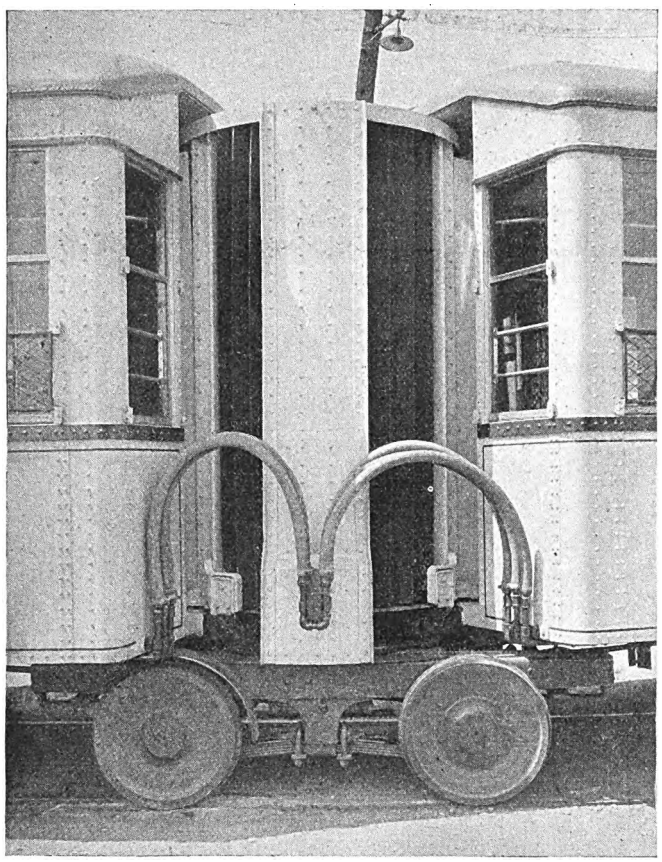
In Montreal a very large proportion of the total daily movement of passengers is concentrated between the hours of 7 and 9 a.m. and 5 and 6:30 p.m. The maximum number of cars in actual service at these rush hours is about three times that necessary to serve the various routes during the remainder of the day. On some particular routes the number of cars during rush hours is six times the normal. The chief problem in a city the size of Montreal is not only to put out a sufficient number of cars to accommodate all passengers who require transportation but to find the best ways and means to get a sufficient number of cars loaded and passed through the narrow, congested streets and intersections in the area south of Mount Royal Avenue and between Papineau and Atwater Avenues. The limited width of the streets in this district, the sharp curves and the intersections have forced the tramways to restrict the maximum length of a car to about 45 ft. Two-car trailer trains have been used to some extent, with a total length of about 92 ft. The new duplex cars have practically the same capacity as a trailer train, with a total length over all of about 80 ft.

The general appearance of the car is shown in the accompanying illustrations. All passengers enter by a large front door nearly 6 ft. wide. There are three separate exits, one two-stream exit near the rear of the front section, one two-stream exit near the front of the second section and a single-stream exit at the rear. All exits in the rear section are equipped with automatic treadles. The doors, however, are under the complete control of the conductor, whose position is at the rear of the forward section so that he has a good view of all exits at all times. The three automatic doors in the rear section are interlocked with the motors and brakes so that the car cannot be started until all of the doors are closed, and the doors cannot be opened until the car has stopped. Through the use of an emergency button the conductor can open all doors in both sections.

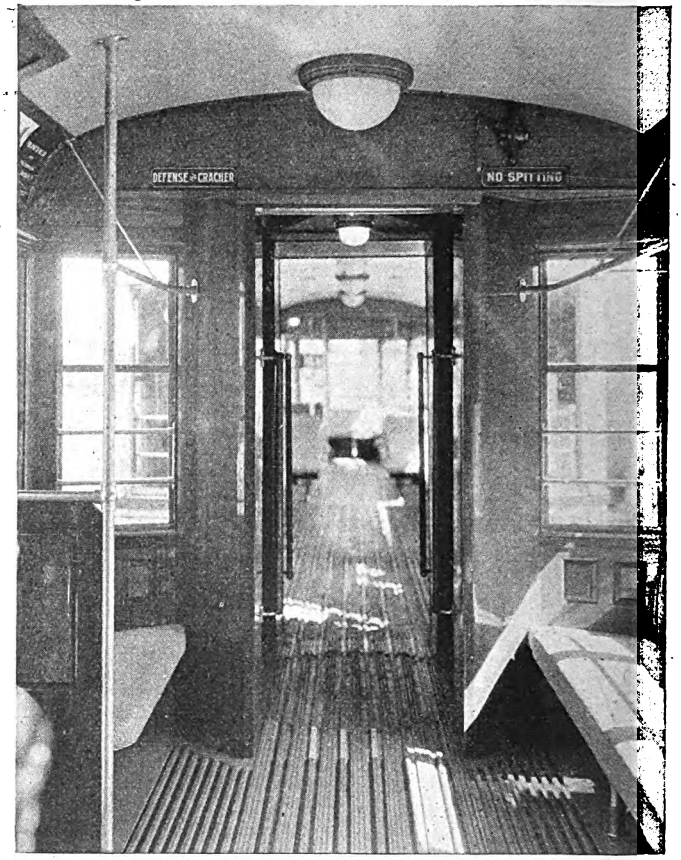
The unit is 80 ft. $\frac{1}{2}$ in. long over all, the front and rear bodies being of equal length, 30 ft. $9\frac{11}{16}$ in. The front and rear vestibules are each 6 ft. 11 in. long, and taper toward the ends. The width of the bodies is 8 ft. $4\frac{11}{16}$ in. over the eaves. The height from the rail to the top of the roof is 11 ft. $1\frac{1}{2}$ in. and the height of the floor above the rail is 34 in. The leading and trailing trucks of the unit have a 5-ft. 4-in. wheelbase, with 26-in. diameter wheels; the center truck, which does not carry motors, has a wheelbase of 4 ft. 4 in. with 24-in. wheels.

The articulation coupling between the two sections of the car, shown in one of the diagrams, is designed on the universal joint principle, obviating difficulty in turning, even on curves of minimum radius. A special feature of the articulated unit is that the rear end of the front section and the front end of the rear section both travel on a common turntable which is supported by a very soft spring arrangement. The construction of this turntable prevents any twisting action between the two bodies around the coupling. The weight is carried on rollers. The cup-and-ball connection acts only to couple the units together. The floor of the passageway between the two car bodies is flush with the floors of both at all

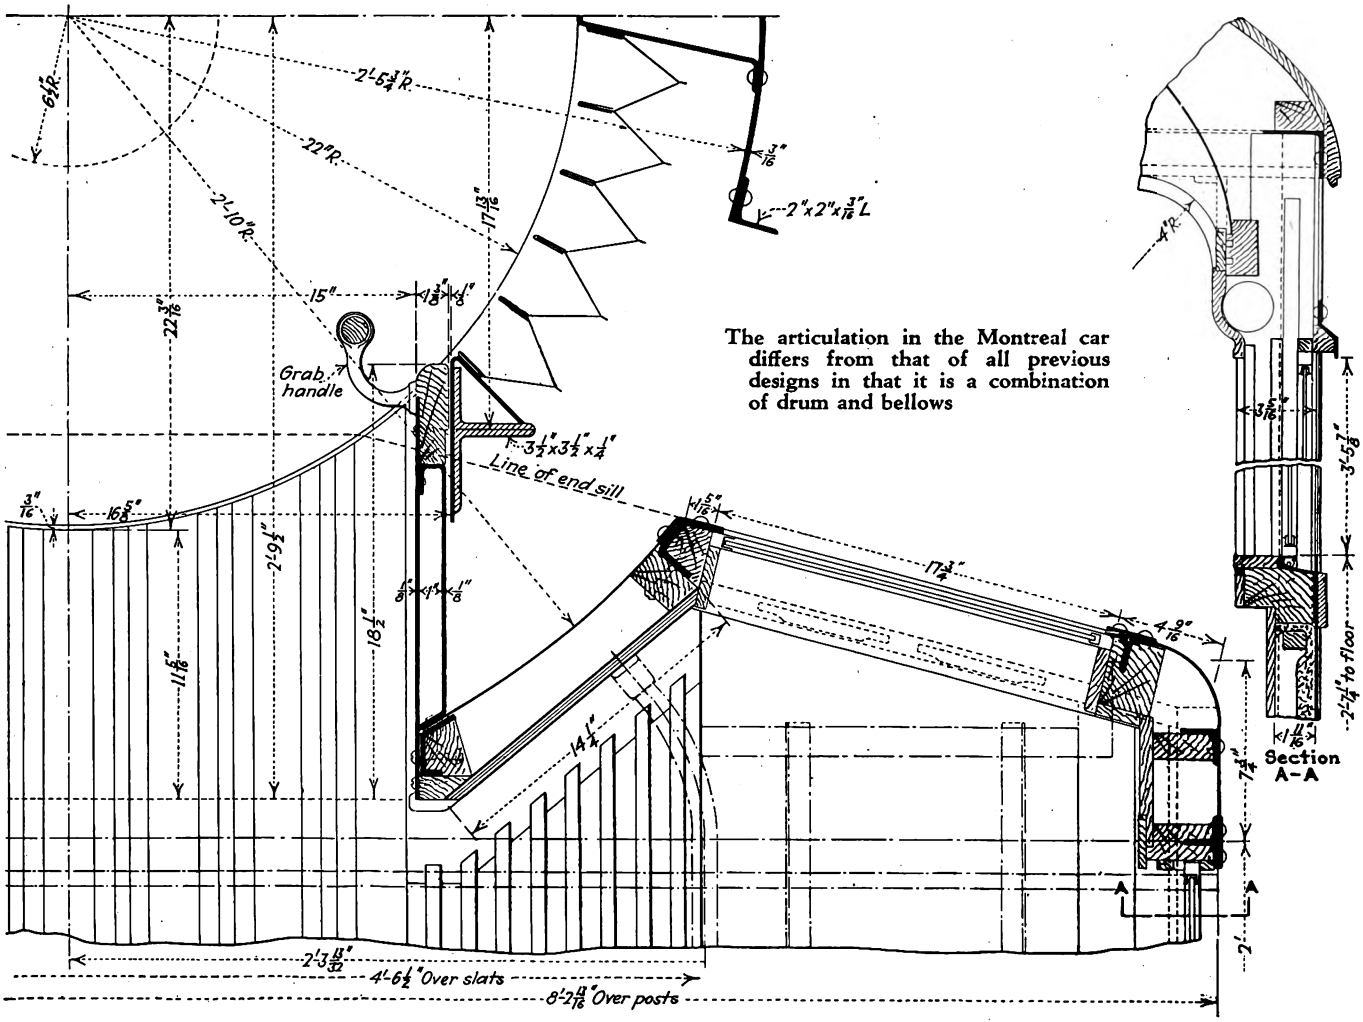
Digitized by Google



A near view of the drum connecting the two sections. The bellows at either side of the drum are not seen in the picture



Framing around the windows at the drum. Good lighting at the inner ends of the two bodies is obtained in this manner



The articulation in the Montreal car differs from that of all previous designs in that it is a combination of drum and bellows

Digitized by Google

times, even when taking a curve at the top or bottom of a grade.

The passage through the vestibule over the articulation coupling is of ample width, and the vestibule is proof against rain and snow, an important consideration in encouraging passengers to use the rear section. In each section the floor is covered with safety treads, and there are window guards over the windows of each section. The current-collecting equipment is mounted on the roof of the rear section. The free space between the motorman and the conductor is practically the same as in many standard pay-as-you-pass cars, and covers about one-third of the space in the entire unit.

In the first unit the seats in the front section are arranged longitudinally, while those in the rear section are arranged both transversely and longitudinally. The front section seats 41 and the rear section 49, a total of 90. There is standing room for 108 passengers, making the total rush-hour capacity 198.

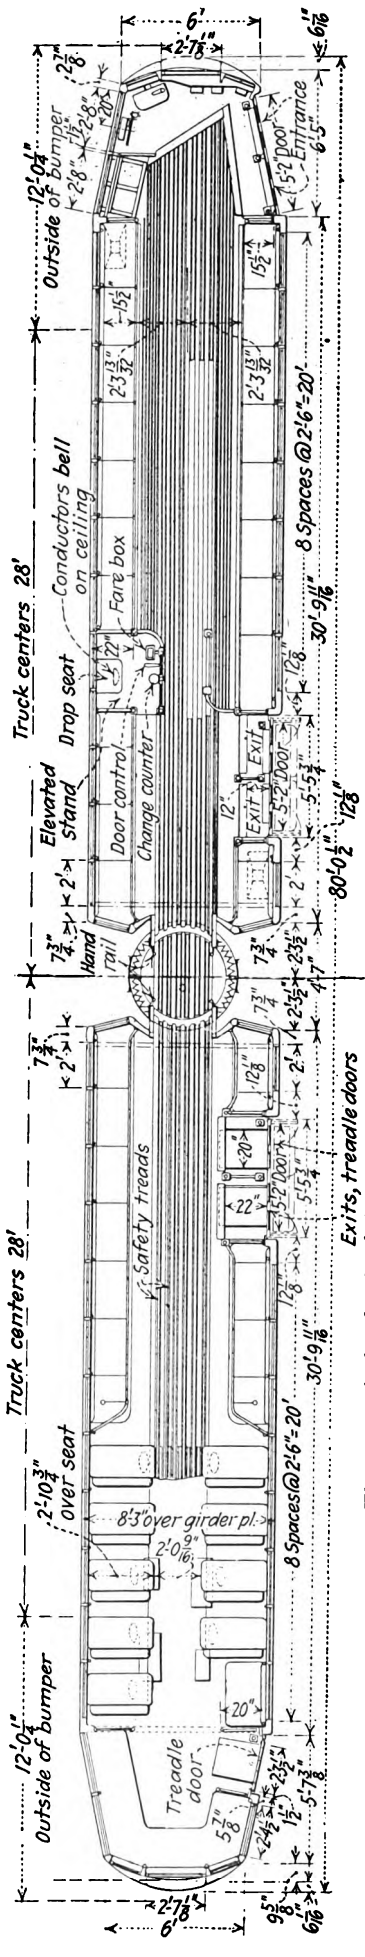
COMPARATIVE OPERATING EXPENSE, STANDARD CAR AND ARTICULATED UNIT

	Cents per Car-Mile	
	46-ft. Car	Articulated Car
Overhead expense	15.2	21.7
Platform expense	11.8	11.8
Energy (at 1.25 cents per kilowatt-hour)	5.6	7.8
Maintenance	3.5	4.5
Carhouse expense	1.0	2.0
Total expense	37.1	47.8
Relative cost per single body	37.1	23.9
Relative net economy, per cent	100	65

From his position in the front section of the car, the conductor will control the exit doors in the rear of the front section in the usual manner. For the control of the doors in the rear section the conductor has a three-position switch, which functions as follows: With the switch in the first position the doors are controlled

Length over all	80 ft. 0½ in.
Passenger seats	90
Standing capacity	108
Total rush-hour capacity	198
Weight, light, pounds	58,000
Weight with seated load, pounds	70,000
Weight with rush-hour load, pounds	86,000
Light weight per seat, pounds	630
Light weight per passenger, with rush-hour load, pounds	290
Total weight per passenger, seated load, pounds	770
Total weight per passenger, rush-hour load, pounds	430
Energy demand compared with standard train, empty, per cent	64
Energy demand compared with standard train, seated load, per cent	70
Energy demand compared with standard train, maximum load, per cent	73
Relative energy demand for rush-hour round trip, per cent	72
Weight on driving wheels, per cent of total	75
Maximum grade on which unit can operate all day, per cent	6
Maximum grade in tripper service, per cent	8

by the treadle; with the switch in the second position the treadle feature is cut and the doors are under the control of the conductor, but he is not able to close a rear-section door while a weight of 8 lb. or more is on the step; with the switch in the third position the treadle mechanism is inoperative, so that the doors cannot be opened. Normally the switch will remain in the first position and the rear section doors will require no attention from the conductor, except in unusual circumstances, as when the car stops opposite an excavation, or when the conductor must open the doors at a terminal. The doors are interlocked with the motor control and the brake valve, so that if any door is open the car cannot



The new articulated unit of the Montreal Tramways is slightly more than 80 ft. long and seats 90 passengers

be started, and if a door is opened accidentally while the car is in motion the brakes will be set at once.

No provision is made for a second conductor on the rear section, as it is felt that the inclusion of a third man in the crew would wholly or in part defeat the purpose for which the car was designed. Further, it is felt that the crew will be a safer unit with a two-man car than with three men, since if the automatic equipment fails it fails on the side of safety, while if there is a failure of the human element it is more likely to result in disaster. An auxiliary operating button is placed in the rear section, by means of which an employee riding in that portion of the car can have control of the doors in an emergency.

In the second unit individual bucket type seats are placed at an angle. While the seating capacity is less it was felt that there is a degree of privacy that is not possible with the standard type of seat. The arrangement also gives a greater amount of free aisle space to facilitate movement in the car during rush hours.

Each section of the car will have a brake cylinder to furnish braking power to the wheels of two driving and one idling axle. The controller does not have the dead-man feature, but the doors will not be operative without a pressure of at least 20 lb. in the brake cylinders. If the brakes are released while the doors are open they will be reapplied immediately in emergency.

Digitized by Google

This safety feature is in addition to the ordinary power control interlocking so that the car will not start if the doors are open even if it is standing on a grade.

Two Westinghouse 510-A2 motors, rated at 42 hp. each, will be carried on each of the end trucks.

It is the intention to use the cars during rush hours only and to confine them to lines on which the grades are 6 per cent or less, on account of the limitations of motor capacity. On some tripper runs this will be modified and the cars will be placed on routes where there are short momentum grades up to 8 per cent. The motor capacity is sufficient to allow the cars to operate over 6 per cent grades of reasonable length throughout the day, and it also is sufficient to allow the car in tripper service and with relatively cool motors to operate over the 8 per cent grades without overheating.

If extended service with the new units makes it seem desirable to use them on heavier grades than those mentiond, this can be done either by using the Timken type of axles with Cardan drive, with small-diameter lightweight motors or the Westinghouse double-reduction drive. The mounting of two motors of the conventional type on the center truck would necessitate elevation of the car floor 4 in. above the present 34 in.

Other equipment on the cars includes Westinghouse straight air brakes with emergency feature, Hedley anticlimbers, Faraday high-voltage car signal system, Westinghouse DH-16 compressor, standard metal conduit, K-35 control with 806-J-16 line switch, National Lock Washer Company curtain fixtures, Pantasote curtains, Keystone destination signs, National Pneumatic Company door operating mechanism, Cleveland fare boxes, slat floor covering with Kass safety treads, Nuttall helical gears and pinions, Peacock staffless hand brakes, rigid aluminum hand rail, three-ply Salamander insulation, Canadian General Electric heaters with thermostatic control, Haskelite headlining, cherry interior trim, Canadian Car & Foundry Company journal boxes, Safety Car Heating & Lighting Company dome lighting fixtures, O. W. Meissner pneumatic sanders, Robert Mitchell Company sash fixtures, Ottawa Car Manufacturing Company seats, Ohio Brass Company Form A trolley base, Keystone trolley catcher, Lyman Tube & Supply Company Ideal trolley wheels, Railway Utility Company honeycomb ventilators and H-B wheelguards.

Some of the principal figures on the unit are given in an accompanying table.

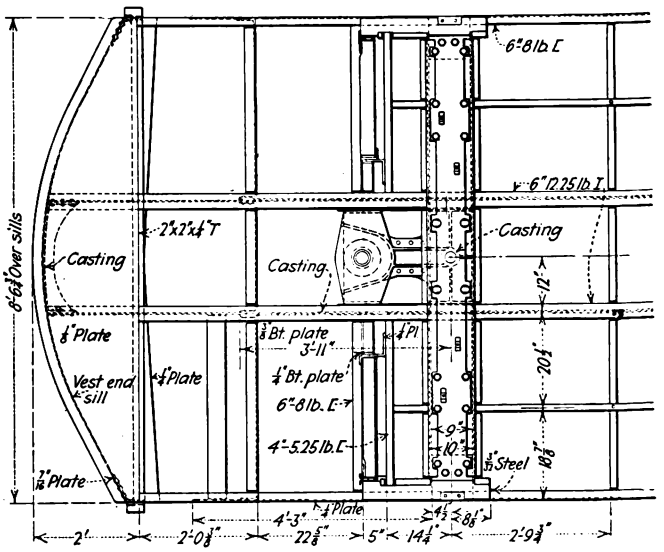
Based on Montreal's experience, an accompanying table shows a comparison of the operating expense for one of the company's standard 46-ft. cars with two men and an estimate of the expense for the articulated car: This is based on 40 car-miles a day for 300 days a year, a total of 12,000 car-miles a year. The energy consumption is based on a seated load throughout the trip.

Interborough Accident Presents Unusual Features

Force of blow against curtain wall in Seventh Avenue subway wreck of Aug. 24 cut ninth car of steel train completely in two

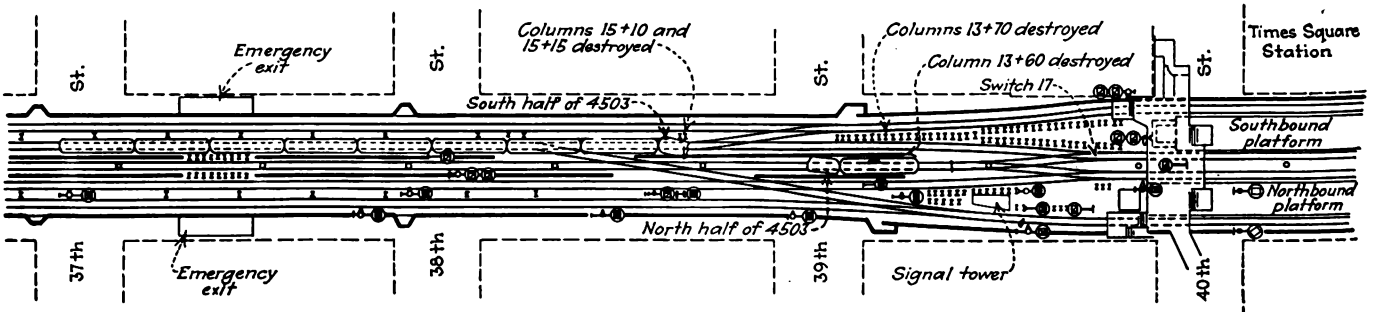
JUST what happened to cause the wreck of a ten-car train which occurred shortly after 5 p.m. on Aug. 24 on the southbound express track at the Times Square subway station of the Interborough Rapid Transit Company in New York City still is a matter of conjecture. It is possible that the details of the failure never will be known completely. They still are under investigation to inquire further into the circumstances surrounding the accident.

In order to understand what occurred, some knowledge of the layout in the vicinity of Times Square station is



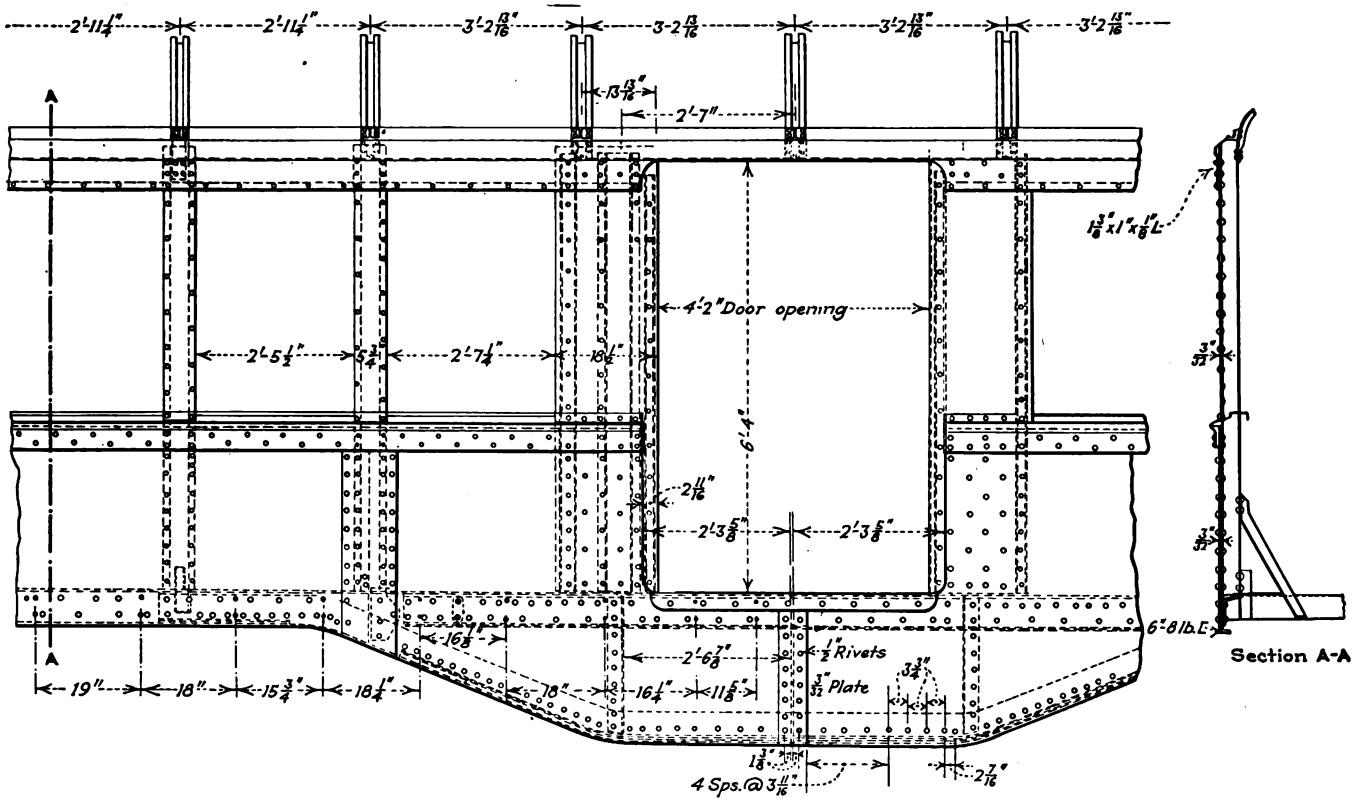
Framing of the car that was destroyed. The center sills are continuous and straight from one end to the other, and the side sills are continuous, although they are depressed in the vicinity of the center door

essential. The accompanying map shows the south end of the station, which has four through tracks running approximately north and south. These are spread apart to allow space for station platforms between the two northbound and the two southbound lines, local and express, the latter being in the middle. Immediately south of the station platforms the express tracks are turned outward on either side to give room for a fifth track in the middle of the right-of-way. This track is used for



Layout of tracks south of the Times Square station of the Seventh Avenue subway, showing the position of the two portions of the train after they came to rest

Digitized by Google

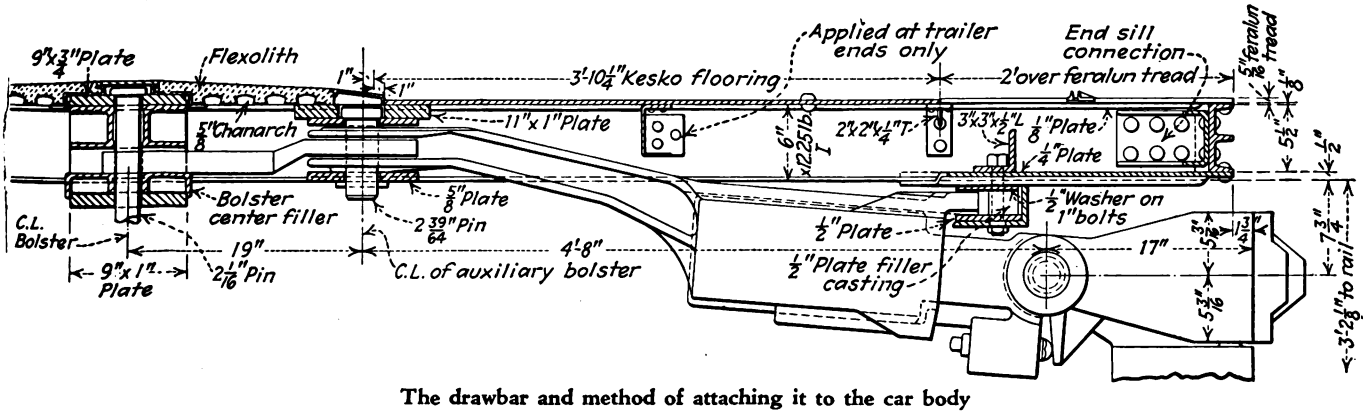


Elevation of framing in the vicinity of the side doors. The body was severed at this point

the purpose of turning back trains which arrive at the station southbound on the express track. It is connected with the southbound main line track with a facing point switch and to the northbound main line by a trailing point switch, both interlocked through a tower located approximately 80 ft. away. All other switches in the immediate vicinity are also interlocked and controlled from the same tower. Signals for informing the motormen of southbound express trains as to the position of the facing point switch, known as No. 17, are located at the south end of the Times Square station, so that trains cannot be signaled to proceed unless the switch position is properly indicated. The signal also is connected with an automatic stop, so that if by any chance the train moves against the signal at this point power will be cut off and the air brakes will be applied automatically. There is a down grade of 0.59 per cent in the station, followed by a 0.29 per cent down grade immediately south of it.

The facts connected with the occurrence of the wreck are now well established. The train in question, which was a standard ten-car steel express of standard make-up, left the Times Square station southbound at 5:08 p.m. The signals were set against the main line, but in order to permit the train to proceed a signal maintainer released the automatic trip and signalled the train by hand. This was apparently done to avoid tying up the southbound express track at the height of the rush hour. The first eight cars passed over the switch successfully, taking the main-line track. The front truck of the ninth car also passed over. The rear truck of this car, as well as both trucks of the tenth car, took the track leading into the siding.

Approximately 130 ft. beyond the point of the switch there is a curtain wall of reinforced concrete and including the main columns supporting the street overhead, separating the middle track from the southbound express track. The ninth car collided with this approximately opposite the middle door with such force that it was cut in two separate pieces. The forward section was dragged approximately 150 ft. before the automatic air brakes stopped the train. The rear portion, propelled by the tenth car, was forced along the middle track for about 70 ft. beyond the end of the curtain wall before it was stopped. Although the car was thus cut in two, the



The drawbar and method of attaching it to the car body

Digitized by Google

couplers, which were of the Westinghouse automatic mechanical and air connection type, held the halves of the cars to the ones next to them.

In the progress of the forward end of the train after the curtain wall was struck, column 13-60 at the end of the wall was destroyed, as were columns 13-70 and 13-75 on the opposite side of the express track. At the point where the forward half of the car came to rest columns 15-10 and 15-15 also were destroyed.

Investigation Reveals Car Equipment Not at Fault

The investigation made immediately after the wreck by the Transit Commission indicated that the car equipment was in perfect operating condition and in the judgment of the experts did not cause the accident. The facts collected regarding the occurrence were as follows:

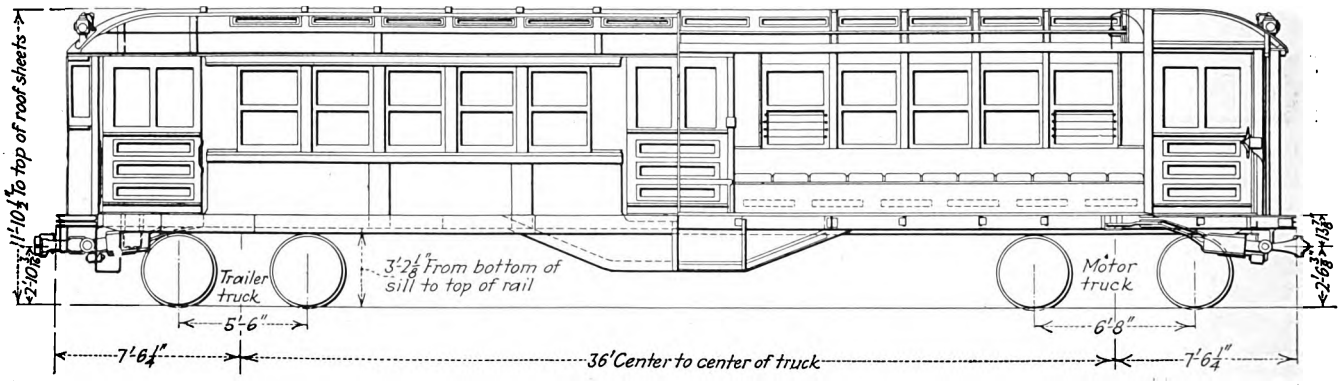
At 4:58 p.m. Towerman H. King, in charge of the I.R.T. signal tower in the Seventh Avenue tunnel, south of 40th Street, reported that he was unable to operate the switch from the middle track at that point and called for Signal Maintainer Baldwin, who was stationed at 34th Street and Seventh Avenue, to come to 40th Street. Towerman King was attempting to operate this switch to allow a special train which came from Van Cortlandt Park to go into the spur track so that it could be turned back northbound from Times Square. As he was unable properly to work the lever on his interlocking machine controlling the switches and signals he called Signal Maintainer Baldwin from the 34th St. I.R.T. station and told him of the trouble.

When the lever failed all of the safety devices functioned perfectly. The signals went to red, and the trains halted. Maintainer Baldwin and Helper Carr came to the scene of the trouble and did what is the comman practice in railroad operation. They manually operated the automatic stop and hand signalled to the motorman, thus allowing the train, which was to have been turned, to proceed on downtown.

The train that was derailed followed immediately after this one, and left the station at 5:08. As to the cause of the change in switch position which caused the accident, the Transit Commission stated that in the opinion of its signal and switch experts the switch that caused the derailment was turned into the middle track while the train was passing over it. There was nothing to show that the switch was turned by the train itself. It might have been turned over by a movement of the lever in the tower or by someone moving the switch valves located near the track.

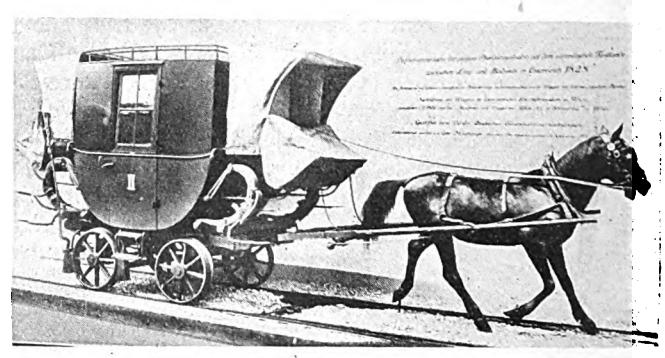
The switch that caused the derailment was not the switch which was out of order, but is the one that normally operated on the same circuit with the switch that was out of order. It would have been impossible to throw the switch while any part of a train was passing over it, except by a pushbutton in the back of the interlocking machine or by the switch valve.

The car that was demolished, No. 4503, was one of a series of cars built in 1916. It was of all-steel construction, being made of structural and rolled shapes. The drawings reproduced with this article show the principal dimensions of the car and particularly of the framing in the vicinity of the center side doors at the point where it was torn apart. It will be seen that while the sills are continuous from end to end the side plates are cut away to make room for the doors. Additional beams are riveted to the sills, being kicked down to give additional vertical stiffness and compensate for the discontinuous side plates. Another drawing shows the connection of the drawbar and coupler, which successfully withstood the enormous strain imposed when the car collided with the wall.



Elevation of the standard steel subway car of the type involved in the accident of Aug. 24

First Horse Car Line in Europe



Reproduction of full-sized model of first horse car on the continent of Europe

ONE of the exhibits now at the German National Museum in Munich is a full-sized model of a horse car built and used in 1828 on a line between Linz and Budweis in Austria, completed that year. This is said to have been the first horse car line in the continent of Europe. The model was presented to the museum by the German Railway Association (Verein Deutscher Eisenbahn Verwaltungen).

Relation of Customer to Seller True Basis for Rate Structure

By Richard Sachse
Consulting Engineer, Los Angeles, Cal.

Mr. Sachse, in his article entitled "Determining the Proper Price for the Transportation Product," published last week, discussed in detail the many factors affecting rate making. In this article he cites three important rate cases to show the attitude of one state commission toward these various factors.—EDITOR.

RATE structures of mass transportation utilities should be based, primarily, not on distance, nor time, nor approximations of cost of various services, but on the relation, in regard to service taken and received, of the customer to the seller. Attempts to put into effect rate schedules built squarely on such a basis are still comparatively rare. It seems worth while, therefore, to review briefly three of the recent important California electric railway rate case decisions to show the attitude of one commission toward fare problems. These three important rate proceedings have for a year or more been before the California Railroad Commission. They concern the rates of the largest urban and interurban mass transportation utilities of the state: the Pacific Electric Railway, the Los Angeles Railway and the Key System Transit Company. In all three the question of the rate structure was a major issue. The commission in its several decisions reached certain conclusions and made certain pronouncements which may be of value to the entire industry and, whether there be agreement or disagreement, may assist in pointing the way.

Views of the California Railroad Commission on three important rate cases concerned many fare problems, including zone system versus city-wide fare, peak versus off-peak riders and flat rate versus reduced and special rates

The Pacific Electric Railway, with its interurban, suburban and city lines, both electric car and bus, serves the metropolitan area tributary to the city of Los Angeles, in San Bernardino, Los Angeles, Riverside and Orange Counties, including the cities of Los Angeles, Pasadena, Glendale, Riverside, San Bernardino, Redlands, Fullerton, Santa Ana, Anaheim, Long Beach and a number of others. This transportation system is a combination of large interurban and urban passenger lines and is one of the largest freight carriers of the state, with a total revenue in 1927 of $19,647,000. The Los Angeles Railway is the largest street railway system in California and one of the largest in the United States, handling more than 75 per cent of the Los Angeles local passenger traffic and operating a large fleet of buses in addition to its rail service. Its gross revenue in 1927 was $13,288,000. The Key System Transit Company combines an interurban ferry and electric train service between San Francisco and the east bay counties of Alameda and Contra Costa with a local street railway service in Oakland, Berkeley, Alameda, Richmond and other cities, supplemented by bus service. Its operating revenue in 1927 was $7,453,000.

These three mass transportation systems may be taken as representative of the industry, for they give almost all types of service. The Pacific Electric in its Los Angeles city service operates under a zone fare system; in its interurban service under a distance tariff at various unit rates per mile with an assortment of reduced rates for round trips, commutation, Sunday passes and other special trips. The Los Angeles Railway is on of the few remaining large systems with the flat 5-cent fare, including free transfers (no city zones). The Key System Transit Company also has a flat fare, 7 cents, except for a few of its longest lines in zoned suburban service. Its transbay interurban service is on a flat rate regardless of distance, with greatly reduced rates for monthly commutation tickets.

Each of the three systems found it necessary to apply to the Railroad Commission for increased fares. The Pacific Electric Railway and the Los Angeles Railway asked for a flat increase without a change in the rate structure; the Key System Transit Company asked for a new schedule of rates constituting a considerable departure from the rate forms then in effect. The main characteristics of the rate structures of the three systems as they existed at the time of the rate application and as proposed by each company are shown in Tables I and II, accompanying.

A discussion of the issues of these interesting rate proceedings before the California Commission is not within the purpose and scope of the present analysis. It is sufficient to say that in the Pacific Electric Railway case the commission established certain experimental rates which were modified somewhat in a later decision, and that provision was specifically made for further experimenting if deemed necessary or desirable. In the Los Angeles Railway case the commission denied the company's application for the specific rates requested and allowed no increase whatever, maintaining the 5-cent flat fare. The company's application for a rehearing was denied. This case has been taken into the federal court, the company alleging confiscation.

In the Key System case the commission made several decisions. Temporary emergency rates were first put into effect pending final decision. A year later, after submission of the entire case, the commission ordered for the street car lines an entirely new rate structure different from the flat rate and different from the rates applied for by the company. On the interurban lines the

Digitized by Google

commission reduced the rates. The company refused to accept these rates and asked for a rehearing on the ground that the rates ordered by the commission would reduce the income annually by more than $1,000,000, compared with the then existing fares, instead of providing for an increase in net income of approximately $1,000,000, which increase was reasonably required according to the finding of the commission. The rehearing was granted and a later decision annuls and modifies the former order. Table III shows the rate structures of the three companies in accordance with the latest decisions of the commission.

In the Key System case the California Commission in its decision dated Nov. 9, 1927, made certain findings of fact on rates and rate structures. The commission said:

> Past horizontal fare raises have successively proved insufficient to meet the financial requirements of applicant and it appears reasonable to conclude that the remedy, at the present time, cannot be found by the granting of a further horizontal increase in fares.
>
> The basic 5-cent fare on street car lines has many meritorious advantages and a serious attempt should be made to develop a fare schedule built upon the basic 5-cent fare that will meet the reasonable financial requirements of the company.
>
> Sufficient accurate and dependable data as to the exact form of satisfactory rate schedules for applicant are not available and that, to secure such information, extensive experimentation should be made in the form, kind, amount and spread of rates for various services of applicant, and any such experimental rates established should be subject to prompt change or elimination whenever it becomes apparent that they are unsatisfactory or against the public interest.
>
> The earnest and aggressive use of modern merchandising methods on the part of applicant is essential to the success of any fare plan.

On the above basis the commission ordered "as an initial experiment, rates based upon a modification of the plan tentatively recommended by the commission's chief engineer" and substantially as follows: a zone system for the company's street car lines with a 5-cent zone fare in each individual zone and a 10-cent through fare in two or more zones. In addition, two weekly passes were ordered and a reduced individual off-peak rate, good between 9 a.m. and 4:30 p.m. every day in the week. On the interurban transbay lines the one-way fare between San Francisco and any point in the east bay territory was reduced 1 cent, from 21 cents to 20 cents (the company had asked for a 25-cent fare), and a modification in the form of the commutation ticket was made with a slight increase in the rate.

The company asked for a rehearing, stating that the experiment ordered by the commission would result in such a reduction in gross revenue that it would, in the opinion of the company, precipitate its system into bankruptcy. The commission granted the rehearing and modified its first decision, stating in its opinion and order of May 29, 1928, that there was little hope for success with such fares unless the company tried them out wholeheartedly. Since the company believed that the risk was too great in view of its financial condition, the experimental fares could not be considered. Since the decrease of expenses had already been considered the commission confined itself with the possibility of further increased revenue.

The commission then discussed at some length several possible rate structures for the street car lines, including the 5-cent zone fare, the 5-cent zone fare with the $1 weekly pass, the 10-cent flat fare with the $1 weekly pass, the 10-cent flat fare with reduced token fare and $1 weekly pass, the 10-cent flat fare with reduced token fare and $1.25 weekly pass. It finds that there are serious objections to each. The discussion of rate structures is concluded with a reference to the statements of several electric railway operators who testified specifically against the experimental fares proposed and in favor of the fares proposed by the company. Under this record and the conditions stated the commission felt that to order any of the forms of fare proposed in the previous order would be in the nature of questionable experimenting with a situation extremely hazardous both to the applicant and to the public. Accordingly the matter was left open for further order until the company may petition the commission to file fares which it believes will most nearly meet the exigencies of the situation.

TABLE I—RATE STRUCTURES AT TIME OF APPLICATION TO COMMISSION

	Interurban Service	Local Service
Pacific Electric Railway	Mileage rate, from 0.9 cents per mile for commuter tickets to 2.75 cents for one-way fares	Through fare of 10 cents, 6-cent zones and free transfer
Los Angeles Railway	None	Flat rate of 5 cents and free transfer
Key System Transit Company	Flat rate of 21 cents for one way and $5.20 for monthly commutation	Flat rate of 7 cents and free transfer, no zones

That the commission gave much attention to the problem of a proper fare structure in this proceeding is clearly apparent not only from the decision of the majority, but also from the two minority opinions accompanying the decision. Commissioner M. J. Carr in his "Opinion Concurring in Part and Dissenting in Part" discusses the matter quite fully. While he was in general agreement with his associates he was not in entire accord as to the nature of the relief or the kind of order which should be made. The important point, he felt, was, "can any system of fares having some semblance of fairness between classes of riders be devised which will make it possible for this company to exist and to continue to serve the great population tributary to its lines?" Whether or not a fare is justified on paper and in theory, it is futile if the public will not ride. To a very large extent the riding public fixes and determines the rate of fare. In a footnote Commissioner Carr says:

TABLE II—RATE MODIFICATIONS APPLIED FOR

	Interurban Service	Local Service
Pacific Electric Railway	Increase of 20 per cent for existing rates	Various changes contemplating approximately a 20 per cent increase
Los Angeles Railway	None	Cash fare of 7 cents, 6½-cent token, 6-cent interim fare, free transfer and universal transfer (good on two systems)
Key System Transit Company	Flat rate of 25 cents for one way and $6.50 for monthly commutation	Cash fare of 10 cents and a $1 weekly pass

> Here the commission is in effect rendering a judgment against one class of riders, namely, the commutation riders, and in favor of the casual or occasional transbay rider. The issue as to which of these two classes should be required to bear an increased burden really has not been tried out in the course of the proceedings, the record being surprisingly barren of testimony or discussion to aid in reaching a correct conclusion. This situation illustrates concretely what I sense is a serious defect in regulation of rates by the commission. A rate case is fully presented and the commission reaches a sound and well-supported conclusion that revenue should be decreased or increased as the case may be. The question then arises as to the class of persons to secure the benefit or suffer the detriment. While the patrons of the utility theoretically have a hearing practically they do not.

This commissioner disagrees that a commission should assume complete management in the matter of prescrib-

Digitized by Google

ing a specific rate schedule. He held that while he was in entire accord with his associates in the premise that competitive and economic conditions will determine largely the level and kind of fares, it is logical that where a company is not earning a reasonable return it should be given some latitude in establishing new fares which it believes will yield it something of a return under the existing conditions. There is nothing unfair or unreasonable in the casual or occasional rider paying more than the regular rider. Whether the fare structure will work is a very different question. The company claims it will. Its success or failure depends largely on the way it is received by the public.

Commissioner Carr further stated that he agreed with Commissioner Seavey that any trial fare structure to which the company is opposed is almost certain to fail, as it would not receive a fair trial. In view of the uncertainty of the results of such a structure he did not believe the commission would be justified in issuing a mandatory order requiring it.

A quite different view was held by Commissioner E. W. Decoto, who said it seemed clear to him that there is no fare proposed or that could be devised at the time that would yield a greater gross revenue than that in force. The company cannot compete with the privately-owned automobile or with buses or with the tendency of

TABLE III—PRESENT RATE STRUCTURES, ORDERED BY THE CALIFORNIA RAILROAD COMMISSION

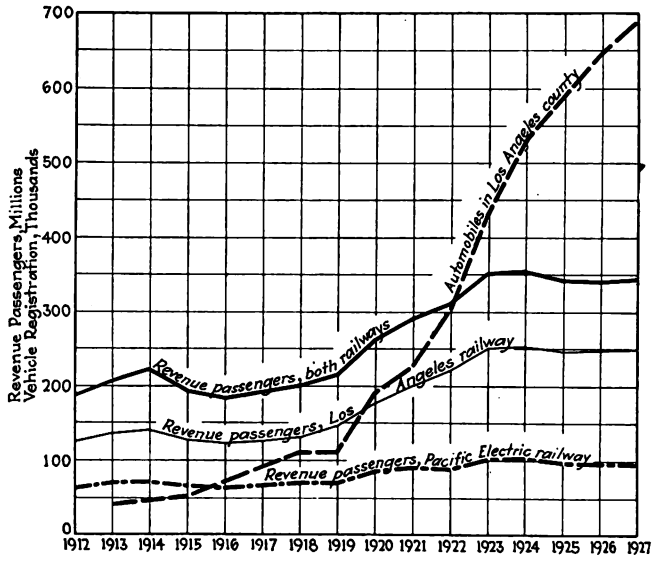
	Interurban Service	Local Service
Pacific Electric Railway	One-way fares of 2 cents per mile on certain heavy lines and 2.75 cents per mile on all other lines, round-trip rates 5 cents less than double the one-way fare of not more than 25 cents, and 10 cents less than double the one-way fare of 30 cents and more, reduced rate 30-ride, 90-day family ticket, 60-ride, 40-day individual ticket, $9 monthly pass on large part of system, $2.50 Sunday pass and minor rate provisions.	In Los Angeles four 5-cent zones with 10-cent and 15-cent through zone fares and 25-cent round-trip fares; in other cities 5-cent one-way fare where prior rate was 6 cents, and 10 cent one-way fare where prior rate was more than 6 cents
Los Angeles Railway	None	Flat fare of 5 cents with free transfers. (No increase; application denied.)
Key System Transit Company	Flat fare of 21 cents for one way and $6.50 for monthly commutation	Flat fare of 7 cents, free transfer

the people to leave street cars, by raising the cost of street car travel. He believed that little could be learned by further study, so that he held that the fares should be definitely fixed at 7 cents and the case closed. In this view a company should not be permitted to go above a certain fixed rate (7 cents in this case) regardless of the utility's belief that a higher fare or a different rate structure will produce greater revenue and better service. Should such a view prevail it is clear that the effective management of the utility would definitely pass from the owners to the commissioners.

That the California Commission is much impressed by the advantages of the nickel fare is further apparent from its decision dated April 7, 1928, in the Pacific Electric case. The local fares, prior to that decision, in the cities served by the Pacific Electric were generally above 5 cents.

The commission says:

An increase in the local fares in the cities of Long Beach, San Pedro, Santa Monica, Venice, San Bernardino, Riverside and Glendale would result in little, if any, increased gross revenue, and the requested increase in these rates should be denied. These operations, however, are relatively unimportant and it is rcommended that such fares be placed on a 5-cent basis to be consistent with the interurban fare schedules.



Annual revenue passengers carried by electric railway lines serving Los Angeles and automobile registrations for a period of fifteen years, showing the effect the increasing use of automobiles is having on street car patronage

Referring to the company's local service in the city of Los Angeles the decision contains this statement:

A serious problem is presented with respect to the fares on the local rail lines of applicant in Los Angeles. The record indicates that a total increased revenue of some $250,000 annually is required to yield a fair return on this property. The evidence further shows that the company's requested increase of zone fares to 7 cents and 12 cents, respectively, will not only fail to return any additional gross revenue, but, it is estimated, will actually result in a decrease of nearly $60,000 under present revenues. Such a result is obviously not in the public interest and the request should be denied.

Three zone plans are proposed by our chief engineer. The only one which appears to be adequate to return the increase in revenue desired is the so-called four-zone plan, consisting of one 15-cent zone, three 10-cent zones and four 5-cent zones. This plan, it is estimated, will result in an increased revenue of $200,000 annually, or $50,000 less than the required additional revenue. There appears, however, to be no other form of fare which will return to the company a greater increase in revenue. This form of fare will have the advantage of abolishing the present objectionable odd coin fare of 6 cents in Los Angeles. I believe the adoption of such a fare schedule is the most satisfactory disposal of the Los Angeles local situation and the accompanying order will so provide.

In the Pacific Electric case, as in the Key System case, the commission was in favor of rate experimentation along the lines recommended by its chief engineer, A. G. Mott, who proposed (1) an extension of the Glendale trial rates to other portions of the system; (2) the trial of a low one-way off-peak rate; (3) the trial of a monthly pass, and (4) the trial of a Sunday excursion pass. Only in this way, the commission stated, can it be determined with finality whether there is any merit in such experimental plans. These fares should be inaugurated for a trial period, and should they prove unsatisfactory the necessary adjustments should be made.

The effect of conclusions based upon the information at the commission's disposal is most clearly shown in the Los Angeles Railway rate case decided in April, 1928. In that case the California Commission denied the company's application for an increase in the flat 5-cent fare notwithstanding the fact that upon the commission's own computation and on the commission's own valuation and rate base the company was earning a return of less than 5 per cent and had been earning between 5 and 6 per cent of the commission's own figures since 1924. That the matter of rate structure was an

Digitized by Google

important consideration in the commission's mind is apparent in the concurring opinion of Commissioner M. J. Carr, who says:

> This is the second time this company has sought from the commission authority to depart from the basic 5-cent fare which, with inconsequential exceptions, has prevailed on its Los Angeles system for many years, and to enter upon the uncharted sea of multi-coin fares. . . .
>
> This company occupies the streets under franchises, most of which call for a 5-cent fare. While such fare provisions are subject to change by the state in the exercise of its police power, agreements of this character should not be brushed aside or ignored in the absence of clear and convincing evidence that adherence to them will work grave injustice to the company. Particularly is this so in view of the many advantages of the basic 5-cent street car fare as contrasted with serious objections both in respect to service and financial results that seem to be attendant upon a multi-coin fare structure.

In a footnote this commissioner indorses the conclusions of the commission's chief engineer and says:

> Mr. Mott, chief engineer of the commission, spent about six weeks in other sections of the country studying street railway conditions. Testifying here after pointing out the confusion flowing from multi-coin fares and basing his testimony upon his extensive study and investigation, he added:
>
> "Another feature that has impressed me is that in most cities that have departed from the single coin fare of 5 cents, subsequent revenues have continuously diminished to such a degree that results of operation ultimately have often been nearly as unsatisfactory on the higher fares as they were on the 5-cent fare. It may be that there is no logical stopping point between the 5-cent fare and the 10-cent fare."
>
> Later in his testimony, after referring to the experience of the Key System Transit Company in securing a much smaller increase in revenue than expected from an increase in fare from 6 cents to 7 cents, he stated:
>
> "With that situation in mind, together with the fact that in most of the Eastern cities where they have these multiple-coin fares the system is not a success financially, I could not help but conclude that there must be some inherent merit in the basic 5-cent fare."
>
> This testimony throws grave doubt upon the permanency of any increase in revenue due to horizontal increases in fare and as to the beneficial effect of any such increase upon the financial status of a street railway company.

This quotation makes it evident that it would be of greatest moment, at least to the California mass transportation systems, if an authentic study were available showing whether these deductions and conclusions are sound and based on fact, or whether they are wrong and based on surmise and insufficient or erroneous information. The writer is satisfied that the facts are altogether different and the conclusions unsound. If the facts were as stated and the reasoning were good there would be little or no hope for the mass transportation utilities. Fortunately, it can be demonstrated beyond doubt that the controlling things are the service and not the nickel fare; a reasonable, workable rate structure and not the presence or absence of the multi-coin rate. But the commissions do not and cannot know these facts unless they are properly and convincingly informed. And the information must come from the utilities themselves.

A study of court and commission decisions in other states show similar difficulties. Too much attention undoubtedly is given in rate cases to the theories of conflicting methods of valuation and depreciation, of obsolescence, going concern, development cost and similar moot questions. Too little time and thought is spent by the mass transportation utilities on the more acute and important realities of the manner and kind of price of our product and means and ways of how best to dispose of that product and to whom. These are the problems of rate structure and of selling. And it is very necessary that these controlling elements receive adequate attention in all rate cases.

Munich Becoming Active as an Electrification Center

LINES of the German State Railways in the southern part of that country are in particularly favorable position for electrical equipment because of the abundance of water power. One of the latest sections to be equipped electrically is that between Rosenheim, Bavaria, and Salzburg, Austria. This permits through electric operation between Munich and Salzburg, as the section between Munich and Rosenheim had already been equipped.

Bavaria now has under electric operation 440 miles of route with about 940 miles of track. Power is purchased from a large hydro-electric system. A 110-kv. transmission system, about 250 miles long, owned by the railroad, supplies power to four substations—in Pasing, Landshut, Murnau and Rosenheim. The combined transformer capacity is 50,000 kva. The present system requires somewhat over 100,000,000 kw.-hr. of energy annually. With completion of the generating plants that are supplying power the combined single-phase capacity of the system will be increased from 60,000 kw. to more than 80,000 kw., with a potential annual output of 250,000,000 kw.-hr.

In view of the form of contract it has made with the power system, the railway plans to extend electrification further on lines that warrant a fair return on the investment, in order to obtain the maximum benefit from the use of the power available. The first line contemplated for conversion is that between Munich and Stuttgart. This carries heavy passenger and freight traffic, and also is in competition with the parallel line through the Tyrol, Vorarlberg and Switzerland. The latter route already is operated electrically as far west as the French frontier at Basle.

It is understood that the western continuation of the German line beyond Stuttgart as far as Kehl, near Strassburg, will also be electrified, probably in connection with the electrification of other trunk lines in the states of Baden and Württemberg. Electric power will be supplied from hydro-electric plants in the Black Forest and a station projected on the Rhine River between Lake Constance and Basle. The German State Railways has recently acquired a partnership in this enterprise.

The German reports regarding the electrification projects lay great emphasis on the economies to be obtained. It is claimed that the annual fuel saving for the Bavarian electrification already installed amounts to 140,000 metric tons of coal per year. Coal is rather expensive, as the nearest mines are in northern Germany. The saving in locomotive and shop crews, due to electrification, is estimated at about 600 men. For most of the local service, one man is assigned to each locomotive, although the train conductor rides in the cab to be available in emergencies.

In addition to the electric locomotives in the Bavarian district, mentioned in a previous issue of this paper, a number of multiple-unit cars are coming into use. These are being used in suburban service, replacing trains formerly hauled by light electric locomotives. The usual make-up of the train includes a heavy motor car with a continuous rating of 500 hp., a trailer with complete control equipment, and two to four light-weight trailers between. The latter are of the same type as used formerly in steam service.

Chartered Bus Business Increasing at Louisville

By G. B. Powell,
Bus Manager Louisville Railway, Louisville, Ky.

ENCOURAGED by the fact that more than 31,000 miles of chartered bus business was done during 1927 by the Kentucky Carriers, Inc., bus subsidiary of the Louisville Railway, Louisville, Ky., the company has recently increased its equipment. Two specially built de luxe parlor car buses have been purchased to take care

Comfortable seats, full headroom, parcel racks and carpeted floor are features of the interior of the new buses

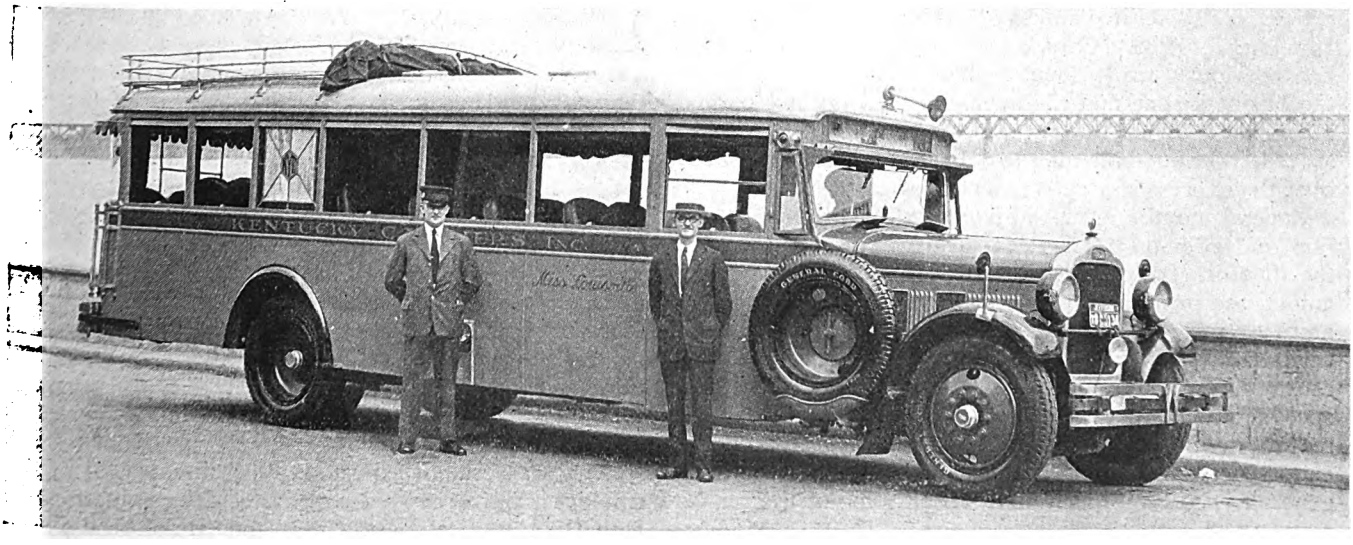
of the expanding volume of business of this character. The buses are of the White model 54 type, and are equipped with engines developing in excess of 100 hp. The bodies were especially designed for this particular job and were built by the Bender Body Company of Cleveland, Ohio. Many features making for passenger comfort and convenience have been incorporated in the construction, such as 76-in. headroom, 16-in. aisles, double-spring and air-cushioned seats, specially shaped seat backs upholstered in leather, carpeted floors, lavatory, ice water fountain, baggage compartment, parcel racks over the passenger's heads, with an additional compartment over the rear wheel housing for heavy baggage, and electric fans. Seats are provided for 26 passengers but on short trips the number can be increased by means of folding seats to accommodate a total of 30.

The company is now operating one-day excursions each Sunday and holiday to local points of interest within a radius of 100 miles. During the summer months eight-day vacation tours are operated to such distant points as Washington, D. C., Green Bay, Wis., Asheville and Chattanooga. It is also planned to operate an extensive southern tour every two weeks during the coming winter. The buses are available for charter for special trips at any time when not otherwise engaged.

Detroit Extends Its High-Speed Express Service

WITH the inauguration of an express railway line on Grand River Avenue the City of Detroit Department of Street Railways has taken another step in its plan for providing high-speed transportation on its streets. Effective Sunday, Aug. 19, 1928, this plan, the value of which had been so effectively demonstrated on Jefferson Avenue during the past year, has been extended to another section of the city. Street cars now run express on Grand River Avenue between Henry Street and Joy Road, a distance of approximately 4 miles, with only eight stops, local passengers between these points being served by a newly-established bus line. The cars run local from the center of the city to Henry Street, a distance of 1 mile, and from Joy Road westerly to the end of the line, the safety zone stops in these sections being about three blocks apart. Canvas canopies shelter waiting passengers at the express stations, which are located at Henry Street, Temple, Trumbull, Buchanan, Fourteenth, Warren, McGraw Avenues, Grand Boulevard, Quincy Avenue and Joy Road. These shelters are similar to those on Jefferson Avenue, which were illustrated in this paper, issue of Jan. 7.

Under the new schedule on Grand River Avenue the passengers may now ride in a street car from Joy



One of two de luxe buses recently added to the fleet operated by the Kentucky Carriers, Inc., at Louisville

Digitized by Google

Road to the City Hall, approximately 5 miles, in nineteen minutes. The actual running time over this section prior to starting the express line was 27 minutes. All Grand River line patrons west of Joy Road receive the full benefit of this cut in running time and patrons who board the local buses at stops between express stations are being urged to transfer to the cars at the nearest station in order to avail themselves of the time-saving feature. The faster running time makes possible a saving of four cars in the base and ten on the peak schedule.

The new service is to be effective on week days only from 5:30 a.m. to 9 p.m., the cars being run local all the way at other times, including Sundays and holidays. Signs giving the periods of express and local service are placed at all safety zones along Grand River Avenue at which the cars do not stop during the express service period. These signs advise passengers to board the transfer buses at the curb.

Express Cars Automatically Get Right of Way

With the co-operation of the traffic division of the Detroit police department arrangements have been made for the installation of contactors on the trolley wire governing the control of the automatic traffic signal lights which are located at various points along the route of the express cars. By means of this device the express car, upon approaching the traffic light, automatically throws the signal in its favor. The contactor is installed far enough away from the crossing to change by the time the car has reached the intersection at its normal speed. The lapse of time also eliminates any hazard that might exist if the signal were to be changed suddenly without allowing time for vehicles to clear the crossing. A contactor on the opposite side of the intersection causes the light to be returned to its regular automatic control when the car passes beneath it.

The auxiliary local bus line between Henry Street and Joy Road is equipped with 15 buses of 29-passenger capacity. These buses have been completely overhauled and are painted in ivory and green, the new standard color scheme for buses adopted in Detroit. By using 29-passenger buses, instead of the 21-passenger buses which are used as auxiliaries on the Jefferson Avenue line, the principal objection to the use of transfer buses, that of overcrowding, has been removed.

Express operation was first inaugurated in Detroit on the Jefferson Avenue line on Sept. 28, 1927. An article on this service appeared in the issue of this paper for Jan. 7, 1928. Cars on the Jefferson Avenue line had previously made about six stops to the mile outside the business zone and the average speed did not exceed 12 m.p.h. Under the express arrangement stops were spaced from one-half mile to 1.16 miles apart, and speed over the express section was increased to 18 m.p.h.

Several months after the inauguration of the express line on Jefferson Avenue the traffic survey bureau of the Detroit Police Department conducted an inquiry among the owners of private automobiles and the operators of motor trucks who were in the habit of using this street, with the view of determining their opinions as to the practical benefit of the new arrangement in speeding up traffic and relieving congestion. The great majority of those who replied to the questionnaire endorsed the new plan and were agreed that conditions generally had been much improved. Some of the replies were quoted by the JOURNAL in the issue of March 3, page 358.

L.G.O. Controls More Than 5,000 Buses

SOME interesting figures on London bus traffic were elicited at a recent hearing in London before a joint commission of Parliament to consider railway bills. They include statistics of the associated companies of the London General Omnibus Company, as well as the L.G.O.

It is well known that during the past two or three years the interests connected with the London General Omnibus Company have obtained control of a number of other omnibus companies operating for the most part within the London County area. The capital issued and outstanding of all of these companies, but apportioned only where a part of the company has been taken over by the underground group, is £9,076,445; additional expenditures not yet represented by issued capital, £1,947,989; total £11,024,434.

Equipment taken over in the merger includes garages in occupation or under construction, 73; garage capacity in omnibuses, 5,467; number of omnibuses owned and operated, 5,226; number of road-miles covered within the London traffic area, 1,459; outside of that area, 232; total 1,691 miles.

Number of routes or sections of routes worked, 512; number of bus-miles run in 1927 (not including two companies recently acquired), 195,734,163; number of passengers carried in 1927 (not including the two companies already mentioned) 1,698,940,235.

Frank Pick, managing director of the Underground group, which controls the L.G.O., said that in 1927 about 30 per cent of the bus routes operated paid no profit over operating expenses and depreciation. On these routes 190,000,000 passengers were carried, or about 11 per cent of the total number of passengers. Nevertheless, as a whole the business was profitable and the company paid last year a return of 7 per cent on its capital.

Most of the traffic carried by the buses was short-distance service—that is to say, 57 per cent of it was for 1 mile or less where the fare was only 1d. (2 cents). The average fare paid on the omnibus was 1.18 pence. Since 1917 omnibus traffic has increased 148 per cent, subway traffic 24 per cent and tramway traffic 25 per cent.

First Aid Saves Lives in Chicago

LIVES of eight persons have been saved by employees of the Chicago Rapid Transit Company, Chicago, Ill., as a result of the first-aid training under the supervision of the medical department, according to figures just given out by Dr. Hart E. Fisher, chief surgeon. Five of the persons saved were in no way connected with the organization, and their lives were saved at places removed from company property. Nine "L" employees have been awarded medals in connection with the saving of these lives, two being honored in one case. Their exploits include resuscitation from drowning, electrical shock and other accidents. In addition, 24 other Rapid Transit employees have received medals for outstanding demonstrations of ability to meet emergencies.

A total of 2,277 Rapid Transit employees have completed the first-aid training course since this organized activity was established on the "L" lines. All of these employees have received certificates of graduation from both the American Red Cross and the Chicago Rapid Transit management.

Making Modernization the Goal

Many improvements can be made to existing rolling stock to increase patronage and so eventually to obtain revenue needed for the purchase of new equipment

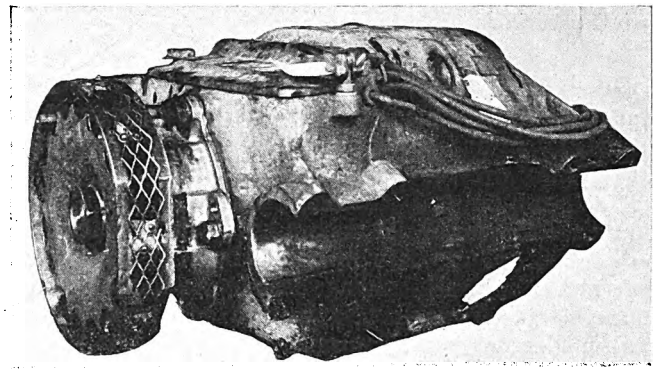
By A. B. Gibson
Traction Apparatus Section Head
Westinghouse Electric & Manufacturing Company

WE IN the electric railway industry are today engaged in an extensive program of modernization. The public is demanding that transportation facilities keep pace with the general advance of society in the perfection and use of those conveniences which make living easier, more rapid and more luxurious. A period of unprecedented social prosperity is here.

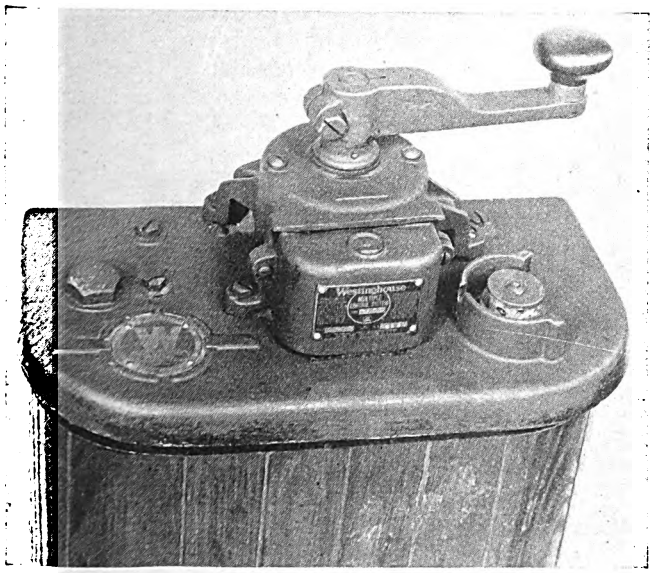
The electric railway is affected perhaps more than almost any other branch of transportation, as the public comes into contact with the street car most frequently. The rapid development of motor buses, with their modern appearance, flexibility of service and easy riding qualities, combined with the general demand for something new, has made it desirable and necessary that the electric railways include them in their service. The private automobile, with its appeal of luxury, individuality and speed has come into such common use in our large cities and suburban communities as a form of daily transportation that it is now perhaps the greatest competitor of the electric street car.

To help in meeting this growing competition the electric railway industry has turned to the builders of cars and car equipment for a street car which incorporates most of the advantages of the private automobile and motor bus but which, at the same time, retains the fundamental advantages of the street car for mass transportation. The street car presents no parking problems and renders a service the reliability of which has been hard to equal either by bus or private automobile.

The manufacturer has met this demand by numerous new cars having deep, comfortable upholstered seats, wide-vision windows, streamline bodies, smoothly running trucks, and luxurious, well-illuminated interiors. New types of motor drive have been developed incorporating double-reduction gears running in oil and the worm-auto type of drive. New high-speed motors for these new drives have been designed, anti-friction bearings have been employed, and improvements have been made in the design of electric control apparatus. These new developments make possible more rapid acceleration, and higher speed service along with the luxury and comfort demanded by the American public. These combined new designs have made it possible for the street car again to compete for a larger share of our city and suburban transportation patronage.



External fans have been developed to provide ventilation for types of motors originally without it. The illustration shows a Type 306-CA motor with external fan



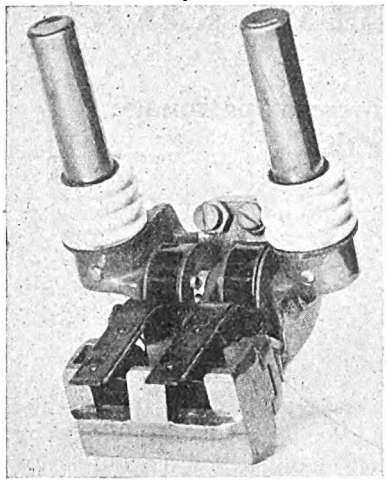
The TA handle switch when placed on K controllers using a line switch reduces burning of fingers and segments

The next problem before the industry is to obtain the necessary capital to purchase new cars and make possible the retirement of those now in service. In some places the money is available for such a program. Fortunate are those who are in such a position, because the new modern car is, without question, the best avenue to increased revenue and decreased operation and maintenance costs.

But what are those to do who have not the necessary capital for such a step? This is the question which confronts a large number of operators at the present time. To these the possibilities of modernization of the equipment already in service offer the first and best alternative. The progressive manufacturer has not been blind to this necessity, and numerous avenues have been opened for incorporating in the equipment now in service many of the advantages of the most modern design.

Cars can be redecorated and repainted, new and more comfortable seats can be installed, the lighting can be improved and numerous other improvements can be made

Digitized by Google



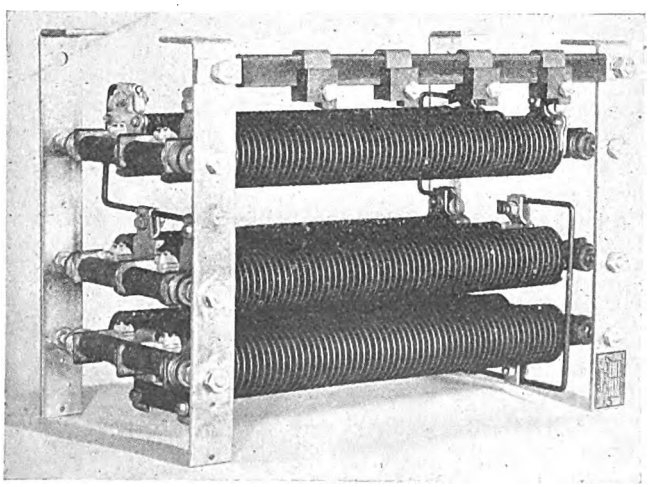
Scrapping the entire brush-holder when the box is worn out is unnecessary with this detachable box type brushholder

to the electrical equipment which permit higher speeds and lower operating and maintenance costs. External fans have been designed for the non-ventilated types of motors which make possible from 36 to 50 per cent increase in capacity. Newly designed square wire armature coils to replace the round wire coils have made from 10 to 12 per cent increase in capacity on either ventilated or non-ventilated motors. Installations of these have made possible marked improvements in acceleration and speed of old cars. Change in gear ratio to meet present conditions also is helpful.

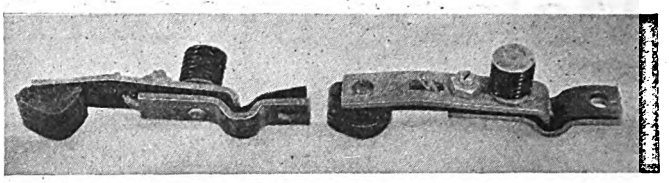
The development of oil-sealed lubrication of armature and axle bearings for old motors has made it possible to show a marked decrease in cost. Improvements have been made in brush-holding design incorporating the detachable box brush-holder feature and twin washer brush-holder finger mechanism.

The adoption of dual ventilation to certain ventilated motors in service has resulted in marked reduction of commutator and brush wear and has shown improved commutation. The greater part of the improvements made in recent years in the construction of unit switch control have been so designed that they can be incorporated in the old equipment at a moderate expense. New contact fingers have been developed for use in drum controllers which result in longer life and improved operation.

All these and many other improvements are possible on the old car equipments now in operation. The regular overhaul period for cars affords the best opportunity for incorporating them in old cars. By such a program the progressive operator may obtain a large part of the advantages of new designs. Those who are following out such a program have noted marked results toward again securing the patronage of the public such as they enjoyed a few years ago.



The Type M resistor, as used in railway service, only weighs a third as much as the corresponding grid resistor and the units are less liable to break



The compensating controller finger insures maximum contact at all times and compensates for worn, burned and irregular drum segments

Modernization is the goal of the electric railway industry today. It is needed if the industry is to retain its present patronage and to win back much of that patronage which has been lost during recent years. This can be accomplished most effectively by taking advantage of all the opportunities for improving service which are afforded and which can be accomplished by rehabilitation.

Reason for Surface Car Trains in Europe

KÖLN, GERMANY, Aug. 23, 1928.

To the Editor:

American managers may not understand the reason in some large European cities for the large number of center-entrance cars, necessitating two-man operation. In the smaller towns one-man cars have been quite common, some having been in use since before the war. But with our narrow streets, long cars are not practicable, so that a great deal of the traffic is hauled in the larger cities by two-car and three-car trains, and in suburban service by four-car trains. On these trains the average number of men per car is not two but $1\frac{1}{2}$, $1\frac{1}{3}$ and $1\frac{1}{4}$.

There is also another good reason for not using more one-man cars in large cities. Our stops are much farther apart than in America and average only from 4 to $5\frac{1}{2}$ per mile. That means that more people board cars at each stop, and with one-man operation, too much time would be taken at the stops if passengers had to pay their fares to the operator while boarding. With center entrances, also, lower steps are possible.

For suburban service center-entrance cars have the additional advantage that the front end can be separated from the rest of the car by a bulkhead. This permits the reservation of space, or a compartment if desired, not only for the motorman but for luggage, including market baskets.

The reader may be interested in the following figures on the number of passengers hauled in Köln recently at a large assemblage of gymnasts. About 350,000 attended from all parts of Germany, America and other countries. On Sunday, July 29, the principal day, the Köln Street Railway System handled from noon, in one direction to the stadium, on one track of a double-track line, 221,000 passengers with three-car trains. From 1:30 to 5 p.m. 150 trains of this length were run per hour in each direction, carrying 33,000 passengers per hour. In the evening, after the exhibition, the same crowd had to be taken back. Compared with this number, it is estimated that 17,000 people traveled in 5,664 automobiles.

F. J. Martin Wins August Maintenance Prize

The judges in *Electric Railway Journal's* Maintenance Contest award the monthly prize for August to F. J. Martin, superintendent of maintenance for the Pittsburgh Railways, Pittsburgh, Pa., for his description of the combination air compressor and street crane used by that company in track construction work

ONE of the handiest pieces of maintenance equipment used by the Pittsburgh Railways is a machine which can travel under its own power, lift heavy pieces of trackwork, and supply compressed air for the operation of compressed air tools used in track construction work. This unit has rubber-tired wheels and can travel at a speed of 20 m.p.h. It carries a 7 ft. crane, having a pneumatic hoist, and can lift 2½ tons. It provides an effective and safe means for moving trackwork and lifting rail into and out of the track area.

The machine is equipped with a compressor which has a capacity of 110 cu.ft., and can supply air for operating two of the latest-type concrete breakers. With this piece of equipment the work is done more economically and quickly than before. Track gangs are able to move to various locations, start and complete two or more minor repair jobs in a nine-hour day with less men that they used formerly.

This equipment was described by F. J. Martin, superintendent of maintenance for the Pittsburgh Railways, and entered in ELECTRIC RAILWAY JOURNAL'S maintenance contest. It provides a handy labor-saving tool for trackwork that has resulted in real economy for the company.

MORE NEW IDEAS WANTED

While this is the last of the monthly prizes to be awarded it is to be hoped that the practice of sending in maintenance items for publication will continue. The contest has brought to light many short cuts in maintenance practices which are very ingenious and new to most of the industry. There still are many other good methods that have not been sent in, and about which little is known. That a great wealth of ideas in practical maintenance for reducing costs and labor exists in the industry has been brought out by the maintenance contest. It has also served to show the need for interchanging practices with other properties throughout the country.

In the contest a total of nineteen prizes totaling $750 have been awarded. These were given to men connected with railways in all parts of the United States and Canada. Three men received two prizes. They were A. Taurman, Birmingham, Ala.; James A. Duffy, Fairmont, W. Va.; and Charles Herms, San Diego, Cal. The number of items sent in concerning shop practices was much greater than for other departments. Maintenance of overhead lines, tracks and buses offer a fertile field for more material of this character. The JOURNAL will continue to pay $5 each for maintenance ideas submitted and accepted for publication. If department heads will discuss this with their various maintenance foremen, several ingenious methods and devices undoubtedly can be uncovered.

The sending in of this material does not entail a great amount of labor. A photograph can be taken or a rough sketch made illustrating the construction and operation of the device or method of carrying out an unusual maintenance practice. Instead of considering the description as an article, a letter can be written telling about this. This can be in long-hand where a typist is not handy. Sketches may be in pencil or blueprints may be submitted, if drawings have already meen made. Sketches do not need to be finished drawings, but only sufficiently complete so that they will illustrate clearly the construction or operation of the device. The material should be mailed to ELECTRIC RAILWAY JOURNAL, 10th Avenue and 36th Street, New York City. Just send in a clear description of your method or device and the JOURNAL editors will do the rest.

F. J. Martin

THE electric railway experience of F. J. Martin, superintendent of maintenance Pittsburgh Railways, who was awarded the monthly maintenance prize for August, has all been with that company. He was born in Pittsburgh and while attending grade school entered the service of the Pittsburgh Railways during his vacation period, in 1909. After leaving high school in 1916 he became night receiver for the transportation department, and served in that capacity until the late war. After returning from service he was made dispatcher, holding the position until 1919, and then was transferred to assistant division superintendent and was promoted to be supervisor in 1920. During this time he took a four-year course in electrical engineering, and in 1926 was promoted to the position of superintendent of maintenance, which position he now holds.

Maintenance Methods and Devices

Simple Construction for Pit Wheel Grinder*

By John Gerson
Assistant Engineer South Carolina Power Company, Charleston, S. C.

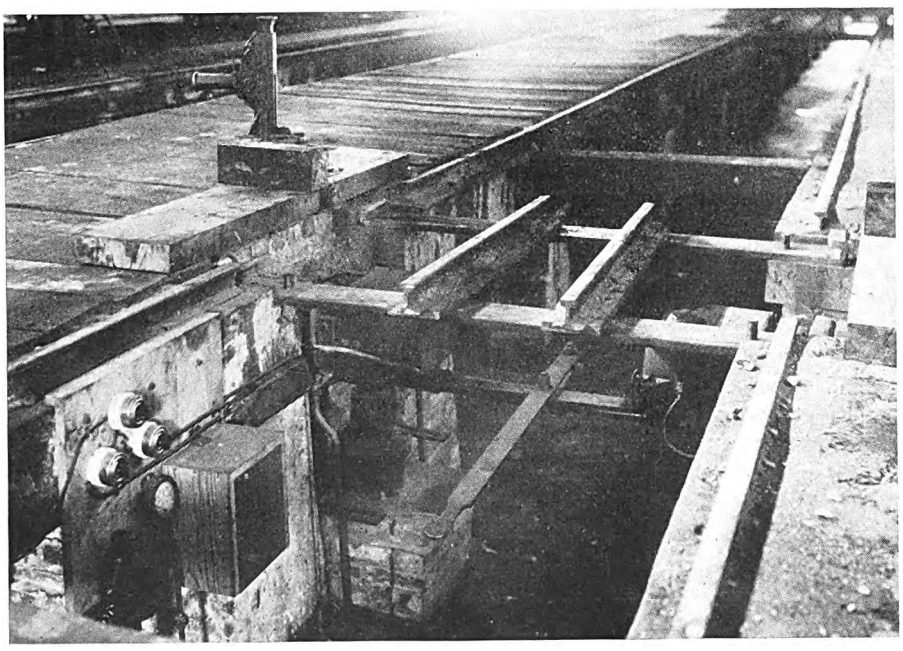
SMALL electric railway properties usually have a definite limit to the expenditure that can be made for shop equipment. One of these was the South Carolina Power Company, and in order to eliminate flat wheels a pit wheel grinder was constructed at low cost by using parts which were already on hand.

Two brake cylinders were set in brick foundations. The pistons of these were connected by a fixed beam. On top of this was a movable beam, and on each end of the latter was mounted a small compressor motor. Grade Q emery wheels, 16x1 in., grain 20, are mounted on the compressor motor shaft to do the grinding.

The grinding wheels, together with the motors, are raised and lowered by the brake cylinders. Air pressure for these is controlled through a motorman's standard brake valve, which is mounted on a board in the pit. This board also contains a circuit breaker and switches for controlling the compressor motors. A special trolley wire above the track has in series a high resistance to limit car wheel driving speeds. To provide sidewise movement of the grinding wheels the movable beam slides on the lower one. Movement is produced by a lever mounted on the fixed beam and secured to the movable one. The beams are curved to such a radius as will give a taper of 1 in 20 to the surfaces of the car wheels, dressed by the grinding wheels.

The cost of the grinder was $112, and it saves $2.65 per pair of wheels over the old method of ginding previously used by this property. A 2-in. flat spot is ground out in about fifteen minutes, and an additional fifteen minutes is required for jacking. The cost of grinding a pair of wheels, including labor and material, averages $1.35.

Submitted in Electric Railway Journal Price Contest.

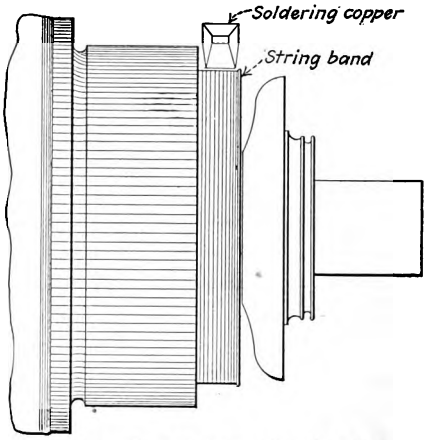


Pit grinder used in the shops of the South Carolina Power Company

Polished Surface for String Bands Reduces Flashing*

By Charles Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

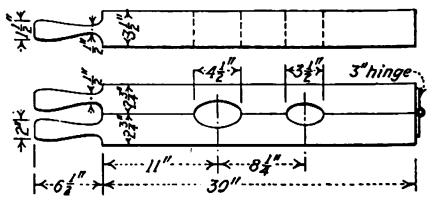
STRING band failures have been eliminated on armatures of the San Diego Electric Railway, San Diego, Cal., since an improved method of insulating these was adopted in 1925. The V-ring at the end of the commutator is given a coat of orange shellac and then the band is applied as usual. The band is then given four heavy coats of orange shellac, each coat being ironed in with a hot soldering iron. This gives a smooth surface to the band, and the naturally fluffy texture of the string is changed so it becomes a homogeneous mass and will not unravel. Bands are given from three to four coats of dipping varnish as they go to the baking oven for drying after being dipped. After coming out of the oven the band has a high polish, and carbon dust and dirt will not adhere to it. The various coatings form an excellent insulation which is quite flexible and durable, so that it will withstand severe temperatures.



Method of applying string band to armature

Axle Polishing Tool

BEARING fits on axles were polished originally in the Tompkinsville shop of the Richmond Railways, Inc., Staten Island, N. Y., by hand with fine emery cloth while the axle was turning in the lathe. This was slow and tedious. The tool shown in the accompanying sketch was designed to improve this method. It consists of two pieces of white



This simple clamp has afforded a means for decreasing the time for polishing bearing fits

Digitized by Google

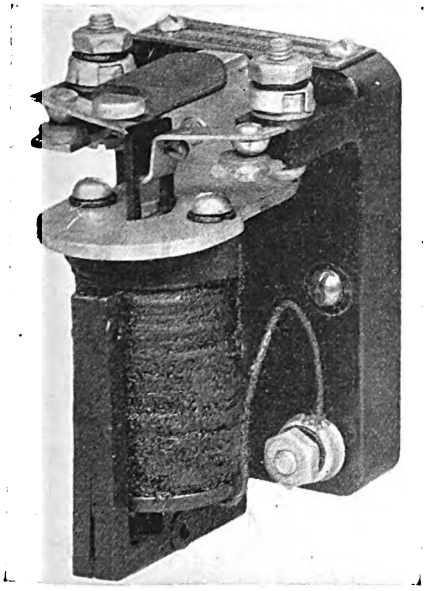
wood, 30 in. long, 3½ in. wide and 2¾ in. thick. They are hinged at one end and have suitable handles at the other. These blocks are bored with half holes of diameters such that when clamped together they approximate the various axle fits. The vertical diameter is made slightly less than the horizontal diameter in order to provide for rigid clamping.

The emery paper is placed around the circumference of these holes and is clamped over the axle fits, while the axle is revolved in the lathe.

New Equipment Available

Relay Warns When Power Fails

FOR use where a small inexpensive device is needed to actuate a warning signal a relay has been announced by the General Electric Company, Schenectady, N. Y. It acts



New undervoltage relay

when power fails or voltage drops on an important circuit. The device has been given the number CR-2904-F-1.

In operation, the coil circuit of the relay is connected across the two legs of the power supply which it is desired to watch. When the coil is thus energized, the relay contacts are held in an open position. By connecting a circuit through the contacts to a bell, horn, light or other signaling device, warning will be given when power fails or voltage drops, as in that event the coil will be de-energized, the contacts will close and the circuit to the warning signal will be completed. The relay can be used on either direct or alternating current.

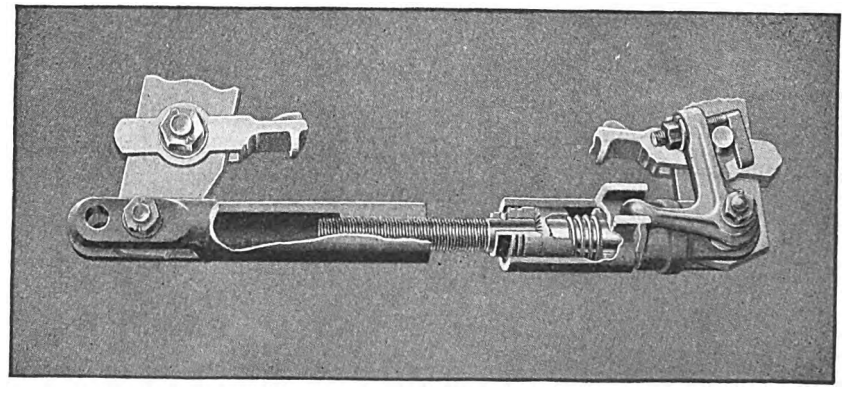
The relay is of the solenoid type, having a laminated armature of three sections, the central leg of which is fastened to a bakelite operating arm which raises and lowers the contact tips. The entire device is mounted on a molded compound base, 1⅞ in. wide and 2½ in. high, and is packed in a small cardboard carton together with a small, enameled tube resister, the rating of which varies according to the voltage and frequency of the application. The relay can also be supplied for panel mounting.

When used as a voltage drop warning device, adjustment to the proper operating voltages is made by means of an adjustable brass screw protruding into the air gap, over the outside leg of the armature. Thus a very fine adjustment of pick-up and drop-out may be obtained. In actual tests, the relay was made to drop out at 106 volts, after picking up at 112 volts, or at 95 per cent of the pick-up voltage. This ratio is held over a considerable range.

A typical application of the relay is on storage battery charging outfits. When the battery falls below the critical voltage, the relay places it on charge or increases the charging rate, and disconnects it when the voltage has come back to its full value.

Improvements in Slack Adjuster

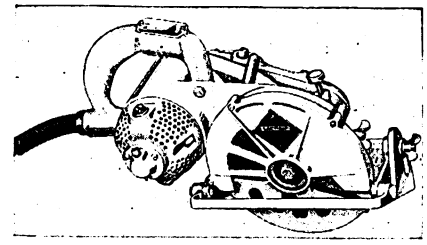
RECENTLY the mechanical slack adjuster manufactured by the J. G. Brill Company, Philadelphia, Pa., has been redesigned to facilitate the installation of new brakeshoes, eliminate a large amount of labor, and obviate the necessity of removing bolts or pins for reinstalling shoes. When new shoes are to be installed it is unnecessary to disconnect the opposite end of the brake rod in order to shorten it. The ratchet housing and the accompanying ratchet of the slack adjuster are moved back against the spring which holds the two ratchets together, so that the teeth are disengaged. Then the brake rod can be shortened by using a wrench on the hexagonal section. The ratchet feature results in more positive action and eliminates the chance of slippage.



Improved type of mechanical slack adjuster

Small Electric Hand Saw

CUTTING capacity of 2 in. is obtained with a small electric hand saw, a late addition to the Alta line of portable electric tools manufactured by the Wappat Gear Works, Inc., Pittsburgh, Pa. A noteworthy feature is the safety guards. The



New small electric hand saw

lower guard encloses the saw blade completely. It opens gradually by telescoping into the upper guard as the saw is pushed into the material, and snaps shut immediately as the cut is finished, thus affording protection to the workman and to the saw blade.

The new saw is built in three models, one for plain square cutting, a second for bevel cutting, and the third with adjustable dado cutter for grooving. On all three models the shoe is adjustable vertically, making it possible to set the saw to cut any required depth. The saw cuts all

Digitized by Google

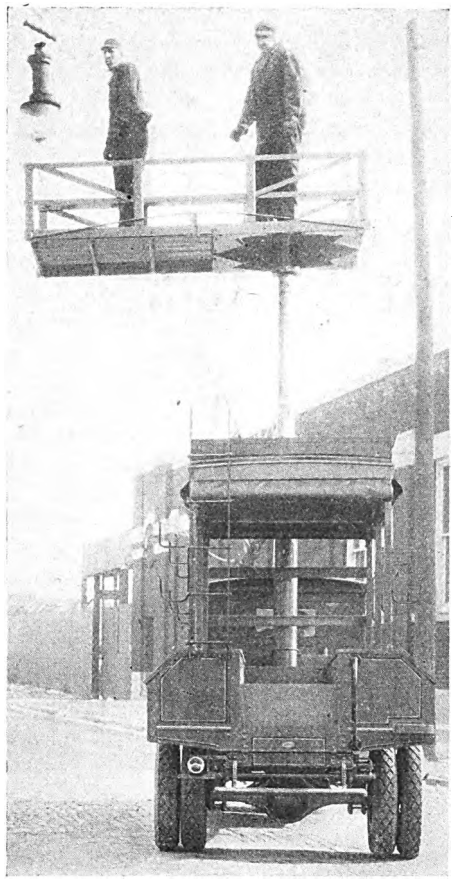
kinds of wood, metal, bakelite, fiber, and similar materials.

A high-speed universal ball-bearing motor, fan cooled, furnishes the power and shoots a blast of air to the front of the saw, thus clearing the sawdust away and making it possible to follow a line accurately. The saw shaft, mounted on tapered roller bearings, is driven by helical gears also mounted on ball bearings, all completely inclosed and running in grease. A double-pole, non-arc switch is mounted in the handle within easy reach of the operator's forefinger. The frame is all aluminum, highly polished, and all exposed steel parts are rust-proofed. Various parts are made of heat-treated aluminum alloy to retain lightness and obtain maximum strength.

Hydraulic Repair Tower

LIGHT in weight and compact in construction, a fast-operating hydraulic repair tower is announced by the Wood Hydraulic Hoist & Body Company, Detroit, Mich. It is designed for mounting on truck chassis having a capacity of 2 tons or more, and weighs approximately 1,200 lb. The principle involved is the same as in the hydraulic-operated dump trucks manufactured by the company, and all pumps and power take-off parts are interchangeable.

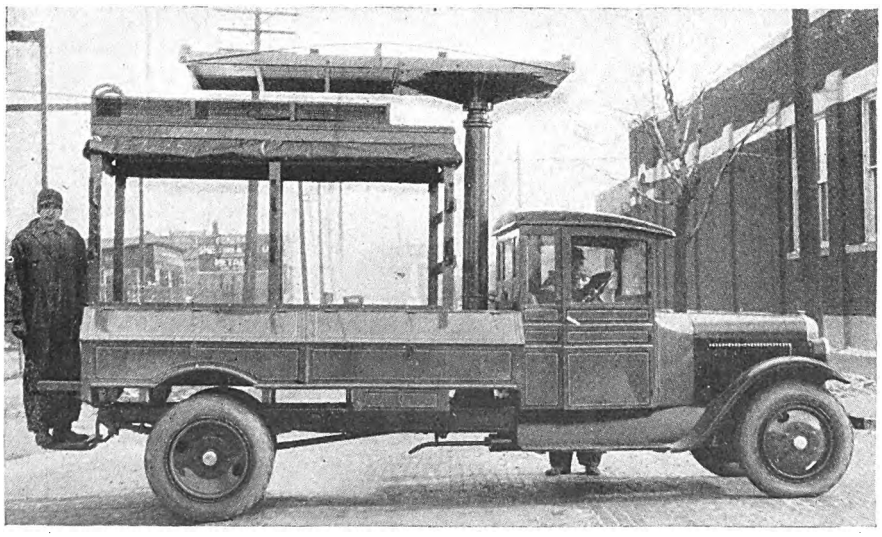
A 7-in. hydraulic cylinder with 5-in. hollow piston is used for the raising and lowering of the platform. This has a gear-driven pump, power take-off, oil reservoir piping and control valves. A wooden swivel working platform, 9x4 ft., with steel brace rods and hinged double-guard rails, is provided. It is insulated heavily between platform and platform base-



Front view with tower raised

plate. The platform may be locked securely in any position desired, and it is at all times rigid and level whether extended at right angles to the chassis or in fore or aft position.

Lowered in carrying position, the top of the platform is 11 ft. 6 in. from the ground. This varies slightly according to the height of the chassis frame. Fully elevated, it is 16 ft. 11 in. from the ground. Full elevation is obtained in about 40 seconds. On a tower truck supplied to the Twin City Rapid Transit Company, St. Paul, Minn., a collapsible ladder reaching from the top of the cab to the platform has been installed. This elevates and lowers with the tower. It permits workmen to climb up and down for tools or parts needed without lowering the platform.

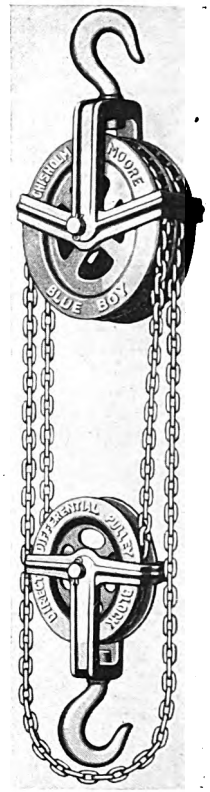


Side view of tower truck

Differential Chain Hoist

"BLUEBOY" is the trade name under which a new direct differential chain hoist is being marketed by the Chisholm-Moore Hoist Corporation, Cleveland, Ohio. The hoist is designed for extra heavy load. Sheaves, malleable iron yokes and drop forged hook are painted blue.

It is equipped with Hercules Inswell electric welded load chain. The chain is copper plated, which gives the hoist a particularly attractive appearance.



Direct differential hoist

Hinged-Type Finger for Railway Controllers

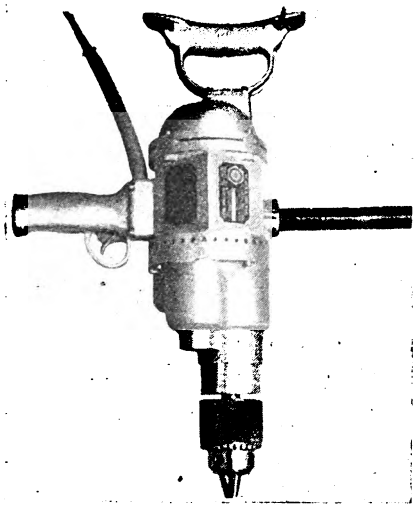
HINGED fingers of an improved type for railway controllers have been brought out by the General Electric Company. By employing a smaller radius on the contact tip support they have been made self-aligning, and at the same time the clearance between the contact tip support and the housing has been reduced so as to minimize the up-and-down movement of the tip on the segment.

The main arm is punched from bar steel, and will not bend or buckle. The tip, carried on the main arm, is designed for quick and easy removal since the finger proper will outwear many tips. The heel or hinged end of the arm seats and rocks on a steel plate, the joint being sufficiently narrow to permit alignment of the tip with the segment. This feature insures full-width contact and reduces heating and burning of both tip and segment.

Digitized by Google

Heavy Duty Electric Drill

ANNOUNCEMENT of a ¾-in. heavy-duty portable electric drill is made by Black & Decker, Towson, Md. It is designed to meet the need for a powerful drill of this capacity to take straight shank drill bits. The drill has an exceptionally powerful universal motor, operating on direct or alternating current. The armature



Portable electric drill

and spindle thrust are mounted on ball bearings.

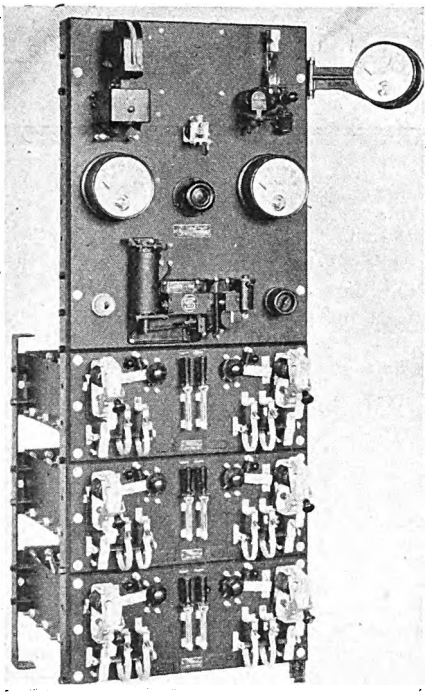
There is a three-jaw geared chuck, and the drill will work successfully in the toughest steel.

Panel for Charging Six Vehicle Batteries

SIX vehicle batteries, each of the 42-cell, 13-plate type can be charged through a new control panel announced by the General Electric Company, Schenectady, N. Y. The panel is for use in conjunction with a motor-generator set consisting of a 27-kw., 110-volt generator driven by a 40-hp., 550-volt, three-phase, 60-cycle motor.

In conjunction with a magnetic starter for the motor, the panel gives overload protection for the generator, restarting of the set and resumption of charging after line failure and full automatic shut-down after completion of the charging of the batteries.

On the generator section of the panel are mounted a snap switch for controlling the magnetic starting switch; a tumbler switch for full-automatic shut-down; a field rheostat; a voltage regulator; an overload and shunt-trip circuit breaker with a circuit opening auxiliary switch; auxiliary and line contactors, an ammeter and a voltmeter. The auxiliary contactor controlling the line contactor is adjusted to pick up at a proper voltage to insure charging. Its coil is connected through an interlock on the motor starting switch, thereby preventing the set from being driven from the batteries should the line voltage fail. An ammeter on a swinging bracket indicates the charging current delivered to the various batteries. Their charging voltages are indicated by a voltmeter which is mounted on the generator section of the panel.



Battery charging control panel with voltage regulator

The charging sections of the panel incorporate double-pole battery contactors equipped with a shunt-holding coil and which operate with ampere-hour meters having quick break contacts. On completion of the charge, the contact breaking device opens, de-energizing and opening the contactor and disconnecting the battery from the charging set.

When the last battery has been shut down a series of interlocks and switches shut down the set.

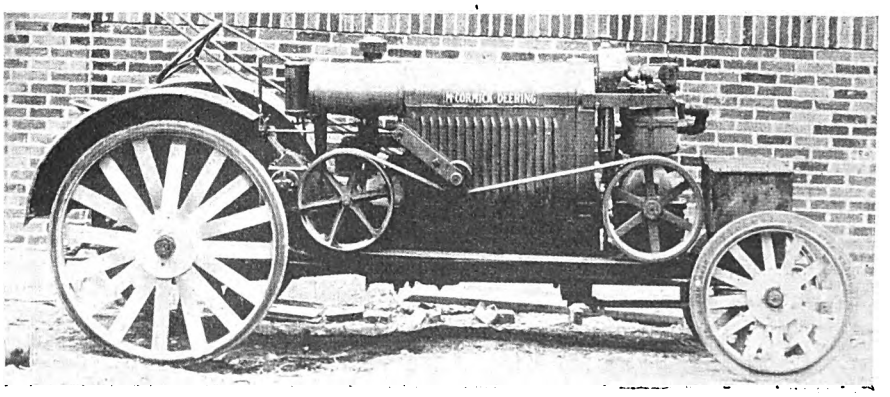
Each charging circuit also includes an ammeter-voltmeter switch for reading charging current and voltage; a single-pole, single-throw lever switch for boosting the charge; a pilot light to indicate when a battery is plugged to the panel, and a fuse for short-circuit protection.

The panel is of unit-section construction. Each section, with its resistor supports, is a unit which is secured to the skeleton framework by means of four corner capscrews at the front and four bolts at the rear. Removal of a section is accordingly simple.

Tractor Type Compressor

HEAVY loads can be hauled behind a self-propelled four-wheeled air compressor now being manufactured by the Pontiac Tractor Company, Pontiac, Mich. The compressor is a Quincy type W-4 of 124 cu.ft. displacement. It has a separate radiator with pump-driven circulation. This keeps the temperature of the air coming from the compressor from 60 to 70 deg. below the temperature of compressors which are cooled from the motive power radiator. The compressor has a three-bearing crankshaft with forced feed lubrication. This unit is controlled by a Penn unloader with a hand unloader attachment. The compressor with the air tank and tool box are mounted on a frame which attaches to either the McCormick-Deering or Fordson tractors.

The tractor drives the compressor through a power take-off pulley which has a clutch allowing it to be thrown into or out of gear at will. The forward drive of the belt brings the belt tightener into correct relation with the belt.



Self-propelled four-wheeled air compressor

Association Activities

National Safety Council to Meet in New York City

ELECTRIC railway executives who are members of the National Safety Council will find much of interest in the program which has been arranged for the Electric Railway Section of that organization when it holds its seventeenth annual convention in New York City Oct. 1-5, 1928. Meetings and luncheons of this section will be held at the Hotel Waldorf-Astoria and will be participated in by men prominently identified with the safety movement.

The tentative program of the Electric Railway Section is as follows:

MONDAY, OCT. 3, AT 2 P.M.

Grand Ball Room, First Floor

Joint public safety session.

Representatives of Electric Railway Section assisted in arranging this general program which will be of interest to all electric railway men.

TUESDAY, OCT. 2, AT 9:30 A.M.

Main Room, on the Roof

Noteworthy accomplishments of the section during the past year. A. W. Koehler, chairman.

"Promotion of Accident Prevention through Inter-Departmental Co-operation," by John J. Reynolds, claims attorney Boston Elevated Railway, Boston, Mass., representing American Electric Railway Claims Association.

Discussion.

"Overcoming Transportation Hazards," by D. L. Fennell, general superintendent of transportation Kansas City Public Service Company, Kansas City, Mo.

Discussion.

"One-Man Car Operation from a Safety Standpoint," by D. A. Scanlon, general superintendent of railways Northern Ohio Power & Light Company, Akron, Ohio.

Discussion.

"Bus Operation from a Railwayman's Point of View." Speaker to be selected.

Discussion.

WEDNESDAY, OCT. 3, AT 9 A.M.

Main Room, on the Roof

"Reconciling Increased Speed with Safety," by Lucius S. Storrs, managing director American Electric Railway Association, New York.

Discussion.

"The Shop Employees' Contribution to a Safe Railway," by Henry Cordell, master mechanic Chicago, North Shore and Milwaukee Railroad, Highwood, Ill.

Discussion.

Election of officers.

WEDNESDAY, OCT. 3, AT 12:30 P.M.

Pennsylvania Hotel

Joint luncheon of Electric Railway and Public Utilities Sections.

THURSDAY, OCT. 4, AT 9:30 A.M.

Waldorf-Astoria

Safety play entitled, "Whose Fault?" Produced and presented by Public Service Corporation of New Jersey, Newark, N. J. Courtesy, A. J. Van Brunt, director safety education.

General round-table discussion.

Officers of the Electric Railway Section of the National Safety Council are as follows:

Chairman, A. W. Koehler, superintendent of accident prevention the Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

First Vice-Chairman, H. K. Bennett, safety manager United Electric Railways, Providence, R. I.

Second Vice-Chairman, E. K. Eastham, safety director United Railways of St. Louis, St. Louis, Mo.

Third Vice-Chairman, Melvin W. Bridges, safety engineer Chicago Rapid Transit Company, Chicago, Ill.

Secretary, J. E. Stott, safety engineer Georgia Power Company, Atlanta, Ga.

Of interest to electric railway men should be the proceedings of other sections of the National Council, which are to be held concurrently either at the Waldorf-Astoria or other hotels throughout the city. The Employees' Benefit Association Section is to meet Wednesday afternoon at 2 p.m. and Thursday morning at 9:30 a.m.; the Fire Prevention Section meets Friday at 9:30 a.m. and the Health Service Division meets Tuesday at 2 p.m., all meetings to be at the Hotel Pennsylvania.

The meetings of the Public Safety section, to be held at the Hotel Waldorf-Astoria, are to be general joint sessions with the Electric Railway, Public Utilities, Steam Railroad, and Taxicab and Fleet-owners groups in attendance, and extend over the entire week. Tuesday morning the papers and discussions cover "Accident Facts—How to Get Them"; the afternoon session is devoted to "Accident Facts—How to Use Them." Wednesday morning and afternoon the discussions cover motor vehicle legislation and traffic law enforcement, respectively. All day Thursday is given over to the subject of traffic engineering, and the meetings conclude Friday morning with an open session of the committee on personality and public accidents.

Are You Going?

PUBLICATION in this paper of an appeal to those who intend to go to the conference luncheons to be held at the 47th Convention of the A.E.R.A. brought many requests for tickets, according to Leslie Vickers, economist of the association. Arrangements have been completed so that there will be 750 seats all told, or 50 for each luncheon. Already 500 tickets have been sold. While there still are tickets for these luncheons, the only way to be sure of a place is to send your check for $1.50 per plate to Mr. Vickers. Specify which luncheons you wish to attend. Address him at A.E.R.A. headquarters, 292 Madison Avenue, New York City. And don't forget to

Inclose Your Check!

Billion Dollar Transit System Proposed

SUBURBAN transit relief in the metropolitan district of New York City presents a problem entirely different from that of local transportation and requires a separate solution, according to Francis Lee Stuart, consulting engineer, speaking at a meeting of the American Society of Civil Engineers held at New York Sept. 5. He estimated the ultimate cost of a suburban transit system at more than $1,000,000,000. Mr. Stuart said, in part, that:

Any extension of the present New York City subway systems into suburban territory should be opposed on account of their inadequacy and the discomfort for long riders. The subways should be used for rapidly distributing local city traffic. A proper solution of the suburban commuter problem of Manhattan should include intercommunication between all sectors of the metropolitan district. It should make provision for a distribution system in and through Manhattan without transfer, which would be supplemental to, and have no physical track connection with, the present city transportation system.

Provision should be made so that residents of the New Jersey, Westchester, Long Island, and Staten Island sectors of the metropolitan district may be routed to and through Manhattan when desired, from any one sector of the suburban area to another sector, thus securing the benefit of through routing and effectuating a two-way, interstate, passenger traffic movement.

The plan should be all-embracing and give all sectors common advantages. There should be Hudson River and East River crossings in the vicinity of 57th Street and connections to Westchester; and at the Battery, other crossings of the Hudson and East Rivers, connecting with east and west routes to Staten Island. Preference should be given to the 57th Street Bridge for crossings to New Jersey in that vicinity, because of its location and other advantages, and because of the fact that it would be much cheaper per track than a tunnel crossing. Preference should be given to tunnel crossings of the Hudson and East Rivers at the Battery because this would serve the lower end of Manhattan and would divide the outlying suburban territory of New Jersey and Long Island to an economic advantage.

The distributing system in Manhattan should be through terminal tunnels deep enough so as not to interfere with local subways, possibly on a third level. To make a minimum use of the local street

Digitized by Google

distributing means in Manhattan, which are already crowded, the system should consist of two terminal tunnel routes extending from the Battery to 57th Street, separated several blocks apart, one on the East Side and one on the West Side, with four or five station stops in each line for suburban transit, at which no local station-to-station traffic in Manhattan would be allowed.

There should be a connection between these two terminal tunnel routes at the Battery and at 57th Street; and possibly an inside terminal loop between 57th Street, 23rd Street, and Madison and Seventh Avenues. This in effect would give a choice of routes from all sectors and would divide the system into simple east side and west side terminal routes easily understood by the general public, with an inside terminal loop to cut down unproductive mileage and facilitate operation when desired.

All tunnels should be of sufficient size to accommodate the standard railroad suburban equipment, which now represents a big investment of the railroads. Probably many of these coaches could be converted for multiple-unit operation at relatively small cost.

There are enough residential sections and diversified industries in the metropolitan district for all to find pleasant homes sufficiently close to their work, where the cost of transportation is within reach of their pocketbooks. The great mass of commuters comfortably delivered within walking distance of their destinations in Manhattan, without transfer, would gladly pay the cost of such improved service.

To accomplish the benefits sought for the public would take from five to eight years and would require the co-operation and co-ordinated effort of all the railroads and of the New Jersey, Westchester, Long Island, and Staten Island sectors. Individual effort would be ineffective and could not succeed.

The railroads have the collecting and distributing means already available in the suburban territory for intrastate and interstate purposes; but they could not be expected voluntarily to assume further financial obligations in such a re-organization of the present unprofitable commuter business except with the co-operation of all concerned and with the assurance of the proper support of the public rate-making bodies.

As a practical method of inaugurating such a plan, an operating company should be formed by all the railroads, which company would lease, for passenger purposes only, existing rights-of-way of such suburban railroads as may be needed. It would operate through the tunnel terminal routes on a fare which would be sufficient to pay operating costs, lease rentals, taxes, interest, amortization, etc., on the entire cost of the system.

Such a suburban transit system could be built gradually and would cost approximately $1,250,000,000 to $1,500,000,000. The system by the time it could be completed would probably be carrying 700,000,000 passengers yearly and the charges might add 10 to 15 cents to each railroad fare to or from Manhattan, depending on the amount of benefit assessment levied.

The securities of this system, supported by the needs of such a vast and growing population and based on a proper agreement as to a rate of fare required to stabilize the financing of its cost, approved by the Interstate Commerce Commission, by the two states, and by the city, would be a very desirable offering to investors and could be marketed on unprecedented terms, probably 3½ per cent, or lower.

In the discussion that followed the presentation of Mr. Stuart's paper, Gustav Lindenthal brought out the fact that tunnels cost from 100 to 150 per cent more than bridges. Charles E. Fowler, consulting engineer, expressed the opinion that decentralization was proceeding so fast in the metropolitan district that the transportation needs a decade hence will be so different from those of today that a large undertaking such as that proposed by Mr. Stuart should be inaugurated with caution. Harold M. Lewis, executive engineer Regional Plan of New York, presented data which he has collected concerning the transportation situation. John A. Miller, Jr., associate editor, ELECTRIC RAILWAY JOURNAL, expressed doubt concerning the feasibility of creating one single transportation system to serve the many and widely scattered suburban communities in the metropolitan district.

American Association News

Special Trains to Cleveland for Eastern Delegates

TWO special trains have been chartered by the American Electric Railway Association to carry delegates from the Eastern section. One of these trains leaves via New York Central at 6:30 p.m., Eastern standard time, Sept. 21, and will carry delegates from New York City, Albany and Syracuse. The other train leaves at 6:25 p.m., Sept. 21, via Pennsylvania Railroad and will pick up delegates from Washington, D. C., and through the Pennsylvania region. Information may be obtained from J. F. Craig, Westinghouse Traction Brake Company, 150 Broadway, New York.

Arrangements have been made by the New England Street Railway Club for a special train from Boston to Cleveland, Ohio. The train will leave Boston, Sunday, Sept. 23 at 3:40 p.m., and will be routed via the Boston & Albany Railroad to Albany and the New York Central from Albany to Cleveland, returning the same way. Stops will be made for delegates at Worcester, Springfield, and Pittsfield, Mass.

Information regarding tickets and reservations on this train may be secured from T. H. McGarry, Eastern Massachusetts Street Railway, 28 Chauncy Street, Boston, Mass.

In addition to the above, about a dozen special trains have been chartered for delegates from other sections of the United States.

Educational Conferences at Cleveland

CONFERENCES of personnel, educational and industrial relations directors will be held at the Hollenden Hotel, Cleveland, Ohio, on Wednesday, Sept. 27, and Thursday, Sept. 28, under the auspices of the committee on education. These conferences will deal with administrative problems in the field of industrial relations.

The topics for discussion are, "Job Training," "General Training," "Organizations and Functions of the Personnel Department," "Organizations of the Educational Department," "Employment and Accident Prevention."

On both dates the conferences will be preceded by a luncheon. It is expected that those who planned to attend will keep the afternoons open. Further information can be secured from A. J. Sarré, superintendent of industrial relations, New Orleans Public Service, Inc., New Orleans, La.

Metropolitan Section Will Have Get-Together Breakfast

FOR the benefit of those attending the Cleveland Convention of the American Electric Railway Association from the New York district, the Metropolitan Section has arranged a "Dutch Treat" breakfast on Tuesday morning, Sept. 25, at 8:30, in suite 100, Hollenden Hotel.

Invitations will be extended to all delegates from the New York district, whether or not they are members of the Metropolitan Section, A.E.R.A.

COMING MEETINGS OF *Electric Railway and Allied Associations*

SEPT. 22-28, 1928
American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

Sept. 25 **— Central Electric Railway Master Mechanics' Association, Cleveland, Ohio.**

Oct. 1-5 **—National Safety Council, safety congress, New York, N. Y.**

Oct. 8-12 **—American Welding Society, fall meeting, Philadelphia, Pa.**

Oct. 24-25 **—Public Utilities Association of West Virginia, annual meeting, Huntington, W. Va.**

Nov. 7-8 **—Iowa Electric Railway Association, operating meeting, Roosevelt Hotel, Cedar Rapids, Iowa.**

Nov. 13-16 **—National Association of Railroad and Utilities Commissioners, New Orleans, La.**

Nov. 21-22 **—Public Utilities Association of Virginia, Hotel Roanoke, Roanoke, Va.**

Jan. 14-18, 1929 **—American Road Builders' Association, convention and road show, Cleveland, Ohio.**

Jan. 23-25, 1929 **—Electric Railway Association of Equipment Men, Southern Properties, Houston, Tex.**

News of the Industry

New Boston Agreement

Hourly rates on Elevated unchanged. Vacation privilege extended. Question of discipline discussed

THE board of trustees and the carmen's union of the Boston Elevated Railway, Boston, Mass., have reached a settlement as to the contract to be effective from July 1, 1928 to July 1, 1929. Only two changes have been made in the existing agreement.

Section 102, which entitles any employee who is suspended or discharged to have his case taken up by the officers of the association with the officers of the company and to be reinstated if he is not found guilty of sufficient cause to justify the action taken, has been changed by this addition:

Provided that during the public management and operation of the company the final appeal by the association in behalf of an employee who is suspended or discharged shall be to the board of trustees of the Boston Elevated Railway the decision of a majority of whom shall be conclusive, and shall not be subject to arbitration except for personal bias, prejudice or bad faith, and if made the subject of arbitration shall not be altered unless such bias, prejudice or bad faith is shown.

The other change consists in granting one week's vacation with pay to all members of the association who have been in the employ of the company for at least one year and have not been absent from work more than 28 days during the preceding year. A large number of employees now have vacations and the present action in extending this privilege to members of the association is in accord with modern industrial practice.

Recent years have shown a decline in passenger traffic in the summer months, which has resulted in laying off several hundred men during the period of lessened traffic. The provision for vacations will tend to lessen the hardships of a lay off of this kind.

The change with regard to discipline and discharge places the final determination as to fitness for the transportation service entirely in the hands of the Board of Trustees.

President Mahon of the Amalgamated issued the following statement:

There has been a mistaken notion in this city that the organization of which I have the honor to be president has attempted to interfere with discipline on the Boston Elevated Railway system. This idea seems to have been focused upon the happening of the recent unfortunate accident at Beach Street. I instructed Mr. Vahey, our counsel, to make a statement directly after the investigation by the Department of Public Utilities which I have read and which I approve.

It doesn't seem, however, that it was as far-reaching as I thought it would be. As a matter of fact the organization which I represent has never attempted to influence the management of the road either in the hiring of men or the discharge of them. We have only claimed that sometimes a man was discharged by reason of unionism, prejudice, bias or bad faith. On those occasions we thought that we should take up their cases and discuss them with the management and if we arrived at no satisfactory conclusion, should arbitrate them. We have arbitrated only five cases on this system in sixteen years, which is a very remarkable record.

We think that discipline has been and properly should be in the control of the company. We make no complaint about discipline unless one of the four elements which I have mentioned before occurs.

In view of our recent settlement with the trustees of the Boston Elevated Railway I thought it proper to say that we wanted the people of the communities served by this company to understand that we haven't in the past and don't intend in the future to interfere with discipline on this road so long as justice and fair play are shown toward our membership.

The outstanding provision in the new agreement, the matter of discipline, has been a tender issue in the past and public attention was focused upon it after the recent fatal accident at Beach Street in which a motorman who had been reprimanded for infractions of the rules and yet had been retained in the service, was wholly responsible for the crash.

The rule has been in the past that a union member who was discharged or suspended could take his case before his own union executive board which had a right to take the matter up with the management of the company and the company was obliged to furnish its reasons. If the company and the union executive board did not agree the matter would have to go to an arbitration board whose decision was final, so that it was extremely difficult for the management to discharge a man except where the most positive proof existed of his unfitness. It is generally believed that this change was brought about, or at least facilitated, by the determined stand Governor Fuller took in the matter of discipline of the men arising out of the Beach Street accident.

Rates of wages, which remain as they were, are 75 cents an hour for the uniform men on two-man cars and 85 cents an hour for the men on one-man cars, and the operators of buses. It is said that the vacation provision will cost the company about $180,000 a year.

Brief Filed in Denver

Through its attorneys the Denver Tramway has filed a brief resisting the efforts of the city of Denver, Colo., to have the United States Supreme Court review the case in which the lower courts and the United States Court of Appeals ruled that the company has a perpetual franchise in the city of Denver.

Settlement in Sight

Commission decides Washington Railway & Electric must be party to 10-cent fare application of Capital Traction

THE District of Columbia Utilities Commission recently ruled that the Washington Railway & Electric Company must become a party to the Capital Traction Company's rate increase petition. This ruling, made effective immediately by the action of the Washington Railway & Electric Company in waiving the ten days' notice provision, was rendered in connection with a movement for the dismissal of the case by the People's Counsel.

It was claimed by the People's Counsel that the proceedings should be stopped because the Capital Traction Company had indicated through its president that it would not accept the requested increase unless such increase were made applicable also to the Washington Railway & Electric system. It was also claimed that the increase in fares could not be applied to the lines of the Washington Railway & Electric Company since that company had not been made a party to the case.

In arriving at its decision to bring in the Washington Railway & Electric Company, the commission pointed out that the verbal statement of the president of the Capital Traction Company about the intentions of his company in applying the increase sought did not constitute a withdrawal of that company's application. It was also brought out that the president of the Washington Railway & Electric Company had stated voluntarily that his company certainly expected to participate in whatever increase in rates might be granted the Capital Traction Company. The commission also ruled that the Capital Traction Company could introduce operating statistics of the Washington Railway & Electric Company, gathered from utility reports, as evidence of information applying to its own case. This was in answer to protests by the People's Counsel that such evidence showing that the Washington Railway & Electric Company also needed a higher fare, would have the effect of bringing that company in "through the back door."

The president of the Washington Railway & Electric Company stated that his company had not been consulted by the Capital Traction officials about the application for the fare increase. Although he did not state whether or not his company desired an increase in fare, he pointed out the difficulties that would result from a dual rate of fare. He also stated that it had always been the policy of the commission to establish a unified fare in the District of Columbia when awarding an increase in fare to

Digitized by Google

one company, whether or not the other asked to be made a party to the proceedings. Counsel for the Capital Traction Company protested that a dual rate of fare would be discriminatory against the company charging the higher rate.

An application for a straight 8-cent cash fare or a 10-cent fare with four tokens for 30 cents was filed on June 15 by the Capital Traction Company. At that time officials of the Washington Railway & Electric Company announced they were not a party to the petition. However, it was generally accepted that the utility commission would require both companies to maintain the same fare in case the increase were granted. The present rates are 8 cents cash or six tokens for 40 cents on both systems in the District.

Canadian Border Men Receive 2 Cent Increase

By a large majority, platform employees of the Hydro-Electric Railways, Windsor, Canada, voted on Aug. 28 to accept a 2-cent wage increase rather than submit their demands for an additional 10 cents an hour to a board of arbitration. The agreement, which was drawn up and submitted by William R. Robertson, superintendent, will be retroactive to July 1 when the old contract terminated. In addition to seeking increased wages the men asked the commission to allow one week's holiday with pay and the operation of two-men cars on trunk lines. The last-named concessions are to receive further consideration, according to a communication to the men from the commission. The wage increase of 2 cents brings the maximum pay up to 62 cents an hour, in addition to which the men receive free uniforms.

Five-Cent Community Fare Suggested for Detroit Suburbs

The heads of the three down-river municipalities—Ecorse, Wyandotte and River Rouge—conferred recently with W. G. Fitzpatrick, attorney for the Detroit United Railway, Detroit, Mich., regarding the fare increases in effect since the Department of Street Railways at Detroit began operation of its cars over the Detroit United Railway tracks to Wyandotte.

Ira Kreger, Mayor of Wyandotte, was elected permanent chairman. He selected a committee to forward to the county board of supervisors a request that an annual rental of $15,000 charged the Detroit United Railway for use of the River Rouge Bridge be abolished, on the ground that the rental raises the overhead expenses of the company and that no other public transportation service pays a similar rental charge.

Finally a committee was named to meet representatives of the railway to work out a solution of the problem. Efforts are to be made to establish a 5-cent fare for transportation within the limits of each municipality.

Riding as Guests in Philadelphia's New Subway

Philadelphia indulged in a real lark on Sept. 1, the day the Broad Street subway was thrown open for inspection. With embossed invitations in their possession some 20,000 persons rode free as guests of the Mayor, the city and the Philadelphia Rapid Transit Company. All of Philadelphia was represented—the butcher, the baker and the big profits makers—and many a prosperous "strap-hanger-for-a-day" rode with his family while the limousine stood idle in the driveway. Here's how one of the local accounts put it:

Public Ledger Photo

Mr. Mitten and public officials on first run of Broad Street train

It was a lark, riding in the subway. The riders came in spotless holiday attire—dainty maids all in white, beaming matrons in expensive gowns and wearing jewels, dignified gentlemen with canes and eyeglasses, who peered critically at the new equipment and talked sonorously of comparative values between New York and Philadelphia rolling stock.

"Half of 'em piles right back through the turnstiles and goes back where they got on," said one Rapid Transit veteran, "they's just out for a ride and to see what $87,000,000 looks like in a hole under the ground."

"Only 6½ miles. It's not much on length, but it makes up for a lot of short-comings in quality," an enthusiast declared. He referred to the lights, for this is an entirely illuminated subway. He referred to its dustless atmosphere, the special ventilating system that works by passage of the trains; to expensive tile stations, to its four-track construction, the airiness of the place and its spaciousness.

Over Saturday and Sunday the subway was the city's most popular source of amusement.

"I guess about two out of three couples Saturday night were young bloods out with their Shebas," said a City Hall supervisor. Others killed the best part of Sunday afternoon showing municipal progress to the girl friend. Policemen passed up the ball game to ride on the cars.

One old man jiggled a free pass under a crony's nose and chortled at his craftiness.

"I've rid round the durn thing 24 times and, by jing, I'm going round again," he cackled.

When the road was opened to public service the next day it was one thrill upon another for the children. No sooner were they in the trains than they raced to the front car and massed before the half-open window, standing there the entire trip, their hair blown straight back by the rush of air gulping up the flitting picture of the freshly painted passageway beneath the city.

The grown-ups, too, craned necks in every direction as they walked down the entrances.

Utility Hearings Postponed

Because of the absence from Washington of Judge Healy, chief counsel for the Federal Trade Commission, the commission's first hearing on public utility publicity methods scheduled for Sept. 13 has been deferred until Sept. 18. For that day the following witnesses have been called:

H. P. Weeks, director of the Iowa section of the National Electric Light Association; J. W. Bennett, who will present matter received from the Canadian branch of the National Electric Light Association, and C. H. Howell, president of New Jersey Electric Association and chairman of the New Jersey Public Utility Information Committee.

Opportunities for Self-Advancement in Wisconsin

Educational courses in elementary accounting, advanced accounting, commercial salesmanship and other subjects will be offered by Wisconsin Public Service Company and the Menominee and Marinette Light & Traction Company to their employees during the coming winter. Classes will be organized at each division where a sufficient enrollment is obtained. No charge is made for enrollment, the necessary texts being prepared and furnished by the company. Employees are urged to take advantage of one of these educational opportunities.

Conciliation Board to Consider Twin Cities Wages

The appointment of a conciliation board to arbitrate in the railway wage dispute in Fort William and Port Arthur, Ontario, is announced by the Department of Labor at Ottawa, Canada. The application for the board was made by the employees and concurred in by the municipalities. The chief point of contention is stated to be in regard to wages. A general increase of about 5 cents an hour is being requested by the men. The question of one-man cars will also be dealt with, it is intimated. The employees are members of the Amalgamated Association. The roads in the sister cities are run under the auspices of the municipalities.

Losses Disclosed at Fare Hearing in New York City

Hearings were opened on Sept. 7 by the New York Transit Commission on the Eighth & Ninth Avenues Railway's application for a 7-cent fare on all of its lines. Commissioner Leon G. Godley presided. The hearing was adjourned until Sept. 21.

According to John Vance Hewitt, counsel for the railway, the company had suffered a steady loss running into millions, despite the strictest economies practiced by the receivers. He said that the loss from May, 1927, to the present time had been $140,000. Charles H. Jewett, the second witness, produced figures on the cost of electrification of the system between 1898 and 1902, when the transition was made from horse-drawn cars to electric surface cars.

Before the witnesses were examined, Assistant Corporation Counsel Joseph A. Devery questioned the power of the Transit Commission to regulate the fare.

George H. Stover, counsel to the Transit Commission, proposed that the railway withdraw its petition under section 29 of the Public Service Commission law, and re-submit it under section 49, inasmuch as under section 29 the commission must either approve or deny the increased fare asked, while under section 49 it had the authority to investigate the question of an adequate fare and fix the rate accordingly. Mr. Hewitt, counsel for the company, had no objection. Commissioner Godley reserved decision on the matter of a choice of section.

Public Receives Cars Favorably in Cleveland

Sixteen of the Cleveland Railway new articulated cars, described in ELECTRIC RAILWAY JOURNAL, issue of Sept. 1, pages 328-331, were put into service on the Euclid Avenue line in Cleveland, Ohio, on Sept. 10. At the same time the company opened its carefully worked-out campaign to make car riding more popular by running full page advertisements in the daily newspapers. The advertisements describe the new cars and conclude with this statement:

There are no traffic problems or parking worries if you use the street railway.

The manner in which the public received the new cars is regarded by company officials as a positive indication that they will add riders to the line. The riders were particularly interested in the articulated connection between the two cars and seemed especially pleased with the comfortable leather seats, the elimination of the step between the front vestibule and the floor of the car, the various safety devices and the pleasing interior decorations.

The cars are being operated with one motorman and two conductors. It would be possible to operate them with only one conductor were it not for the confusion which would result in passing through East Cleveland, where the fare is 2 cents more than in Cleveland.

Joseph H. Alexander, president of the Cleveland Railway, recalled that the new cars were put into service 40 years after the first electric cars started operating on Euclid Avenue. At that time ELECTRIC RAILWAY JOURNAL carried the following statement:

Horse cars have been taken altogether from Euclid Avenue and electric motors reign supreme. Eight cars run throughout the day. Inquiries of employees and patrons who have ridden on the motor cars every day since they began running show that no bad effects have been observed on watches carried in the cars. One conductor enthusiastically declares that his watch runs better than ever since subjecting it to the action of the electric current.

Strike Flurry Subsides in Oklahoma City

A ticklish situation in Oklahoma City, Okla., which arose unexpectedly, was clarified recently when a threatened strike of the men of the Oklahoma Railway failed to materialize and the men admitted no grievance and resigned from the union. The organized element of the railway recently asked the company to adjust grievances, which involved a demand for an increase of approximately 20 cents an hour in the wage, which ranged from 44 to 53 cents depending on seniority; revision of the seniority policy in favor of bus drivers who want to go back to street car and freight service with their old rating and recognition of an Oklahoma City local of the Amalgamated.

Negotiations between workers and railway officials were at a standstill pending word from Hubert Hudson, president, who was in Arizona. Meanwhile talk of a strike simmered down and employees began resigning from the new local union, which had been organized among the train service employees. On Tuesday, Sept. 4, all the officers of the union resigned. The company posted a notice that the men who withdrew from the union and desired to sign up would be given their old positions with the company.

Calamity as Bert St. Clair sees it

In the Interest of Safety at Niagara

A resolution has been passed by the City Council of Niagara Falls, N. Y., appointing a committee to investigate reports of the swaying of the Falls View Bridge of the International Railway, Buffalo, N. Y., across the Niagara Gorge at Niagara Falls. Reports that the bridge sways under heavy traffic, especially on holidays, have been current for several years, but investigations by engineers have shown the toll bridge to be safe. One Buffalo newspaper, in commenting editorially upon the action of the Niagara Falls City Council, recommended that the company invite the American and Canadian governments to have engineers make impartial investigations to determine the safety of the steel arch span above the Niagara Gorge. The action of the City Council was taken following reports that the company itself curtailed traffic over the bridge during the Labor Day rush period.

Change in Service Sought by Colorado Line

The Grand River Valley Railroad, operating from Grand Junction to Fruita, Colo., has asked the Public Utilities Commission for permission to reduce its service so that it may engage only in the hauling of carload lots of freight and let the motor bus take care of passengers and small freight. It claims a loss of $10,000 las year. The Western Motorway, Inc., informs the Commission it is ready to take up the passenger service from Grand Junction to Fruita and Mack, Col.

No Service in Off-Peak Hours

Service by trolley between New Castle and Delaware City has been curtailed by the Delaware Electric Power Company. Cars run between the two towns only during the late morning and afternoon. Formerly cars were run between New Castle and Delaware City, connecting with Wilmington, every hour. The change does away with cars in the middle of the day, except on Sunday. The height of the traffic is early in the morning and late at night. Very few people use the cars in the middle of the day.

Many workmen living at Delaware City use the trolleys to get to their work at the Delaware Rayon Plant near New Castle. The curtailment of service will in no way affect their commuting, it is said, as these people use the cars early in the morning and about 5 o'clock in the evening. Soldiers at Fort du Pont likewise will not be affected in coming to and from Wilmington. Car service will be maintained late at night to carry them back to Delaware City.

On Sunday cars run every hour, commencing at 8 in the morning and stopping at 12:30 at night.

Date Set for Hearing in Baltimore Depreciation Issue

The Maryland Public Service Commission has set Nov. 15 as the date to open a hearing on the depreciation issue in the case of the United Railways & Electric Company, Baltimore, Md. H. Carl Wolf, chief engineer of the commission, has announced that he believes he can complete the valuation work by that time, barring unforeseen delays.

In the meantime, however, counsel for the commission plans to continue its efforts to win a stay of the hearing and with this in mind will seek an appointment with Justice Brandeis, of the United States Supreme Court. Recently Justice Brandeis refused to give an immediate decision and this was followed by an application made by the United to have the commission hold an immediate hearing on the depreciation issue. This was in accordance with a decision handed down by the Maryland Court of Appeals.

Dry Dock Petition Put Over

The Transit Commission has adjourned to Sept. 19 its hearing of the application of the Dry Dock, East Broadway & Battery Railroad for a fare increase to 7 cents. The company operates the Grand Street crosstown line, the Grand Street to Brooklyn line, the Postoffice, Manhattan, to Brooklyn line, and the Avenue B line.

Assistant Corporation Counsel Joseph A. Devery questioned the right of the commission to rule on the company's application for increased fare, but Alfred T. Davison, counsel for the company, insisted that the Public Service law permits the commission to adjudicate the fare question. He submitted tariff schedules of the company, but these were excluded temporarily and the hearing adjourned to permit submission of briefs on the admissibility of the papers.

Reroutings in Salt Lake City to Become Effective

Mergers and reroutings of many lines of the Utah Light & Traction Company, Salt Lake City, Utah, are to become effective within the next few weeks, following the suggestions of Ross W. Harris, traffic expert, who has conducted a survey of the conditions. Mr. Harris pointed out that the burden of traffic routed down Main Street between 5 and 6 p.m. was causing unnecessary congestion. With a staff of assistants, Mr. Harris has been working on Salt Lake's traffic problem since February. The expert's conclusions do not deal exclusively with car congestion, but embrace many angles of the traffic problem. During his survey Mr. Harris had the co-operation of Commissioner T. T. Burton, head of the public safety department, and Chief of Police Joseph E. Burbidge.

According to E. A. West, general manager of the company, the survey indicated a means whereby the city might conveniently solve some of its major street congestion problems.

New Warning Signals on International Interurbans

The International Railway, Buffalo, N. Y., is installing a new type of automatic electric flashing signal at all highway crossings over its interurban lines in western New York. The new signals, evolved by the electrical engineering department of the company, are built on a concrete base in the center of the highway on both sides of the crossing. The base is painted black and white in a checkerboard design.

If warnings mean anything then motorists are amply protected at International Railway crossings

The red electric lights hung on the crossarms flash alternately from one side to the other and there is a red prism reflector near the base so that headlights shining upon it will focus the attention of drivers upon the crossing sign.

The red lights start flashing when trolleys are approximately 2,000 ft. from the crossing or from 30 to 32 seconds away as compared with the requirements of the New York State Public Service Commission of 20 seconds distance from the crossing, giving a wide margin of safety. Flashing signals of this type are being made the standard for the Buffalo-Niagara Falls high-speed interurban.

Experimental Rate in Oklahoma To Be Permanent

The Northeast Oklahoma Railroad, Miami, Okla., has announced that the 10-cent passenger rate to any point on its lines in Oklahoma, which has been in effect for several weeks, will be made permanent. It is unofficially understood that this rate has brought an increase of approximately 60 per cent in passenger travel. In the original announcement of the 10-cent fare experiment it was stated that since the area served by the company in Oklahoma was not unlike a metropolitan service area in that all points had an equal interest in the service, it was believed this rate would prove popular.

The company also announced that on Sundays during September an excursion rate of 35-cents for the round trip between Columbus, Kan., and any Oklahoma point on the line will be in effect.

New Solutions Offered for Seattle's Paving Problem

Refunding of the debt of the Seattle Municipal Railway, Seattle, Wash., on a longer time basis, with greatly reduced annual payments and passage of a home rule bill by the next state Legislature, giving to cities of the first class a free hand in the financing and operation of their public utilities, is proposed by Councilman A. Lou Cohen as solutions of the city's track paving problem. Declaring his determination to sponsor action on both these measures, Mr. Cohen expressed confidence that success in the effort not only would enable the speedy completion of paving between the street car tracks, but that the railway system would be able to rehabilitate itself out of its own earnings without further bond issues.

Preparing to Argue Interborough Fare Case

Mayor Walker of New York has announced that he will go to Washington to attend the hearing before the United States Supreme Court on the Interborough Rapid Transit Company's petition for a 7-cent fare. The hearing on the appeal taken by the city from a ruling in the Statutory Court in New York City is scheduled for Oct. 1. The Mayor is familiarizing himself with the ramifications and technicalities of the case so that he will be in a position to give aid to the city's counsel in arguing the case before the highest court. Samuel Untermyer will argue the case for the city, according to Mayor Walker. Mr. Untermyer recently hurried home from Europe after he had been stricken with an acute attack of asthma, but it is said that he will be able to appear in the case unless there should be some adverse development in his condition not now foreseen.

Counsel for the Interborough Rapid Transit Company last week seemed an order to prevent the city from obtaining a Supreme Court review of the four motions lost by the city and the Transit Commission in the Statutory Court in New York. This order dismisses two appeals for a review of the four lost motions on the ground that the appeals were not filed within the time required by law. One of the motions was to strike out the amended and supplemental complaint of the Interborough Rapid Transit Company.

Better Handling of Rochester Subway Interchange

Steps toward bringing about the efficient handling of traffic on the subway railroad at Rochester, N. Y., were taken at a conference recently in the office of Charles R. Barnes, Commissioner of Railways, at which it was agreed that this matter should be in charge of a joint committee representing the steam railroads, the New York State Railways, by which the road is run, the city, and the shippers.

The committee will consider all matters in connection with the handling of cars in the subway to and from industrial sidings, also interchange movements between steam roads. It will suggest reports and methods for the efficient handling of cars in the subway so as to accommodate best shippers and the roads interested. This committee's report will later be submitted to the general conference of interested parties for consideration.

At the recent conference there was a general discussion of the character of the form which should be used in the delivery to and interchange of cars through the subway railroad. It was finally agreed that each steam railroad shall furnish the New York State Railways with a standard form of switching waybill which shall include date and time of delivery to the subway and all necessary information, at the time delivery of cars to the subway is made; sufficient copies to be furnished the New York State Railways.

Deferment of Service Problems in Seattle

To give time for a Council survey of the Seattle Municipal Street Railway situation in Seattle, Wash., the utilities committee of the City Council has laid over for six weeks a decision on the variety of petitions for car line extensions and new bus service. This action was taken after Assistant Superintendent Roy E. Furse of the municipal railway system told the Council that his department faced a loss of $160,000 on bus operation this year and that a general rehabilitation of the railway system was necessary to solve the transportation problem.

Subways Crowded Everywhere—South American's Comment

After making a tour of inspection of the subway systems of London, Paris and New York, Guillermo Fels, engineer-in-chief and general manager of the Buenos Aires Underground Railways, has left New York for home. He noted that the milling crowds of the Times Square have parallels in European cities. So far as the indignities suffered by women in the crowded cars Señor Fels said that a similar condition existed in the Argentine. When two cars were set apart there for women exclusively, one at either end of every train, the cars were left empty. Later the management decided that the women were afraid of end cars so the two middle cars were set aside for them, and again the women shunned the cars. Consequently, the plan was considered a failure.

No Settlement in London, Ont.

Appointment of conciliation board expected to settle demands for wage increases. Railway unable to meet demands

NO SETTLEMENT has been made of the wage dispute on the London Street Railway, London, Ont. The Amalgamated Association has made application to the Minister of Labor calling for the appointment of a board of conciliation to handle the controversy. The Minister of Labor placed the matter before the management Aug. 31, and the company stated its position and advised the Minister that the matter of a conciliation board would be taken into consideration by the company at the next meeting of the board of directors.

The strained relationship in London is the result of agitation over a new agreement which started on Jan. 30 of this year when the Amalgamated Association filed a 60-day notice with the railway, signifying its desire for an adjustment of wages and working hours. Subsequently demands were filed for an adjustment of the wages of motormen and conductors, of 7 and 12 cents an hour. This is from a rate of 48 to 55 cents for motormen and conductors. A rate for one-man operators of 65 cents an hour, an increase of 12 cents an hour, and a rate of 65 cents an hour for bus operators, from the present rate of 50 cents an hour, were also filed. Other demands included time and a half for all overtime and also time and a half for all Sunday work.

At present motormen and conductors are paid on the basis of 48 cents an hour with 12 cents an hour for all overtime and 12 cents an hour for all Sunday work; that is, motormen and conductors are receiving 60 cents an hour on Sunday and one-man operators 65 cents. Bus operators receive 50 cents an hour and 10 cents an hour for all overtime work and on Sundays receive a straight 60 cents an hour. Requests were also made for a reduction in hours of carhouse men working twelve hours a night, the union suggesting that these hours be reduced to 9 hours a night.

The company's position was explained by the statement that it was operating on a 5-cent fare and as its applications to the city of London for an increase in fares had been refused the railway claimed it was unable to meet any of the demands of the employees, or in fact, allow for any increase in wages.

Under the industrial disputes investigation act the company is not bound to agree to the appointment of a board of conciliation, but it is said that it will likely agree to the appointment of a board of this kind to handle the matter.

New Children's Cards in Baltimore Oct. 15

The United Railways & Electric Company, Baltimore, Md., has authorized the school children to use their last year's identification cards in the purchase of 5-cent school tickets until Oct. 15. This was occasioned by a postponement in the opening of the public schools from Sept. 5 to 17 on account of an outbreak of infantile paralysis.

In order to relieve the teachers and principals from the task of making out lists of pupils entitled to the 5-cent tickets the United has decided to permit each child to fill out his or her own application and have it signed by the teacher or principal.

Senator Couzens to Report to Detroit Mayor on Finance

United States Senator James Couzens conferred recently with Mayor John C. Lodge of Detroit, Mich., relative to transportation problems in general and the finances of the Detroit municipal railway. Both refused to discuss the nature of their conversation. As a first step in the conference Mr. Couzens and the Mayor considered railway affairs with Clarence E. Wilcox and G. Ogden Ellis, of the street railway commission. It is said that Senator Couzens will place his ideas relative to financing and other problems in writing and submit them to Mayor Lodge.

Proposed Subway Developments Continue in Cleveland

At the last meeting of the executive committee of the Cleveland Railway, Cleveland, Ohio, Joseph H. Alexander, president, was authorized to have the firm of Parsons, Klapp, Brinkerhoff & Douglas make a survey of the Cragin subway proposal in conjunction with the rapid transit plans of the Van Sweringens. This development for the first time brings Raymond Cragin's subway plan in contact with the Van Sweringens' rapid transit program. Operation by the Cleveland Railway is contemplated in both plans. The proposal of the Cleveland Subway Company, promoted by Raymond Cragin, realtor, is to construct subways to cost $30,000,000 to be owned by the city, operated by the Cleveland Railway and paid for out of street car and motor coach receipts.

When Mr. Cragin broached his subway construction scheme to the City Council, he stressed the point that the subways were designed to serve a different territory than that to be served by the projected rapid transit lines along the rights-of-way of various railroads entering the new union terminal. Subway routes proposed would serve city car riders primarily, while the Van Sweringens' rapid transit lines would barely touch any residential section of Cleveland, serving the suburban riders primarily.

Digitized by Google

Engineers employed by the Cleveland Railway have been studying the Van Sweringens' rapid transit plans for nearly a year. They have collected a mass of data forecasting changes which would be brought about by rapid transit lines and making recommendations as to how street car and motor coach routes should be co-ordinated with rapid transit service. Their report has not been made public. Recently the street railway committee of the City Council suggested that Mr. Cragin should take up his subway proposition with the Cleveland Railway before asking the Council to pass on it.

Lately a new mystery subway company, called the Cuyahoga Subway Company, was incorporated for operation in Cleveland through two firms of attorneys, who say they do not know what interests are connected with the company. Petitions for an initiated ordinance have been prepared and are being circulated. If the petitions receive 5,000 valid signatures, the City Council will be required to submit the ordinance to a vote of the people at a regular or special election. The proposed ordinance grants the Cuyahoga Subway Company sweeping rights to construct subways, elevated lines and appurtenances in or over any street in the city. Nothing definite has been divulged so far about methods of operation or fares.

Interstate Question Raised at East St. Louis

The City Council of East St. Louis, Ill., on Aug. 22 directed Dan McGlynn, corporation counsel, to take steps to compel the East St. Louis & Suburban Railway to establish a single fare zone in East St. Louis on its Belleville-St. Louis line.

At present the fare from downtown East St. Louis to 42nd and State Street is 10 cents straight or 8 cents if tokens are purchased. The fare from downtown to Roberts Place (5400 on State Street) is 12 cents and the fare to Edgemont 14 cents. All this territory is within the city limits of East St. Louis. On all other East St. Louis lines, including the Rosemont, Washington Park and Alta Sita divisions, the fare is 10 cents cash or 8 cents with tokens.

Former United States District Judge English in September, 1919, issued an injunction which forbade interference by the Illinois Commerce Commission or any other state, county or city body under which the company split East St. Louis into three fare zones on the East St. Louis & Suburban line to Belleville. Prior to the injunction granted by Judge English the fare to Edgemont was the same as any other section of East St. Louis.

The city probably will apply to the Interstate Commerce Commission for relief, since the St. Louis-Belleville line crosses the Mississippi River into Missouri. An effort will also be made to have the present United States district judge modify or remove Judge English's injunction order.

New Financial Plan and Ordinance Projected in Chicago

Consolidation proposed under new suggestion with service-at-cost, ultimate city purchase, home rule and terminable permit. Railway managements studying plan

STREET car fares may be removed as a possible political football in Chicago for the next ten years, if plans devised during the week ended Sept. 15 by a sub-committee of the City Council's local transportaton committee materialize.

At a meeting of this sub-committee on Sept. 10, it was decided to alter a section of the proposed new railway program, which is based on a "service-at-cost" arrangement, to provide that street car, elevated and motor coach fares could not be reduced during the initial ten-year period of the new regime. The proposed financial set-up, amending the present state law, in its original form provided that changes in rates of fare could be made either up or down by the local regulatory commission,

Reason for Change Explained

The drafting committee, appointed by Chairman E. I. Frankhauser to rewrite the ordinance to that effect, explained the purpose of the change as being "to keep the city's purchase fund growing during the ten-year period, so that we will have enough money for extensions and so that ultimate purchase will be possible. If fares were decreasing during that initial period it would hurt the finance plan of the project." The new clause, however, will not prevent a fare increase in the event that higher fares are needed to make the financial plan safe.

In the first ten years the program provides for spending $135,000,000 for extensions and improvements to both the surface and elevated lines and, in addition, approximately $65,000,000 for downtown subways. It is estimated that the income from the properties will permit these investments on a cash fare of 7 cents and ticket rate of 6⅔ cents on the surface lines and cash and ticket rates of 10 cents and 8⅓ cents, respectively, on the elevated lines, with a 2-cent charge for transfers between the two systems.

The fundamental principles underlying the new financial plan and ordinances are (1) service-at-cost; (2) city purchase; (3) home rule through a local commission; (4) a terminable permit that can be terminated by purchase of the consolidated transportation system by the city.

Engineer Outlines Plan

Under the proposed home rule powers, the city would determine the initial capital account of the new company, the initial construction program, the initial rates of fare, the initial percentage of gross receipts to be set aside for a renewal and depreciation fund and for a damage reserve fund. The local commission would be appointed by the Mayor with the approval of the City Council, and have the same powers and duties as now held by the Illinois commerce commission and local board of supervisory engineers.

As outlined by Major R. F. Kelker, Jr., city engineer, who with the help of the corporation counsel's office drafted the financial and legislative program, only such items as operating expenses, taxes, payments into renewal and damage reserve funds, cost of money in initial purchase price, cost of money for extensions and additions, payments into sinking fund, and compensation allowed to the new company, would comprise the "cost of service." Major Kelker said:

> The rates of fare and other revenues must produce a return sufficient, after payment of the charges enumerated, to leave a balance in the hands of the company. This balance will represent an overcharge to the car rider for service rendered and is paid to the trustee of the city purchase fund.
>
> It is obvious that such an overcharge cannot be returned to the individual car rider; consequently, it is held by the trustee for the benefit of the rider and may be used for two purposes only: (1) Purchase of the property by buying bonds issued for the initial capital value or for the purpose of extensions or by construction of a city-owned subway and (2) for the commutation of fares.

Comment Awaited

The city's $55,000,000 traction fund would be transferred to the city purchase fund and invested in first mortgages of the new company.

The new financial plan and proposed ordinances were submitted by the committee on Sept. 7 to elevated and surface lines officials and bankers. No comment, however, has yet been made regarding them. The enabling legislation, by which the provisions of the ordinances could become effective, is still being worked out by the committee.

Public Control of Eastern Massachusetts Continued

THE Eastern Massachusetts Street Railway stockholders, by a vote of 159,393 shares to 43,007, have approved the continuation for five years of public trustees for the suburban lines out of Boston, Mass.

Digitized by Google

Recent Bus Developments

More Taxicab Troubles in Louisville

Although the city of Louisville, Ky., some months ago enacted a new ordinance barring jitney buses from the streets, and the Louisville Railway finally removed this thorn from its side, a new trouble has developed in the 25-cent taxicab. Just recently a company operating as the Gordon 25-Cent Cab Company, announced a new line of cars, operating at 25 cents for 2 miles; 40 cents for 3 miles and 50 cents for 4 miles, carrying one or four passengers for that price.

The Louisville Taxicab & Transfer Company, the old company, immediately purchased 50 Essex cars and met the price. On Sept. 2, the Dodds 25-Cent Cab Company announced that it had contracted for 100 Whippet cars, and was offering a service for 25 cents from any point within the city limits to the business section.

The Louisville Railway has placed a poster on its cars which reads: "Two Miles, 7 Cents. Four Miles??"

Two Rides for 25 Cents in Kansas City

The new bus fare rate on all trunk line buses in Kansas City, Mo., proposed by the Kansas City Public Service Company, was approved by the City Council at its regular meeting on Sept. 10. The new rate of two rides for 25 cents as opposed to 15 cents straight, the fare which has been in effect since last June, was scheduled to become effective on Sept. 15.

Rides Free in Salt Lake City

New trolley buses were placed in regular service on the Fourth East line of the Utah Light & Traction Company, Salt Lake City, Utah, on the morning of Sept. 9. All rides were free during the entire day and 17,700 passengers were carried. Ten coaches operate on this line on a regular ten-minute schedule with 12½-minute service on Sundays and 7½-minute service during rush periods.

Chicago-Joliet Service Started

In accordance with the permit recently issued by the Illinois Commerce Commission, motor coach service between Joliet, Ill., and downtown Chicago was started on Aug. 15 by the Chicago & Joliet Transportation Company, a subsidiary of the Chicago & Joliet Electric Railway. With a fleet of five new 29-passenger Yellow parlor coaches the company operates eight round trips daily between the two cities, a distance of approximately 40 miles. The running time in either direction is one hour and 40 minutes. The fare from terminal to terminal is $1; round-trip tickets, $1.60.

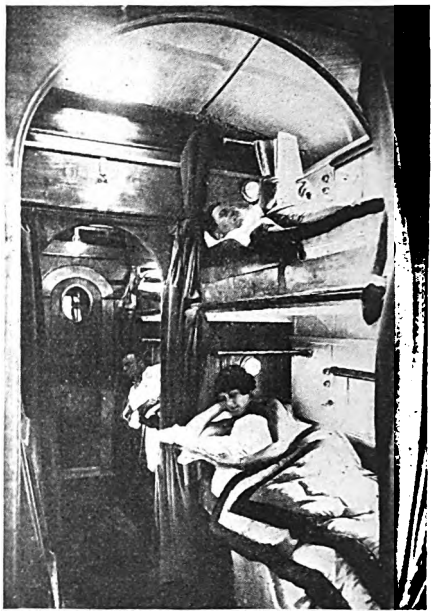
Sleeping Service in England

New route of 200 miles, recently established, attracts wide attention in Europe

SLEEPER bus service between London and Liverpool, a distance of about 200 miles, the first of its kind in England, and said to be the first in Europe, was started in August by the Albatross Roadways, Ltd. The new service—of a non-stop nature—will not compete with local railways, tramways or buses, but it threatens to compete with the services of the long distance steam railways. The fare for the journey is 25 shillings. This is about the same as the third-class railway fare.

The coach which is used has no very spacious windows, for it is intended for night-time service only. The body is 27 ft. long and 11 ft. high. The wheelbase is 17 ft. Extra large low pressure tires are fitted to minimize vibration. Sleeping accommodations are provided for twelve passengers. The journey is accomplished in about nine hours.

There are three compartments, or cabins, with four berths in each. Two of these are arranged one above the other on one side of a central gangway, and two on the other. Each berth is 6 ft. long by 2 ft. wide. To secure privacy, each one is provided with curtains. At the front of the vehicle are a lavatory and small kitchen. A steward serves tea and coffe as the journey nears its end. The position of the lavatory and the kitchen up front and the rubber matting on the floors are all designed to isolate the traveler from noise. Space for luggage is provided under the lower berths and in lockers below the floor level. Water is carried in a 20-gal. tank under the floor and is raised by hand pump to an overhead tank.



Night travelers attracted to bus accommodations

Greater space for the bunks could be secured by making the coach body 2 or 3 ft. longer, but if this were done the question of meeting the legal maximum dimensions would be raised. Connected with the berths are windows to secure ventilation, blinds, reading lamps and ash trays. Bell pushes are provided for summoning the steward.

The country traversed is, on the whole, fairly flat so that steep grades are infrequent. Hence there is little need of using the lower gears with their accompanying noise. Passengers report that the journey is comfortable and that their sleep in the new bus is not much disturbed.

Service is given three nights a week in each direction. Similar development of other routes is expected. The railways have met the increase in bus services with a promise to provide third-class sleepers in their night trains. In spite of strong agitation in the past, they have supplied sleeping accommodations to first-class passengers only. Second-class carriages were abolished long since but the third-class still remains.

The mammoth successor to the stage coach of Dickens, Irving and DeQuincey

Financial and Corporate

Merger of Two Holding Companies Effected

The United Light & Power Company has acquired voting control of American Light & Traction Company it is revealed in the earnings statement of the former for the twelve months to July 31, 1928. According to the plans revealed both companies retain their separate identities, though United controls the American Company through ownership of a sufficient amount of stock. A statement by United Light & Power says:

Since our last published statement we have greatly increased our holdings of American Light & Traction Company stock. We now own a clear majority of the total voting stock of that company. It is our opinion that an accurate reflection of the situation requires that a consolidated earnings statement including consolidated earnings statement of American Light & Traction Company be substituted for the earnings statement heretofore published and this will be our future policy. American Light & Traction Company will continue to publish its independent earnings statements.

United Light & Power Company and subsidiaries, including consolidated earnings of American Light & Traction Company, for the twelve months ended July 31, 1928, showed income of $6,218,589 after taxes, depreciation, interest, amortization, subsidiary preferred dividends, etc., equal after prior preferred class A and B preferred dividends to $1.31 a share on the combined 3,132,691 shares of class A and class B common stocks outstanding.

Among the properties controlled by the United Light & Power Company is the Tri-City Railway & Light Company, whose subsidiaries own and operate street railway lines in Davenport, Muscatine, Rock Island, Moline and East Moline. The American Light & Traction Company controls the Muskegon Traction & Lighting Company and the San Antonio Public Service Company.

Greater Earnings Than Ever in Cleveland

Summary of events during 1927 presented by President Alexander to company stockholders shows that year recently closed was eventful one. Steady rise in income, but decrease in passengers carried. Bus a problem

OUTSTANDING events in the affairs of the Cleveland Railway, Cleveland, Ohio, during the year ended Dec. 31, 1927, besides earnings greater than ever before, were, according to President Alexander, the sale of stock in an amount sufficient to pay for all the probable needs of the system this year and next; the establishment of new relations with and between employees, including a pension system; the continuation of a rate of fare lower than generally obtaining elsewhere for comparable service despite a decrease in riding; the submission to the United States Board of Tax Appeals of a long continued protest of the claim of examiners for the Internal Revenue Department for additional income and excess profit taxes for the years 1913-1921 inclusive; the start toward acquiring additional facilities for the system; the beginning of negotiations for rapid transit in co-ordination with present services.

Minor events were the creation of the capital retirement sinking fund under the provisions of the new franchise ordinance, a decrease in the number of accidents, lowered costs of injuries and damages, maintenance and power, lessened labor turnover, experimental installation of new types of cars and motor coaches with their promise of improved service or lowered cost or both; the issuance of school passes to children in attendance at public and parochial schools. The high standards of maintenance and operation to which the company is long committed by its contract with the city to provide the best transportation at cost were maintained throughout the year.

Civic events of special interest to the company were the approval of bonds for the construction of a new high level bridge across the Cuyahoga Valley; the great Cleveland Industrial Exposition and the convention and exhibit of the American Electric Railway Association at the Public Auditorium; municipal elections in all of the communities served, which insure no radical changes in those local governments, and the creation, late in the year, of a non-partisan, non-political, citizens committee of Greater Cleveland for the purpose of studying and formulating a plan of metropolitan government.

Rebuilt three 1,200-type cars for rapid transit service.

Repaired and rebuilt 96 auto trucks.

Installed 23 top-deck floors in double-deck motor coaches.

Increased efficiency of operation, together with the decrease in mileage operated, affected the work of the equipment and buildings department like that of the power. The quality of the work done, was, as always, fine, and the manner of its doing, a large factor in the reduced maintenance costs. The accompanying table indicates the variety of this department's work and the extent of its reduction in labor and material costs.

The differences varied monthly from an increase of 1.04 per cent to a 4.59 per cent decrease, but by every standard of measurement was adequate to the demand throughout the year.

The number of rides in 1927 was only equal to that of 1916. The mileage that year was 32,240,683. Rides per car-mile then were 11.64; in 1927, 10.40. The average seating and carrying capacity of equipment is greater now than then, while the frequency and regularity of operation is as good, if not better.

Two independent traffic studies were conducted during the year. One in connection with the work of the fact finding committee studying sites for the proposed new bridge across the Cuyahoga Valley; the other, that the company might have the latest statistics and opinions for guidance in the proposed coordination with the projected rapid transit system of the Van Sweringen interests. Mr. Alexander says both surveys have been helpful and the city has met the decline in traffic with increased diligence in its daily traffic checks.

At the beginning of the year the route mileage operated by motor coaches was 63.88 miles, exclusive of operations in substitution for street car routes temporarily discontinued, and at the close of the year it was 68.78. The substituted mileage was 3¼ miles. The addition of route-miles and service on the older routes totals 10 per cent over a year ago. The cost of coach maintenance has been reduced approximately one-fourth, due to increased efficiency as the company's experience broadened. The department had at the close of the year a total of 134 coaches.

Car builders were asked to submit samples and, following the street railway exposition the first week of October 1927, the company commenced the operation of two units seemingly most adapted to its needs; one, an articulated unit, and the other, a four-motored, double-truck car like the company's standard car. After nearly three months' experiment the company ordered 25 of the articulated units. Final determination on the other 50 authorized by Council was made early in 1928.

Accidents

There was a decrease in street car accidents of 4 per cent, due in part to the decrease in car-miles operated and passengers carried, but largely to the effect of prevention work. There was an increase of 18 per cent in motor coach accidents due to the increase in mileage and traffic. There was a decrease in the total number of accidents of 556; but there was an increase in the number of personal injuries, the number of claims filed and of lawsuits brought against the company. More claims were settled, more lawsuits tried or settled than in any year of the company's history Thanks to the awakened mind of Cuyahoga County's jurors, the total cost of injuries and damaged remained about $900,000. In this connection President Alexander said:

I cannot resist saying here that it is our policy and the aim of our general counsel and all employees having to do with this work to make full payment for all damage caused by us, but also to resist all exaggerated and false claims to the utmost, because the monies we pay out on all claims are not ours, in the sense that they may be paid to you or invested in your behalf, but are ours in trust from our patrons to make proper satisfaction of real claims and any monies unexpended in such ways to be returned to the public in improved service or lower fare.

* Deficit.

The company relaid 12 miles of single track during the year, of which more than two-thirds were necessitated by public work rather than condition of the rail.

Traffic

The service measured in "Ordinance" car-miles was 571,129 less than the service of 1926, but the company operated 425,155 motor-coach-miles more than 1926. It varied monthly from an increase of 65,620 to a maximum decrease of 99,030. These decreases in service were due mainly, if not entirely, to lessened industrial activity throughout the community served. There were fewer rides by 4½ per cent than in 1926.

President Alexander says that the employees responded almost as one man to the pension and insurance plans, previously mentioned in Electric Railway Journal, and in the last half of the year during which plan and department have been in effect 83 men were placed on pension. The average age of these employees is 72 years. How worthy the

employees were of the action taken in their behalf will be apparent, the management believes, to anyone who glances over the list that accompanied the statement. The president referred to it as the honor roll of the company: "83 citizens each of whom has devoted nearly 40 years of his life to the furnishing of transportation to this community."

Franchises

The city of Cleveland passed ordinance No. 79613 amending the rate of fare section of the Cleveland contract so as to provide for half fare for school children. This ordinance was declined, but throughout the fall of the year an experiment was conducted with school passes. A card, good for transportation on all lines of the company, within certain hours, and on school days, is sold pupils of the public and parochial schools on application each week, at a price of 35 cents. Should the pupil ride to and from school only, the pass gives half fare. The experiment develops that the pass is used to a much greater extent than this so that each ride is on a basis of one-third fare or less. Further, it has not increased riding as the city and the company had hoped.

The hope expressed a year ago that Cleveland's satellite cities of East Cleveland, Cleveland Heights and Lakewood would grant new franchises in accordance with the recommendations of the Greater Cleveland Transportation Committee and these franchises would receive the city of Cleveland's approval, had not been realized at the time President Alexander wrote. Then, Cleveland Heights was in the process of drafting and submitting a new franchise, East Cleveland was prepared to follow and Lakewood informally had indicated that when the franchises of these cities had been approved by the city of Cleveland, it would fall in line. Cleveland Heights granted a franchise, but on application to the city of Cleveland for authorization to accept it, the company did not receive approval. With the determination of the Cleveland Heights franchise so long pending, the situation in the other cities perforce remained in *status quo*.

Under the existing East Cleveland franchise the rate of fare is to be determined at five-year intervals. The present five-year period ends in June, 1928. Inasmuch as the rate in that city is now the Cleveland rate, the company has notified the city that it desires to arbitrate the rate. By the terms of the East Cleveland franchise the rate of fare may not be less than the Cleveland rate, so the company was hopeful of a favorable decision.

The Cleveland Council informally indicated its feeling that suburban franchise contracts and service requests should be held in abeyance until rapid transit plans were further advanced. In November the company commenced a traffic survey since the management is intent to arrive at an early conclusion, "that this vexatious and costly question of our suburban relations may be finally settled."

President Alexander says:

The effect of traffic abuses and delays, of injuries and damages, while being minimized, has not been removed and is still reflected in our expenses. Changing industrial and traffic conditions tend to increase the number of operation. The decrease in the number of our riders is not apparent during the rush hours and that service at the peak of traffic demand is furnished at peak prices. In other words, it is scarcely possible to diminish service in exact ratio with a lessened demand so that the expense of operation decreases as does the revenue. Improvement of travel or the return of a better balance between rush hour and non-rush hour riding will, we believe, make the allowance for maintenance and operation sufficient to meet the expense chargeable against it.

Soon after the meeting of the stockholders in 1927 the management agreed with the city upon improvements and additions to the property, long deferred because of financial conditions, and undertook to provide them. Specifically, they were:

100 street cars at an estimated cost of...	$1,200,000
50 motor coaches at an estimated cost of	600,000
Four 117th Street operating station....	350,000
West automatic substations equipped...	1,000,000
Track in Pearl, State and Broadview Roads	262,000
Service buildings	207,500
Miscellaneous	20,000
Total	$3,639,500

The following is the schedule of rates in cents per hour paid trainmen from the taking effect of service at cost:

Beginning March 1, 1910, first year of service 23, second year 25, thereafter 26.
Beginning June 15, 1910, first year 27, thereafter 30.
Beginning May 1, 1915, first year 29, thereafter 32.
Beginning May 1, 1916, first year 31, thereafter 34.
Beginning May 1, 1917, first year 32, thereafter 35.
Beginning May 1, 1918, first three months 43, next nine months 46, thereafter 48.
Beginning June 1, 1919, first three months 55, next nine months 58, thereafter 60.
Beginning May 1, 1920, first three months 70, next nine months 73, thereafter 75.
Beginning May 1, 1921, first three months 55, next nine months 58, thereafter 60.
Beginning May 1, 1922, first three months 50, next nine months 53, thereafter 55.
Beginning May 1, 1923, first three months 55, next nine months 58, thereafter 60.
Beginning May 1, 1925, first three months 60 ,next nine months 63, thereafter 65.
Beginning May 1, 1926, first three months 65, next nine months 68, thereafter 70.

Section 23 of the Cleveland franchise, ordinance No. 70561-A, reads in part as follows:

"The maximum rate of fare for a single continuous ride within the present limits of the city of Cleveland, whether through a suburban city or not, in one direction, over any route of the said company, shall be 10 cents cash fare, 1 cent for transfer, and no rebate, and beyond and including said maximum rate of fare, the following schedule or scale of fares is hereby established:

"(*a*) 10 cents cash fare, six tickets for 50 cents, 1 cent for transfer, no rebate;
"(*b*) 9 cents cash fare, six tickets for 50 cents, 1 cent for transfer, no rebate;
"(*c*) 8 cent cash fare, seven tickets for 50 cents, 1 cent for transfer, no rebate;
"(*d*) 7 cent cash fare, eight tickets for 50 cents 1 cent for transfer, no rebate;
"(*e*) 6 cent cash fare, nine tickets for 50 cents, 1 cent for transfer, no rebate;
"(*f*) 5 cent cash fare, ten tickets for 50 cents, 1 cent for transfer, no rebate;
"(*g*) 5 cent cash fare, eleven tickets for 50 cents, 1 cent for transfer, no rebate;
"(*h*) 5 cent cash fare, twelve tickets for 50 cents, 1 cent for transfer, no rebate;
"(*i*) 4 cent cash fare, thirteen tickets for 50 cents, 1 cent for transfer, no rebate;
"(*j*) 4 cent cash fare, seven tickets for 25 cents, 1 cent for transfer, no rebate;
"(*k*) 4 cent cash fare, seven tickets for 25 cents, 1 cent for transfer, 1 cent rebate;
"(*l*) 4 cent cash fare, three tickets for 10 cents, 1 cent for transfer, no rebate;
"(*m*) 4 cent cash fare, three tickets for 10 cents, 1 cent for transfer, 1 cent rebate;
"(*n*) 3 cent cash fare, 1 cent for transfer, no rebate;
"(*o*) 3 cent cash fare, 1 cent for transfer, 1 cent rebate;
"(*p*) 3 cent cash fare, two tickets for 5 cents, 1 cent for transfer, no rebate;
"(*q*) 3 cent cash fare, two tickets for 5 cents, 1 cent or transfer, 1 cent rebate;
"(*r*) 2 cent cash fare, 1 cent for transfer, no rebate;
"(*s*) 2 cent cash fare, 1 cent for transfer, 1 cent rebate."

The rates of fare actually in effect follow:

Cleveland:
Beginning March 1, 1910, rate *n*.
Beginning June 1, 1911, rate *o*.
Beginning Sept. 1, 1914, rate *n*.
Beginning Dec. 15, 1917, rate *m*.
Beginning Dec. 26, 1917, rate *l*.
Beginning April 3, 1918, rate *k*.
Beginning April 10, 1918, rate *j*.
Beginning Aug. 4, 1918, rate *f*.
Beginning July 6, 1919, rate *g*.
Beginning Dec. 16, 1919, rate *h*.
Beginning May 12, 1920, rate *f*.
Beginning Nov. 14, 1920, rate *e*.
Beginning Aug. 1, 1922, rate *f*.
Beginning March 1, 1923, rate *g*.
Beginning Sept. 1, 1923, rate *f*.
Beginning Dec 11, 1923, rate *e*.
Beginning Oct. 15, 1926, rate *d*.

East Cleveland:
Beginning June 20, 1918, 5 cents.
Beginning Nov. 14, 1920, 6 cents cash, nine tickets for 50 cents.
Beginning Aug. 1, 1922, 5 cents.
Beginning June 19, 1923, 6 cents cash, nine tickets for 50 cents.
Beginning Oct. 15, 1926, 7 cents cash, eight tickets for 50 cents.
Cleveland Heights:
Beginning March 1, 1910, 5 cents.
Beginning Feb. 14, 1921, 6 cents cash, nine tickets for 50 cents.
Beginning Oct. 15, 1926, 7 cents cash, eight tickets for 50 cents.
Lakewood:
Beginning May 1, 1915, local ride, 3 cents; ride into or from Cleveland, 5 cents.
Beginning May 22, 1925, local ride, 3 cents; ride into or from Cleveland 6 cents cash, nine tickets for 50 cents.
Beginning Oct. 15, 1926, local ride, 3 cents; ride into or from Cleveland, 7 cents cash, eight tickets for 50 cents.

Of the future the president said:

In looking to the future this year we are in a most unusual and favored position. The condition of the system is good, physically, financially and in its relations with the public and its employees. We are abundantly able to meet all of the present transportation needs of Greater Cleveland. Not since the commencement of operation under service-at-cost have we been better able to carry out our part of that agreement.

The same is, we think, true of our partner, the city. Its capacities and powers have expanded and grown even as have our facilities. Originally the city, while reserving to itself the broadest and most complete control of the service to be rendered by us and of regulation of our conduct in supplying that service, had only a negative part in the fixing of the cost of service. Today it may cause savings, order increased earnings and effect more direct economies than could the company ten or more years ago. When, in the original grant, the city reserved the right to fix the service and included specifically the right to fix headways and stops it could not foresee that traffic congestion would actually do the fixing. If the city continues indefinitely to regulate and prescribe service as it did nearly twenty years ago without first removing the real dictator of service, traffic congestion, it will receive a decreasingly best transportation, at a constantly increasing cost.

More than $900,000 of last year's car fares went to the satisfaction of injuries and damages, the majority of which were caused by traffic situations which the city controls. The parking of vehicles on main thoroughfares, especially in the downtown or business areas, is the largest single factor in the cost of transportation, which the city controls. The carriage of city passengers by interurban bus companies, forbidden the interurban electric cars almost at the beginning of service-at-cost, is another factor, although a minor one, in the cost of service, which the city controls. Traffic has been so rapidly growing a burden on the city that it is not to be wondered at that the car rider and the effect on his fare have been lost sight of at times. A reawakening to the rights of the car rider is imminent; a curbing of unfair, costly and needless uses of the street is the most pressing need of the immediate future.

Until the rapid transit plans are determined none of the suburban cities in which we operate will take its proper place in the requirements of Greater Cleveland. I am confident that with the basis of co-ordinated and unified service established the administrations of all of the communities involved will act promptly in the solution of the questions confronting us until the arrival of the larger and faster form of transit.

Increase in B.M.T. Net

After providing for all maintenance charges, taxes and reserves for depreciation the gross income of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for the fiscal year ended June 30, 1928, was $14,565,561, compared with $14,143,305 for a similar period ended in 1927. Expenditures for maintenance-of-way and structure and of equipment, including reserves for depreciation, continued in excess of 24 per cent of total operating revenues. Net income was $6,595,455 against $6,348,445 for the year ended June 30, 1927.

The decade ended in 1928 shows an increase in rapid transit traffic of 153 per cent and a substantial increase in surface line travel.

COMPARATIVE STATEMENT OF EARNINGS AND EXPENSES OF THE BROOKLYN-MANHATTAN TRANSIT SYSTEM FOR YEAR ENDED JUNE 30

	1928	1927
Revenue from transportation:		
Passenger revenue	$45,425,465	$44,633,439
Freight revenue	489,054	588,056
Chartered car revenue	419	560
Miscellaneous transportation revenue	262	357
Chartered bus revenue	.....	1,622
Total revenue from transportation	$45,915,202	$45,224,035
Other street railway operating revenues:

Operation of power plant	3,364,184	3,384,736
Operation of cars—trainmen's wages	7,418,500	7,156,691
Operation of cars—other expenses	4,751,225	4,508,311
Damages	1,269,619	1,471,288
Legal expense in connection with damages	250,646	241,102
General law expenses	92,442	79,064
Other general expenses	1,543,850	1,546,151
Freight expenses	303,376	364,101
Total operating expenses	$30,572,658	$30,388,173
Net revenue from operation	$16,893,944	$16,322,418
Taxes accrued on operating properties	3,367,443	3,223,608
Operating income (*carried forward*)	$13,526,501	$13,098,810
Operating income (*brought forward*)	13,526,501	13,098,810
Non-operating revenue:		
Rents accrued from lease of road	66,546	63,570
Miscellaneous rent revenues	115,997	114,424
Interest revenues	841,690	748,343
Dividend revenues	6,443	7,886
Miscellaneous	42,773	140,032
Total non-operating revenues	$1,073,451	$1,074,256
Non-operating revenue deductions:		
Rent expense	4,347	2,473
Non-operating taxes	30,044	27,288
Total non-operating revenue deductions	$34,391	$29,761
Net non-operating income	$1,039,060	$1,044,495
Gross income	$14,565,561	$14,143,305
Income deductions:		
Interest deductions	$7,736,600	$7,521,032
Rent for lease of other road and equipment	25,000	25,000
Other rent deductions	199,859	239,209
Sinking fund accruals	658	658
Amortization	4,231	3,125
Total income deductions	$7,966,350	$7,789,025
Balance	$6,599,211	$6,354,280
Less—accruing to minority interests	3,755	5,834
Net income	$6,595,455	$6,348,445

PASSENGERS CARRIED

Fiscal Year	Surface	Rapid Transit	Totals
1918	255,569,584	265,400,020	520,969,604
1919	251,893,227	313,933,642	565,826,869

1928	272,782,698	671,202,522	943,985,220

Dissolution Sought by Ocean Electric

The Ocean Electric Railway, which formerly operated lines on the Rockaway peninsula, applied on Sept. 5 to Supreme Court Justice Druhan in Brooklyn, N. Y., for permission to dissolve and wind up its corporate existence. All lines of the company were discontinued three years ago except one running from Hammels to Beach 149th Street, Neponsit, Long Island.

Capital stock of the company, totaling $350,000, is owned entirely by the Long Island Railroad. The directors of the company stated that operation was made unprofitable by competing bus lines.

Ithaca Traction Sold

At a referee's sale held in Ithaca, N. Y., on Sept. 7, the property of the Ithaca Traction Corporation was sold to Frank L. Morse, of the Morse Chain Company, of that city, for $150,000. The sale was held in accordance with a judgment rendered by the Court of Appeals in favor of the bondholders of the company. Mr. Morse said that the plan was to improve and operate the system.

Realize $2,575,300 in Detroit

The properties of the Detroit United Railway and the Detroit, Munroe & Toledo Short Line Railway, Detroit, Mich., were sold for $2,575,300 at public auction on Sept. 12 to Edward W. Durner of Princeton, N. J., and James T. Harrigan of New York, representatives of the organization committee. The sale was conducted by William S. Sayres, Jr., standing master-in-chancery of the United States District Court, under a foreclosure order issued July 25, last.

Reorganization terms of the Detroit United Railway were reviewed in ELECTRIC RAILWAY JOURNAL, issue of May 5, 1928, page 754.

The Detroit United Railway and the Detroit, Monroe & Toledo Short Line Railway will be known as the Eastern Michigan Railway.

Personal Items

F. C. Payne New Superintendent of Chicago's Accident Department

Frederick C. Payne has been appointed superintendent of the department of accident investigation of the Chicago Surface Lines, Chicago, Ill. He succeeds Frank J. Gatrell, who died last winter. Mr. Payne entered electric railway service in 1911 with the Chicago Railways as a statement man. He has been connected with the same department of the company continuously since that time except during his service as adjutant for the 69th Infantry Tenth Division in the World War. After his return from the service he was appointed claims attorney and was made acting superintendent of the department upon the death of Mr. Gatrell.

Mr. Payne was born in Chicago in 1887. After his graduation from the Illinois College of Law in 1910 he was associated with his father in law practice under the name of Payne & Payne.

Commonwealth Power Elects Officers

B. C. Cobb, president of the Tennessee Electric Power Company, was elected president of Commonwealth Power Corporation at the organization meeting of the board of directors held recently in New York City. Mr. Cobb succeeds George E. Hardy, who was elected to the newly created office of chairman of the board of directors. Mr. Cobb has been an important figure in public utility affairs for many years and has been identified with the Tennessee Electric Power Company for the last six years. As vice-president of the corporation since its organization and the operative executive, he has been largely responsible for the successful growth of the Commonwealth Power Corporation system of properties in Tennessee, Ohio, Indiana, Illinois and Michigan.

T. A. Kinney was elected vice-president of the corporation. Mr. Kinney is well known as vice-president of the Tennessee Electric Power Company.

Transportation Department in St. Louis Rearranged

A reorganization in the transportation department of the St. Louis Public Service Company, St. Louis, Mo., carries with it the promotion of seven men to higher positions and the rearrangement of a personnel which has been retained for some years past. The new plan, effective Sept. 1, and approved by Vice-President and General Manager Greenland looks to economy and greater improvement in the operation of the cars.

A. J. Fink, as Director of Transportation, will be in authority. Lined up after him is H. O. Butler superintendent of transportation. The seven promotees have been appointed as follows:

P. Concannon, superintendent of schedule maintenance.

Bryan Williams, chief traffic engineer.

J. H. Rippen, superintendent of methods.

T. Lane, acting principal instructor.

A. W. Taylor, acting superintendent, Manchester Station.

F. C. Irwin, superintendent, Kossuth Station.

W. P. January, superintendent, Park Avenue Station.

P. Concannon moves up from assistant superintendent of transportation, a position that he has held for many years.

Bryan Williams formerly was associate superintendent at Newstead over a period of about two years; John Rippen rose from the position of foreman at North Broadway and Manchester stations; T. Lane served over a long period as instructor of new men entering the service as motormen and conductors at Newstead; F. C. Irwin came up from the position of foreman at Hodiamont; W. P. January from foreman at Newstead, and A. W. Taylor from foreman at Manchester.

Under the old order of things, the street railway system was divided into eight divisions with four of the division superintendents having jurisdiction over all lines operating out of two car stations in each case. Under the new order there will be one superintendent performing the duties of that office at each station, or a total of thirteen superintendents against eight heretofore.

Men Newly Assigned in St. Louis

1. A. W. Taylor
2. J. H. Rippen
3. P. Concannon
4. T. Lane
5. F. C. Irwin
6. E. B. Williams

PHILIP KREMER, staff engineer of the Berlin Street Railway, Berlin, Germany, is leaving Europe for a five weeks trip in this country. He will arrive on the steamship *Paris* about Sept. 18 and will attend the Cleveland convention. Mr. Kremer is coming especially to study the latest developments in cars here. Also coming to this country on the same ship is a high official in the Berlin Police Department, Mr. Schuppau, who will make the same trip as Mr. Kremer, studying traffic conditions particularly.

Track and Line Market Active

Several track projects contemplated. Line material orders large. A number of cars being remodeled or re-equipped. Rolling stock purchases contemplated

PURCHASES of both track and line materials indicate an active market in this equipment during the past 30 days. Particularly noticeable is the activity of the line market which for some time has been apparently dormant. Twin City Rapid Transit Company, Minneapolis, Minn., has ordered 2 miles of 500,000 C.M. 600-volt feeder cable, 3,024 ft. of 1,000,000 C.M. lead-covered cable, one hundred 35-ft. treated cedar poles and one hundred 30-ft. treated cedar poles. Two hundred 15-in. marathon type clinch ears with $\frac{5}{8}$-in. boss for 00 round wire, 100 two-bolt galvanzied guy wire clamps, 200 type P-2N porcelain strain insulators and six type A-4 sectional insulators for 00 trolley have been ordered by the Grand Rapids Railroad, Grand Rapids, Mich. Inquiries have been made by the Western Pacific Railroad, San Francisco, Cal., for one carload of strand.

Pittsburgh Railways, Pittsburgh, Pa., has ordered 20-8 Deg. to 10 Deg. LH Universal trolley frogs, 2,000 ft. of three conductor cable, 200 two-pin 4x5x36-in. crossarms, 50 double curve suspensions, 100 spring lock mining suspensions, 50-00-90 Deg. crossovers, 300 galvanized corner feeder insulators for 1,000,000 C.M. strand, 400 straight line insulators for 500,000 C.M. strand and 500 galvanized insulator pins for W crossarms.

Lehigh Valley Transit Company, Allentown, Pa., has placed orders for 1 mile of 00 grooved copper trolley wire, two carloads of 30-ft. class A Chestnut poles, one carload of 40-ft. class A chestnut poles. Other equipment ordered by this company includes 750 marathon trolley ears No. 14444, 300 marathon trolley ears No. 14441, 250 marathon trolley ears No. 14440 and 50 marathon feeder ears No. 14733.

Many Orders for Track Materials

The Duluth Street Railway, Duluth, Minn., has placed orders for 150 gross tons of 7-in. 93-lb. rail, 20 gross tons of 7-in. 114-lb. rail and 3,000 white oak ties. Tie plates, screw spikes, tie rods and Thermit welding material for the above rail has also been ordered. Grand Rapids Railroad has ordered 2 kegs of $\frac{3}{8}$x8-in. boat spikes and 50 pairs of splice bars for 100-lb. A.R.A. A rail. Seven hundred Thermit rail welding portions section 8040 and one Atlas track grinder have been ordered by the Twin City Rapid Transit Company. Ottawa Electric Railway, Ottawa, Ont., has ordered 2,000 hemlock ties and 40 tons of section 103-287 A rail.

Seven hundred gross tons of 122-lb. grooved guider rail, B.S. section 122-407, have been ordered by the Toronto Transportation Commission, Toronto, Ont. The Public Service Company St. Louis, Mo., is reconstructing the tracks on Franklin Avenue from Third Street west to a point near Twelfth Street at an estimated cost of $150,000.

The Worcester Consolidated Street Railway, Worcester, Mass., has completed the installation of a new crossover on Main St. consisting of two switches, two mates and two frogs at an approximate cost of $3,500. Work has been started by this company on the renewal of the crossover on Main Street, near Ionic Avenue, consisting of two switches, two mates and two frogs. It is estimated the cost will be approximately $3,500. The installation of two new solid manganese crossings over the N. Y., N. H. & H. R.R. at the South Works has been completed. Also the installation of one tongue switch with gutter on Millbury Street, and two switches, two mates and gutters at T. O. No. 168 on Greenwood Street, near Tatman Street, at an approximate cost of $6,547. It is contemplated to renew a switch and mate at Harrington Corner at an approximate cost of $1,000.

The Memphis Street Railway, Memphis, Tenn., will complete its Jackson Avenue extension by Oct. 15. The Holyoke Street Railway Company, Holyoke, Mass., is about to replace its tracks on High Street from Cabot to Sargeant Street, on Hampden Street from Maple to High Streets, and on Race Street, from Dwight to Main Streets.

Contemplated Track Purchases and Expansion Programs

The New York Central Railroad, New York, N. Y., is arranging an expansion program at its Mott Haven yards, in the electrified division, to cost $2,000,000.

Contemplated purchases by the Pittsburgh Railways include 500 tons of 9-in. 134-lb. rail and 10,000 white oak ties 6x8 in. by 8 ft. This company has ordered 500 kegs of $5\frac{1}{2}$x$\frac{9}{16}$ in. spikes, 5,000 tie rods, 500 tons of 9-in. 134-lb. rail, 400 tons 7-in. 122-lb. rail and 10,000 white oak ties 6x8 in. by 8 ft.

One solid manganese frog for a crossover has been ordered by the Lehigh Valley Transit Company. This company also has placed orders for 500 ETS $5\frac{1}{4}$-in. 0000 rail bonds, 100 E 38-in. 0000 rail bonds, 100 E 44-in. 0000 rail bonds, 100 E 72 in. 0000 rail bonds and 100 A-2-72 in. 0000 rail bonds.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been authorized to construct a car line from 47th Street to 60th Street, on North Avenue. Chicago, South Shore & South Bend Railroad has completed the installation of automatic safety block signal between Chicago & South Bend. Three Rivers Traction Company, Three Rivers, Quebec, is proposing to relay about 2,200 ft. of track. London & Port Stanley Railway, London, Ontario, has been authorized to provide increased track accommodation for the Century Coal Company. Montreal Tramways, Montreal, Quebec, proposes to construct 3.98 miles of track in various parts of the city.

Car Equipment and Remodeling Materials

Recent purchases of car equipment have been made by several companies. Lehigh Valley Transit Company has ordered 24 motormen's seats, 60 car seats 36 in. long, six 66 in. long cushions and backs, six 36 in. cushions and backs and sixteen line switches for the 900 type cars. Pittsburgh Railway is remodeling thirty-seven 5000 type cars for one-man operation and fifteen 4700 type cars for one-man operation.

Grand Rapids Railroad has remodeled one Birney safety car and has ordered 1,080 23-watt, 500-volt car lights and headlights, 250 lb. of $\frac{3}{32}$-in. diameter spot cord, 30 gal. of paint and varnish, 576 lb. of cold rolled steel, 1,546 lb. of mild steel bars, three barrels of car journal oil and 800 lb. of common colored waste.

Ten cars are being remodeled by the Duluth Street Railway, for one-man operation. These cars will be equipped with leather upholstered seats, Simplex safety devices and National Pneumatic door equipment. Twin City Rapid Transit Company has ordered 100 gear blanks for G. E. 203 motors, 610 sheets of 26x28 in. plate glass, 610 sheets of 20x28 in. D. S. A. glass, 600 helical equalizer springs 4 in. O.D. by $11\frac{1}{2}$ in. long and 600 helical equalizer springs $6\frac{1}{4}$ in. O.D. by $10\frac{3}{4}$ in. long. Illinois Terminal System is starting work on the construction of four 80-ton locomotives. The installation of multiple-unit control has just been completed on four of the system's parlor cars. Louisville Railway, Louisville, Ky., will change the gage on 23 one-man safety cars recently purchased from the Transit Equipment Company, New York, N. Y.

Rolling Stock

Pittsburgh Railways has received fourteen of the fifteen cars ordered from the St. Louis Car Company. Monongahela-West Penn Public Service Company, Fairmont, W. Va., in

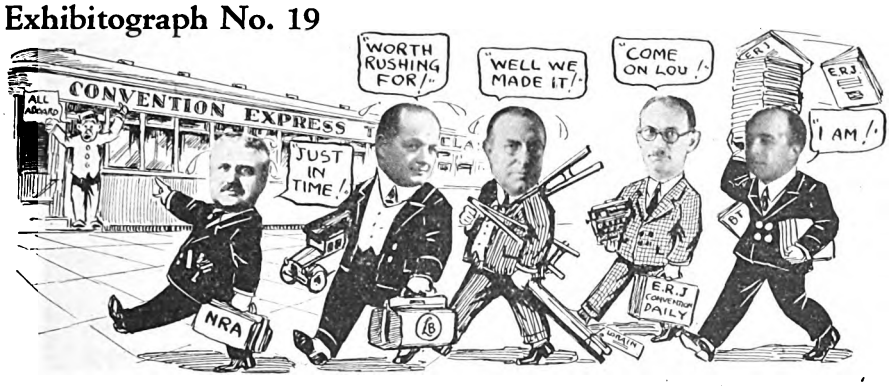
Exhibitograph No. 19



All aboard for the Big Show! Looks like there's going to be something doing—Better be there!

announcing its purchase of ten cars from the G. C. Kuhlman Car Company, stated that it expected to make other purchases for the Marietta City and the Marietta & Beverly interurban lines.

Hamilton Street Railway, Hamilton, Ontario, has been inquiring for ten double-truck cars similar to those purchased last year. Saskatoon Municipal Railway, Saskatoon, Sask., Canada, has ordered four double-truck cars from the Ottawa Car Manufacturing Company. Calgary Municipal Railway has ordered three cars from the Canadian Car & Foundry Company. Toronto Transportation Commission has ordered six model W 23-passenger buses from General Motor Truck Corporation.

International Bus Corporation, a subsidiary of the International Railways Buffalo, N. Y., has ordered ten Yellow Coach gas-electric buses. Pacific Northwest Traction Company, Seattle, Wash., has ordered two A.C.F. 21-passenger parlor coaches. Community Traction Company, Toledo, Ohio, has ordered ten urban twin coaches. Illinois Power & Light Corporation has purchased four A.C.F. parlor coaches. United Electric Railways, Providence, R. I., has ordered twelve urban Twin Coaches.

Buildings and Shop Equipment

Twin City Rapid Transit Company has ordered high-pressure greasing equipment, lubricating oil dispensers and a motor-driven Viking oil pump, an engine oil drain, a steam cleaner and bus washing equipment, one Wallace Radial cutoff saw and one Wallace Universal saw. Toronto Transportation Commission has orderel one No. 12 Cowdry Brake Testing Machine.

A contract for the purchase of electrical equipment for a 750-kw. rotary converter fully automatic substation has been let by the Pittsburgh Railways. West Penn Electric Company, Pittsburgh, Pa., has started construction of a 60x60-ft. building in the rear of its Uniontown carhouse. This building will house the machine shop for the repair of substation equipment, the shops of the relay department and will be a garage for automobile rolling stock

St. Louis Public Service Company has consolidated its De Baliviere and its Hodiamont Avenue carhouses. The City Light & Traction Company, Sedalia, Mo., plans improvements in its power plant to cost $30,000. The Pennsylvania-Ohio Power & Light Company, Youngston, Ohio, plans a substation to cost $100,000. Levis Tramways Company, Levis, Quebec, will erect a stone and brick warehouse and is building an office building. Montreal Tramways is building a substation at Rockfield, an extension to its paint shop at the Youville shops and an office extension at the St. Henri garage.

Cars Being Built for Illinois Central

Ten suburban type motor cars and ten trailer cars are being built for the Illinois Central Railroad, Chicago, Ill., by the Pullman Car & Manufacturing Corporation. Notice of this order was made in the May 26 issue of the JOURNAL.

The center sills of the underframes of these cars are rolled channels. Side sills are angle with all pressed-steel cross-members for floor supports, crossties, bolsters and end sills. The floor sheets are of 0.038-in. sheet steel with pressed-steel longitudinal floor supports. Sliding doors are hung with ball-bearing hangers and tracks. The side doors are provided with electrically operated engines that are controlled by the conductor from either end of the car. These side doors at the closing edge are provided with a buffer of flexible brass covered with sheet rubber to protect passengers from injury. The side doors are also equipped with a contact switch that operates throughout the train, signaling the operator when the doors are closed.

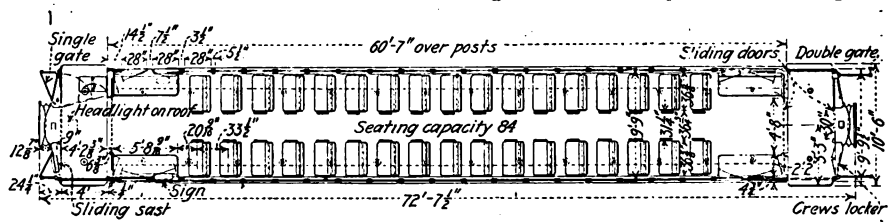
The cars will be equipped with collapsible style gates to prevent passengers from falling between cars when on a station platform. In addition to having a sliding end door, cars at the end of each unit will also be provided with the regular folding gate as an additional safety measure. The vestibules are of a wide type entirely inclosed, ends of the car being provided with canvas diaphragm and the usual vestibule curtain.

Electric heaters are placed under each crosswise and longitudinal seat and two in the motorman's cab. These heaters are operated with 1,500-volt current and in the passenger compartment are thermostatically controlled.

On the sides of the car the removable type of brass sash will be used. On previous cars all sash were of wood. For a unit of two cars (motor and trail car) at one corner of the trail car a three-tread flight of steps is provided. All other platforms are arranged for station platform loading.

DIMENSIONS OF MOTOR AND TRAILER CARS

Length over buffer	72 ft. 7½ in.
Length over end sills	60 ft. 6½ in.
Width over side sheets	9 ft. 9¼ in.
Width over platform plates at side doors	10 ft. 6 in.
Width of side loading door openings	4 ft. 0 in.
Width of body end door openings	4 ft. 0 in.
Width of aisle space at seat ends	2 ft. 7¼ in.



Floor plan of ten motor cars being built for the Illinois Central Railroad. The seating arrangement of the motor cars and trail cars is similar

The superstructure posts are all of pressed-steel members and the side and end sheets are ⅛-in. copper-bearing steel. In the roof the carlines are U shape in one piece from side plate to side plate. The roof sheets and exterior deck panels are of aluminum alloy.

The seating capacity of each car is 84, having 34 cross seats and four longitudinal end seats. All seats are covered with rattan. The main finish panels throughout the car are of aluminum with Agasote for the headlining panels. All doors are of aluminum with an alloy for proper hardness.

The couplers are of self-centering type except between the two cars of the unit. The couplers with their connections complete the connection between cars for pulling, air and electric features and also contain the friction draft spring in their construction. Couplers can be operated from inside of the cab both for coupling and release. The brakes are to be of electro-pneumatic type, two 14-in. cylinders being used on the motor and one 16-in. cylinder on the trail car. The air compressor is operated from the 1,500-volt line with G.E. compressor governor.

Digitized by Google

The truck frames for both cars are of the cast-steel type with double equalizers. The motor car trucks are to have 38-in. rolled steel wheels while the trail cars will have 33-in. wheels. The motor trucks are of a special design to provide for application of the 250-hp. motors, each truck being equipped with two, or a total of four motors per car. All the ten cars are equipped with roller bearings.

The cars are to be of multiple-unit type with the main control and operating equipment underneath the motor car. The batteries for the 32-volt system used for car lighting, door operations, signals, etc., are installed underneath the trail cars. The entire conduit system for the electric wiring is to be installed by using aluminum conduit and aluminum junction boxes. All other fittings such as condulets, unions, couplings, locknuts and bushings are also to be of aluminum, which reduces the weight of the car materially.

Classification of Iron and Steel Scrap

Simplified Process Recommendations R58-28, namely, the first revision of the classification of iron and steel scrap has been issued by the Department of Commerce, Washington, D. C. A general campaign for elimination of industrial waste has been carried on for several years by the Division of Simplified Practices of the Department of Commerce. Early in 1926, the metals industries organized a national committee on metal utilization to co-operate with the Division of Simplified Practice in all waste elimination projects affecting this class of products.

For three years the scrap industry analyzed and studied the question of the classification of this commodity. Conferences were held at which producers, distributors, and consumers were present, so that the specification, when finally drafted, would meet the needs of all phases of the industry. Finally, in 1926, the committee which had drawn up the specifications, requested the Department of Commerce to call a general conference of all interests to consider the adoption of the proposed classification.

At this conference, the proposed specifications were discussed in detail and some minor changes made. They were then adopted for a period of one year, at the end of which time a revision conference was to discuss and, if found desirable, modify the classification. Contract form of purchase of scrap was adopted at the same time. Suggestions and questions that the industry wishes to submit are to be referred to the committee on iron and steel of the National Association of Purchasing Agents, which committee drew up the recommendations.

The standing committee held its annual reunion meeting in Chicago, Ill., on Jan. 18, 1927. This was a joint session with the representatives of the American Railway Association and the Waste Material Dealers Association. The results of the meeting practically insured uniformity as to scrap classifications. Specifications have the approval of the scrap dealers, steel makers, and the committee of the National Association of Purchasing Agents, representing the simplified practice recommendation and the classification of iron and steel scrap.

The following changes were made and have been incorporated in the present edition of this recommendation: Changes in the specifications for classes of scrap for use in the basic open-hearth furnaces, changes in specifications for classes of low phosphorus and low sulphur steel scraps for use in acid open-hearth furnaces, and changes in specifications for classes of scrap for use in gray iron foundry practice. Copies of this bulletin, including the complete simplified practice recommendation and its revision may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 10 cents each.

ELECTRIC RAILWAY MATERIAL PRICES—SEPT. 11, 1928

Metals—New York

Copper, electrolytic, cents per lb	14.525
Lead, cents per lb	6.4
Nickel, cents per lb., ingot	35.
Zinc, cents per lb	6.6
Tin, Straits, cents per lb	47.
Aluminum, 98 or 99 per cent, cents per lb.	23.90
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	53.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	4.225
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1.8
Franklin, Ill., screenings, Chicago	1.5
Central, Ill., screenings, Chicago	1.475
Kansas screenings, Kansas City	2.175

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.80
Tie plates (flat type), cents per lb	2.15
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.875
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb	2.7
Sheet iron, galvanized (24 gage), cents per lb.	3.5
Galvanized barbed wire, cents per lb	3.20
Galvanized wire, ordinary, cents per lb	3.00

Waste—New York

Waste, wool, cents per lb	18.
Waste, cotton (100 lb. bale), cents per lb.:	
White	17.25
Colored	13.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.
White lead in oil (100 lb. keg), cents per lb.	13.75
Turpentine (bbl. lots), per gal	$0.535
Putty, 100 lb. tins, cents per lb	5.50

Wire—New York

Copper wire, cents per lb	16.625
Rubber-covered wire, No. 14, per 1,000 ft.	5.3
Weatherproof wire base, cents per lb	17.125

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ½-in., carload lots, N. Y., per cu.yd., delivered	3.375
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.375
Sand, cu.yd., delivered	2.125

Old Metals—New York and Chicago

Heavy copper, cents per lb	12.375
Light copper, cents per lb	10.875
Heavy yellow brass, cents per lb	7.125
Zinc, old scrap, cents per lb	3.25
Lead, cents per lb. (heavy)	4.75
Steel car axles, Chicago, net ton	$16.25
Cast iron car wheels, Chicago, gross ton	12.875
Rails (short), Chicago, gross ton	16.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50

Chicago, South Shore Improvements to Be Made

The Chicago, South Shore & South Bend Railroad will undertake this month a number of important construction projects, planning to complete all work before the end of the year.

In Michigan City 130-lb. rail in 66-ft. lengths will be laid from Sheridan to Michigan Streets. In South Bend, 100-lb. rail will be installed between College Street and Cummins siding. All joints in both installations will be welded.

A second large construction job will be a new freight interchange with the Chicago, Indianapolis & Louisville Railroad, west of Michigan City. This improvement will eliminate the handling of Monon freight over the main line of the South Shore through Michigan City and thus greatly reduce the amount of freight which has heretofore been carried over the tracks on East Eleventh Street.

There will be three interchange tracks of 50-car capacity, 6,000 ft. of new track in all.

Buses for Oakland

Key System Transit Company, Oakland, Cal., has ordered $250,000 of bus equipment from Fageol Motors Company. This order is for its new Alameda-Oakland lines, which are replacing the trolley system.

TRADE NOTES

BOTFIELD REFRACTORIES COMPANY, Philadelphia, Pa., announces the appointment of W. E. Tierney as its representative in the South and Southwest with headquarters in New Orleans, La.

STEVENS & WOOD, INC., moved on Sept. 1 to larger quarters and are now occupying the twentieth floor of the new Chase National Bank Building at 20 Pine Street, New York City.

BERNARD LESTER, assistant industrial sales manager of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has been placed in charge of the company's business relationships with architects, builders, building contractors, and manufacturers of machinery and motor-driven appliances. His headquarters are at 150 Broadway, New York City.

An Exhibit That Dramatizes an Industry's Progress

FOR the third successive year, the eyes of the local transportation world are focused on Cleveland. Once again this hospitable Ohio metropolis is the mecca for the men who are gathering for this great national transportation conference—the 47th—from every section of the country and from foreign lands as well. They come from every department and from every line of activity. A program has been prepared which promises information and inspiration for every delegate, from the highest in rank to the lowest; from the general executive to the specialized worker.

Since the early days of transportation the American Electric Railway Association convention has exerted a powerful influence in guiding the industry through its long, varied and honorable career. But during the past few years this great national conference has become even more vital than ever, as the industry courageously has battled its way through a confusing tangle of changing economic conditions. It has become a national clearing house of thought and experience through which the industry is working out those policies that gradually but surely are regaining for it public recognition as an essential community service.

JUST as the convention itself has become of increased importance to the industry, so has the exhibit come to play a part increasingly vital in this great national event. The exhibit has grown to be more than merely a commercial display of equipment. It has come to reflect the definite and material advance being made by the electric railways toward meeting new conditions and new transportation requirements.

The big idea back of the exhibit is typified by the fact that operating companies, association committees and sectional associations join in staging displays that help to interpret the forward march of technical achievement.

IT WAS in recognition of the growing importance of the exhibit that this issue of ELECTRIC RAILWAY JOURNAL was conceived. Here is collected for the first time a summary of the many new products and the improvements of standard equipment developed during the year. Here is available for the delegate at the convention an analysis and interpretation of each principal group of apparatus, to aid in his inspection of the many items in which he may be specifically interested. For those who were unable to get to Cleveland it brings the exhibit to their desks—as nearly as that is possible in type and pictures. For the returning delegate, it constitutes an invaluable record for future reference.

All of this has been made possible only through the hearty co-operation of the association and the exhibiting manufacturers. The editors of ELECTRIC RAILWAY JOURNAL take this opportunity of thanking those who have helped to carry out the idea back of this issue. In these pages there is evidence to convince even the most skeptical that the local transportation industry is alert to its responsibility and has the courage, the imagination and the energy needed to win the right to success as a public servant. In the manner in which it reflects the advances made in physical and technical equipment to meet a new day and new conditions, the A.E.R.A. exhibit dramatizes the industry's progress.

Exhibit Again Is Big Feature

Response to demand for merchandising features evident. Comfort rather than luxury outstanding in latest designs. Imposing array of new cars and buses. Light-weight equipment a universal demand

FOR the third time in as many years a great exhibit of cars, buses and equipment has been assembled at Cleveland in connection with a convention of the American Electric Railway Association. In respect to number of devices shown and in range of products this year's show exceeds anything in the exhibits of last year and of 1926. Nothing shown at Atlantic City or elsewhere previously had come anywhere near the exhibits at Cleveland, so that without question this ranks as the greatest of all displays of its kind.

Many things have contributed to the success of this year's exhibit. The demand of transportation men for equipment and devices in keeping with modern needs has been responsible for the development by the manufacturers of new and improved products and methods. In 1926 the space requirements for handling the display of these developments were so great that it was necessary to plan the erection of a temporary building, and then to revise the plan to increase greatly the size of this building. Even then, the outdoor space was taxed to hold the display of cars and locomotives.

This year, with the completion of the Auditorium Building, it has been possible to make a larger readjustment of the floor plan, so that the space is being used to better advantage than in past years. At the time of going to press 118,764 sq.ft. of space was being used by 247 exhibitors. This includes displays of state, sectional and other associations and A.E.R.A. committees. The space actually sold is 108,160 sq.ft. in the booths and 1,167 linear feet of track space. The booth space compares with 116,634 sq.ft. last year.

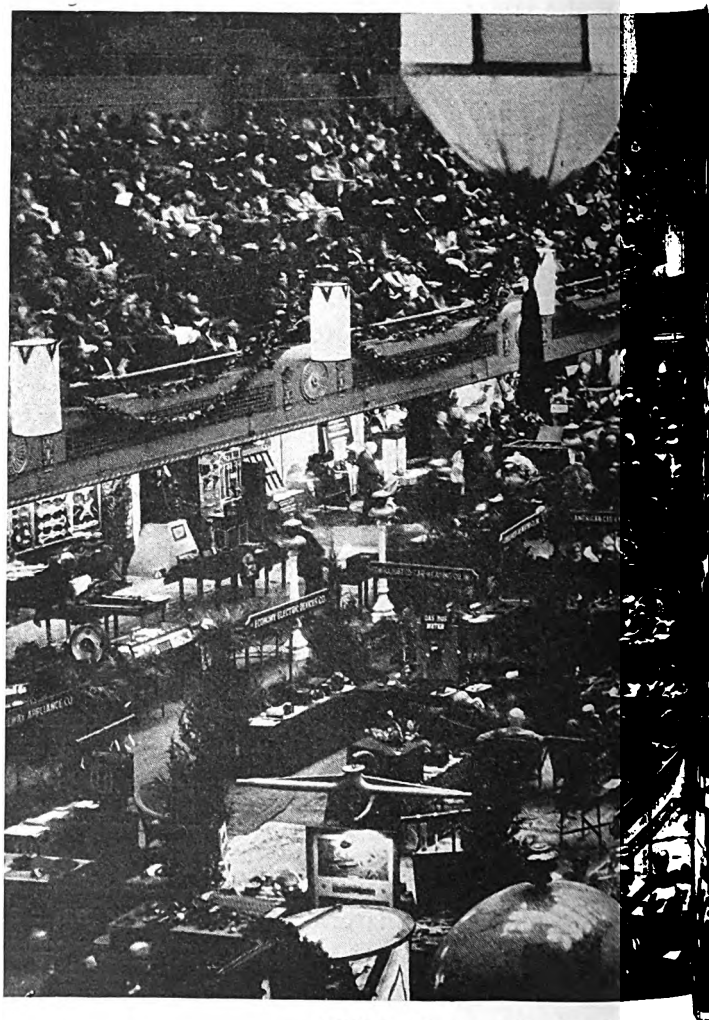
Completion of the north wing of the Auditorium has made possible a rearrangement of the entrance and registration facilities. Those who were at Cleveland will remember the confusion brought about by the use of a number of separate entrance doors along East Sixth Street, with the registration booths along a narrow corridor. This year the main entrance to the convention will be at the north end of the Auditorium. The arrangement is not, however, the same as it was two years ago, for an entrance lobby has been added.

Entering the Arena, the delegate is struck with the brilliancy of an autumn scene. Hundreds of trees have been used for decorations. Their white trunks contrast with the many-colored branches in autumn tints. Draped over the trees are festoons of smilax, giving a touch of evergreen. Even overhead there are trees in a riot of color that has completely transformed the immense hall. In the Auditorium Annex an entirely different scheme has been used to advantage. The decorations are in pastel green and white on black. While contrasting sharply, the lightness and airiness have been carried throughout the plan of decorations.

The numbering system for exhibit spaces is substantially the same as that of last year, making the location of any exhibit easy to find. All the spaces on the main Arena floor are numbered from 100 up to 141, inclusive. Those in the Exhibition Hall beneath begin with 200 and run to 299, with additional booths numbered from 200A up to and including 213A. The covered maintenance-of-way displays in the Esplanade connecting the Auditorium with the Auditorium Annex carry space numbers from 300 to 338. The numbers for the Auditorium Annex are all 400 and above. Those in the north half of the building, at the right of the entrance from the Esplanade, run from 400 to 523 inclusive, while those in the south half, at the left of the entrance, carry numbers from 600 to 685 inclusive.

The general layout of the exhibit follows the plan which has been so successful in the previous shows held in the Auditorium. The Arena floor contains the dis-

Millions of Dollars Worth



Additional space in the Auditorium

of the Cleveland Convention

plays of the large electrical manufacturers, indoor booths of the car builders and car accessory manufacturers and a number of exhibits of general interest.

On the floor below, in Exhibition Hall, are indoor exhibits of trackwork manufacturers and many car specialties. The range of products covers many of the details that go to make up the supply business.

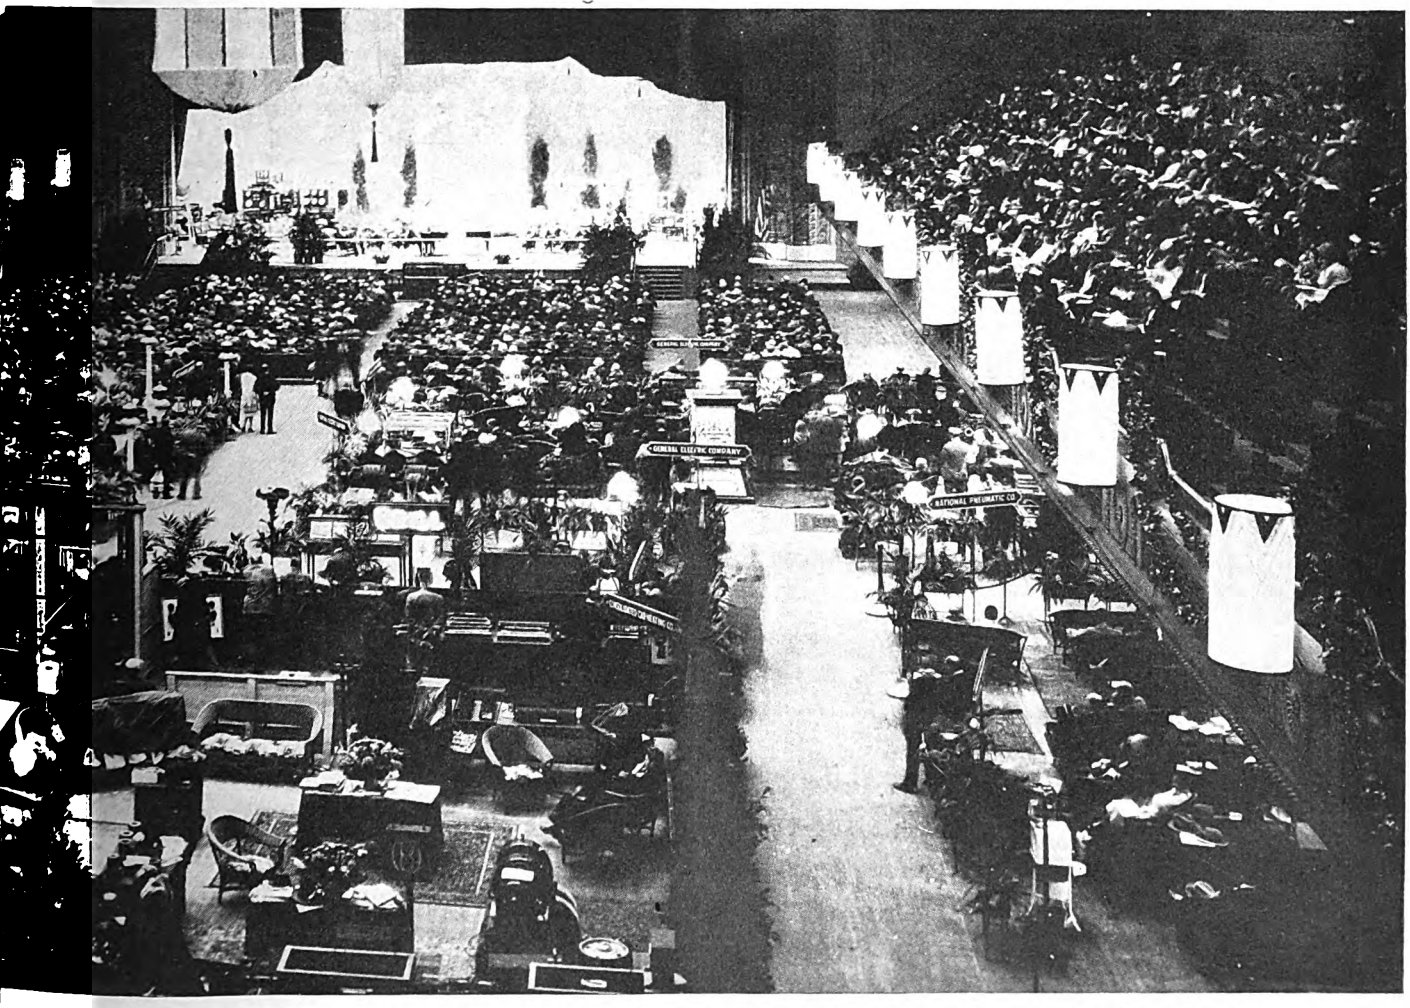
Between the Auditorium and the Annex the Esplanade is taken up principally with working exhibits of maintenance-of-way machinery. In past years these have drawn large crowds of persons who have desired to become more familiar with the actual operation of many of the devices displayed.

To the south of the Esplanade is the open track space. Here are the latest types of city and interurban cars. A great deal of interest attaches to these. Radical innovations have been made by nearly all of the builders, and much time can be spent profitably in an inspection of the developments, the reasons which have prompted them, and the several methods employed for accomplishing such things as weight reduction, greater comfort, better acceleration and improved attractiveness. In this section there also is a complete display of trolley poles and overhead line equipment, erected in actual working order.

As in past exhibits, the Auditorium Annex is devoted largely to the display of buses and bus equipment. Complete buses occupy the center of the hall, immediately in front and to the right of the entrance from the Esplanade. At the north end of the Annex is a display of automotive tools and shop equipment, featuring many recently-developed machines for facilitating the heavy duty of bus repair work. Trucks and chassis are in the center, to the left of the main doorway. At the south end of the building is a display of street car and automotive accessories, covering a wide range of products, including fare collecting and accounting devices, door and window fittings, bearings, trolley fittings, headlights, heaters, glass, seat materials, flooring, and many others.

Completion of the north wing of the Public Auditorium has made available a number of excellent meeting rooms, permitting a rearrangement to much better

of Local Transportation Equipment Are Displayed at A.E.R.A. Gathering



omises even more effective arrangement of the exhibit and meeting rooms than during the colorful show of 1927

Digitized by Google

Much interest attaches to the exhibit of cars and locomotives in the outdoor track space. Even more radical developments than those pictured here are being shown this year

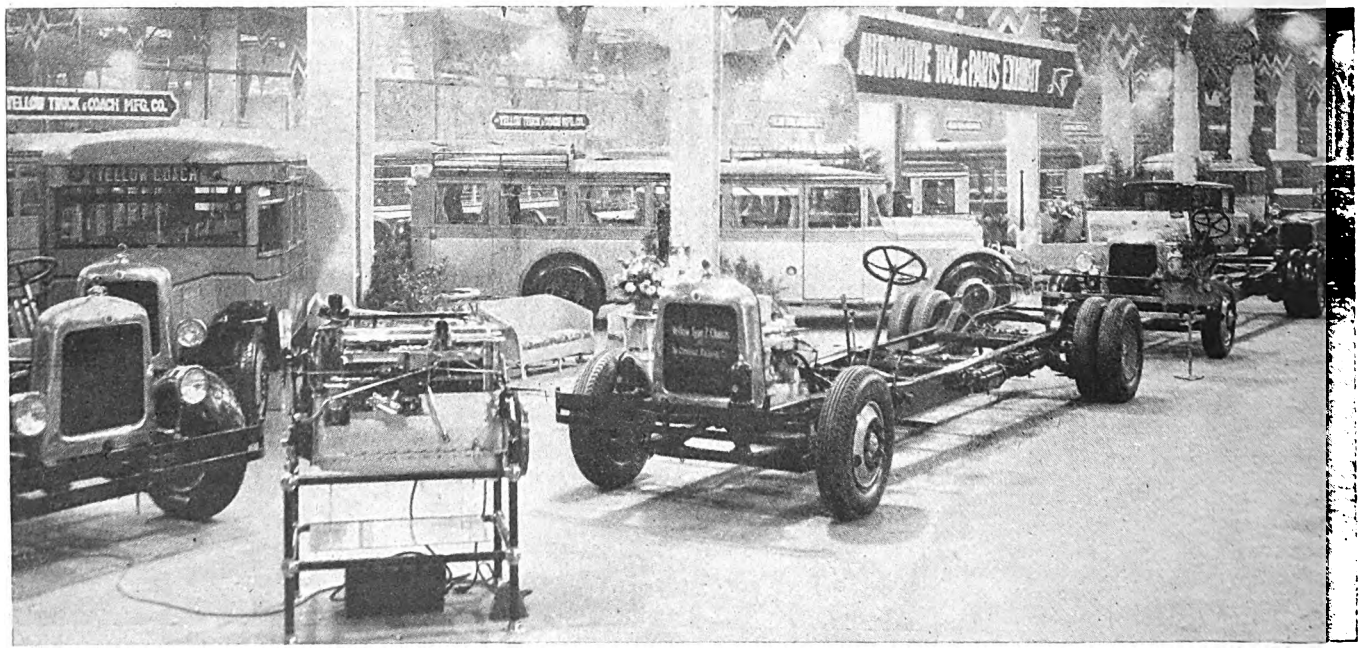
advantage than in the past two years. The American Association meetings will be held in the ballroom on the third floor of the north wing. It is reached most conveniently by the elevators to be found in the lobby at the right of the main entrance. The Accountants' Association meetings will be held in Room A on the same floor and reached by the stairway at the right side of the lobby at the main entrance. Meetings of the Claims Association will be in Room C, on the second floor of the north wing. It is reached by the elevators in the lobby at the right of the main entrance.

The Power Division of the Engineering Association will be held in Room P on the second floor, also reached by the same elevators. The meeting of the Purchases and Stores Division of the Engineering Association on Monday will be in Room S on the mezzanine floor, which is reached by the ramp at the right of the entrance. Wednesday's session of this division will be held along with the Accountants' in Room A. The Rolling Stock Division will hold its meetings in Room R in the lower Exhibition Hall, reached by the stairway at the entrance. The Way and Structures Division will meet in Room W, also in the Exhibition Hall, reached by the stairway. The general meeting of the engineers on Thursday will be held in this same room.

Meetings of the Transportation and Traffic Association will be in Room T, on the second floor, reached by the elevators at the right of the main entrance.

Those attending the Education Committee Training Courses should go to Rooms 257 and 258 on the mezzanine, reached by the ramp.

It would be impossible to give in this article a description of the many innovations on display. In fact, the several articles which make up this issue do little more than give a brief outline of the new products which have been brought out since the last convention.



Not only buses, but bus equipment, parts and general maintenance machinery shown in the Auditorium Annex present many advances over those which attracted wide interest at Cleveland last year

Exhibitors at the 1928 Convention

Directory of all manufacturers at the A. E. R. A. exhibit with company addresses, spaces being occupied, complete lists of products on display and representatives in attendance

ADAMS & WESTLAKE COMPANY, Elkhart, Ind. **Space 604.** Electric car lighting fixtures, brass window sash and curtains for electric cars and buses, automobile and bus lamps, bus lighting equipment. Represented by A. S. Anderson, G. B. Allison, C. E. Banta, Ralph Brown, T. Heaton, T. P. O'Brian, W. G. Porter, R. D. Whitlock, E. E. Whitmore.

AHLBERG BEARING COMPANY, 317 East 29th Street, Chicago, Ill. **Spaces 605, 606.** CJB master ball bearings, Ahlberg ground bearings. Represented by C. J. Bender, P. P. Bender, J. E. Lewis, F. O. Burkholder, R. M. Place, F. J. McNicoll, M. H. Palmer, B. B. Clark, A. S. Benge, R. D. Jones, E. T. Richards.

ALUMINUM COMPANY OF AMERICA, 2400 Oliver Building, Pittsburgh, Pa. **Space 141.** Represented by J. O. Chesley, R. E. Palmer, E. L. Chipman, A. B. Wilber, C. J. Laing, R. P. Hotchkiss, A. H. Woollen, Paul Thornton, S. A. Hartwell, Jr., R. M. Beck, Dain W. Milliman.

AMERICAN BRAKE MATERIALS CORPORATION, 4660 Merritt Avenue, Detroit, Mich. **Space 277.** Latest developments of both thick and thin type Brakebloks for heavy automotive vehicles, automobile passenger cars and industrial machinery. Represented by T. F. Finigan, H. N. Smith, E. Kisby, W. A. Blume, H. D. Harrison, W. F. Seifert, H. A. Gillies, E. C. Clark, F. P. Biggs, W. K. Nelson.

AMERICAN BRAKE SHOE & FOUNDRY COMPANY, 30 Church Street, New York, N. Y. **Space 249.** A.E.R.A. standard patterns of brake shoes, brake heads and keys; Diamond S steel back type shoes; malleable iron brake heads and shoe keys; reception booth.

AMERICAN BRASS COMPANY, 414 Meadow Street, Waterbury, Conn., and the

ANACONDA COPPER MINING COMPANY, 25 Broadway, N. Y. **Space 211A.** Anaconda trolley wire, Hitenso and copper; copper and composite cables for catenary construction; Anaconda seamless connectors for splicing wire and cables; preformed cable; lead sheathed cable; Anaconda hollow conductors; bare and weatherproof copper line wire; Everdur (manganese silicon bronze); seamless and brazed tubing for auto and bus windshields and window casings; nickel, silver and bronze running board moldings. Represented by W. H. Dowd, T. J. Little, H. D. Hawks, C. S. Anderson, W. C. Knoeppel, C. H. Porter, H. G. Burd, F. R. Drake, T. R. Foote.

AMERICAN CAR AND FOUNDRY COMPANY, 30 Church Street, New York, N. Y. **Space, half of 120.** Reception booth. Represented by J. H. Welsbrod, R. J. Smith, A. E. Ostrander, F. H. Gibbs, E. P. Chittenden, J. L. Onderdonk, Thos. Geddes, T. E. Lyons, J. M. Keller, C. P. Dickerman.

AMERICAN CAR AND FOUNDRY MOTORS COMPANY, 30 Church Street, New York, N. Y. **Spaces 618-623.** Complete line of A.C.F. coaches, including 40-passenger metropolitan coach, 29-passenger parlor observation coach, 27-passenger parlor coach, 29-passenger de luxe urban coach, 21-passenger parlor coach, 23-passenger urban coach; two stripped chassis; a Hall-Scott engine display; a cutaway 40-passenger metropolitan coach, showing in detail the structural framing and manner of mounting the power plant and auxiliaries. Represented by C. S. Sale, W. L. Stancliffe, H. Hager, C. C. Castle, W. J. Overman, Henry Ganz, E. M. Hedley, F. S. Beasecker, K. C. Banks, E. W. Bogan, W. E. Cann, H. C. de Raismes, F. H. Foglesong, J. N. Goold, B. L. Graves, R. S. Hayes, L. H. Hyneman, Frank Jay, L. V. Joyce, F. L. Martin, W. L. McCormick, Chas. W. Morey, H. G. Nichols, Jay T. Putney, W. E. Reed, C. W. Wood, P. W. Wood, L. E. Vogt, J. W. Robb, J. J. McMahon, L. E. Hess, J. H. Stickney, F. A. Whitten, Fred E. Dayes, Theo. Renton, Burt Van Gorp, John Watters, Fred Koenig.

AMERICAN ELECTRIC RAILWAY ASSOCIATION COMMITTEES. See page 498.

AMERICAN FORK & HOE COMPANY, 1623 Euclid Avenue, Cleveland, Ohio. **Space 335.** True temper tapered rail joint shims, Stead True Temper rail anchors. Represented by S. L. Henderson, A. F. Fifield, J. T. Reagan, C. H. Wagner, G. B. Durell, W. Withington, A. W. Ferguson, S. S. Chapin.

AMERICAN STEEL & WIRE COMPANY, 208 South LaSalle Street, Chicago, Ill. **Space 206.** Complete line of rail bonds, electrical wires and cables, wire rope, etc. Represented by C. S. Knight, R. E. Francisco, John May, Herman Barthell, H. H. Febrey, A. T. Merriman, Clarence Gilchrist, R. C. Pierce, C. F. Wiley, W. H. Cordes.

ANDERSON BODY COMPANY, Sidney, Ohio. **Spaces 505-507.**

ANDERSON BRAKE ADJUSTER COMPANY, 22nd and Belt Line, Omaha, Neb. **Space 232.** Working exhibit of latest type Anderson non-vibrating slack adjuster, particularly suited for beamless brake rigging; specimens of other types. Represented by C. O. Anderson.

ARCO COMPANY, 6408 Euclid Avenue, Cleveland, Ohio. **Spaces 498, 499.** Display showing in detail all steps in the process of coach body finishing in the Arcozon Pyroxylin system, producing a gloss finish without polishing. Represented by Richard R. Paradies, Geo. B. Sawyer, H. J. Hoffman, S. D. Moore.

ART RATTAN WORKS, INC., Cleveland, Ohio, and Oakland, Cal. **Space 404.** Latest designs in bus seats, including wicker and fully-upholstered parlor car and urban seats; new type reclining back seat. Represented by Charles E. Ferreira, Carl F. Krumhar, George G. Barney.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS, 1847 McCormick Building, Chicago, Ill. **Space 210A.** Chilled tread street car wheels, rim and apex of the flange of which have been covered with chiller. Represented by G. E. Doke, S. C. Massari.

B

BALDWIN LOCOMOTIVE WORKS, Paschall Station, Philadelphia, Pa. **Space 208A.** Truck of the equalized pedestal type for use under heavy, high-speed, interurban passenger cars. Represented by A. H. Ehle, R. M. Campbell, Chas. E. Hale, Lewis W. Metzger, Jr., W. H. Evans, H. J. Snowden, G. J. F. Carpenter.

BENDER BODY COMPANY, 6201 Barberton Avenue, Cleveland, Ohio. **Spaces 600-603.** Bus bodies.

BENDIX BRAKE COMPANY, South Bend, Ind. **Space 407.** Bendix 4 brakes. Represented by D. K. Moore, R. S. Sanford, A. C. Chambers, H. L. Sharlock.

BETHLEHEM STEEL COMPANY, Bethlehem, Pa. **Spaces 283-289.** Special trackwork; pressed steel flangeway guard for roadway crossings; Bethlehem-Keystone metal tie; rolled steel car wheels, axles, armature shafts, gear blanks and brake drums; commercial and industrial applications of Bethlehem torque amplifier; rolled steel truck wheels; items of structural tool and alloy steels and bolt and nut products for the electric railway field. Represented by N. E. Salsich, J. H. Budd, W. E. Loomis, J. L. Toler, G. H. Riddle, J. W. Murphy, R. R. Deghuee, J. V. Honeycutt, R. Knibloe, C. L. Mosses, A. K. Boot, J. H. Smiley, C. W. Nieman, J. P. Madden, A. W. Stoever, E. B. C. Goyne, H. W. Prindle, J. C. Chandler, W. B. Pritchard, C. A. Alden, R. L. Gillispie, M. Vickers, J. L. Tygart, F. M. Hoffman, T. E. Hooper, C. E. Fry.

BINKS SPRAY EQUIPMENT COMPANY, 3124 Carroll Avenue, Chicago, Ill. **Spaces 425, 427.** Complete line of spray finishing and ventilating equipment; everything for refinishing street cars and motor buses, including the new improved spray gun and enclosed type window fans, air motor agitated pressure material containers, etc. Represented by V. G. Green, R. L. Fisher.

BLANCHARD BRO. & LANE, 20 Bruen Street, Newark, N. J. **Space 650.** Genuine leather for the upholstering of buses and automobiles. Represented by William H. Ressland, Curtis S. Withrow, William M. Lalor, Chas. C. Gunterberg, Ryan Sales Engineering Company representatives.

ROBERT BOSCH MAGNETO COMPANY, INC., 3601 Queens Boulevard, Long Island City, N. Y. **Space 617.** Bosch Super-Energy magnetos, Pyro-Action spark plugs, voltage regulated generators, horns, windshield wipers, spotlights and other automotive electrical equipment suited for bus use; a new generator; Bosch type FD horn, offered for the first time for bus service. Represented by A. F. Wagner.

BRAGG - KLIESRATH CORPORATION, Queens Boulevard & Harold Avenue, Long Island City, N. Y. **Space 406.** Brake boosters, slack adjusters.

J. G. BRILL COMPANY, 62nd and Woodland Avenue, Philadelphia, Pa. **Space, half of 120 and track D.** New car for the Delaware Electric Power Company, Wilmington, Del., and new interurban for Monongahela-West Penn Public Service, Fairmont, West Va., on track D; indoor exhibit, latest type Brill seats for electric railway and motorbus service; demonstration of the improved type Brill mechanical slack adjuster; display of recent truck improvements for reducing maintenance, including journal box wear plates, wear caps and bushings for halfball brake hangers and systematic lubrication of brake hangers and bottom brake rods. J. G. Brill Company represented by Samuel M. Curwen, George M. Haskell, George Frey, J. E. Brill, S. T. Bole, George Keller, W. S. Adams, J. A. Hanna, E. Slingluff, Jr., J. A. Brooks, A. J. Briddes, E. T. Deal, A. M. Robinson, W. L. Brown, W. M. Horsell; G. C. Kuhlman Car Company represented by H. K. Hauck, H. G. Arthur, L. G. Sircoulomb, C. N. Pittinger, E. Slingluff, R. H. Watts, C. F. Dennis, T. B. Richardson, H. Hummel; American Car Company represented by F. A. Richards, F. L. Markham, R. S. Hood, Jr., Wirt L. Haymond, W. J. Mackle, B. Schechter; Wason Manufacturing Company represented by C. F. Johnson, R. T. Foster.

BROWN-LIPE GEAR COMPANY, 1117 West Fayette Street, Syracuse, N. Y. **Space 437.** Transmissions, clutches, controls, power take off assemblies.

BUDA COMPANY, Harvey, Ill. **Space 209A.** Photographs and models of special trackwork, track liners and spring boxes. Represented by R. B. Fisher, H. L. Miller, F. W. Marvel, C. T. Miller, H. Brown, P. W. Wood.

BUDD WHEEL COMPANY, 12141 East Charlevoix Avenue, Detroit, Mich. **Space 480.** Budd dual wheel, showing mounting of a 20-in. and 24-in. diameter wheel on same hub; one dual assembly of 9.75 balloon tires on 22-in. rim, showing standard double cap nut method of mounting. Represented by E. A. Clark, E. S. Ingham, C. L. Wenzel, J. H. Barnes.

"BUS AGE," 461 Eighth Avenue, New York, N. Y. **Space 520.** Copies of *Bus Age* and literature. Represented by J. M. Wile, George M. Sangster.

"BUS TRANSPORTATION" Tenth Avenue at 36th Street, New York, N. Y. **Space 102.** Copies of *Bus Transportation* and other McGraw-Hill publications. Represented by James H. McGraw, Louis F. Stoll, C. W. Stocks, R. E. Plimpton, E. F. Theisinger, R. F. Deitz, Frank Dannhauser, T. F. Mueller, Warren Drew, O. A. Feldon, Frederic Rueckert, D. G. Heinly, W. K. Beard, F. A. Miller.

C

CANADIAN CLEVELAND FARE BOX COMPANY, LTD., Preston, Ontario, Canada. **Space 665.** Double-locked fare boxes, zone check boxes, change carriers. Represented by M. C. McElligott, W. Shaw.

PHILIP CAREY COMPANY, Lockland, Cincinnati, Ohio. **Spaces 258, 260.** Rail filler, rail cushion, track pavement, flooring, third rail covering, cable trunking, foot blocking and expansion joint, all of Elastite. Represented by C. V. R. Fullenwider, O. E. Keller, C. L. Addleman, R. J. Scott, W. M. Carlson, C. F. Kayser.

C. G. SPRING AND BUMPER COMPANY, 2660 East Grand Boulevard, Detroit, Mich. **Spaces 513, 514.** Heavy duty spring type bumpers for trucks, buses, taxicabs and street cars. Represented by Fred A. Cornell, B M. Short, F. H. Goodrich, H. P. Moss, N. Y. Kristensen, C. R. Griffiths.

L. C. CHASE & COMPANY, 89 Franklin Street, Boston, Mass. **Space 405.** Chase Velmo, mohair velvet and Chase Leatherwove, imitation leather, showing the latest developments in pat-

Exhibitors at the 1928 Convention

terns and colors. Represented by E. R. Campbell, C. J. Dyer, J. L. Gibson, McArthur Noyes.

CHASE APPLIANCE CORPORATION, 11 West 42nd Street, New York, N. Y. **Space, half of 281.** Silencers for railway tracks, insulated railway rails, noiseless rail fastenings, rail anchor tie plates for railway track. Represented by Warren Osborn.

CHEATHAM ELECTRIC SWITCHING DEVICE COMPANY, 4779 Louisville Avenue, Louisville, Ky. **Space 263.** Actual demonstration of switch point being thrown electrically by the latest type Cheatham switch; improved and shorter type ground box, patented spring holding mechanism, improved circuit changer with or without locking attachment to prevent splitting of switch points; improved light weight contactor. Represented by E. S. Olmsted, Everett C. Brown, S. S. Stolp, R. E. Tafel, R. S. Bowen, John H. Miller, J. D. Augustus.

CHICAGO, NORTH SHORE & MILWAUKEE RAILROAD, 72 West Adams Street, Chicago, Ill. **Space 421.** Complete model of section of the North Shore line and poster displays.

CHILLINGWORTH MANUFACTURING COMPANY, Jersey City, N. J. **Space 616.** Representative types of motor gear cases of the one-piece construction. Represented by G. K. Wanamaker, J. W. Gerke.

CHILTON CLASS JOURNAL COMPANY, 56th and Chestnut Streets, Philadelphia, Pa. **Space 502.** Magazines. Represented by A. W. Brownell, E. E. Elder, George W. Pfeil, Albert G. Metz, Pete Keenan, David Beecroft.

CHRISTENSEN AIR BRAKE COMPANY, 6511 - 15 Cedar Avenue, Cleveland, Ohio. **Space 423.** Bus, truck and trailer air brakes; vacuum air brakes. Represented by Niels A. Christensen, David P. Sawyer, Chas. F. Smith, John J. Brings, A. N. Abelson.

CINCINNATI CAR COMPANY, Cincinnati, Ohio. **Track Space.** One of ten interurban cars for the Indianapolis & Southeastern Railway, one of hundred city cars for the Cincinnati Street Railway.

CLARK EQUIPMENT COMPANY, Buchanan, Mich. **Space 607.** Bus and truck axles, wheels.

CLEVELAND FARE BOX COMPANY, 4900 Lexington Avenue, Cleveland, Ohio. **Space 664.** Double-locked fare boxes, zone check boxes, change carriers. Represented by W. T. Cook, W. Shaw, V. G. Cook, M. C. McElligott.

CLEVELAND FROG & CROSSING COMPANY, 6917 Bessemer Avenue, S. E., Cleveland, Ohio. **Space 278.** Special trackwork. Represented by G. C. Lucas, L. G. Parker, G. A. Peabody, J. A. Donahey, H. I. Prentice.

CLEVELAND PNEUMATIC TOOL COMPANY, 3734 E. 78th Street, Cleveland, Ohio. **Space 452.** Gruss and Westinghouse shock absorbers. Represented by P. J. Hipes, B. H. Prauty, Jr., Ovid Holtan, J. W. Broughton, E. Kreuger, S. Swift, Earl Schultz, F. H. Burr, D. R. Taylor, H. A. Lantz.

CLEVELAND RAILWAY, Cleveland, Ohio. **Track Space.** Articulated unit.

CLEVELAND SOUTHWESTERN RAILWAY & LIGHT COMPANY, 1670 Union Trust Building, Cleveland, Ohio. **Track J.** Interurban car with latest designed seating and seating arrangement. Represented by F. Hurlson, J. W. Osborne, E. L. Hukiee, C. J. Moyers, J. A. Nester.

CLEVELAND TANNING COMPANY, Denison Avenue and Jennings Road, Cleveland, Ohio. **Space 496.** Upholstering leathers for all mediums of transportation. Represented by F. R. Wilhelmy, W. G. Plumer, Albert Hoinke, A. H. Sisson, S. W. Midgley, R. W. Preikschat.

BARRON G. COLLIER, INC., 220 West 42nd Street, New York, N. Y. **Space 104.** Reception booth. Represented by Barron Collier, Edwin C. Faber, T. H. Lumsden, B. V. Swenson.

COLLIER CONSTRUCTION COMPANY, 500 East 102nd Street, Cleveland, Ohio. **Space 311.** Map of distribution system and car lines of Cincinnati Street Railway, with miniature lamps and toy train to show difference in voltage and power conditions effected by installation of 19 new automatic substations. Represented by P. C. Collier, Frank Simpson, W. D. Smoot, M. B. Stahl.

CONSOLIDATED CAR-HEATING COMPANY, INC., 413 North Pearl Street, Albany, N. Y. **Spaces 118, 119.** Motor resistor heaters, buzzers, treadle operated doors, control switches, bells, pneumatic door engines, safety switches, automatic ventilators, relays, fuse boxes, thermostats, resistor boxes, electric car heaters, signals. Represented by Cornell S. Hawley, John W. Conway, William S. Hammond, Jay A. Robinson, George E. Oakley, Harry L. Hawley, Robert J. Parsons, Curtis N. Brown.

CONTINENTAL MOTORS CORPORATION, Detroit, Mich. **Space 497.** Latest engine designs, developed for bus, truck and industrial uses; sectional bus engine, operating to show all moving parts. Represented by O. R. Baird, C. P. Russell, Harry Kline, F. T. Gould, D. A. Andrews, W. A. Frederick, G. W. Blackinton.

COWDREY BRAKE TESTER ORGANIZATION, INC., Fitchburg, Mass. **Space, half of 663.** No. 11A Cowdrey dynamic brake tester. Represented by C. Francis Cowdrey, Jr. Also members of the National Railway Appliance Co., of New York and Hegeman-Castle Corporation of Chicago.

CREW LEVICK COMPANY, 60 Wall Street, New York, N. Y. **Space 492.**

CURTIN - HOWE CORPORATION, 11 Park Place, New York, N. Y. **Space 225.** Sections of poles, ties, car lumber, etc., preserved with ZMA; sections of car panels treated with ZMA and painted; photographs of treating plants using ZMA and ZMA treated timber. Represented by E. H. Walker, W. G. Ritt.

D

DAYTON MECHANICAL TIE COMPANY, Dayton, Ohio. **Spaces 257, 259.** Reception booth.

DAYTON STEEL FOUNDRY COMPANY, Miami Chapel Road and B & O Railroad, Dayton, Ohio. **Space 430.** Dayton steel truck wheels. Represented by George Walther, C. F. Baker, G. A. Baker, R. D. Rothaar, A. R. Lambert.

DE LUXE PRODUCTS CORPORATION, LaPorte, Ind. **Space 454.** New improved de luxe light weight cast iron piston. Represented by L. B. Boyd, H. A. Lightner, W. J. Pollay, C. N. Bentley, E. E. Crowe.

DE VILBISS COMPANY, Toledo, Ohio. **Space 500.** Spray-finishing and spray-painting equipment for steel cars, buses, bridges and buildings; compressing outfits, both motor and gasoline engine driven, pressure feed paint tanks, air and fluid hose, spray guns, other accessories; miniature working model of car exhausting equipments installed for the Cincinnati Street Railway and Cincinnati Car Company. Represented by E. G. Whitmore, members of sales organization.

DE WALTS PRODUCTS CORPORATION, Leola, Pa. **Space 512.**

DIFFERENTIAL STEEL CAR COMPANY, Findlay, Ohio. **Exhibit on track.** Differential electric dump car, electric locomotive crane car and three-way dump body; Clark concrete breaker. Represented by H. Fort Flowers, Harry T. Thompson, Shelly G. Hughes, Ralph E. Stuntz, Emerson M. Blackford.

C. L. DOWNEY COMPANY, 941-947 Clark Street, Cincinnati, Ohio. **Space 666.** Model B-42 mechanical coin teller, S-53 mechanical coin teller, S-RM coin wrapping machine, S-RH coin wrapping machine, show case with counting room supplies. Represented by C. Lee Downey, Ralph K. Long, Lawrence F. Bateman, W. Shaw.

E

EAGLE - OTTAWA LEATHER COMPANY, Grand Haven, Mich. **Space, half of 501.** Leather for de luxe buses.

C. I. EARLL, 142 Susquehanna Avenue, York, Pa. **Space 615.** Trolley catchers and trolley retrievers in operation. Represented by C. I. Earll, H. E. Uhler.

EATON AXLE AND SPRING COMPANY, East 65th and Central Avenue, Cleveland, Ohio. **Spaces 630, 632.** Truck and bus axles.

EBERHARD MANUFACTURING COMPANY, 2734 Tennyson Road, Cleveland, Ohio. **Space 627.** Door controls, folding and rigid seat pedestals, screen holders, emergency door locks, door hinges, folding steps, general line of body braces and corner irons. Represented by Arthur L. Wheeler, Carl R. Hennicke, William Bauer, Charles A. Hennicke, George Thobaben.

ECLIPSE RAILWAY SUPPLY COMPANY, 4824 Payne Avenue, Cleveland, Ohio. **Space 248.** Car fenders, standard lifeguards, H. B. type, trolley retrievers for heavy pole tension, Eclipse No. 10 trolley retriever for sliding shoe service with light pole tension, trolley catchers. Represented by Ross Forward, Paul N. Van Epp.

ECONOMY ELECTRIC DEVICES COMPANY, 37 West Van Buren Street, Chicago, Ill. **Space, part of 116.** Gasoline meters, watt-hour meters, car heaters, car materials.

O. M. EDWARDS COMPANY, INC., Corner Plum and Solar Streets, Syracuse, N. Y. **Space 671.** Metal sash, window fixtures, weatherstripping, sash balances, metal stop casings, anti-rattling devices, vestibule trap doors. Represented by Harold Edwards, J. J. Edwards, H. A. Cronmiller, E. F. Chaffee, F. W. Chaffee, C. H. Rockwell.

ELECTRIC RAILWAY IMPROVEMENT COMPANY, 2070 E. 61st Place, Cleveland, Ohio. **Spaces 330, 331.** Steel arc weld rail bonds, gas weld bonds, copper arc weld bonds and brazed bonds, rheostats for arc weld bonding or brazing with necessary auxiliary welding equipment and brazing furnaces. Represented by F. H. Neff, P. T. Bevers, N. G. Carlson, W. E. Huber, L. J. Rinker, E. B. Moore.

"ELECTRIC RAILWAY JOURNAL," Tenth Avenue at 36th Street, New York, N. Y. **Space 101.** Copies of *Electric Railway Journal* and other McGraw-Hill publications. Represented by James H. McGraw, Louis F. Stoll, Charles Gordon, Morris Buck, John A. Miller, Jr., Clarence W. Squier, George J. MacMurray, J. W. McCloy, Clifford A. Faust, L. H. Church, Victor A. Hanson, Frank Dannhauser, T. F. Mueller, Warren Drew, O. A. Feldon, Frederic Rueckert, D. G. Heinly, W. K. Beard, F. A. Miller.

ELECTRIC SERVICE SUPPLIES COMPANY, 17th and Cambria Streets, Philadelphia, Pa. **Spaces 271 - 276.** Rail bonds, trolley guards, Shelby poles, trolley wheels, compensating series lamp fixtures, Keystone trolley catchers, Golden Glow headlights, International fare registers, vehicle light reflectors, motorman gongs, bus combination rear and stop light, Faraday passenger signal systems, Safety car lighting fixtures, Ivanhoe bus lighting fixtures, emergency car lighting system, rear lights, Keystone and Hunter illuminated destination signs, car and bus mats, steel gear cases, air valves, Samson trolley cord, change carriers, Garton - Daniels d.c. lightning arresters, rear view mirrors for buses, Golden Glow bus headlights, enameled badges, automatic door signal systems, Golden Glow floodlighting projectors. Represented by Chas. J. Mayer, A. H. Englund, H. G. Lewis, Hugh Millar, Chas. W. Weber, J. L. Brown, W. A. Armstrong, F. Coakley, R. Krienberg, I. W. Schmidt, Gale car bus on 75 chassis, 75 heavy duty bus chassis, "Seminole" 22-passenger parlor observation Hunter, H. A. Stone, L. S. Belding, Geo. E. Ackerman, M. S. Earl, J. H. Mahler.

"ELECTRIC TRACTION," 431 S. Dearborn Street, Chicago, Ill. **Space 103.** Reception booth; copies of *Electric Traction* and *Traction Shop and Roadway*, including convention souvenir issues; copies of Electric Traction Pocket List; silver speed trophy, to be awarded to the fastest interurban. Represented by K. J. Kenfield, Claude L. Van Auken, R. S. Torgerson, F. E. Owens, James E. Lytle, E. E. Bodin, A. F. Smith, M. L. Lyles.

ELLCON COMPANY, 50 Church Street, New York, N. Y. **Space 678.** White porcelain enameled stanchions and hand rails with especially designed metal fittings; diamond ball bearing door hangers; porcelain enameled steel pipe, tubing and sheet in various colors. Represented by W. M. Wampler, G. H. Ord, C. A. Koenig.

EVERHOT MANUFACTURING COMPANY, Maywood, Ill. **Space 265.** Electric, gas and air, and gasoline branding irons; blow torches and soldering irons; Ray-O-Lite combination sign. Represented by A. C. Flothow, John H. Payton, C. I. Upton.

F

FEDERAL-MOGUL CORPORATION, 11031 Shoemaker, Detroit, Mich. **Space 519.** Bronze back babbitt lined connecting rod and main and crankshaft bearings, both standard size and undersize; bronze bushings, such as piston pin bushings, etc.; babbitt metals for shop maintenance and for connecting rod work; bronze cored and solid bar stock; line boring tool for crankshaft and camshaft bearing work. Represented by David W. Rodger, Frank Kellison, John F. O'Doherty, Harry A. Shoemaker.

FERALITE CORPORATION, 220 Westfield Avenue, West, Roselle Park, N. J. **Space 629.** Rail welding portions, complete with all accessories such as sand

Bus body and chassis manufacturers are showing several new models in addition to many exhibited in 1927

cores, thimbles, mold boxes, patterns, butt welding clamps, crucibles, etc.; rail welding preheater with rubber tires to operate off 550 d.c. line. Represented by James F. O'Hanlon, Henry J. Barnes, Robert R. Applegate.

FERODO AND ASBESTOS, INC., New Brunswick, N. J. **Space 494.** Bonded asbestos brake lining, used with automotive type brakes on street cars. Represented by John H. Watrous, Lester T. McAuliffe, James J. Reynolds, Edward J. Pope.

FITZJOHN MANUFACTURING COMPANY, Muskegon, Mich. **Spaces 402, 403.** Observation, 21-passenger parlor coach, 21-passenger street car type pay-enter body. Represented by H. A. Fitzjohn, Geo. H. Hermanson, Chas. H. Thunfors.

FOUR-WAY LOCK COMPANY, 4900 Lexington Avenue, Cleveland, Ohio. **Space 668.** Padlocks, cylinders, night latches, drawer locks, chest locks. Represented by W. T. Cook, W. Shaw, V. G. Cook, Jos. P. Muzzio.

FRASER ELECTRIC TRANSMISSION CORPORATION, 2269 Ashland Road, Cleveland, Ohio. **Space 662.** One complete Fraser electro-control unit; component parts for this unit; one 29-passenger bus in operation. Represented by E. M. Fraser, Walter C. Willard.

FREMONT METAL BODY COMPANY, Fremont, Ohio. **Space 477.** One de luxe model 1000 21-passenger observation parlor coach body mounted on Studebaker 76 bus chassis. Represented by Lawrence C. Freeh, Marshall H. Bixler, Clayton D. Beck.

FULLER & SONS MANUFACTURING COMPANY, Kalamazoo, Mich. **Space 424.** Latest models in bus, truck and taxicab transmissions, models being cutaway samples, electrically driven, to show full operation of clutch and transmission. Represented by W. H. Schmidt, G. A. Moerschel, L. A. Bixby, E. L. Ludvigsen, John H. Earle.

FYRE-FREEZ CORPORATION, 17 West 46th Street, New York, N. Y. **Space 316.** Carbon dioxide Fyre-Freez extinguishers. Represented by H. B. Teter, Lee C. Herrick, David Leerburger, Lester H. Carragan.

G

GENERAL ELECTRIC COMPANY, Schenectady, N. Y. **Space 113.** Supervisory control equipment, telemetering equipment, MC-2 air circuit breaker, FKR-55 oil circuit breakers, JR-25 high speed breaker, automatic sectionalizing switch, line material, carbon brushes, railway motors, gear reduction unit, constant oil level bearing, brushholders, control, resistors.

GENERAL MOTORS TRUCK COMPANY, Pontiac, Mich. **Spaces 412-419.** Type Y parlor coach, type Y chassis, type W chassis, type W parlor car, type W city service coach, type Z-240 chassis, type Z-240 parlor car, type Z-240 city service coach, gas-electric chassis, T-42 truck with line repair body, cut away sleeve valve engine. Represented by J. A. Ritchie, P. W. Seiler, G. A. Green, H. E. Listman, E. D. Rutherford, F. J. Brackett, C. A. Epperson, G. B. Fay, J. D. Trueblood, J. J. St. Croix, E. J. Stone, R. C. Snell, M. H. Allen, A. R. Blewett, J. I. Byers, J. G. Campbell, E. F. Drew, R. E. Fielder, L. L. Weidman, J. C. Watts, C. W. Ford, C. F. Knull, T. D. Lenehan, G. A. MacLean, F. W. McDonald, L. H. Reese, T. A. Slattery, C. R. Smith, I. P. Smith, R. S. Smith.

A. GILBERT & SONS BRASS FOUNDRY COMPANY, St. Louis, Mo. **Space 679.** Railroad car and engine bearings, armature and axle bearings, trolley wheels, check plates, journal bearings, ears, frogs, crossings, hangers, stick brass and bushings, babbitt metals, solders, fire extinguishers. Represented by Chas. F. Gilbert, D. M. Brydle, D. U. Browning, J. L. Morenz, H. M. Frank.

GLIDDEN COMPANY, Cleveland, Ohio. **Spaces 449, half of 451.** Bus body showing the latest development in finishing buses in the G. M. F. and Ripolin system as well as other items used on a bus, such as roof enamels, headlining enamels, inside finishers, etc.; panels showing other types of finishes. Represented by L. E. Dean, J. H. Lathe, J. O. Pope, J. L. Noon, E. P. Van Patten, C. H. Brethauer.

GLOBE TICKET COMPANY, 112 N. Twelfth Street, Philadelphia, Pa. **Spaces 279, 280.** Samples of the new transfers installed in Akron, Johnstown and Toledo; samples of the Buffalo transfers; full line of books, cash fare receipts and fare tickets. Represented by William P. Snow, David C. Spencer, Dan T. Morgan, Harry C. Battin, George C. Bowers, Frank W. Rugg.

W. S. GODWIN COMPANY, INC., Race and McComas Streets, Baltimore, Md. **Space 125.** Full sized models of different kinds of track paving protected with steel paving guards. Represented by W. S. Godwin, L. Perkins.

GOLD CAR HEATING & LIGHTING COMPANY, 220 36th Street, Brooklyn, N. Y. **Space 234.** Standard open coil electric heaters with interchangeable elements, electric heaters equipped with enclosed type elements, switches, ventilators, automatic temperature regulating system. Represented by E. B. Wilson, Franklin H. Smith.

GRAHAM BROTHERS, Detroit, Mich. **Space 420.** Street car type 21-passenger motor coach, 16-passenger parlor car type coach, 21-passenger inter-city type utility bus. Represented by A. H. Ferrandou, G. P. Anderson, Edward Kilroe, H. W. Hayes, F. Sage, S. B. Simpson, Harry Bonelli, D. C. McCallum, W. F. Marion, A. E. Cooney.

GRAMM MOTORS, INC., Lima, Ohio. **Space 659.** Type R-31, 236-in. wheel base chassis; type R-31, 236-in. wheel base parlor car coach. Represented by B. A. Gramm, W. J. Gramm, E. G. Crawford, A. B. Kinney, R. E. Schreider, W. J. Grover, H. E. Murray, H. E. Ream.

GRIFFIN WHEEL COMPANY, Chicago, Ill. **Space 106.** One 26-in. 325-lb. spoke wheel, one 33-in. 650-lb. double plate interurban wheel, one 33-in. single plate wheel with section cut out to show the chilled surface. Represented by A. A. Hale, C. P. Whitcomb, Frank Flinn, T. A. Amberg, G. Acker, Lee Saxton.

GUIDE MOTOR LAMP MANUFACTURING COMPANY, Cleveland, Ohio. **Space 685.** Actual operation and method of adjustment of Guide tilt ray headlamps for trucks and motor coaches; complete illuminated display of dome lamps, marker lamps and combination stop-tail lamps. Represented by C. J. McLaughlin, A. E. Harris, W. A. Roettinger.

GUNITE CORPORATION, Rockford, Ill. **Space 431.** Gunite, the graphitic steel; Gunite brake drums, clutch pressure plates. Represented by D. P. Forbes, J. A. Forbes, C. W. Rhoades.

H

HALE & KILBURN COMPANY, 1800 W. Lehigh Avenue, Philadelphia, Pa. **Spaces 215-217.** New type reversible cross seat, two-passenger chair for interurban use, two passenger interurban cross seat, double rotating chair, two-passenger stationary cross seat of semi-chair design, single chair, new types interurban parlor car chairs, double rotating chair with collapsible division armrest, regular cross type motor bus seats, double motor coach chairs, new type double motor bus chair with reclining backs, other types chairs and seats. Represented by W. M. Swope, R. F. Stubblebine, H. B. Gengenbach, R. O. Young, W. G. Flood.

HANNUM MANUFACTURING COMPANY, 60-80 Keefe Avenue, Milwaukee, Wis. **Space 631.** Auto bus and motor truck steering gears. Represented by J. P. Case, J. E. Cummings, Geo. H. Hannum, Glen G. Holt.

HASKELITE MANUFACTURING CORPORATION, 120 South La Salle Street, Chicago, Ill. **Space 401.** Haskelite, Plymetl and Aluminum-Plymetl; Haskelite roofs, headlinings, flooring, advertising racks, inside linings, bulkheads, dash boards, instrument boards and seats; Plymetl exterior waste panels, vestibule linings, sub-flooring and other applications. Represented by James R. Fitzpatrick, James J. Dunne, Lee C. Nash, Alberta E. Bustard, Charles B. Norris, Joseph A. Potchen, Gerald M. Hanrahan, Lyman G. Hill, Emory W. Stoner.

HERCULES MOTORS CORPORATION, Canton, Ohio and Los Angeles, Cal. **Space 495.** Six-cylinder heavy-duty engines, models XYC, 4⅛-in.x4½-in., WXC, 4-in.x4½-in., WXD, 3½-in.x4½-in.; crankshafts, pistons, bearings, connecting rods, oil pump, water pump, etc. Represented by Charles Balough, John Keplinger, Dave Latta, C. R. Schuler.

HEYWOOD - WAKEFIELD COMPANY, 209 Washington Street, Boston, Mass. **Space 206 A.** Seats and seating for electric railways and buses, canvas lined and unlined rattan car seat webbing, rattan for snow sweepers. Represented by George E. Cornwall, Bertram Berry, C. E. Preble, T. D. Owler, J. V. Conway, W. E. Foreman.

H. H. TROLLEY SUPPLY COMPANY, 1965 East 66th Street, Cleveland, Ohio. **Space 643.** Trolley harps and wheels, trolley base, conductor seats, motorman seats. Represented by H. Holland.

HIGHWAY TRAILER COMPANY, Edgerton, Wis. **Space 310.** Highway earth boring machine and pole setter. Represented by W. S. Pedley, F. C. Gokey, C. W. Hammond, E. J. Shaffrank.

HILLIARD CORPORATION, 102 West Fourth Street. **Space 317.** Refinoroil, a fully automatic machine for reclaiming used crank case oil. Represented by Edward Mooers, Eugene H. Proulx, Eugene G. Ballard, Fred W. Dixon.

HUDSON ELECTRICAL HEATING CORPORATION, 11 West 42nd Street, New York, N. Y. **Space, half of 281.**

HUNT-SPILLER MANUFACTURING CORPORATION, 383 Dorchester Avenue, S, Boston, Mass. **Space 408.** Air furnace gun iron brake drums for trucks and buses, both wheel and propeller shaft types. Represented by Victor W. Ellet, Morris B. Brewster, Leroy Arringdale, Joseph Goostray.

HYATT ROLLER BEARING COMPANY, Newark, N. J. **Spaces 633-635.** Hyatt roller bearing journal boxes to fit standard A.E.R.E.A. pedestals, size for size; Hyatt roller bearings applied to electric railway motors, as well as Hyatt equipment employed in shop applications, like line shafting, machine tools, material handling systems, etc. Represented by H. K. Porter, C. A. Johnson, J. W. Wiley, V. N. DeLamater, R. F. Wilson, O. W. Young, R. J. Brittain, B. H. Lytle, J. M. Kelly, W. T. Long, L. L. Hill, H. M. Carroll.

HYNSON, WESTCOTT & DUNNING, Baltimore, Md. **Spaces 332, 333.** Mercurochrome, a germicide for treating and preventing infections. Represented by Nathaniel Nicolai, L. C. Shepherd, B. A. Hulsman, A. L. Johnson, Moffet, Duncan.

I

ILLINOIS TERMINAL RAILROAD SYSTEM, Springfield, Ill. **Track J.** Class C, 80-ton, articulated electric locomotive.

INTERNATIONAL REGISTER COMPANY, 15 South Throop Street, Chicago, Ill. **Space 127.** Fare registers, hand and electrically operated; International Cutawl and sundries. Represented by John Benham, W. E. Richmond, Chas. S. O'Neil.

INTERNATIONAL STEEL TIE COMPANY, 16702 Waterloo Road, Cleveland, Ohio. **Spaces 300-309.** Five types of Steel Twin Ties for standard construction and track renewal on old concrete base; latest model of the D. S. R. track layer, to be shown in operation; model A compression tamping machine, re-designed since 1927 exhibit, to be shown in operation; new heavy duty forged steel rail clip with full width heel and high tensile strength bolt; hot bent channels in all canted type ties. Represented by William P. Day, Thos. J. Clifford, Thos. J. Lavan, Fred H. Ogden, Vincent E. Heglaw, William P. Day, Jr., John J. Day, O. H. Neihus.

IRVING IRON WORKS COMPANY, Long Island City, N. Y. **Space 684.** Safkar steps, both rigid and folding, in steel and duralumin; Irvico steel mesh flooring for power plants, in unit panels and the continuous construction, using the Irving streamline splice; Irvico continuous armoring for concrete floors. Represented by L. H. DeVoe, Wm. Noblett, L. D. Stauffer.

J

JOHNS-MANVILLE CORPORATION, 292 Madison Avenue, New York, N. Y. **Space 680.** Asbestos brake lining, other applications.

JOHNSON FARE BOX COMPANY, 2 West 61st Street, New York, N. Y. **Space 652.** Fare boxes, coin changer, tokens.

JOHNSTON & JENNINGS COMPANY, 877 Addison Road, Cleveland, Ohio. **Space 503.** Type K Alten oil reclaimer, partially operated, showing finished oil coming through; type F 6 Alten oil reclaimer, showing its use for clarifying and reconditioning transformer oil; specimens of crank case, shop, transformer oils, new, dirty and reclaimed. Represented by A. H. Tennent, Robert Grameling, M. F. Lansill.

R. F. JOHNSTON PAINT COMPANY, Pearl and Main Streets, Cincinnati, Ohio. **Spaces 123, 124.** Painted panels. Represented by Leon L. Wolf.

K

KELTON-AURAND MANUFACTURING COMPANY, Bay City, Mich. **Space 426.** Seating equipment for motor coaches and electric cars. Represented by A. L. Harris, Chas. E. Stone.

L

LANG BODY COMPANY, 3088 West 106th Street, Cleveland, Ohio. **Space 447.** Bus body. Represented by C. E. J. Lang, E. J. Lang, H. B. Gehrke, Wm. C. Naegel, Wm. Dreger, H. Sponder, F. Weitz.

LEECE-NEVILLE COMPANY, 5363 Hamilton Avenue, Cleveland, Ohio. **Space, half of 624.** Generators, motors, switches, voltage regulators.

LORAIN STEEL COMPANY, Johnstown, Pa. **Spaces 207, 208.** 100-ft. radius manganese steel tongue switch, with Taurman switch lock attached; full size model of the switch heel; 200-ft. radius Folsom tongue switch; 200-ft. radius manganese steel tongue switch of the A.E.R.E.A. design; full size model of the heel of the Lorain tadpole tongue switch; portion of a street railway crossing cut in two through the chrome nickel insert plate, spelter, bolts and cast-iron binding, showing the method of insuring a full plate bearing and method of locking the bolts and nuts; display of chrome nickel insert plates and manganese steel plates, with freshly fractured samples of both; rail expansion joint of the Pittsburgh Railways pattern; samples of the girder and girder-groove rails. Represented by Wm. W. Kingston, J. T. Moore, S. P. McGough, W. H. Andrews, H. H. McDonald, Otto Fischer, R. E. Marshall, C. A. Rider, J. G. Vance, T. W. Brush, D. P. Steward, S. J. Cotsworth, L. M. Schrufer, Frank H. Lehecka, H. L. Gleeson, Carroll Burton, P. M. Boyd, E. B. Entwisle, H. C. Stiff, J. A. McHugh, H. F. A. Kleinschmidt, E. M. Stutzman, Edward Ott, C. R. Bossler, A. L. George.

M

MACDONALD MANUFACTURING COMPANY, 5015 Wellesley Avenue, S.E., Cleveland, Ohio. **Spaces 681, 682.** Cash receipt holders, zone check holders, transfer holders. Represented by M. Macdonald, E. M. Macdonald, M. Bregman.

MACK-INTERNATIONAL MOTOR TRUCK CORPORATION, MACK MOTOR TRUCK COMPANY, MACK TRUCKS, INC., INTERNATIONAL MOTOR COMPANY, 25 Broadway, New York, N. Y. **Spaces 439-446.** Trucks, buses, chassis, parts.

MANGANESE STEEL FORGE COMPANY, Richmond Street and Erie Avenue, Philadelphia, Pa. **Space 295.** Rol-Man rolled and forged manganese steel pedestal and journal box gibs; bolster and transom chafing plates and numerous examples of other applications of this steel; Rol-Man precision finished pins and bushings for brake gear and other parts. Represented by L. W. Jones, H. Howe.

MARTINDALE ELECTRIC COMPANY, 1260 W. 4th Street, Cleveland, Ohio. **Space 312.** Commutator undercutting, commutator grinding and armature slot cleaning devices, complete line of special electrical devices and electrical measuring instruments. Represented by H. McFarland, W. N. Osbun, P. W. Newell, R. O. Hallier.

MASSILLON STEEL CASTING COMPANY, Massillon, Ohio. **Space 489.** Brake drums.

JAS. H. MATTHEWS & COMPANY, 3942 Forbes Street, Pittsburgh, Pa. **Space 667.**

McGILL METAL COMPANY, Valparaiso, Ind. **Space 409.** Ball bearings, machine parts showing ball bearing applications, ball bearing testing machine. Represented by T. L. Robinson, Frank R. Schubert, W. E. Brownell, V. D. Gilmore.

METAL & THERMIT CORPORATION, 120 Broadway, New York, N. Y. **Spaces 324-329.** Material and equipment for thermit rail welding with complete layout showing method of installing welds and completed welds; working exhibit which shows the process of making the welds complete. Represented by F. W. Cohen, John B. Tinnon, J. H. Deppeler, D. C. Dickson, C. D. Young, H. D. Kelley, J. G. McCarty, R. L. Browne.

MONEY-METERS, INC., 5209 Book Tower, Detroit, Mich. **Space 122.** Fare collection meters.

MORTON MANUFACTURING COMPANY, 5105 - 5143 West Lake Street, Chicago, Ill. **Spaces 676, 677.** Chanarch aluminum and steel flooring, vestibule diaphragms, aluminum and steel car doors, aluminum and steel Kass safety treads, vestibule curtains and parts, window curtains and parts, window fixtures and weatherproofing, Morton suggestion system. Represented by H. U. Morton, Charles D. Morton, J. W. Davis, C. C. Below, C. S. Motter.

MOTOR WHEEL CORPORATION, Lansing, Mich. **Space 457.** Spoksteel drop-forged wheels for motor trucks and buses. Represented by R. G. Siple, Frank U. Winchester.

N

NACHOD AND U. S. SIGNAL COMPANY, INC., 4777 Louisville Avenue, Louisville, Ky. **Space 262.** Operative track models of single track car-counting and non-car-counting signals, double track signals, annunciator signal, stub-end signal, turn right signal, switch indicator, crossing gate model, highway crossing signal with single track car-counting or non-car-counting control, automatic headway recorder, flasher relays, mercury and air-break types, neutral and polar relays, overhead trolley contactors. Represented by Carl P. Nachod, R. E. Tafel, John A. Miller, E. C. Brown.

NATIONAL BRAKE COMPANY, INC., 888 Ellicott Square, Buffalo, N. Y. **Space 610.** Different types of Peacock brakes, Peacock improved brakes, Peacock staffless brakes in operation with dynamometers showing the actual power developed, Peacock No. 420 brake. Represented by F. D. Miller, W. D. Brewster.

NATIONAL CARBON COMPANY, INC., P. O. Box 400, Cleveland, Ohio. **Spaces 226, 228.** A complete line of National Pyramid carbon, graphite and metal-graphite brushes for motors, generators and converters and a complete display of carbon electrodes, rods, blocks and paste used in the electric arc and acetylene welding processes. Represented by E. A. Williford, J. A. Hammond, V. J. Nolan, E. C. Friday, J. L. Green, H. G. Cobb, W. C. Kalb.

NATIONAL CASH REGISTER COMPANY, Dayton, Ohio. **Spaces 611, 612.** National fare recording registers. Represented by A. B. Gary, H. F. Heil, G. A. Rauch, A. A. Keiser.

NATIONAL MALLEABLE & STEEL CASTINGS COMPANY, Cleveland, Ohio. **Space 465.** Metal wheels. Represented by J. H. Jaschka, J. W. Holt, E. H. Sherwood, D. W. Robinson, C. Glick, L. L. McKee.

NATIONAL PNEUMATIC COMPANY, Graybar Building, New York, N. Y. **Spaces 107, 109, 111.** Standard door engines; constant speed door engine; differential door engines; control switches; treadles, featuring the full floating treadle; safety interlocking features; signal lights; pipe bending tools; door switches; door tracks; universal control valve; 600-volt magnet valves, safety control unit for buses; safety reversing device for folding doors. Represented by T. W. Casey, Frank Johnson, J. H. Vander Veer, T. Laurent, T. Clifford Laurent, Michael Griffin, A. Frank Paul, George W. Hall, H. D. Mallison, Wm. J. Campbell, O. A. Broten, R. S. Frehse, Frank E. Casey, P. R. Forman, L. DeWinner, J. R. Newkirk, H. J. Nimzik, E. G. Parvin, R. D. Conklin, Horace R. Hockley.

NATIONAL RAILWAY APPLIANCE COMPANY, 420 Lexington Avenue, New York, N. Y. **Space, part of 117.** NSD gong ringer, Bell fare box, Godward gas generator, Garland ventilators, Tapley performance and brake testing meters, National hand holds. Represented by B. A. Hegeman, Jr., H. A. Hegeman, A. B. Kroeger, J. M. Pratt, R. H. Stier, F. M. Richards, M. Garland.

NEW DEPARTURE MANUFACTURING COMPANY, 269 North Main Street, Bristol, Conn. **Space, half of 624.** Complete line of New Departure ball bearings in double row, single row, radax and magneto types. Represented by Lisle H. Gaylord, John Collins and others.

NICHOLS-LINTERN COMPANY, 7960 Lorain Avenue, Cleveland, Ohio. **Space 672.** Motor coach heaters, roof ventilators, street car ventilators, indicating signals, air and mechanical sanders, universal lanterns, electric fans for motor coach use. Represented by Wm. Lintern, J. B. Lintern, A. R. Lintern, Geo. D. Lintern, W. A. Lintern, W. E. Foreman, A. L. Lye.

NORMA-HOFFMANN BEARINGS CORPORATION, Stamford, Conn. **Spaces 613, 614.** Complete line of Norma open and closed type ball bearings as used in electric railway accessories as well as bus transmissions, generators, etc.; Hoffmann roller bearings in the various types suitable for railway axles and motors, as well as heavy duty applications in bus design; typical mountings of these bearings, made in section to illustrate the principles of correct bearing design and application. Represented by C. P. Wilson, Norman Bell, D. E. Batesole, R. E. Hecker, C. D. Kilham, F. W. Mesinger, T. J. Harley.

NORTH EAST ELECTRIC COMPANY, 379 Lyell Avenue, Rochester, N. Y. **Space 608, 609.** Generators, starting motors, ignition horns, control units. Represented by J. C. Halbleib, L. H. Guilford, I. W. Dietz, D. P. Cartwright, E. C. Kehoe.

NORTHERN GRANITE & STONE COMPANY, 1022 Hanna Building, Cleveland, Ohio. **Space 334.** Granite paving block, steel reinforcing, patching material.

R. D. NUTTALL COMPANY, East Pittsburgh, Pa. **Space 110.** Standard BP helical gear; similar gear with noiseless feature.

O

OHIO BRASS COMPANY, Mansfield, Ohio. **Space 115.** Spring lock hanger, duplex trolley frog, feeder dead-end clamp, Hevi-Bed Titon band, AW-15 cross bond, renewable underrun section insulator, Spangrip clamp and lashing, pole sleeve, lightweight trolley base; other equipment, including line materials, rail bonds, headlights, car equipment. Represented by J. R. Palmer, L. W. Birch, G. L. Draffan, A. L. Price, C. H. Tomlinson, E. F. Wickwire, J. H. Drew, C. H. Burkhalter, E. G. Deis, E. W. Loughridge, M. McCormick, A. J. Knight, W. B. Fincher, J. L. Hogan, D. MacLaughlin, J. M. Mellor, H. C. Parker, T. W. Passailaigue, P. L. Warren, G.

E. Willis, S. L. Walworth, J. H. Walker, H. R. Sampson, E. C. Brown, R. F. Gheen, F. A. Strail, F. Attwood, S. S. Matthes, E. A. Larrson, W. P. Bovard, F. L. Wolf, C. C. Beck.

OHMER FARE REGISTER COMPANY, Dayton, Ohio. **Spaces 250-256.** Nine types of standard indicating and printing fare registers; six types of No. 79 ticket printing registers; ten types of No. 80 ticket printing registers; two types of No. 232 ticket office ticket printers; printing and non-printing taximeters; mileage recording instruments for motor buses, commercial vehicles, steam and electric railway cars; fare boxes and industrial counters. Represented by John F. Ohmer, R. L. Hubler, R. M. Ohmer, C. W. Ketteman, I. F. Lutz, Geo. F. Jacobs, R. T. Abrell, H. S. Sibley, L. P. Stickel, others.

OIL JACK COMPANY, INC., 15 Park Row, New York, N. Y. **Space 410.** Jacks.

OKONITE COMPANY, OKONITE-CALLENDER CABLE COMPANY, INC., 501 Fifth Avenue, New York, N. Y. **Space 219.** Samples of rubber covered and varnished cambric insulated wire and cable; friction and rubber insulating tapes; Okocord; samples of impregnated paper and super-tension cables; splicing materials, junction boxes, splices, etc. for all voltages. Represented by J. D. Underhill, W. R. Van Steenburgh, F. J. White, Ray Baker, R. M. Johnson.

OLIVER IRON AND STEEL CORPORATION, South Tenth and Muriel Streets, Pittsburgh, Pa. **Space 233.** Black and Monel metal bolts, nuts and rivets; forgings, track tools and complete line of pole line hardware and construction specialties. Represented by Warren M. Heim, Clarence E. Guthridge, Hanson Thomas, Joseph R. Hileman.

OSGOOD BRADLEY CAR COMPANY, 351 Mountain Street, Worcester, Mass. **Track G.** One 1929 model double-truck, one-man, two-man electric car. Represented by John E. Bradley, William J. McKee, C. H. Turner, S. B. Wight, Jr.

P

PANTASOTE COMPANY, INC., 250 Park Avenue, New York, N. Y. **Space 204.** Pantasote curtain and upholstery material; Agasote headlining and wainscoting; exhibit of the proper and improper way of applying Agasote. Represented by William A. Lake, William Anderson, Herbert G. Mastin, H. H. Horn.

PEREY MANUFACTURING COMPANY, INC., 101 Park Avenue, New York, N. Y. **Spaces 223, 224.** Mechanical and electrical turnstiles, passimeters, coin boxes.

PITTSBURGH PLATE GLASS COMPANY, Pittsburgh, Pa.,

PITTSBURGH SAFETY GLASS COMPANY, Creighton, Pa. **Space 625.** Duplate glass; non-shattering glass for windows; modern color schemes, exposed panels and street railway products. Represented by W. D. Snyder, F. A. Derfus, A. Nelson, Carl E. Schaefer.

R

RADEL LEATHER MANUFACTURING COMPANY, Newark, N. J. **Space 670.** Upholstery leathers in various colors and designs; Calflyke leathers, in several color shades; Turkish Vellet leathers; Spanish and Capitol grains; de luxe bus leathers, Brilliantones. Represented by Frank J. Radel, Thomas A. Sullivan, O. R. Overmyer, J. E. Menaugh.

Last year, seat manufacturers displayed luxurious, comfortable seats, to meet present-day demands. This year's display even shows an advance in this trend

RAIL JOINT COMPANY, 165 Broadway, New York, N. Y. **Space 209.** Continuous joints and special plates of the latest designs for welding. Represented by E. A. Condit, Jr., Alex Chapman, R. R. Seward, C. A. Disbrow, district sales agents.

"RAILWAY AGE," 30 Church Street, New York, N. Y. **Space 464.** Copies of *Railway Age, Railway Mechanical Engineer, Railway Engineering and Maintenance, Railway Electrical Engineer, Railway Signaling.*

RAILWAY MATERIALS CORPORATION, Toledo, Ohio. **Spaces 291, 293.** Brake shoes and brake heads. Represented by E. C. Folsom, R. O. Polsdorfer, J. E. Hyatt, H. E. Locey, C. A. Ernsthausen.

"RAILWAY PURCHASES & STORES," 9 South Clinton Street, Chicago, Ill. **Space 669.** Magazines. Represented by H. B. Kirkland, K. F. Sheeran, J. D. Murphy, Jr., Edward Wray.

RAILWAY TRACK - WORK COMPANY, 3132 East Thompson Street, Philadelphia, Pa. **Spaces 320-323.** Vulcan rail joint grinder, Eureka radial rail grinder, Atlas rail grinder, Ajax electric arc welder. Represented by W. B. Goodall, A. M. Nardini, H. M. Moorhead, C. H. Wood.

RAILWAY UTILITY COMPANY, 2241-2247 Indiana Avenue, Chicago, Ill. **Spaces 313, 314.** Utility heaters, heat regulators, ventilators, and ground detectors. Chromalox strip heaters, Chromalox rheostat heaters. Represented by E. J. Magerstadt, J. H. Denton, W. J. Pine, W. G. Hartwig, Earl G. Magerstadt, R. R. Holden, Edwin L. Wiegand, E. N. Calhoun.

READE MANUFACTURING COMPANY, 135 Hoboken Avenue, Jersey City, N. J. **Space 641.** Miniature track spraying equipment, Reade non-poisonous weed killer. Represented by R. W. Pritchard, C. H. Reade.

H. H. ROBERTSON COMPANY, 511 Wood Street, Pittsburgh, Pa. **Space 296.** Ventilating and daylighting of buildings; Robertson ventilators, skylights and sidewall sash. Represented by F. C. Russell, A. R. Gray, Pierre Blommers, H. F. Hackerdorn, Jr., H. G. Raybon.

ROOT SPRING SCRAPER COMPANY, Kalamazoo, Mich. **Space 315.** Short blade snow scraper, air-operated Root all-spring steel life-guard. Represented by E. A. Weeks, Marie J. Root.

ROSS GEAR & TOOL COMPANY, 18701 Winslow Road, Cleveland, Ohio. **Space 626.** Steering gears.

RUSSELL MANUFACTURING COMPANY, Middletown, Conn. **Space 429.** Clutch facings, brake lining, fan belts, waterproof straps, webbing, hood lacing, tow lines. Represented by Frank Fuhrman.

S

SAFETY CAR DEVICES COMPANY, Wilmerding, Pa. **Space, half of 108.** Braking equipment.

SAF-T-CAB CORPORATION 1330 Terminal Tower, Cleveland, Ohio. **Spaces 448-450.** Saf-T-Cab, Saf-T-Bus. Represented by Bernard D. Deweese.

ST. LOUIS CAR COMPANY, St. Louis, Mo. **Space 105.** Car seats in Space 105; interurban car and city car in track exhibit. Represented by Edwin B. Meissner, George L. Kippenberger, Howard R. Gass, Morrison J. Oswald.

SANFORD MILLS, Sanford, Me. Selling Agents: L. C. Chase & Co., Boston, Mass. **Space 405.** Mohair upholstery fabrics, artificial leather. Represented by Eldon Campbell, Walter Scott.

SATTLEY COMPANY, 3246 East Woodbridge Street, Detroit, Mich. **Space 126.** Coin counting, coin sorting and coin wrapping machines; coin wrappers. Represented by Daniel W. Smith, W. Bruce Howard, A. F. Hugart, J. J. Bannert.

S.K.F. INDUSTRIES, INC., 40 East 34th Street, New York, N. Y. **Spaces 236, 238.** Car truck and railway motors equipped with S.K.F. bearings; other heavy duty applications of S.K.F. anti-friction bearings. Represented by H. A. Allen, R. R. Hirsch, W. F. Temple, R. R. Zisette.

SKINNER AUTOMOTIVE DEVICE COMPANY, INC., 2225 Dalzelle, Detroit, Mich. **Space 479.** Skinner oil reclaimer, an automatic electrically operated machine for renewing crankcase oil. Represented by Robert G. Gregory, Frank Brazel, Wm. W. Sanford.

PETER SMITH HEATER & MANUFACTURING COMPANY, 10501 Haggerty Avenue, Fordson, Mich. **Space 338.** Heaters. Represented by E. J. Smith, E. O. Merline, Morris Eastwood, B. F. Carville.

SNAP-ON WRENCH COMPANY, 14 East Jackson Boulevard, Chicago, Ill. **Space 428.** Complete line of Snap-on socket wrenches for hand operation, including special thin walled sockets; shanks and sockets for use with electric and pneumatic motors, Blue Point end wrenches, Boxocket wrenches, other hand tools; moving display, showing the construction and operation of Snap-on ratchet wrenches; tool boxes, cases and cabinets. Represented by C. H. Tennyson, E. A. Glenn, A. M. Crandall, Joseph Johnson, E. S. Hansen.

SOUTH BEND LATHE WORKS, 425 East Madison Street, South Bend, Ind. **Spaces 453, 455.** Lathes.

STANDARD OIL COMPANY (Indiana), 910 South Michigan Avenue, Chicago, Ill. **Space 227.**

STANDARD STEEL WORKS COMPANY, Philadelphia, Pa. **Space 207 A.** Light-weight, rolled steel, 26-in. wheel, showing noise-deadening feature, as used by Delaware Electric Power Company; armature shafts of quenched and tempered carbon steel. Represented by G. J. F. Carpenter, W. H. Evans, C. E. Hale, L. W. Metzger, Jr., H. J. Snowden, R. N. Watt.

STATE AND SECTIONAL ASSOCIATIONS. See page 498.

STUDEBAKER CORPORATION OF AMERICA, South Bend, Ind. **Spaces 474-476.** Inter-city de luxe coach for 20 passengers on the 75 heavy duty bus chassis, 21-passenger street car bus on 75 chassis, 75 heavy duty bus chassis, "Seminole" 22-passenger parlor observation car on 76 special bus chassis. Represented by Charles H. Wondries, Paul H. Castner, J. L. Engels, C. H. Miller, F. C. French, H. E. Kopman, T. E. Connor, Jos. Swanson, J. R. Lake.

SWARTWOUT COMPANY, 18511 Euclid Avenue, Cleveland, Ohio. **Spaces 264, 266.** Swartwout rotary ball bearing ventilators. Represented by D. K. Swartwout, Jr., L. P. Russon, E. N. Walton.

T

TEXAS COMPANY, 17 Battery Place, New York, N. Y. **Spaces 128, 130.** Display of electric railway lubricants, bus oils, automotive oils. Represented by George R. Rowland, T. C. Dick, A. F. Brewer, Dr. R. Haskell, William Harrigan, P. B. Bowman, C. E. Smith, H. E. Mead, J. F. Lamb, W. H. Goebel, N. H. Steindler, H. E. Delcour, J. W. McGuire, C. R. Schablitzke, H. A. Guba, F. R. Splawn.

TIMKEN-DETROIT AXLE COMPANY, 100-400 Clark Avenue, Detroit, Mich. **Space 400.** Bus front axles, equipped

Exhibitors at the 1928 Convention

with brakes; bus rear axles, both bevel and worm gear; worm gearing that has carried bus 585,000 miles; model 51 truck for electric railway cars (this model superseding model 50), equipped with 64011-W worm drive axles (superseding 64010-W axles). Represented by P. W. Hood, Wm. Bonn, Nelson R. Brownyer, Chas. S. Dahlquist, L. W. Fischer, George E. Fox, Rex S. Gay, Gabe Hilton, Charles E. Hoffer, Robert Koeppen, Wm. L. Love, P. W. Sloan, John S. Wardwell, George E. Watts.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio. **Spaces 673, 674.** Built up display, showing a mountain scene with an electric train in actual operation on the mountain side and a city in the foreground; assortment of Timken bearings. Represented by H. J. Porter, J. W. Spray, E. W. Austin, Guy Waters, W. C. Sanders, Ernest Wooler, R. P. Kelley, Frank Druar.

TOOL STEEL GEAR & PINION COMPANY, Elmwood Place, Cincinnati, Ohio. **Space, part of 116.** Single reduction driving unit for high-speed motors; tool steel quiet gears; dictaphone installation to demonstrate noise eliminating through quiet gears; wisdom tooth pinions. Represented by C. E. Sawtelle, LeRoy Brooks, Jr., E. S. Sawtelle, P. H. Conroy, H. G. Ross, J. P. Biggert, W. H. Evans, Eric Dilger, J. L. Lundberg, A. E. Forester, R. L. Reichling.

TUCO PRODUCTS CORPORATION, 30 Church Street, New York, N. Y. **Space 644.** Tuco Flexolith composition flooring for motor coaches and street cars, Tuco National standard waterproof canvas roofing, car window screens, insulation. Represented by D. W. Pye, H. B. Chamberlain, R. F. O'Leary, W. Byrnes, E. J. Corcoran, C. H. Kadie, R. Gaines, T. L. Miller, C. M. Schramm, H. B. Wilson.

TWIN COACH CORPORATION, Kent, Ohio. **Spaces 466-473 and track space.** Twin Coach parlor car; standard 41-passenger urban coach; urban coach with a section cut away to show body construction, engine mountings and other details of operating units; trackless trolley; two automotive rail street cars, one with four 35-hp. motors, the other with two 50-hp. motors; new 60-hp., 6 cylinder engine. Represented by F. R. Fageol, W. B. Fageol, Ross Schram, J. Allan Smith, E. W. Bradley, P. H. Brehm, E. S. Rider, W. E. Brown, O. R. Fageol, R. C. Smith, C. H. Fageol, H. B. McKelvey, B. V. Bassett, H. E. Simi, E. B. Loveland, H. M. Gill, Wm. Doyle, P. H. Manske, J. H. Stakes, C. O. Sparhawk, Thos. Owen, H. P. Kane, W. Carlson, A. E. Brehm.

U

UNA WELDING & BONDING COMPANY, 1615 Collamer Avenue, Cleveland, Ohio. **Spaces 336, 337.** Rail joints, welders, Goodspeed automatic welding head, a.c.-d.c. welders, automatic welding rod, die rod, rod 700 for manganese welding, rod 200 for rail joint welding, rod 300 for building up cupped rails, other rods for various welding purposes. Represented by E. R. Alexander, E. W. Kronbach, L. S. Burgett, J. B. Austin, A. A. Probeck.

UNION METAL MANUFACTURING COMPANY, Canton, Ohio. **Space 651.** Fluted steel distribution and transmission poles in the outdoor track space; indoor exhibit, sample sections of these poles with a complete line of fittings. Represented by W. A. Porterfield, D. C. Barrick, C. E. Moran, E. W. Riemenschneider, E. H. Crider, A. S. Fromm.

UNIVERSAL LUBRICATING COMPANY, 1400 Schofield Building, Cleveland, Ohio. **Spaces 292, 294.** Two pinion end and two commutator end bearings. Represented by S. W. Scofield, T. H. J. Williams, E. Dreher, H. H. Lytle, G. F. Lytle, J. C. Daigen, J. Graham, F. T. Twerell.

V

VAN DORN COUPLER COMPANY, 2325 South Paulina Street, Chicago, Ill. **Space 261.** Complete line of radial M. C. B. couplers, car air and electric couplers, pin and link couplers, M. C. B. couplers for gasoline motor rail cars; also the latest design of car air and electric couplers. Represented by B. W. Sullards, H. E. Van Dorn.

VERSARE CORPORATION, Albany, N. Y. **Space 660.** Gas-electric coach for service at Cincinnati, Ohio; skeleton gas-electric coach, showing structural design; 43-passenger electric coach duplicate of those operating in Salt Lake City; 36-passenger electric coach, with Versare opposed motor drive. Represented by Frederic Pruyn, O. F. Warhus, R. MacDonald, R. H. Nash, H. W. Fero, Edw. I. Barton, R. R. Schemerhorn, C. G. Bordeaux.

W

WALTER MOTOR TRUCK COMPANY, Queens Boulevard & 37th Street, Long Island City, N. Y. **Space, half of 663.** Walter snow fighter. Represented by Maurice Walter, J. H. Sharkey, R. T. Carroll, B. A. Hegeman, Jr., H. A. Hegeman, J. M. Pratt.

WAUKESHA MOTOR COMPANY, Waukesha, Wis. **Space 493.** Two bus engines of 120 hp. and 75 hp. capacity, a larger six-cylinder engine for high power, engine parts. Represented by P. C. Ritchie, J. G. Swain, J. E. DeLong, J. M. Boorse, C. P. Ross, L. M. Ward, J. B. Fisher, L. Bower, L. M. Kanters.

WESTINGHOUSE COMPANIES,

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa. **Spaces 112, 114.** W-N drive unit, car and bus motors, control equipment, line material, high-speed circuit-breaker, arc welding equipment, linestart motor and linestarter display, portable meters, oil testing outfit, porcelain insulators, lightning arresters, Micarta display, Hollow-spun poles, Osiso and renewal parts. Represented by executives, district office representatives and headquarters sales and engineering department representatives.

WESTINGHOUSE TRACTION BRAKE COMPANY, Wilmerding, Pa. **Space, half of 108.** Variable load brake; brake cylinder dust protector; automatic car, air and electric coupler; pneuphonic air horns; Wabco brake cylinder packing cups and gaskets; automotive pressure brakes and vacuum brakes for buses, trucks and pleasure cars. Represented by headquarter's executives, district sales representatives and engineers.

WM. WHARTON JR. & CO., INC., Easton, Pa. **Space 222.** Proposed standard A.E.R.E.A. tongue switch, 100 ft. radius, equipped with type "N" lockbox; one-half solid manganese steel crossing, street over steam; keyed center iron bound frog, with cast iron body; manganese steel switch point, similar to those furnished for the Broad Street Subway in Philadelphia; seamless steel cylinders for high pressure gases. Represented by J. R. Smith, A. L. Bray, R. C. McCloy, Chas. N. Shaffner, H. F. McDermott, Chas. H. Wood, Chas. M. Griffith.

WHEEL TRUING BRAKE SHOE COMPANY, 219 Tuxedo Avenue, Detroit, Mich. **Space 282.** Abrasive brake shoes for all conditions of wheel wear. Represented by Judson M. Griffin, F. F. Griffin, O. Perry Allen.

WHITCOMB WHEEL COMPANY, 1911 65th Street, Kenosha, Wis. **Space 661.** Six-wheel, light-weight motor coach, with independently sprung front wheels and unit body and chassis construction. Represented by James A. Whitcomb, H. J. Goodyer, Irving Puerner, R. T. Van Lone, J. C. Whitcomb, Thelma G. Whitcomb.

WHITE COMPANY, Cleveland, Ohio. **Spaces 653-658.** White bus chassis, both 4 and 6-cylinder models, with and without bodies; bodies of street car and parlor car types; truck chassis of various capacities, with and without bodies, including model 58, new high-speed heavy duty chassis. Represented by Walter C. White, Saunders Jones, Stanley P. Seward, W. A. Maynard, R. W. Knowles, G. R. Bryan, J. N. Bauman, V. W. Fries, L. G. Avery, A. J. Scaife, M. D. Munn, J. T. Swigart.

WHITEHEAD & KALES COMPANY, River Rouge, Mich. **Space 504.**

WHITE MANUFACTURING COMPANY, Elkhart, Ind. **Space 268.** Truck and brake pins and bushings, side and center bearings, trolley harps, track sanders, chafing plates, wire connectors, oil burning torches, tar kettles, concrete mixer heaters, switch heaters. Represented by W. McK. White, M. R. Elliott.

WILLARD STORAGE BATTERY COMPANY, 246 East 131st Street, Cleveland, Ohio. **Space 639.** Standard line of heavy and medium plate bus batteries for buses, trucks, oil-switch operation, emergency system, power and signal work. Represented by R. J. Nightingale, C. T. Klug, C. F. Oestermeyer, E. M. Sutherland, M. J. Brennan, A. E. Harrold, S. C. Aikenhead.

C. H. WILL MOTORS CORPORATION, 1030 Ramsey Street, Northeast, Minneapolis, Minn. **Space 634.** Tropic-Aire hot water heaters for motor buses and passenger cars, one of the heaters being installed and operating. Represented by C. H. Will, C. M. Yerxa, Edmund Burke, V. J. Butterfield.

WILSON - IMPERIAL COMPANY, 115 Chestnut Street, Newark, N. J. **Space 129.** Car cleaning materials. Represented by D. J. Giles, Frank Sherritt, Chas. A. Beaumont.

ALAN WOOD IRON & STEEL COMPANY, Widener Building, Philadelphia, Pa. **Space, half of 501.** Steel floor, formed steps, runner boards, trolley steps, etc., adaptable for buses, trucks and street cars; samples of the AW Standard Diamond and AW Diamondette floor plates. Represented by J. Raymond Jones, Geo. Clinton Fogwell, Willard S. Haring.

Z

ZENITH-DETROIT CORPORATION, Detroit, Mich. **Space 628.** Carburetors, fuel filters. Represented by V. I. Shobe, F. M. Ruby, H. S. Manwaring, B. Hannah, C. C. Sands.

A.E.R.A. and Other Associations Exhibiting

The following departments and committees of the American Electric Railway Association have exhibits or reception spaces:

American Association, Committee on Education. Spaces 636, 638, 640, 642.

American Association, Publicity and Advertising Department. Spaces 201, 411, 508-510, 523.

American Association, Statistical Department. Main lobby, both sides of stairway.

Engineering Association, Division of Purchases and Stores. Space 200. Delineascope, displaying view of stores building, stores layout and material handling devices of many electric railways. Represented by W. V. Shoemaker.

Engineering Association, Rolling Stock Special Committee No. 4, Lighting. Space 212A. Various lighting equipment.

Engineering Association, Rolling Stock Special Committee No. 9, Noise Reduction. Space 205.

Engineering Association, Way and Structures Special Committee No. 2, Special Trackwork. Space 205.

Engineering Association, Way and Structures Special Committee on Welded Rail Joints. Space 205.

Joint Committee of National Utility Associations. Space 267.

The following associations are represented, some with exhibits, others with reception space only:

American Automobile Association, National Motor Bus Division. Spaces 515-518.

Arkansas Utilities Association. Spaces 297, 298.

Canadian Electric Railway Association. Space 218.

Central Electric Railway Association. Space 220.

Illinois Electric Railway Association. Spaces 245, 247.

Indiana Public Utility Association. Spaces 235, 237.

Iowa Electric Railway Association. Spaces 203A, 204A.

Maryland Utilities Association. Spaces 241, 242.

Midwest Electric Railway Association. Spaces 269, 270.

Missouri Association of Public Utilities. Spaces 200A, 299.

New England Street Railway Club. Space 290.

Oklahoma Utilities Association. Spaces 201A, 202A.

Pennsylvania Street Railway Association. Spaces 239, 240.

Public Utilities Association of Virginia. Spaces 243, 244.

Southwestern Public Service Association. Space 205A.

1928 CAR SHOW

Includes Several Unusual Models

Aside from extensive improvements being made in conventional cars during the year, several radically different designs are shown for the first time. Automotive type rail coach introduced by the Twin Coach Corporation

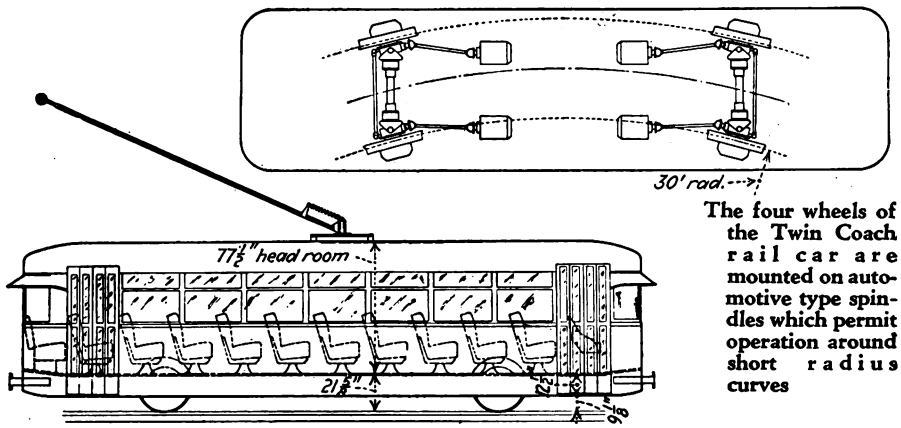
LAST year delegates attending the American Electric Railway Association convention at Cleveland beheld in the car exhibit a number of new cars, most of which were wide departures from the type of street car to which they had been accustomed. They saw cars with sloping windshields, richly upholstered seats, attractively painted exteriors, high-speed motors, worm drive and double reduction drive trucks, small diameter wheels, and many other features new to the industry. It was an exhibit of surprises and the forerunner of a growing interest during this past year in fundamental changes in conventional design.

This year the car exhibit reflects a continuation of last year's trend toward features intended to attract patronage. In addition, several radically new ideas are introduced, notably in the small capacity, long wheelbase, four-wheel units shown by Twin Coach Corporation and St. Louis Car Company. Here, however, the conventional single-truck car has undergone a complete metamorphosis, characterized chiefly in the Twin Coach unit by the introduction of automotive design ideas in a rail vehicle.

No less startling than some of the designs themselves are the names with which the new-day street cars are being dubbed. The 1929 model sample car by Osgood Bradley has become an "Electro-Mobile," in which we see the automotive influence even on railway terminology.

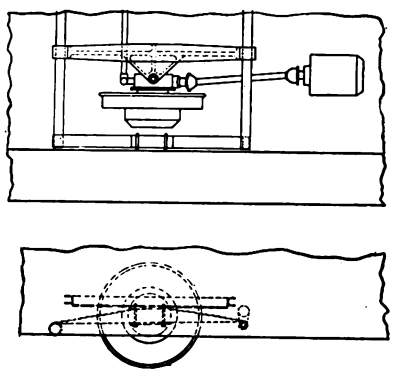
Other cars in the exhibit, while less startling in their departures from convention and precedent, present, nevertheless, many interesting features. A high-speed, light-weight interurban car, one of a group built for the Indianapolis & Southeastern Railway by the Cincinnati Car Company, is an outgrowth of the original Cincinnati model of this type shown at the last two exhibits. This company also is showing one of the group of 100 city cars being built for the Cincinnati Street Railway. A sample of the new cars being built for the Delaware Electric Power Company, Wilmington, Del., is being shown by the Philadelphia plant of the J. G. Brill Company. The Kuhlman Car Company, another Brill unit, is showing one of the interurbans built for the Monongahela-West Penn Public Service Company.

In addition to its "surprise" four-wheel car about which great secrecy was maintained until the actual opening of the exhibit, the St. Louis Car Company is exhibiting an interurban car built for Pittsburgh. One of the group of new articulated units built for the Cleveland Railway by the Kuhlman plant is also on display. This is the final design adopted from the sample Cleveland unit exhibited a year ago. Last but by no means least in this array of modern equipment is the rebuilt high-speed interurban car of the Cleveland & Southwestern Railway & Light Company.



The four wheels of the Twin Coach rail car are mounted on automotive type spindles which permit operation around short radius curves

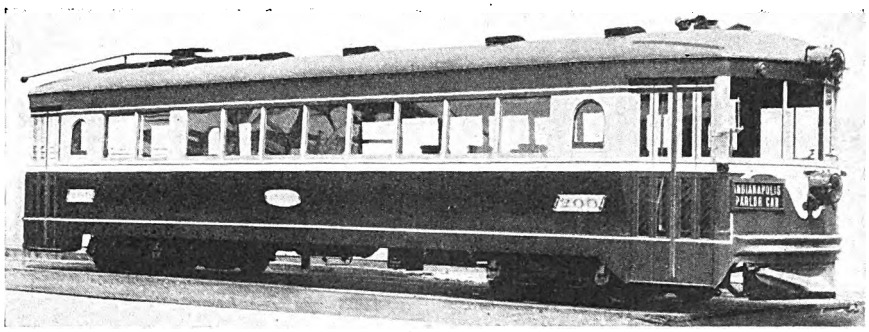
It was possible by housing the wheels of the new Twin Coach automotive type rail car within the body to secure a very low floor height



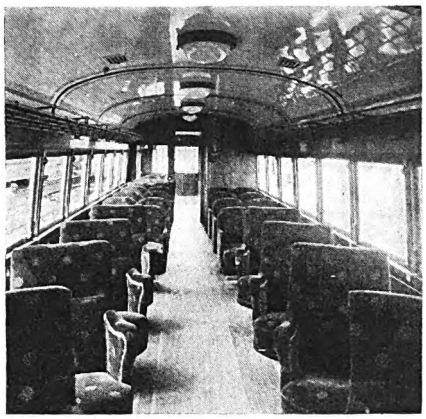
Motors on the Twin Coach rail car are suspended from the body and drive each wheel through a universal and Timken worm assembly

The Twin Coach automotive type car is a radical departure from all previous types of rail equipment. The body is almost identical with the regular Twin Coach bus bodies. By adaptation of the automotive steering knuckle principle to rail car construction, a long wheelbase, four-wheel rail vehicle, capable of operating around short radius curves is obtained. This construction made it possible to achieve a 44-passenger vehicle weighing 16,500 lb. with almost double the motor capacity of a conventional single-truck car. The principal advantages of the design, it is claimed, are economical operation, rapid and smooth starting and stopping, easy riding, quietness, interchangeability of rail car parts with

Digitized by Google



One of the ten interurban cars built for the Indianapolis & Southeastern Railway by the Cincinnati Car Company



Interior of the Cincinnati interurban car showing observation feature of the main passenger compartment and unusual seating arrangement

bus parts and attractive appearance.

Although this car is mounted on 34-in. wheels, the floor height is only 22 in. This was made possible by housing the wheels within the body, suspending the motors from the body frame and using automotive type worm drive. Quietness, smooth operation and easy riding were special objectives in the design. To achieve this, rubber inserts are used in the Morand type cushion wheels, designed with sufficient bearing area on the rubber to avoid excessive pressure. The springs are of chrome vanadium steel, of the semi-elliptical type, as used in the standard Twin Coach, and are 60 in. long.

Two of these new rail cars are on display, one in the Twin Coach booth in the Auditorium West Wing and the other in the outdoor car exhibit. The two models differ only in the motors. The car inside is equipped with four 35-hp. high-speed G.E. motors, while the one in the track exhibit is powered with two 50-hp. Westinghouse motors. Each car is equipped with front and rear air-operated doors, the rear door being treadle-operated.

General features of the St. Louis four-wheel car are understood to include the use of a long wheelbase specially designed to permit operation on sharp radius curves. No detailed information on the design was available at the time this issue of the JOURNAL went to press.

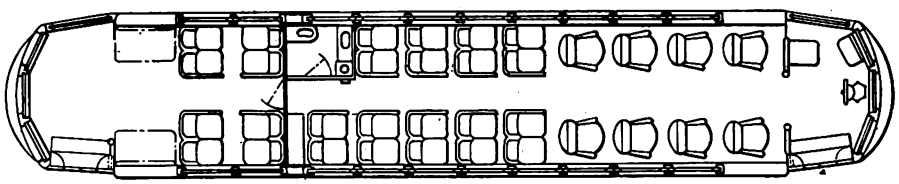
The Cincinnati high-speed interurban has an over-all length of 46 ft. 2 in., with an extreme width of 8 ft. $10\frac{5}{8}$ in., and measures 10 ft. $8\frac{5}{8}$ in. from the rail to the top of trolley boards. The wheelbase is 5 ft. 4 in., and the truck centers are 26 ft. 10 in. Other dimensions are shown in accompanying illustrations. Side sills in the underframe are formed of steel angles $3x5x\frac{5}{16}$ in., extending the full length. Cross sills are of 3-in. by 6.15-lb. channels riveted to the underside of the sill angles. The open side of each platform is supported by a built-up knee, formed of No. 10 Ga. steel plate, pressed to shape. The end of each platform is reinforced with a No. 10 Ga. nosing plate, the full width of the car and 30-in. deep. Each end of the car is equipped with a steel buffer pressed from $\frac{3}{16}$-in. steel plate and shaped to the contour of the dash. The body bolsters are 7 in. deep and of the riveted steel box girder type.

Body framing is of the high side, smooth inside wainscoting finish type of typical Cincinnati curved side construction. Double two-leaf folding doors are installed on the right-hand or step side of each vestibule. The doors are set flush with the front edge of the step well and fold in against the body and vestibule corner posts. No. 18 blue Jaspe Armstrong linoleum covers the floor under the seats, and No. 13 light gray linoleum covers the aisle and platforms. The doors, partitions, post cappings and moldings are of American walnut finish. Trimmings throughout the car are of bronze, with a satin finish. Each car is equipped with twenty-four 500-watt Consolidated electric heaters.

The main passenger compartment is fitted with Hale & Kilburn No. 15 modified Pullman type chairs, with aluminum foot rests and fasteners for holding cloth seat covers. There are also eight stationary double bucket cross-seats in the main passenger compartment, and four of the same type in the rear smoking compartment.

This car is mounted on Cincinnati passenger type, cast steel side frame trucks, described in another article in this issue. The electrical equipment consists of four General Electric 40-hp., 60 per cent tapped field motors and K-75 controllers for single-end operation. Single-end straight G.E. air brakes with all emergency and safety features as furnished by the Safety Car Devices Company, and including a 15-cu.ft. compressor, are provided. The Cincinnati air-magnetic track brake equipment is a special feature of this car and is covered in the discussion of the truck exhibit elsewhere in this issue.

The second car in the Cincinnati Car Company exhibit is one of 100 cars being built for the Cincinnati Street Railway and is of the single-end, straight side, arch roof, end entrance, center exit, double truck, city passenger type. Its over-all length is 44 ft. $7\frac{3}{8}$ in.; height from rail to top



Floor plan of the Cincinnati interurban car with general dimensions and other design information

GENERAL DIMENSIONS

Length over dashers	45 ft. 2 in.

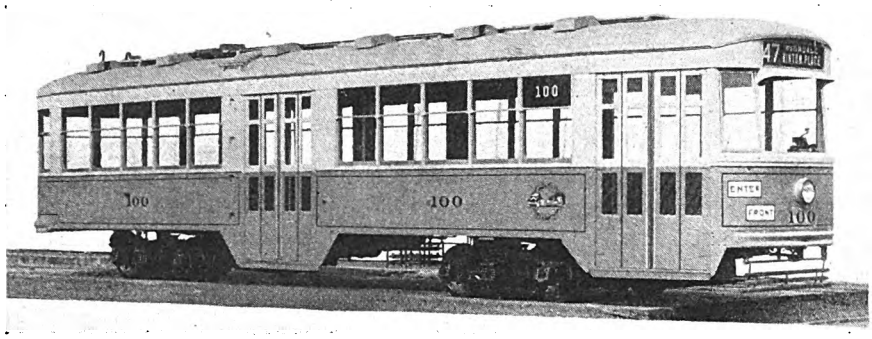
Cross-section of the Indianapolis & Southeastern interurban cars, showing construction details



One of the 100 cars being built for the Cincinnati Street Railway by the Cincinnati Car Company is at the exhibit

of trolley boards is 10 ft. $8\frac{5}{16}$ in. and its extreme width is 8 ft. $3\frac{1}{4}$ in. The wheelbase is 5 ft. 4 in., and the truck centers are 21 ft. 8 in. apart. The seating capacity of the car is 50 passengers. Other dimensions and general information are given with accompanying illustrations.

The underframe is of steel construction. Side sills are steel angles, $3x5x\frac{5}{16}$ in. Cross-sills are of 3-in. by 6.15-lb. channels fastened to the underside of the side sill angle. Both end sills are also 3-in. by 6.15-lb. channels. The step hangers, risers and tread plates are formed of No. 10 Ga. steel plate, flanged at the ends and riveted to the longitudinal center sills and body cross-sills.

Side girder plates are No. 14 Ga. Armco iron riveted to body piers and side sills, reinforced at the top by a No. 12 Ga. pressed steel belt rail channel. Girder plates are reinforced at each window section by pressed steel stiffeners which permit the side wainscoting of the car to be smooth from pier to pier.

The front vestibule is flat, semi-elliptical in shape. At the rear, the vestibule is full semicircular. The front vestibule has a depth of approximately 16 in. from vestibule corner post to center of dash, and corner posts are tapered in approximately $6\frac{5}{8}$ in. from body side sill line on each side of the car.

The center side exit is 57 in. wide and has double folding doors of the two-panel type hinged together with continuous rod-flanged hinges. The doors are arranged to fold into the step well and are hung on ball-bearing door shafts.

There are fourteen stationary double light-weight, deep-cushioned seats in the car, four being located on the closed side of the front end and five on each side of the rear end. Two double seats of the same design are located in the extreme rear end of the car. A longitudinal seat for five passengers is located at the center exit opposite the door opening, and one for four passengers on the closed side of the car back of the motorman's cab partition. Another longitudinal seat extends on the right-hand side from the center door opening to the front door opening. All seats are upholstered with genuine brown Spanish leather.

Cincinnati, passenger type, arch-bar trucks, with spring yoke pedestal journal boxes and combination coil and semi-elliptical spring bolster suspension are used under this car. These are described in the truck article elsewhere in this issue. General Electric, single-end, safety control brake equipment furnished by the Safety Car Devices Company is installed with all safety features for one-man, two-man operation.

An outstanding feature of the Cleveland Southwestern rebuilt car is the unusual seating arrangement and the type of seats used. On the left-hand side of the car the seats are arranged in pairs, while on the other side they are in a single row and set

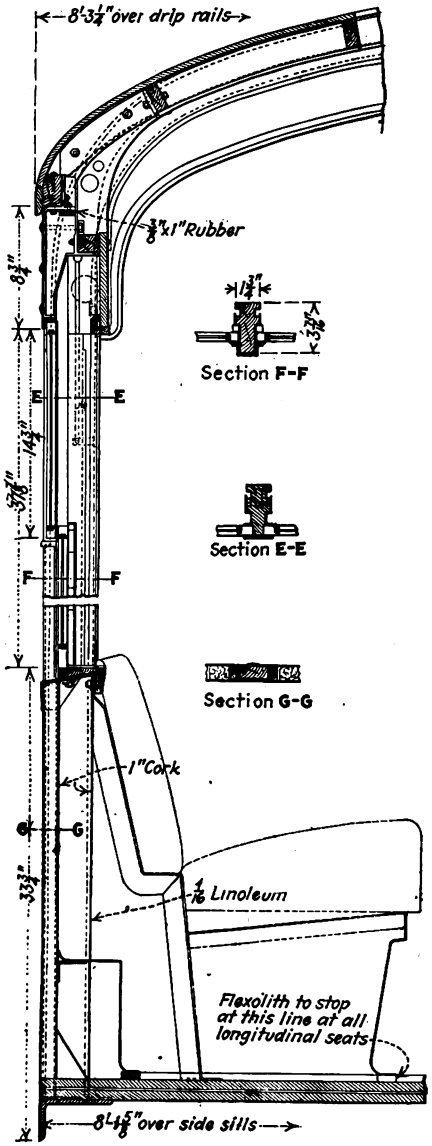
Underframing of the Cincinnati city car, showing the rugged construction



Cross-section of Cincinnati Street Railway car

at an angle to the side of the car. The cross-seats, of the double bucket type, are plush upholstered and unusually roomy. The single seats are individual bucket type.

The J. G. Brill Company outdoor exhibit this year consists of two cars, one being a one-man, two-man, city passenger car, built at the Philadelphia plant, and the other being a one-man, two-man, double-truck, interurban car manufactured by the G. C. Kuhlman Car Company. The city car is one of ten being built for the Delaware Electric Power Company, Wilmington, Del. The interurban is one of five, together with five city type cars, being built for the Monongahela-West Penn Public Service Company, Fairmont, W. Va.

The Wilmington car was designed to meet the present demand for improved appearance, comfort, safety and convenience in electric railway rolling stock. An unusual feature of the design is the deep dropped platform to give a low, single step from the street to the platform. Both platform and body floors are ramped to obtain necessary truck clearance and to keep the step heights to the minimum. Automatic rear treadle doors are provided to reduce the time for interchanging passengers. A selector valve permits the operator to manipulate any door at will. The car is equipped with four 35-hp. motors and variable load brakes.

Inside the car the finish is mahogany. An equipment cabinet on each platform incloses the various operating devices. The floor is covered with tan-colored Flexolith, and a white enameled Agasote ceiling extends continuously through the car from vestibule to vestibule. Both the semi-individual cross-seats of the Brill No. 201-D type and the longitudinal corner seats have deep spring cushions, upholstered in brown leather.

Side post centers on this car are spaced 3 ft. 5 in. apart. The center vestibule sash slopes inward and is flanked by hinged side sash. All sash are of narrow tubular brass and those in the vestibule are fitted with non-shattering glass.

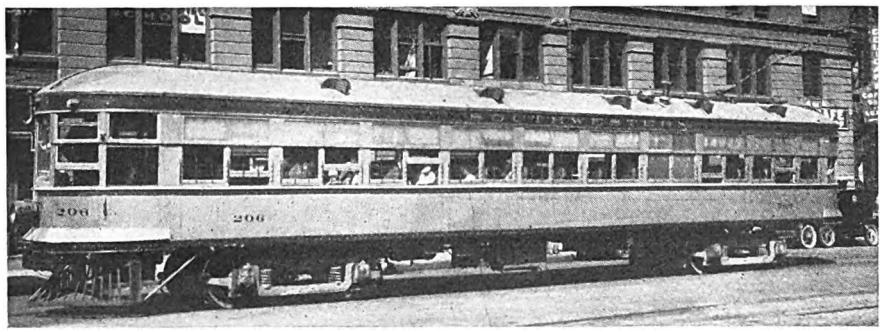
At each end sill, channel corner posts extend from side sill to side sill, serving as a support for the Haskelite roof and assuring necessary strength

Interior of the Cleveland Southwestern Railway & Light Company interurban, showing the unusual seating arrangement and the extra wide comfortable seats

at the body corners. Commercial steel shapes, combined with pressed steel U-shaped side posts, deep aluminum letterboard between the corner posts and a side sheathing of $\frac{3}{32}$-in. steel constitute the principal features of the construction.

The car is mounted on Brill No. 177-E trucks, equipped with 26-in. diameter wheels and the latest type of Brill mechanical slack adjusters. Five of the cars in the lot built for Wilmington are equipped with General Electric No. 265 motors; the other five have Westinghouse No. 510 motors. Complete specifications for these cars were published in the July 28, 1928, issue of this paper.

The ten cars for the Monongahela-West Penn Public Service Company are the first of their type to be placed in service by that property. Though five are for city and five for interurban service, they are practically of identical design. As indicated by the sample car on display, particular at-

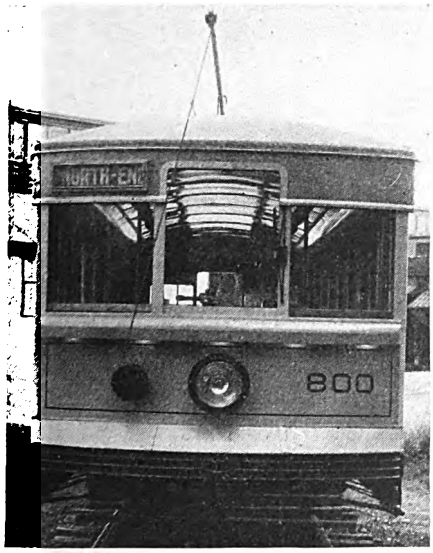


The Cleveland Southwestern Railway & Light Company is showing one of the six interurbans it has rebuilt

Digitized by Google

tention was given to external appearance.

The five interurban cars in this order are equipped with leather upholstered, reversible seats, with deep-spring cushions and spring upholstered backs. They accommodate 44 passengers each. Philippine mahogany inside finish and battleship linoleum floor covering contribute to the interior attractiveness. A mahogany equipment cabinet in each vestibule conceals the operating control equipment. Complete specifications of these ten cars were published in the June 30, 1928, issue of ELECTRIC RAILWAY JOURNAL.



Front view of the Monongahela-West Penn interurban car being exhibited

The Pittsburgh interurban car exhibited by the St. Louis Car Company is one of fifteen ordered by the Pittsburgh Railways. It is equipped with four 60-hp. motors and is capable of attaining a speed of more than 55 m.p.h. The outside is painted red with the center work in gray, while the interior is finished in three colors of Duco. The seats are of the individual bucket type, upholstered in plush and leather, and are arranged in single rows at an angle to the sides of the car.

Each car is 52 ft. 10 in. long over the anti-climbers, 8 ft. 4 in. wide, and weighs 49,000 lb. complete. The bodies are of all-steel construction, with arch roofs and sliding center doors. All air piping for the brakes, safety equipment, whistles and doors is of copper tubing. The trucks are equipped with S.K.F. roller journal bearings, inside-hung Westing-

house motors and rolled steel wheels. Further details are given in the accompanying specifications.

Another attraction at the car exhibit is one of the Cleveland Railway articulated units built by the G. C. Kuhlman Car Company. These were designed principally to give improved distribution of passenger loads in two-car train operation and to provide equipment of greater attractiveness and riding comfort with which to meet automobile competition. At the same time, the articulated construction gave lower weight and lower operating cost, and is expected to reduce maintenance. The two cars of this unit are joined by a vestibule which permits the passengers to move from one car to the other even on short radius curves. The seating arrangement, wider windows, lighting system and wide aisles are among the many interesting features of this unit. It was described fully in the Sept. 1, 1928, issue of this publication.

For the first time in a number of years, the Osgood Bradley Car Company is represented in an electric railway car exhibit with its 1929 model car which it has called "the Electro-Mobile." The object in this design was to obtain a car of conservative construction but of lines and proportions to give an appearance of gracefulness and attractiveness. Its general size, arrangement and equipment

Osgood Bradley sample car for 1929, the "Electro-Mobile," may be seen at the exhibit

are intended to fit the requirements of the average size city property. Full details of the design and equipment appeared in the June 23, 1928, issue of this publication.

It is worthy of note that a considerable proportion of the cars on display this year are manufacturers' models intended to be sold as complete units and backed by the manufacturer's sponsorship of design. Since the number of cars of this type has increased at each convention for the past three years there are definite indications of a resumption of design initiative by the builders with the object of stimulating the purchase of street cars on a more economically sound basis than has been the practice in the past.

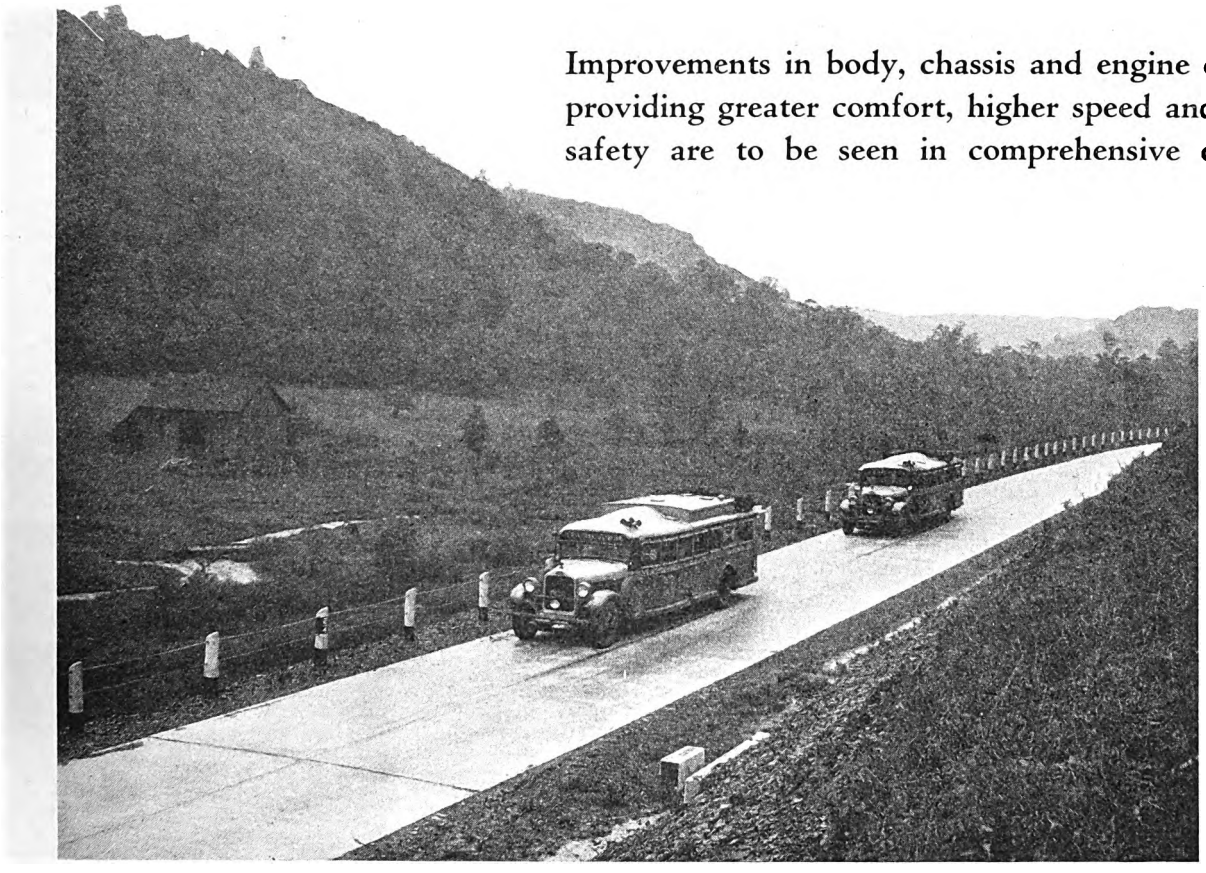
NEW BUSES OF MANY TYPES Hold Attention

Improvements in body, chassis and engine **design,** providing greater comfort, higher speed and **more** safety are to be seen in comprehensive **display**



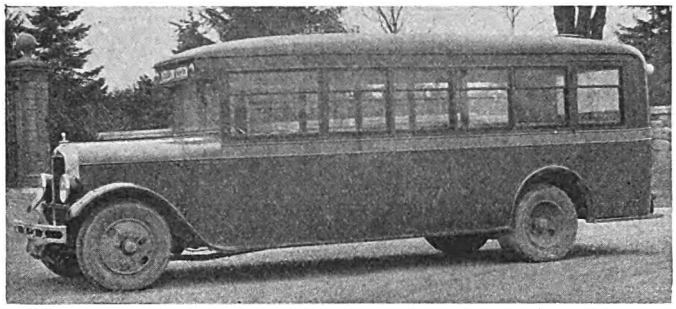
White chassis with Bender bodies speeding through the beautiful Pocono Mountains

BUS riders of today are demanding more than mere transportation. This is evidenced by the impressive display of bus bodies and equipment. Commodious, restful seats, full vision windows and adequate illumination, ample ventilation and sufficient warmth, wider aisles and proper headroom; these requisites, together with attractive appearance, inside and out are, to the passenger, fully as important as a dependable engine and a sturdily built chassis. That bus manufacturers have kept pace with these demands is demonstrated by advances in bodies, chassis and accessories exhibited at this year's convention. In body design the ends of beauty as well as utility have been better served, and the conflict between capacity and comfort appears to have been decided definitely in favor of the latter.

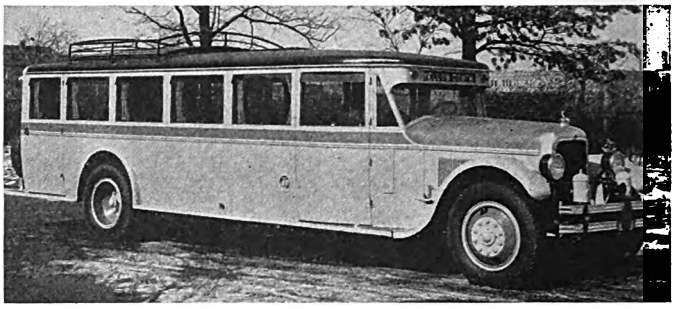
The increasing importance of long distance riding is reflected in the attention that is given to the care of baggage. Unusual arrangements have been devised to permit of carrying suit cases and parcels inside the body and, where it is still necessary to carry excess luggage on the roof, substantial inclosed receptacles have replaced the railed inclosures and loose canvas covers of a few years ago. Safety features have not been overlooked, as is evidenced by improvements in brake design and the use of metal in body construction.

The General Motors Truck Company is represented by its full line of city and parlor car types of bodies and chassis. Here are the familiar Yellow Coaches, types Y and Z, in addition to which there is shown the recently developed type W. This latter, shown in both parlor and city types, was brought out in recognition of the demand for a small, high quality bus. The special feature is the use of the Cadillac eight-cylinder V-type power plant, modified as necessary, to meet motor coach requirements. The type W parlor coach has an over-all length of body of 18 ft., over-all width of 84 in., and headroom of 68 in. Leather-upholstered bucket seats are arranged in pairs on one side of the aisle and singly on the other, accommodating a total of seventeen passengers. Four more can be seated by the use of drop seats. The type W for city service has an over-all body length of 23 ft. 8 in., over-all width of 90 in., and headroom of 76½ in. Accessories include rear vision mirror and a heating system of the electric blower type, eliminating all pipes inside the body. A new outboard mounting for the front spring suspension has been developed. The springs are shackled at the front to a heavy channel cross member outside the chassis frame instead of directly under it. Other features are an oversize, underslung, worm-driven rear axle, a four-speed transmission, a multiple-disk clutch with special lubrication. The four-wheel service brakes combine hydraulic control with mechanical transmission of the type used on the model Z.

Digitized by Google



The new Yellow Type W is powered with Cadillac eight-cylinder engine



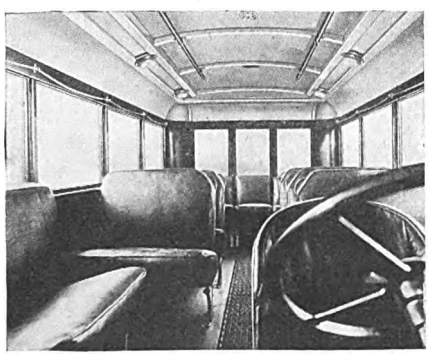
The Yellow Type Y parlor coach is provided with Westinghouse air brakes

General Motors is also exhibiting its stock model types Y, W and Z chassis, a truck with line repair body, and a cut-away sleeve valve engine.

Smaller Types of Buses Have Definite Place

Representative of the smaller capacity buses is the exhibit of Graham Brothers, the bus division of Dodge Brothers. The exhibit includes a 21-passenger street car type coach and a 21-passenger intercity bus. The seats, upholstered in genuine leather, are recessed so as to increase the knee room. Beauty has been emphasized both in general appearance of the bodies and in color schemes, the street car coach being shown in a combination of cream, maroon and gray; the intercity type in cream, brown and yellow. The heating system is of the forced circulation type. Interior illumination is provided by six flush type fixtures with 21-cp. lamps. The Graham Brothers 16-passenger coach is indicative of the trend toward a small capacity parlor car type of bus where traffic requirements are light. Inside body length is 14 ft. 7 in., width 70 in., and headroom 60 in. Four double seats are arranged on the left side of the body, four single seats on the right and four individual seats of the chair type across the rear.

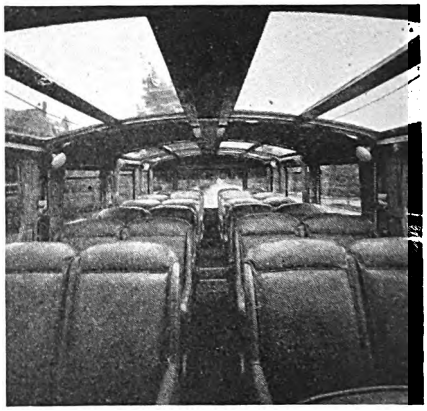
Graham Brothers have made few changes in their chassis other than to widen the forward tread 3 in. to improve the turning radius. The rear tread also has been widened slightly to permit of the use of balloon tires. Front springs have been lengthened 2 in. and the use of the three-stage progressive type of spring is continued in the rear end. The Hannum steering gear has been substituted for the type previously used, and Nichols-Lintern fan type blower heaters have replaced pipe heaters. Power is supplied by a six-cylinder heavy duty engine fitted with an 11-in. single-plate clutch and four-speed transmission. Four-wheel internal expanding hydraulic brakes are supplemented by an emergency hand brake working on the propeller shaft.



Convenient seating arrangement in Graham Brothers city type coach

Included in the Mack International Motor Company's exhibit is a bus body of rather unusual type. It is conventional in external appearance; through an ingenious arrangement the driver's seat has been placed somewhat forward of the customary position, affording a wider entrance. The body is mounted on a chassis of but 210-in. wheelbase, but provides comfortable seating room for 29 passengers. Mack is also showing a 29-passenger parlor observation car, mounted on its type AL chassis with six-cylinder 94-hp. motor. Wide plate glass windows extend across the rear, and an aluminum grille work, enclosing two spare tires, protects the rear body panels. A special type of body, built according to specifications of the Reading Railroad and intended for auxiliary service in connection with that system, has full headroom, seats 29 passengers and carries the baggage in spacious racks over the passengers' heads. Mack's exhibit also includes a 25-passenger parlor car mounted on a type AB chassis, driven by a four-cylinder engine.

No changes of a radical nature have been made in the chassis exhibited by the Mack organization, but a number of minor refinements have been incorporated in the design. A chassis for mechanical drive, mounting a standard six-cylinder 96-hp. engine, provided with four wheel BK booster brakes, and with the 26 points of rubber shock insulation indicated is shown. The company is also showing a driving line display of the four-cylinder mechanical layout, including engine, transmission, shaft brake and rear axle transmission, and a gas-electric driving line showing the arrangement of the electrical and mechanical equipment. The gas-electric assembly consists of a six-cylinder engine and a single General Electric motor and generator. Both exhibits are mounted on display stands and in motion to show driving action.

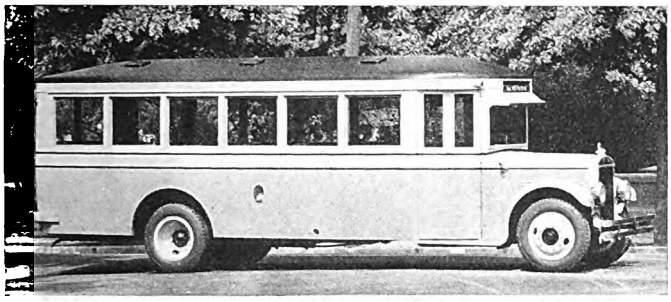


Attractive seating arrangement in a Mack observation coach

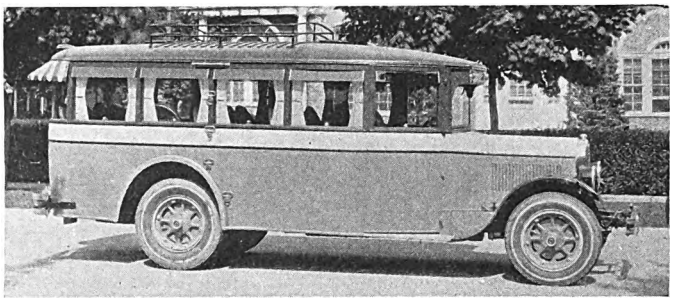
Rather unusual is a drop forging exhibit, showing the process of making a standard banjo housing, crank shaft, and connecting rod, complete from the original steel billet through to the finished product and chippings.

The FitzJohn Manufacturing Company is featuring its general utility coach, a 12-passenger parlor-car body mounted on a Reo Model FB light bus chassis of 143-in. wheelbase. This bus is designed for special parties, for express service in cities and where a larger type bus is not warranted. Body framing is hardwood, while exterior panels are of sheet steel. Exposed interior trim is in walnut, with headlining and quarter panels of textile leather. Mohair drapes at the windows are in colors to harmonize with the upholstery.

Digitized by Google



Latest Mack production is a 29-passenger close-coupled coach with 210-in. wheelbase



For light traffic routes, 12-passenger utility coach body by FitzJohn

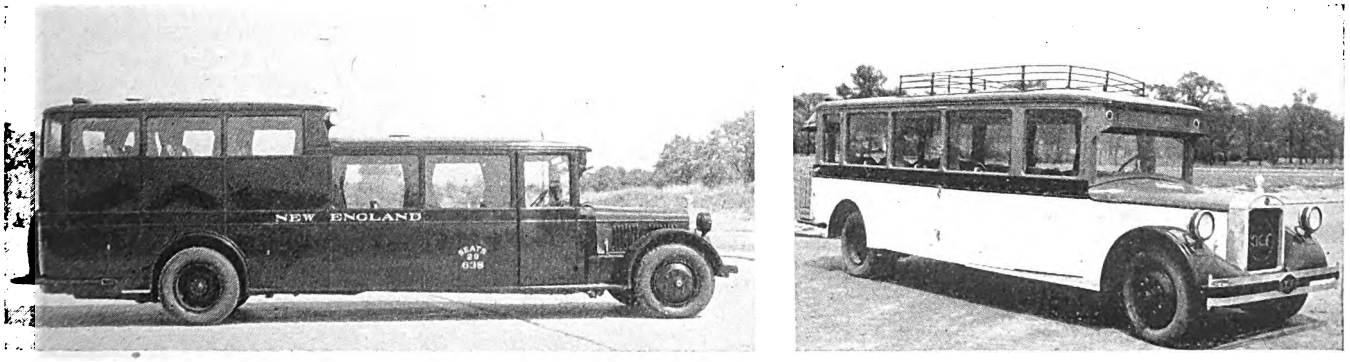
Seating arrangement provides two forward facing double chairs on the left side and two forward facing single chairs on the right. Single chairs facing the aisle are placed over the wheel housing. A built-in seat across the rear end of the body accommodates four passengers. All chairs are of wicker, upholstered in genuine leather. Baggage is stowed on the roof.

FitzJohn is also displaying a 21-passenger "pay-enter grand" coach body and a 21-passenger observation coach body, both mounted on Reo chassis of 175-in. wheelbase. In the former the interior is attractive, with good illumination, ample ventilation, a spacious aisle, full headroom and extra wide, restful seats, supplied by Hale & Kilburn. The heating system is from the exhaust through thin-walled steel tubes running along both sides of the body and covered by a perforated sheet steel guard.

In the 21-passenger FitzJohn observation coach seats are of the individual chair type of woven fibre, attractive and substantial. Backs are form-shaped and spacing allows ample knee room. Headlining is of textile leather in colors to harmonize with seats and drapes and is carried down over the quarter panels. All lower panels, which are also covered with textile leather, are made in sections so as to permit of easy removal. A luggage rack is located on the roof over the center of the car, and a nickel-plated grille protects the body panels at the rear.

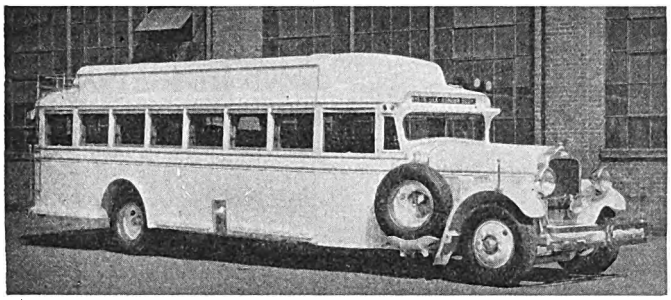
The American Car & Foundry Motors Company exhibit consists of a stock model parlor observation coach seating 29 passengers, a 23-passenger parlor coach, a 29-passenger de luxe urban coach, a 27-passenger parlor coach, and a 40-passenger metropolitan coach. Here is a range of styles in body and chassis to cover practically every requirement of motor bus operation. Something new among the models is the urban coach, which was developed to meet the demand for more luxury in excess fare fast city service. Length over the bumpers is 28 ft. 6 in., over-all width 8 ft. and headroom 76 in. Paneling above the belt line is of 18-gage aluminum, die formed. Below the belt line it is of $\frac{1}{4}$-in. ply-wood, metal faced, with joints covered with aluminum molding. Panels can be replaced quickly and at little expense. Body framing is of white ash, and roof framing is steel-reinforced. The entire body is machined to template so that individual pieces may be obtained from the builder with the assurance that they will fit. Seats, supplied by Brill, are upholstered in genuine leather, Spanish finish, and are spaced on 30-in. centers, with aluminum grab handles at the aisle ends. Heating from the exhaust is distributed through seamless tubes carried along the sides of the body below the seat level and protected by metal guards.

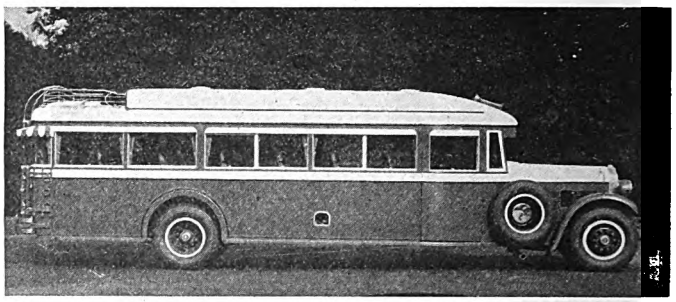
The A.C.F. metropolitan coach was brought out to meet the demands for an automotive unit to handle mass transportation. It is shown in two models, with gas-electric and mechanical drive. The engine, of the Hall-Scott type, with gas-electric drive, is mounted on the left side near the middle of the body. There are two doors on the right side, front and rear, the latter of which is controlled by a driver's switch and treadle plate in the floor. Forty passengers can be seated in leather-upholstered seats, the majority of which face forward, and with standees loads up to 100 can be carried. Length over the bumpers is 31 ft., and over-all width 8 ft. The framing and running gear are built as a unit without separate chassis. Panels are of sheet steel. The wheelbase is 230 in. with a body overhang ahead of the front axle of 33 in. and back of the rear axle of 95 in. The metropolitan coach with mechanical drive is similar except that the engine, carried midway between axle centers, is on the right side of the coach. Mounted as a unit with the engine are the single-plate dry-disk clutch and the three-speed transmission, this later being adopted in preference to the four-speed gear box with the idea of securing faster acceleration and of minimizing gear shifting. Final drive is by under-



At left, the A.C.F. parlor observation coach does away with seats over the wheel-housing and provides dustproof compartment for baggage. At right, an A.C.F. 23-passenger parlor coach has observation section at the rear

Digitized by Google





At left, White chassis, with Bender de luxe body, providing full headroom, with baggage space over passengers' heads. At right, wide windows characterize this White bus with all-steel body by Lang

slung worm to a full floating axle. The worm and wheel, which are supported by Timken roller bearings, are in line with the engine, offset to the right or left, according as mechanical or gas-electric drive is used. The I-beam front axle is of the reversed Elliott type, of drop-forged, heat-treated steel, with Timken bearings on the steering knuckle pins. The steering gear, of screw and nut type, is mounted almost directly over the front axle.

Four-wheel service air brakes supplied by Westinghouse, are of the internal expanding type with fabric-lined shoes. The engine is of the Hall-Scott six-cylinder type, $4\frac{1}{4}$x$5\frac{1}{2}$ in., and is rated to develop nearly 100 hp. at 1,800 r.p.m. Electrical equipment in the gas-electric model is supplied by General Electric.

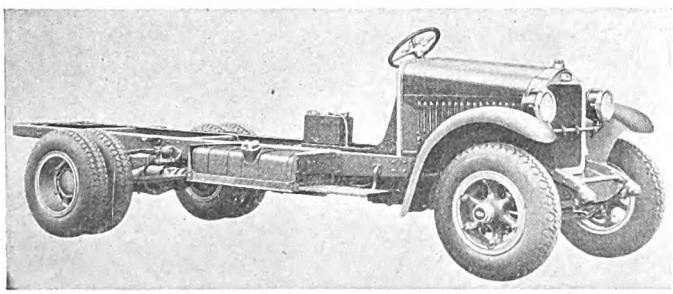
Designed originally to take care of excess baggage without resort to carrying it on the roof the raised deck feature of the parlor observation coach has been found, so its manufacturer claims, to possess a distinctive sales appeal. Wheelhouse seating is entirely avoided, a considerable proportion of the load is isolated from engine noises, and the baggage is placed at the curb level under lock and key and protected from dust. Seventeen passengers are carried in the upper compartment and twelve in the lower section, all seats, of the individual chair type, facing forward.

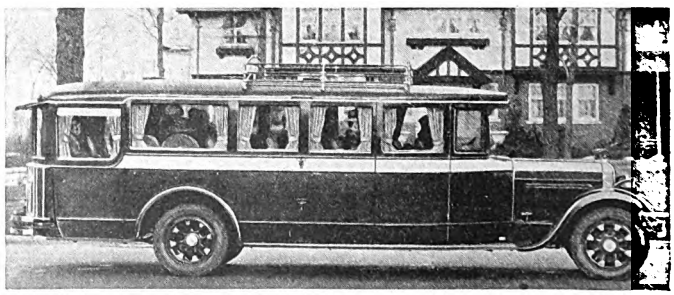
A wide range of bus models of various capacities and types, new bodies in unusual light-weight design and a high-speed, heavy-duty truck are included in the White Company exhibit. The fully-equipped models include the body work of both Bender and Lang of Cleveland. One of the features of the display is a six-cylinder, 100-hp. bus, equipped with Westinghouse four-wheel air brakes and mounted with a new type parlor car body by Bender. This bus has a wheelbase of 240 in. and seats 33 passengers. Inside overhead baggage compartments, run the full length of the body on both sides. All seats are upholstered in leather, those at the rear being reversible so as to permit of the use of card tables. A model 54 six-cylinder, 100-hp. chassis is shown stripped. The same chassis is shown with Bender "Pullman-of-the-Highway" bodies of both 25 and 36 capacities, and with a Bender 29-passenger semi de luxe "pay-enter" body. The exhibit also includes model 53 bus chassis with 21-passenger "pay-enter" body, another of the same type with a 16-20 passenger parlor observation body, a model 50-B with a Bender 29-passenger "pay-enter" body, and one of the latest Lang 29-passenger parlor coaches of all-metal construction.

The new White truck, known as model 58, has been brought out for freight or express service where high speed must be combined with large capacity. It is equipped with high pressure pneumatic tires and dual rears. Cut-away models of White motors and clutches are also shown.

Studebaker's contribution to the de luxe class is the "Seminole," a 22-passenger parlor observation car, designed for comfort and luxury. Riding comfort is assured by the use of deeply upholstered seats set at a lounging angle with ample leg room. All seats are hinged at the front for easy adjustment or removal. Side panels are padded to reduce road noises and windows are non-rattling. A body width of 90 in. and headroom of 62 in. provide seating comfort and easy access. A single-valve Kysor heater has individually controlled outlets. In the street car class this company is represented by its 21-passenger model, mounted on a 75 heavy duty chassis. Here again passenger comfort has been attained by the use of well spaced leather upholstered seats. Aisle and rear end space give room for twenty or more standees. Six dome lights against a white enamel ceiling supply illumination. For service on routes where a combination city and de luxe service must be afforded the Studebaker Company has brought out a 21-passenger unit possessing city bus convenience and parlor car luxury. The body is particularly rugged in its construction but the weight has been kept down by the extensive use of laminated wood in place of metal.

Studebaker's chassis exhibit consists of a type 75 heavy-duty bus chassis, which is used for mounting both the intercity coach de luxe and the "Seminole" type of bodies. It is equipped with the "Big Six" L-head engine, which develops 96 hp. Ease





At left, the new White Model 58 high-speed truck chassis, for freight or express service. At right, the "Seminole," a 22-passenger parlor car by Studebaker

Full headroom, city bus convenience and parlor car luxury in Studebaker's 21-passenger utility coach

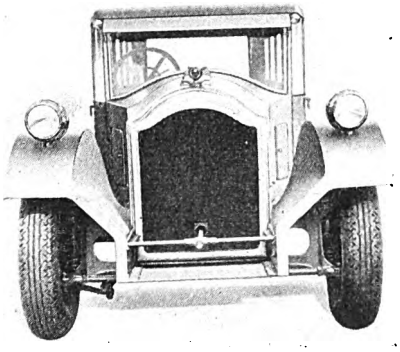
of braking action and greater driving safety are insured by the Westinghouse vacuum brakes with which all buses of this type are now provided. A fuel pump replaces the vacuum tank, its principal advantage being a positive flow of gasoline to the carburetor. Drive shafts are of molybdenum steel to a semi-floating rear axle. Additional safety is secured by a double face disk-type emergency brake mounted on the propeller shaft. A low center of gravity is obtained and the rear ramp eliminated by dropping the frame back of the wheel housing. Riding comfort is obtained by extra-heavy full balloon tires and long, resilient springs. Oversize Timken bearings were selected for the differential mountings. An extra heavy, box section, malleable housing, made in one piece, covers the differential. By removing the rear cover plate the entire mechanism is exposed for inspection or repair.

The Fremont Metal Body Company exhibits a de luxe 21-passenger, model 1,000, observation parlor car body mounted on a Studebaker 76 chassis. The special feature is the headroom of 65 in., unusually high for de luxe bodies of this capacity, permitting of the installation of interior baggage racks. Provision is also made for carrying excess baggage in enclosed containers on the roof. An effort is made to have this coach approach in appearance the high class passenger automobile, particularly as regards the design of the engine hood, cowl and windshield. Curved glass has been installed in the rear corner windows. Form-fitting chairs, upholstered in real leather, amply spaced and with unusually high backs, set off the interior to good effect.

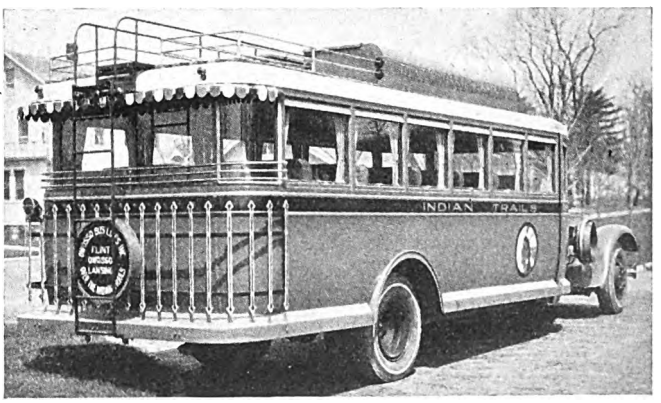
The Whitcomb Wheel Company of Kenosha, Wis., is showing a six-wheel bus with body and chassis of its own design. Chassis and body are of unit construction, carefully worked out so as to eliminate unnecessary weight without sacrifice of strength. An unusual departure from convention is the axle-less front end. This is accomplished by riveting two cast steel brackets to the side members of the frame.

The trend toward all-metal body construction is exemplified in the exhibit of the Lang Body Company. With a steel frame, aluminum panels and aluminum alloy castings wherever practicable, the body is claimed to be strong, light and durable. Its appearance is, in addition, decidedly pleasing. The body is 8 ft. in width, over all, and has interior headroom of 6 ft. 4 in. Weight is given as 6,400 lb. The entire structural strength is carried in the frame, with panels extremely light and so arranged as to be quickly and easily removed. An ornamental grille of nickel plated steel rods protects the rear. Seats are upholstered in real leather and the interior is sumptuously fitted out.

Embodying a number of distinct improvements developed or adopted during the past year Gramm Motors is showing a parlor coach and its type R-31-236-WB motor coach chassis. Interior is spacious, well lighted and well ventilated, with roomy comfortable seats. The frame is equipped with a tubular cross member mounted on brackets so as to occupy a position under the bell housing of the engine.



Axle-less front end of the Whitcomb Wheel Company's bus



Ornamental rear end and roof baggage container on a recent model, by the Fremont Metal Body Company

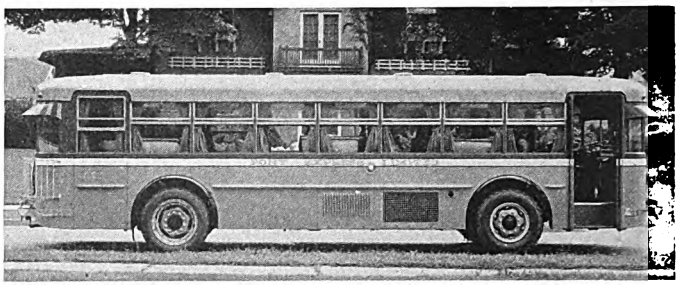
A Lang all-metal body with spacious interior baggage racks

The company has recently increased the size of its standard six-cylinder engine to 4⅛ in. bore by 5⅛ in. stroke. The length of the rear axle has been increased to 70⅝ in. so as to permit of the use of larger tires. Leece-Neville electrical equipment has been made standard throughout. Bragg Kliesrath booster brakes, on all four wheels, have been adopted.

One of the most distinctive contributions to recent development in the field of automotive transportation has been the Twin Coach, produced by the Twin Coach Corporation of Kent, Ohio, and represented at the exhibit in several distinct types. The parlor car, with seats for 40 passengers, is of the type used in service between Detroit and Chicago. Being intended for high-speed service, the color scheme, consisting of a yellow lower body, white belt, green upper body and yellow roof was adopted primarily for high visibility on the highway. The interior is finished with green leather upholstery on the seats, green carpet on the floor and attractive curtains. At the left rear corner is a completely equipped lavatory 32x32 in. with a jackknife folding door concealed by a green plush curtain.

The urban coach is a standard 40-passenger Twin Coach with blue leather deep cushioned street car seats, 6 ft. 5 in. headroom and wide aisle. The trackless trolley which, in

Digitized by Google



At left, Gramm's parlor car is of pleasing appearance. At right, a Twin Coach intercity bus of the type in service between Chicago and Detroit

body design, very closely resembles the urban coach, is equipped with General Electric units. Its capacity is 42 seated passengers. A feature of the structural design of the two units, the Twin Coach and the trackless trolley, is that many of the parts are identical and interchangeable.

Unusual interest centers around the mechanical and structural features of the 43-passenger electric coach exhibited by the Versare Corporation. It is a duplicate of the ten recently put in service in Salt Lake City. It is driven through a double-reduction gear by two Westinghouse 50-hp. 600-volt direct-current motors. One motor is mounted in front of each of the two rear axles, being trunnion supported by longitudinal members which are part of the cross frame. Resistors are of the spiral type and so arranged as to serve for heating the car when necessary. Braking is electro-dynamic, using the propulsion motors as generators. Driver's control is through pedals. The controller pedal moves through six notches to full series position where the motion is checked for an instant, after which five additional notches carry the motors into full parallel. The other pedal controls the pneumatic brakes, which are supplied by the Westinghouse Traction Brake Company. Air compressors, made by the General Electric Company, are of sufficient capacity to supply brakes, windshield wiper, door mechanism and horn. Axles are supplied by the Eaton Axle & Spring Company. The four rear wheels are equipped with dual pneumatic tires. Trolley base, harp, poles and retriever are supplied by the Ohio Brass Company. The over-all length is 31 ft. 7 in., width 8 ft., and height from ground to roof on inflated tires, 9 ft. Owing to the extensive use of duralumin in the frame and sheathing the weight is kept down to approximately 16,000 lb. All seats are upholstered in leather, and hand straps are provided for standees. National Pneumatic apparatus is used to open and shut the doors, the front door being handled by the driver and the center door equipped with automatic treadle plate.

The Versare exhibit includes a gas-electric coach, completely equipped, a skeleton gas-electric coach cut away so as to show structural and operating details, and a complete 36-passenger electric coach introducing the new Versare type of opposed motor drive.

The Fraser Electric Transmission Corporation is showing one of its electro-control units for bus drive. This is a complete motor-generator, with two armatures rotating in one magnetic field. The control of speed is through variations in the armature connections and the field strength. This single unit is designed to do the same work as the generator and motors of the familiar gas-electric drive. Besides the unit various component parts are shown. Another complete unit is shown installed for operation on a 29-passenger city-type bus.

First-Aid Equipment Shown

TREATMENT of injuries with Mercurochrome is featured in the exhibit of Hynson, Westcott & Dunning. Mercurochrome is a germicide and is employed in treating and preventing practically all types of infections. Due to the fact that it does not irritate workers report minor injuries more readily, as they learn that the applicaion of this does not hurt and that the treatment of the injury is not more painful than the injury itself.

Interesting Exhibit for Purchasing Agents

PURCHASING agents and storekeepers should not fail to visit the interesting exhibit of the Purchases and Stores Division of the American Electric Railway Engineering Association. This exhibit, located in the north wing of the exhibition hall, includes a delineascope, which shows views of modern stores equipment and material-handling devices. Escalators, chutes, cranes, magnets, and lift trucks are shown in operation in 34 different utilities in this country, Canada and Mexico. Views of stores buildings and stores layouts are shown from utilities in 21 different states.

In addition, there are displayed various sets of forms as recommended in the Manual and a complete exhibit of forms and methods of storage accounting. W. V. Shoemaker, chief stores accountant of the Philadelphia company and subsidiary companies, Pittsburgh, Pa., is present at the exhibit to answer questions and explain the procedure.

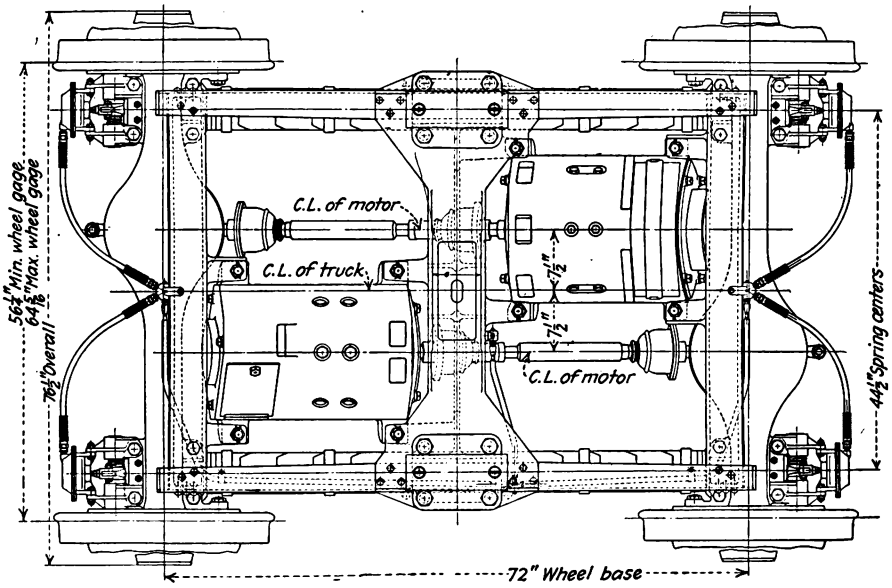
CAR TRUCKS DISPLAYED
Show Progress During Year

Several entirely new designs of trucks and truck parts being shown at the exhibit. Many standard pieces of equipment on display have been improved

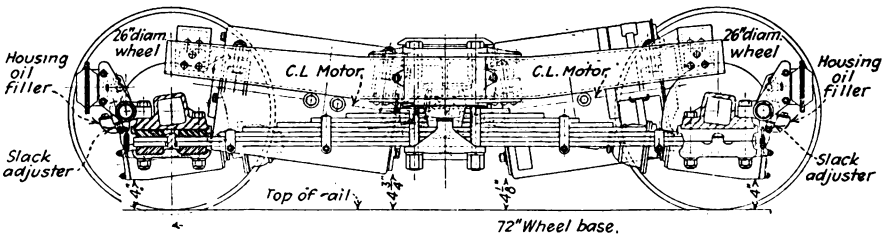
CAR truck manufacturers in the past year have developed several new designs, representing distinct departures from conventional practice or changes on standard models in this important field. At least six new truck models have made their appearance, and in addition many pieces of truck equipment have been improved. Last year the truck manufacturers introduced to the industry the small diameter wheel trucks with high-speed motors, automotive-type worm and double reduction gear drives, and new spring arrangements. Most of these designs also included roller or ball bearings.

This year there are further refinements in some of last year's new models and some entirely new designs. Introduction of cars mounted on four wheels by the Twin Coach Corporation and the St. Louis Car Company will attract particular attention because of the unusual methods adopted for achieving riding ease and ability to negotiate sharp curves. Among the important new trucks and improved models being shown are the model 51 Timken-Detroit Axle Company truck, with the new 64011-W worm drive axle, the equalized pedestal type truck of the Baldwin Locomotive Works, trucks developed by the Cincinnati Car Company for its high-speed interurban and city type cars and the trucks of the Osgood Bradley Car Company.

In truck parts there are likewise many new products and improvements of former equipment. Westinghouse has an improved W-N double reduction gear drive; the Tool Steel Gear & Pinion Company has a quiet, single reduction gear drive, and Nuttall is showing a noiseless gear. Brill exhibits a redesigned mechanical slack adjuster, and the Anderson Brake Adjuster Company has a "non-vibrating" slack adjuster. Standard Steel Works Company has developed a light-weight rolled steel wheel with a noise-deadening feature. The Manganese Steel Forge Company is showing its precision finished pins and bushings for truck parts, and several other manufacturers of similar equipment are represented with their latest products.



Model 51 Timken-Detroit Axle Company truck, which supersedes the model 50 exhibited last year

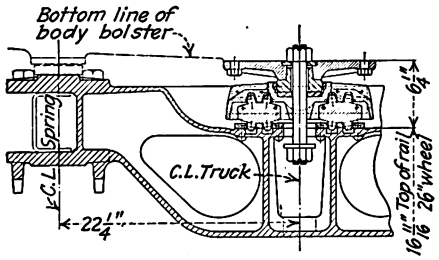


Side elevation of the model 51 truck, showing the unusual spring arrangement

The Timken-Detroit Axle Company's new model 51 truck supersedes the model 50 exhibited at the 1927 convention. The new truck is equipped with a 64011-W worm drive axle which supersedes the 64010-W axle. Last year's model 50 truck, which introduced the idea of worm drive axles, diaphragm brakes, internal expanding brake shoes and automotive type springs for street cars, and which included the introduction of spring suspended, light-weight, high-speed motors, was a radical departure in car truck practice. It was introduced frankly as an experiment with the objectives of reduced noise and weight, and improved riding in view. The model 51 is the result of a year's study of the earlier truck in service on a number of electric railway properties.

The model 51 differs from the previous design essentially in the arrangement of springs and the truck frame. The side frames of the first model were curved over the axles and joined at the ends to form a complete frame carrying the axles. In the 51 truck the axle housings and springs really form the truck frame. A simple structural cradle carried over and

Digitized by Google



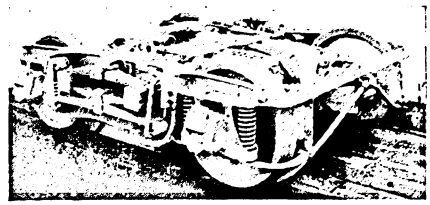
Center plate for the new Timken-Detroit Axle Company truck

inside the half-elliptic side springs merely serves as a support and mounting for the motors. Instead of having two short half-elliptic springs mounted on a truck frame, as in the model 50, the new design provides simply one long half-elliptic spring on each side, from axle to axle. The spring ends are bolted to the axle housings and support the motor cradle and trunk bolster at the center. The axle and worm drive used with the new truck have been designed for heavier loads. Also, the brake diaphragms are mounted differently and the entire brake mechanism has been redesigned.

Trucks included in the Cincinnati Car Company exhibit represent two distinct types, one designed for high-speed interurban service and the other for city operation. Ease of riding and safety at high speed were the principal objectives sought in the first, while simplicity, ruggedness and low maintenance were primary considerations in the latter. The interurban trucks have cast steel side frames, spring pedestal journal boxes, and combination full and semi-elliptic spring bolster suspension. In addition to the regular air brakes, the trucks carry Cincinnati duplex air-magnetic track brakes. The unusual spring arrangement and the magnetic track brakes are the two outstanding features of this design. The rail brakes can be used either for emergency or service operation. The shoes are spring supported approximately 2 in. above the rail on each truck side frame and are lowered into magnetic contact with the rails by a simple pneumatic mechanism and operated from the motorman's position by the sand control on the standard M-28 type of brake valve. By this arrangement the track brake is automatically brought into operation whenever an emergency application of the air brakes is made through the Safety Car Devices equipment.

The four electric shoe brakes on a double truck installation are connected in series-parallel from the trolley, the two shoes on each truck being connected in series. Full saturation of a shoe is reached with approximately 45 amp. at half line voltage, giving an attractive force between the rail and shoe of approximately 4,800 lb. This equipment was developed jointly by the Cincinnati Car Company and General Electric Company.

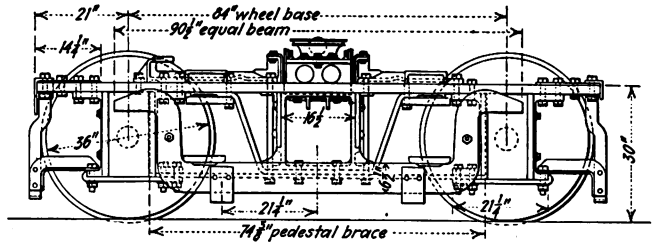
In the field of heavy, high-speed trucks, many unusual features are presented by the truck developed by



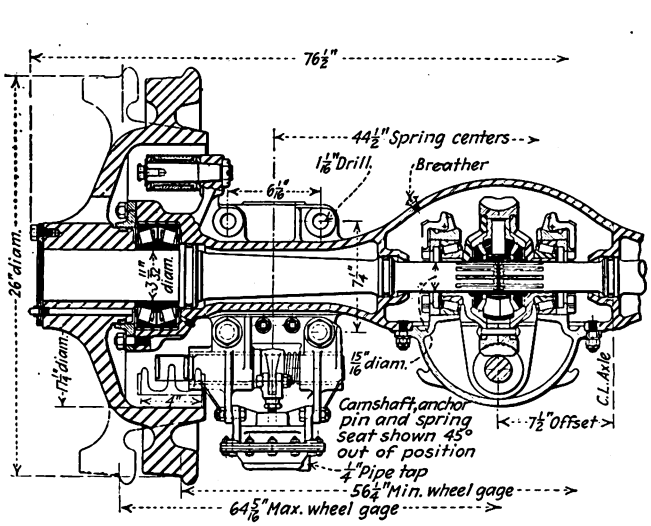
Cincinnati Car Company truck under the Indianapolis & Southeastern Railway interurban car, equipped with duplex air-magnetic rail brakes

the Baldwin Locomotive Works for the Chicago, South Shore & South Bend Railway. This is of the equalized pedestal type with heavy angle end frames. The side frames are forged steel and are secured to the end frames by corner gussets, and to the steel slab transoms by heavy cast steel gussets. They also support the clasp brake rigging in which special attention is given to the suspension to prevent chatter. The bolsters are case hardened with castellated nuts and cotter pins.

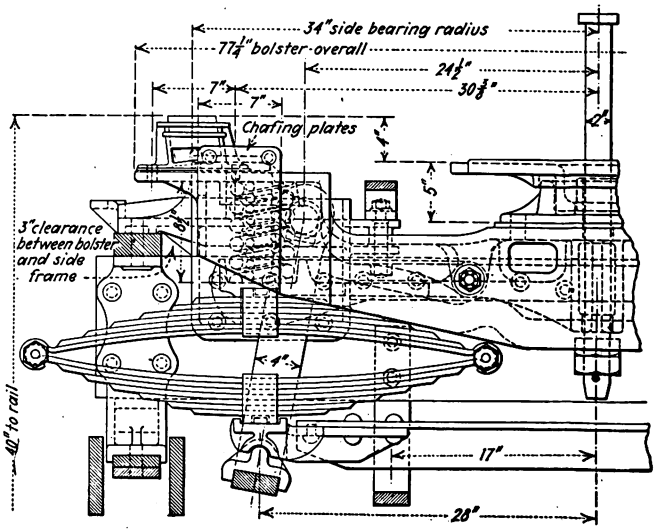
The spring arrangement is especially noteworthy. The bolster is supported on auxiliary coil springs located above the full elliptic springs, and carried in a cast steel spring housing attached by a fulcrum bolt to the bolster. The equalizing beams are



Side elevation of the equalized pedestal type truck of the Baldwin Locomotive Works for use under heavy, high-speed interurban passenger cars



Timken-Detroit Axle Company's new worm drive axle, the 64011-W type

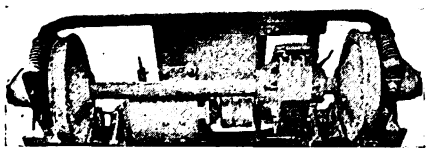


Detail of the bolster and swing link of the new Baldwin truck

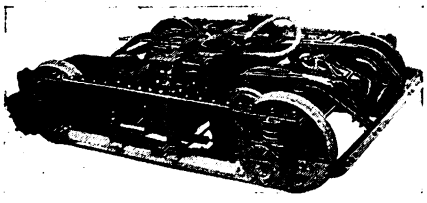
Digitized by Google

die punched from steel plates, and are equipped with separators to prevent chafing of the pedestals. They are designed with easy curves and support the frames through high helical springs of large diameter, considered essential in absorbing rail shocks due to low joints, etc. Each side of the swing links supporting the bolster and elliptic springs from the truck frame is hung from pins carried in sockets in the frame gusset plates. The design permits a comparatively low car height for high-speed service.

The Osgood Bradley type 45-66 KDA 35 trucks under this company's exhibit car are equipped with Westinghouse-Nuttall double reduction drive, and high-speed, full spring mounted motors. They are the truss frame, spring pedestal type, with coiled springs over the Hyatt roller



Single reduction gear drive for high-speed, spring suspended motors, developed by the Tool Steel Gear & Pinion Company



Osgood Bradley's type 45-66 KDA 35 truck is equipped with Westinghouse-Nuttall double reduction drive, high-speed, full spring mounted motors and brake diaphragms

bearing journal boxes, and with conventional double elliptic, spring supported, swing type bolsters with damper attachment. The brakes are of the conventional type, but are actuated by diaphragm brake chambers, one being installed for each wheel. With this design much of the body brake rigging is eliminated and the total weight of all brake equipment is much less than with the old type. The trucks of the Osgood Bradley sample car were described in the June 23, 1928, issue.

A new single reduction driving unit for use with high-speed motors has been developed by the Tool Steel Gear & Pinion Company and is shown on one of the Cincinnati cars at the exhibit. This drive was developed especially for the light-weight, high-speed motor, and is simple and rugged. In this design the motor is connected to the reduction unit by a flexible coupling arranged to give sufficient flexibility to care for any reasonable wear or looseness in the journal boxes, or end play in the axle, or angularity of the axle due to unequally proportioned load on the truck springs. The unit itself consists of a gear and pinion carried on SKF roller bearings and operating with continual lubrication. The housing is oil and dust-tight and is split longitudinally so that if necessary the lower half can be dropped for inspection. The gear unit is mounted upon the axle with a swing link suspension directly over the pinion. This suspension arrangement keeps the unit and the motor in alignment.

The W-N drive, introduced to the industry last year, was designed for high-speed motors. It is a double reduction, self-contained gear unit, with fixed gear center distances maintained by Timken bearings. The gears operate entirely in a bath of oil in a one-piece case.

A new feature of the W-N drive is the Westinghouse-Nuttall noiseless gear. These gears are being shown in both the Westinghouse exhibit and the R. D. Nuttall Company exhibit.

In addition to its reducing unit the Tool Steel Gear & Pinion Company is also showing the new quiet gear it has developed. A dovetail groove in the blank, filled with lead, has proved effective in deadening the ringing noise of the gear.

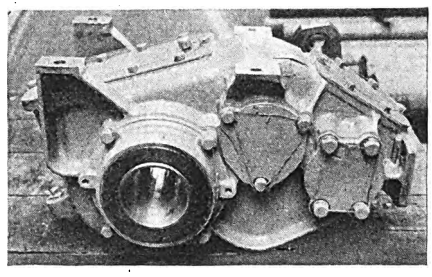
Other manufacturers exhibiting gears and gear cases or other drive parts are the General Electric Company, the National Railway Appliance Company, the Electric Service Supplies Company and the Chillingworth Manufacturing Company.

The J. G. Brill Company is showing at the convention its redesigned mechanical slack adjuster. It was redesigned to facilitate the installation of new brakeshoes, eliminating a large amount of labor and obviating the necessity of removing bolts or pins for the reinstallation of shoes.

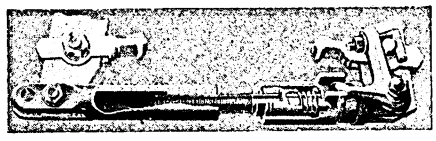
The Anderson Brake Adjuster Company has a working exhibit of its latest type of non-vibrating slack adjuster and other types manufactured. The new non-vibrating type is particularly suited for beamless brake rigging.

Among the other manufacturers of brake equipment represented at the convention are the Westinghouse Traction Brake Company, which is showing an operative exhibit of the variable load brake, the American Brake Materials Corporation, the Safety Car Devices Company, the Wheel Truing Brake Shoe Company, the Railway Materials Corporation, the American Brake Shoe & Foundry Company and the National Railway Appliance Company.

Among the manufacturers exhibiting car wheels are the Standard Steel Works Company, the Association of Manufacturers of Chilled Car Wheels, the National Malleable & Steel Castings Company, the Griffin Wheel Company and the Bethlehem Steel Company. The Standard Steel Works Company is showing a 26-in. special light-weight, rolled-steel wheel with deadening features, as used by the Delaware Electric Power Company on the new cars being built by the J. G. Brill Company. The Association of Manufacturers of Chilled Car Wheels has on display one of its



The W-N drive with double reduction gears for use with high-speed, full spring mounted motors



Brill mechanical slack adjuster, redesigned to facilitate reinstallation of brake shoes

new single plate chilled tread wheels with reinforced flange. The rim and apex of the flange of this type wheel have been covered with chiller to give an improved composition of grain structure. The Griffin Wheel Company is showing wheels with chilled rims and back flanges.

Manufacturers of roller and ball bearings, journal boxes, chafing plates, pins and other truck parts, have interesting exhibits. Among these are the Manganese Steel Forge Company, the Timken Roller Bearing Company, the Hyatt Roller Bearing Company, A. Gilbert & Sons Brass Foundry Company, the Ahlberg Bearing Company and the Norma-Hoffman Bearings Corporation. The Manganese Steel Forge Company is featuring its precision finished pins and bushings for brake gear and other parts made of manganese steel.

Interesting Developments in Methods and Devices for

FARE COLLECTION

Many new features, especially in ticket issuing machines, are being shown at the Convention. The manufacturers of apparatus of this kind are well represented

VITAL as it is in street railway and bus operation, fare collection is signalized at the convention by an especially interesting exhibit of apparatus placed on the market for that purpose by various makers. Practically all of them manufacture equipment for both railway cars and buses, though the apparatus often differs somewhat according to the class of service for which it is intended. Some manufacturers also build a third variety of equipment for station use.

Perhaps the most novel features at this convention in apparatus for fare collection and registration are the ticket printing and issuing machines of the Ohmer Fare Register Company and the National Cash Register Company, both of Dayton, Ohio. The Ohmer machine for use on cars and buses is known as the Ohmer ticket printing register, type 80. It is so small that when it is placed on an ordinary sheet of writing paper there will be a margin of paper all around the register. It stands less than 1 ft. high and weighs only 30 lb. At the same time it is said to be so rugged and simple in construction as to be thoroughly capable of standing the rough usage to which an instrument of this kind must be subjected. There is an untamperable mechanical tie-up between the amount which is indicated to the passenger when the fare is paid, that on the ticket issued to the passenger, and that printed on the strip which goes to the auditor. The amount and class of fare are indicated at the top of the register, both at the front and at the rear, so that they can be checked by anyone else in the car or bus. The management's printed slip has these figures and also the number of the operator, the trip in or out, the date, the zone and the class of fare paid with totals in different colored inks, from time to time.

Another feature of this register is the ease with which it can be used. Where several fares of the same kind are paid consecutively, they can be recorded simply by repeated pressure on the operating button. Where the amount and class of fare to be registered are changed, quick setting of

The new type 80 Ohmer Ticket Printing Register for use on buses or cars issues its ticket at the side and is electrically or hand operated. It weighs only 30 lb.

one or more levers is necessary, but they can be set by the sense of touch alone.

A number of outstanding mechanical features are incorporated in the design. They include an ink roll capable of printing as many as 200,000 tickets, a self-sharpening knife without springs for cutting off the printed tickets, an arrangement for printing simultaneously the tickets and the records, a simple device for taking up the slack in the paper, etc. Type 80 register is manufactured for use with either hand or motive power.

In addition, the same company has a large number of well-known devices of other types, and also a ticket printing machine, which issues a complete standard-size cardboard railroad ticket on demand, with names of stations, date, etc., and with complete records of all tickets issued for auditing purposes. It is known in this country as the Ohmer Ticket Office Ticket Printer Type No. 232. Abroad it is put on the market by the Allgemeine Elektricitäts Gesellschaft and is widely used. The ticket issuing machines of the London Underground Railways, of which particulars were given on page 579 of the issue of this paper for April 7, 1928, are of this type.

Another ticket printing and issuing machine has just been placed on the market by the National Cash Register Company of Dayton, after extended tests in practical use on several motor coach and street railway lines, and is being shown. When a fare is registered a ticket automatically is printed and issued. The information on the ticket includes date, ticket number, "from" station, "to" station, amount of fare, kind of fare, operator's number, number of register, name of company, and instructions to passengers. Each one of these elements is also printed on a "trip sheet" within the register for auditing purposes. When a ticket is issued there is a plain indication of all details, visible to both passenger and operator. The register weighs about 90 lb. and is finished in dull black enamel.

In the field of fare boxes and registers this year, a new design being

Digitized by Google

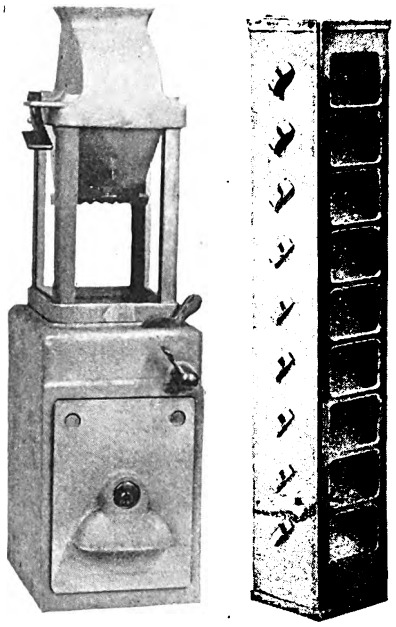
Type 80 Ohmer Ticket Printing Register in use

shown at Cleveland is the safety fare box of the Bell Register, Inc., Springfield, Mass. This box is manufactured by Smith & Wesson, Inc., of the same city and is being shown in the booths of the National Railway Appliance Company. It is able to take all kinds of fares; paper, tokens or coins. After falling on an inspection plate these fares are dropped into a locked drawer which cannot be removed while any coins are on the inspection plate. When the drawer is removed by the inspector it locks itself with a sliding cover, to open which a second key is needed. Features of this box stressed by the manufacturers are its small size and lightness and the speed with which fares collected can be cashed in. Another new fare device shown by the same exhibitors is apparatus for accounting for the number of passengers carried from zone to zone, the amounts paid and every fare transaction taking place on the trip. It is easily understood by passengers and operators alike and is particularly adapted to long bus routes. Both of these devices have proved satisfactory in trial use.

The International Register Company of Chicago is showing its latest types of electrically and manually operated registers, including in the former class a register brought out last year which can be operated by the foot, thus speeding up the handling of passengers and fares on a one-man car. The "cutawl," though not a fare collection or registering device, is mentioned here because it is also on exhibit in the booth of the same company.

Money-Meters, Inc., of Detroit, successor to Rooke Automatic Register Company, has a full line of its automatic registers, which permit instantaneous audit by the passenger, of nickels, dimes, quarters, half dollars and metal tokens, or any of these in various combinations. The models are portable or stationary in form and may be operated manually or by electricity.

The new National Fare Recording Register issues a complete ticket and can be operated by one hand



Aluminum fare box with locked drawer and apparatus for issuing and accounting for zone tickets, of Bell Register, Inc.

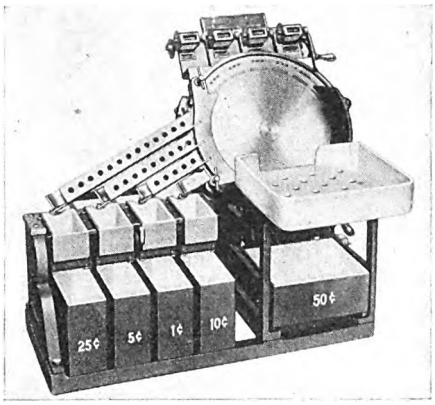
The principal new feature in the exhibit of the Johnson Fare Box Company is its electrically operated nickel-dime-quarter box, adapted for either one-man cars or one-man buses over a series of zones where the rate of fare is 5 cents per zone or 10 cents per zone. The box will automatically record the fares on the overhead register, giving a visible and audible registration of all fares deposited, thus minimizing the duties of the operator. With this type of box a company may put in either the pay-as-you-enter system to destination with an identification check, or the pay-as-you-leave system, as recommended by the A.E.R.A. fare collection committee in 1927. The company's exhibit also includes Universal change carriers, hand operated fare boxes for odd fares, electrically operated fare boxes for 5 and 10 cent fares, and electrically operated fare boxes for 10 cent fares and tokens.

In the field of inclosed fare boxes, the Cleveland Fare Box Company and its associated Canadian company of the same name are emphasizing particularly a new fare box of its well-known type, which has been brought out for bus operation, designed so as to resist the rattle and wear which naturally comes from engine vibration. The Cleveland company is showing also its double lock fare boxes for urban, suburban, and inter-

Digitized by Google

urban cars and buses, its zone check boxes used as an aid to collecting suburban and interurban fares, and its change carriers, both lever and "slip" operated.

Associated with the Cleveland Fare Box Company are also, of course, the Canadian Cleveland Fare Box Company, the Four-Way Lock Company, the C. L. Downey Company and the James H. Matthews Company. The Four-Way Lock Company specializes



Downey sorting machine in operation

in padlocks, cylinders, night latches, drawer locks, and chest locks, all of the four-way type. A full line of all are being shown at Cleveland. The C. L. Downey Company's exhibit relates to improved machines for separating, counting, wrapping and bagging coins. This display includes what is said to be the only machine which has the mechanical principle of forced separation, and positive count. The four associated companies mentioned with James H. Matthews & Company, whose exhibit will be mentioned later, have in operation a miniature counting room to demonstrate the efficiency and application of these machines to all operative conditions. A view is given of the Downey company's counting machine on exhibition.

The Sattley Company, Detroit, Mich., will have an extensive exhibit of coin counting, coin sorting and coin wrapping machines, as well as coin wrappers.

Zone Check Receipts

MacDonald Manufacturing Company, Cleveland, shows a full line of its cash receipt, zone check and transfer holders. Its cash receipt holder is manufactured in four lengths, 5 in., 6 in., 7 in. and 8 in., and is arranged so that it can be attached to the steering post column when used on a bus or to 1¼-in. tubing when used on one-man cars. This permits operators to issue receipts with one hand, leaving the other free for the guidance of the car.

It will be remembered that the holder, with an accompanying pad of tickets, permits the issue of the proper ticket or receipt, marked on both ticket and stub to indicate "in" or "out" trip, kind of fare paid, and station on and off.

The company's zone check holder is a modification of its cash receipt holder. It is made in three sizes, to contain six, nine, or twelve pads. The ticket, when issued, indicates the zone of origin and the amount of fare paid. Opposite each pad is a key lever which can be pressed quickly, thus filing the auditor's stub into the holder and out of the way of the next succeeding ticket. Like the fare receipt holder, the zone check holder can be attached to the steering post column of a bus or to a post on a car, or it can be attached to any ordinary fare box, thus permitting operators to issue destination checks as the fares are paid. Like the fare receipt holder it is made of monel metal and stainless steel.

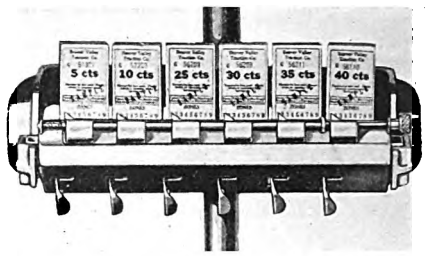
Other Means for Collecting Fares

Fares may be collected and registered, particularly at subway and elevated stations and at pre-payment and post payment areas for buses and street railways, by coin controlled turnstiles. The Perey Manufacturing Company, New York, is showing several patterns of such turnstiles this year. The latest model is arranged for two-way operation, *i.e.*, paid entrance and free exit. One shown at the booth is arranged to be released with nickels and the other with dimes. Other types are arranged to release when operated by a cashier or ticket taker. The same company is also showing, for trolley cars and buses, an electrically operated coin box and overhead register combination with instantaneous visible and automatic registration.

Two alternatives are possible when a passenger does not pay his fare by cash. One is to pay by ticket, as when he presents a transfer. The other is to pay by token.

The products of the Globe Ticket Company, Philadelphia, Pa., are well represented by samples of new transfers recently installed in Akron, Johnstown and Toledo, which are practically punchless. The company also has samples of the interesting Buffalo transfer, of which an account and reproductions were published in the issue of this paper for March 3, 1928. It also has on exhibition a full line of ticket books, cash fare receipts, and tickets.

James H. Matthews & Company, Pittsburgh, are exhibiting an extensive line of metal fare tokens, allocated and unallocated, illustrating a variety of designs, ideas, sizes and metals. The exhibit includes as well, metal dies for making tokens, indicating the accuracy of manufacture and difficulty of counterfeiting. In connection with its associated companies, the Cleveland Fare Box Company, the Canadian Cleveland Fare Box Company, Ltd., and the C. L. Downey Company, it has a miniature counting room in operation. In addition to the exhibits along the fare token line, the company also is showing bronze safety trophies and medals as made for a number of electric railways.



The MacDonald zone check holder can be operated with one hand and is made in several sizes to accommodate as many as twelve ticket pads

Lighting Exhibit at A.E.R.A. Convention

SUPPLEMENTING its 1928 report, rolling stock special committee No. 4 has made a study of lighting, and will have an educational exhibit on electric railway lighting in the basement of the auditorium at the annual convention in Cleveland. A number of lighting equipment and lamp manufacturers will loan such material as car and industrial lighting reflectors, appropriate incandescent lamps, and illustrations of their recommended application. Most of the equipment mentioned in the 1928 report will be displayed for examination and discussion.

The interest evinced by visiting operators in the committee's car lighting exhibition last year indicated that this subject was of considerable importance to them. As the committee's 1928 report also includes recommendations on shop, office and yard lighting, the application of suitable equipment for lighting properties will be stressed particularly.

Digitized by Google

New Ideas Brought Out in

MOTORS and CONTROL

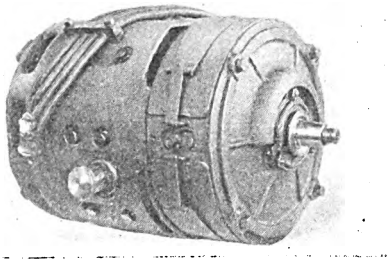
Light-weight motors, both for standard suspension and for the double-reduction and worm-gear drives, are brought out. Progress also is shown in control devices and safety car control

STARTLING changes are rare in the electrical equipment of cars. However, the visitor at the exhibit this year cannot fail to note that despite the standardization in that line the leading manufacturers have within the past year brought out a number of greatly improved motors and controllers. When the new drives with high-reduction gearing, either spur or worm, were brought out a little more than a year ago, it was necessary to adapt motors to railway service from the automotive field. Within the year both large manufacturers have brought out new motors specially designed for the service.

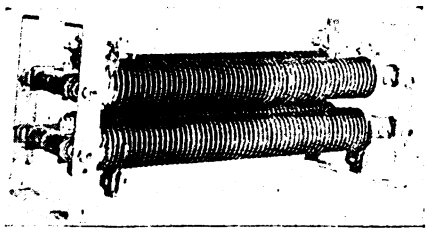
The Westinghouse Electric & Manufacturing Company is featuring several railway motors embodying its latest developments. Two high-speed motors, types 1425 and 1426, respectively 35 and 50 hp., were designed primarily for use with the W-N drive which was exhibited last year on several of the new cars. These motors are wound for 300 volts each, and are placed two in series for use on a standard 600-volt circuit. Both motors are arranged for complete spring suspension, either with the W-N drive or the worm drive.

The latest standard motor shown by the Westinghouse company is the 510-E, which incorporates all the features of vital importance such as dual ventilation, oil seal lubrication, heat-treated ally shaft and bolts, forged steel fan, and open rear end. Particular attention has been given to the construction back of the commutator to prevent breakage of leads. The 535-A, 60-hp., 600-volt motor, also in the exhibit, is particularly suitable for low-floor suburban and interurban cars with 26-in. wheels. It has the open rear end, permitting ventilation at that point, interchangeable brush-holders, cast-steel fan and other modern elements.

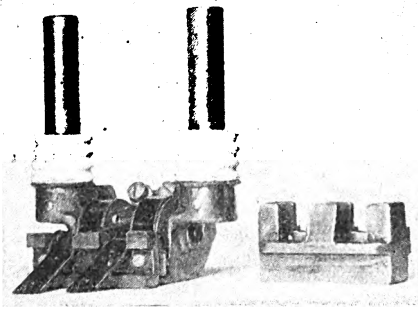
In control equipment the UP-32 unit switch is a new design for heavy duty service. It is a complete unit with switch mechanism, operating cylinder, valve magnet and blowout details assembled together, ready for installation in a switchbox or in a cabinet. The cylinder forms the support for all details of the switch unit, which in turn supports the switch when mounted.



The Westinghouse 1426 motor, designed for high-speed drive with double reduction or work gearing



Type M resistor of Westinghouse Electric & Manufacturing Company, wound of high-resistance strip set on edge



The detachable box brush-holder, a recent improvement put out by Westinghouse

Types 806-J-7 and UM-2-H line switches, the first one electro-pneumatic and the second magnetic, are for use in conjunction with K control. The first has the same design feature as Westinghouse HL control, and is arranged for cabinet or underfloor mounting. The UM-2-H switch has greater current-carrying capacity and arc rupturing capacity, but is lighter in weight than previous types. The TA handle switch, also on exhibit, has been used in conjunction with various new and old types of K control. By utilizing lost motion the line switch, instead of the finger on the main drum of the controller, takes the heavy arcing. The type TC-102 control switch is a simplified, inexpensive switch for high-voltage circuits of either K or multiple-unit control equipments.

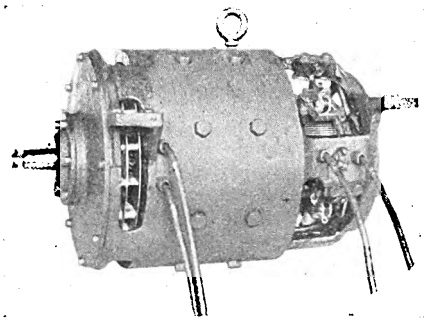
The type M resistor is an assembly of individual units of alloy ribbon wound edgewise on porcelain insulator tubes. It is recommended by the company for use on all modern cars. For heater type resistors the type 197-J control resistor has been developed. Its fundamental features are well established, having remained virtually the same for eighteen years.

Renewal parts are also being made a feature in the Westinghouse exhibit. These are being shown as a means of improving the operation and reducing the maintenance cost for older types of apparatus. They include a compensating finger designed to overcome the deficiencies of the old standard flat bronze fingers on K controllers. The action is indicated by an enlarged working model to show the self-aligning and automatic adjusting features of this improved type. The twin washer brush-holder finger has been reproduced three times normal size to show the principle of the mechanism that has become standard for brush-holders on new motors. A heat-treated armature shaft, commutators, armature coils and armature bearings are shown

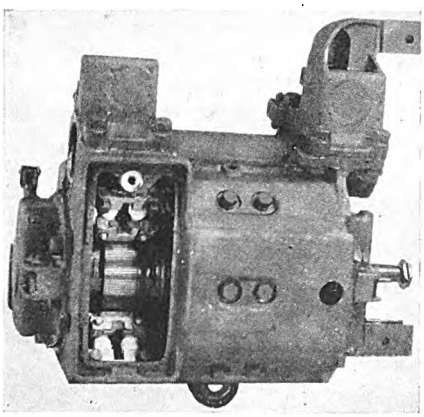
Digitized by Google

with descriptive signs calling attention to the improvements. New types of reverser fingers shown are designed to increase the capacity of reversers by reducing the heating. The detachable brush-holder box can be removed and replaced without disturbing the remainder of the brush-holder mechanism.

Several new types of railway motors are featured in the General Electric Company's display. The GE-265-F motor incorporates the new constant oil level bearings, brush-holders located on the bottom of the motor for pit inspection of brushes, ventilation through the top commutator cover and field coils with connecting cables permanently attached. This is now the company's standard 35-hp., 600-volt motor. It weighs 1,415 lb. Included with it are a partially wound armature, a complete set of armature coils and insulation and a light-weight malleable iron gear cover of rugged construction.



The GE-1126 automotive-type railway motor, for use with the recent drives



The GE 265-F railway motor has the brush-holders below to facilitate inspection from the pit

The GE-298 motor, rated at 50 hp. at 600 volts, was developed for trolley bus, double reduction or other special drives. It weighs 870 lb. The bearings are of an anti-friction type, one being balls and the other rollers.

There also is an exhibit of the GE-1126 motor and D-201 gear reduction. The motor, rated 35 hp. at 600 volts, weighs 483 lb., while the gear reduction weighs 525 lb. The electric design is conventinonal, with 600 volts on each commutator. The gear reduction housing surrounds the double-reduction helical gears. The motor is coupled to the gear reduction by double universal joints which allow a rigid support of the motor and a freedom of movement of the gear reduction without misalignment strains on either. Ball bearings are used throughout, and the gears dip in oil.

A model of the constant oil level bearing shows visually the path of the oil with this type of lubrication. As its name implies, the bearing maintains the oil supply to the waste packing at a constant level. As oil is used by the bearing the constant level is maintained by oil passing from an ample supply reservoir to the constant oil level chamber. The level in this chamber may be set at the most efficient height.

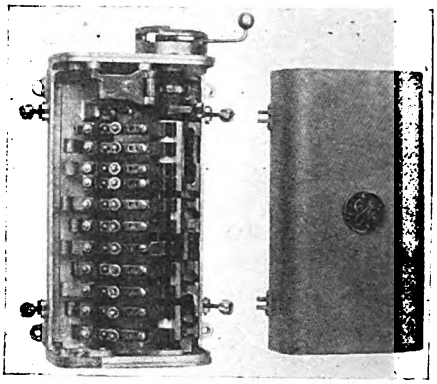
There is a display of renewable carbon way brush-holders to show visually the advantages of this type and also to show the simplicity of the construction used in the present-day brush-holder. Display boards with various types of carbon brushes also will be shown.

An entirely new development shown by the General Electric Company is the PCM control, which was brought out to meet the need for quicker starts in congested city streets. Other control equipment shown in a display rack includes a standard four-motor K-35 controller and a K-75 low-height controller, equipped with LB-2 and LB-4 line breaker control devices, and connected so that they will actuate the line breakers that are part of the display. The line breaker is the standard DB-987 having a capacity suitable for four 75-hp., 600-volt motors.

Display boards will show the many types of controller fingers and arc deflectors used in controllers. MS switches and MR circuit breakers indicate the improvements that have been incorporated during the past year.

In resistors, the standard BG cast-iron type and the EW edgewise-wound ribbon type are exhibited. The latter has the new unbreakable resistance conductor, whose features are few joints and light weight. The terminals are braced to the resistance conductor and substantial bolts are used for clamping the terminals.

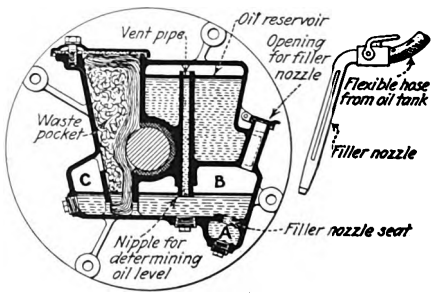
A complete operative equipment of the new electrically actuated type will be displayed by the Safety Car Devices Company. The advantages claimed for it are shorter application and release times with greater flexibility of control, more prompt action of doors, possibility of incorporating automatic safety features in either the controller or the brake valve as desired, fewer pipes and lower weight.



The S-174 automotive controller of the General Electric Company, for double-motor electric drive

The same company is exhibting, both as part of the main display and among a group of detached apparatus, a diaphragm-type foot valve and a diaphragm-type cutoff valve, used to replace the former combined foot and cutoff valve. The separation of these devices simplifies the equipment somewhat, since only one cutoff valve is required for either single-end or double-end equipments.

A complete line of economy electric railway meters is being shown by the Economy Electric Devices Company. These include both the plain watthour meter and the meter with car inspection dials.



General Electric constant oil level bearing for railway motors

The National Carbon Company will exhibit its full line of National Pyramid carbon, graphite and metal-graphite brushes for motors, generators and converters and also will have a complete display of carbon electrodes, rods, blocks and paste used in the electric arc and acetylene welding processes.

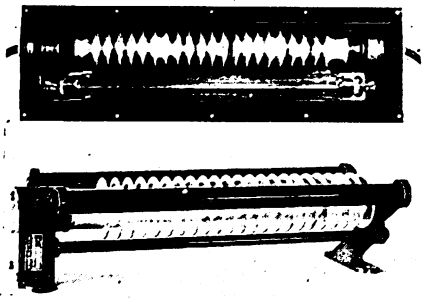
Digitized by Google

Changes to Reduce Weight Feature

LATEST CAR EQUIPMENT

Aluminum is used in many car equipment parts. Resistor type electric heaters smooth out power peaks. Refinements in fixtures and furnishing show de luxe trend

THAT increased attention has been given the improvement of car equipment in order to keep pace with the de luxe trends in car construction is shown from the many displays at this year's convention. New developments and improvements are shown at nearly every booth. When one considers car equipment, the first thought is of the larger parts, such as heaters, door engines, trolley bases and poles, control and air brakes. The smaller parts, however,



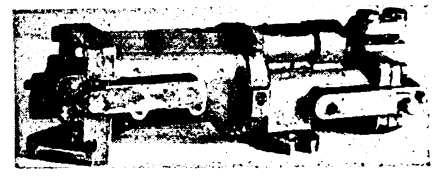
Panel type motor resistor heater in case with standard type heater for installation along sides of cars, and motor resistor heater with foot rest for installation under cross seats. Consolidated Car Heating Company

constitute the real bulk of purchases. These include such items as window fixtures, weather stripping, sash balances, anti-rattling devices, stanchions, door hangers, curtains, floor plates and step treads. Modernized and improved designs are shown in all these lines.

Probably the most interesting development in heater construction is in the use of resistors connected in the main motor circuits so that energy wasted in accelerating the car and the current generated in dynamic braking are utilized for heating the car interior. Rheostatic heaters for this class of service are shown by the Consolidated Car Heating Company, Inc., The Railway Utility Company and the Westinghouse Electric & Manufacturing Company. There have been several trial installations of such heaters and the Cleveland Railway has installed 50 equipments manufactured by the Consolidated Car Heating Company, Inc., in its new articulated units. Of two motor resistor types of heaters shown in the Consolidated exhibit, R-1065 is designed to be placed underneath the cross seats and has a foot rest. The heating element consists of a motor resistor unit cast in an aluminum radiator shell. The resistor is a high resistance nickel-chromium alloy wire inclosed in a seamless steel tubing filled with manganese oxide. After filling the steel tubing is swedged to a smaller diameter, thus compacting the magnesium and wire into one solid unit. The type R-1460 motor resistor heater, for mounting in a duct along the sides of the car, consists of a motor resistor unit and a regular car heater unit in the same case. This is the type used in the Cleveland cars.

The Consolidated Car Heating Company, Inc., is also showing an improved design of safety switch for car heaters. Fuses for the different circuits are mounted in a compartment of the switch box, the cover of which can be opened only when the switch is in the open or "off" position. The switch is of the toggle type and the mechanism is designed to open the contacts without depending on a spring. The arc chute is hinged and can be swung up easily, exposing the contacts for inspection.

A relay designed to cut off the heater load during acceleration is

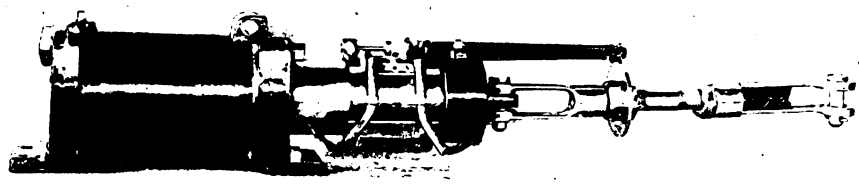


Light-weight door engine. Consolidated Car Heating Company

another improvement shown by the Consolidated Company. The relay coil is in series with one of the motors. When current reaches the value for which the relay is calibrated, contacts will close the circuit and open the magnetic switch which controls the heaters in the car.

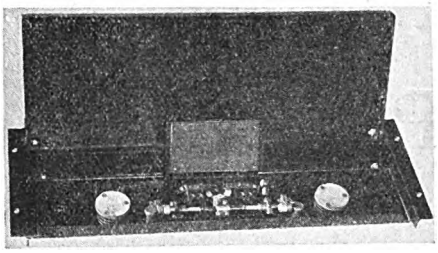
An improved inclosed type element for electric heaters is a feature of the exhibit of the Gold Car Heating & Lighting Company. This company stresses the value of interchangeable elements in electric heaters, and shows improvements in switches, ventilators and automatic temperature regulating devices. The Railway Utility Company is featuring its Chromalox strip heater. Improved features for the car rider's comfort shown by this company include heat regulators, ground detectors and ventilators. The company is a strong advocate of the value of having heaters with underwriters' labels.

The lightest trolley base that the R. D. Nuttall Company has ever built is featured by that company. This is built of aluminum and weighs but 67 lb. It has double race Timken roller bearings, hardened steel wearing parts and other features. An-



Door switch mounted on differential door engine. National Pneumatic Company

Digitized by Google



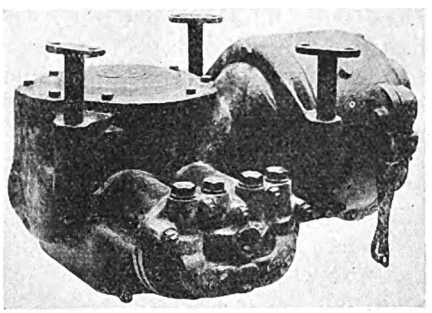
Treadle switch mechanism. Consolidated Car Heating Company. Treadle plate raised to show construction and rubber stops

other type, the U. S. 20-A roller bearing trolley base, weighs only 104 lb. It has tapered roller bearings, a grease reservoir which requires filling but once in each six-month period, a dust guard to eliminate the possibility of dirt getting into working parts and a bronze shunt for conducting the current around the roller bearings. This company also has an interesting array of trolley poles, harps and wheels. A light weight trolley base is also shown by the Ohio Brass Company. The standard Shelby seamless steel trolley pole is reinforced by a new method so that the reinforcement becomes practically integral with the body of the pole. Trolley harps are designed with a view toward light weight, strength and toughness, and wheels to stand the severe usage of electric railway service.

The White Manufacturing Company has an interesting design of trolley harp and axle. The harp is made of high-grade malleable iron with screw-attached phosphor bronze contact springs. Trolley catchers and retrievers in operation are shown by both C. I. Earll and the Eclipse Railway Supply Company. This latter company is also showing a new model retriever for sliding shoe service with light pole tension.

Known widely for its snow scrapers, the Root Spring Scraper Company has a full line of these on exhibit. In addition, it is showing an improved lifeguard for use by railways in their modernization program. The Eclipse Railway Supply Company also has a full line of improved car fenders and life guards.

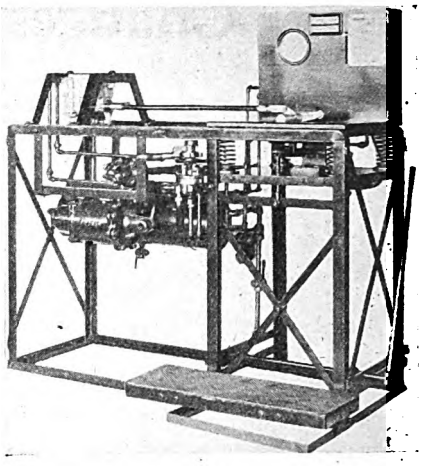
Differential door engines with new features are a part of the exhibit of the National Pneumatic Company. This type of engine is suitable for operating light-weight folding doors and steps. A substantial door switch designed for mounting on this engine is capable of completing two circuits when the door is opened and two additional circuits when the door is closed. A light-weight aluminum door engine is a feature of the exhibit of the Consolidated Car Heating Company, Inc. Adjustments for



Center gear type air compressor with T-bolt suspension. General Electric Company

controlling the engine speed are made in the cylinder heads. These are accessible from the side, which is desirable when the engine is mounted in door compartments. Although aluminum is standard, this engine is also furnished in cast iron when extra weight is not objectionable.

Automatic treadle controls for doors are features of both the Consolidated and National Pneumatic Companies' exhibits. One of the features of the Consolidated design is that the treadle plate stops on rubber. This eliminates noise. The treadle switch, mounted in a steel box, is a unit by itself. One of the features of the switch design is that the finger makes a sliding contact on the underside of the contact bar. The full floating type of treadle is featured by the National Pneumatic Company.

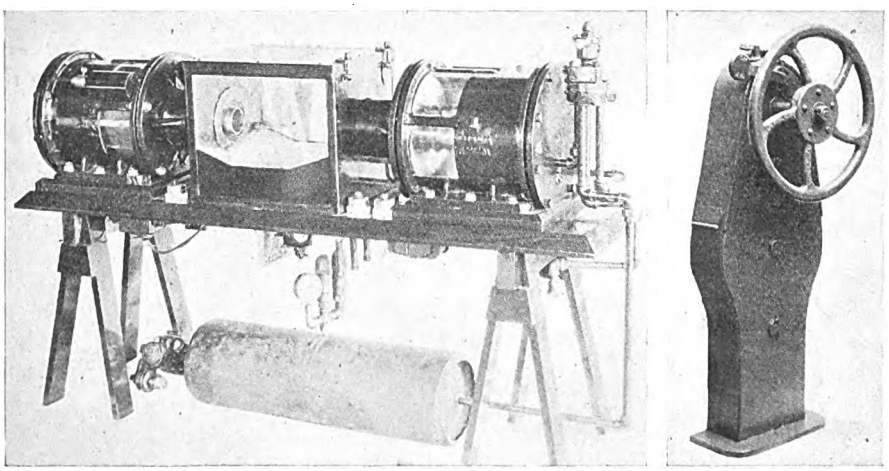


Demonstration rack of variable load brake equipment. Westinghouse Traction Brake Company

A new type of sliding door track containing a renewable bearing surface for door-hanger rollers is shown by the National Pneumatic Company. Other types of improved ball bearing door hangers of the diamond type and special door fittings are included in the exhibit of the Ellcon Company. Aluminum and steel doors with improved features are also shown as a part of the Morton Manufacturing Company's exhibit.

Various types of floor coverings and materials for floor construction form interesting displays for officials advocating improved cars. Tuco-Flexolith composition flooring for cars is shown by the Tuco Products Corporation, aluminum and steel flooring by the Morton Manufacturing Company and standard Diamond and Diamondett floor plates by Alan Wood Iron & Steel Company. Improvements have been made in step treads and in standard forms of folding steps for trolley cars.

Several new products are shown in materials for wainscoting, headlining, car insulation and roofing. The Pantasote Company, Inc., long a pioneer in this field, is showing Agasote and Pantasote in a multitude of uses. Car insulation and Masticoke flooring are shown by



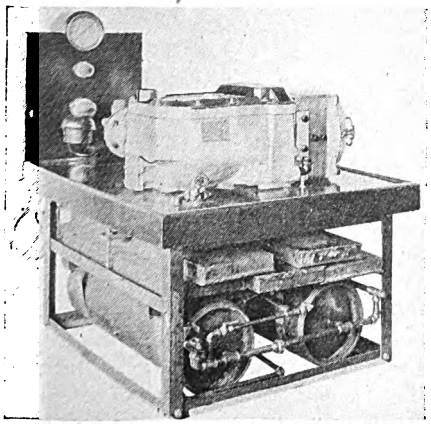
At left, demonstration rack of brake cylinder protector. Westinghouse Traction Brake Company. At right, heavy type Peacock brake of National Brake Company, Inc.

Digitized by Google

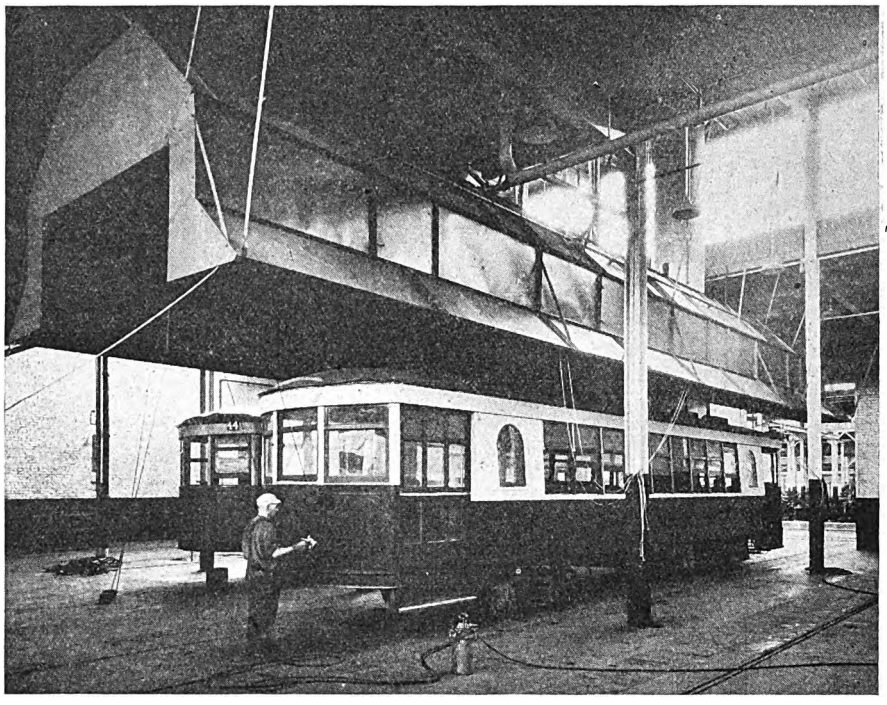
Johns-Manville. A new headlining and side material in the form of porcelain enameled sheets is featured by the Ellcon Company. It is hard, durable and stays clean and bright. The Adams & Westlake Company also show a full line of curtain material. Haskelite, Plymetl and Aluminum-Plymetl are demonstrated and uses shown in the Haskelite exhibit.

Improvements in metal sash, window fixtures, weather stripping, sash balances, anti-rattling devices, screen holders, door locks, hinges, etc., are interesting displays of O. M. Edwards Company, Inc., and the Eberhard Manufacturing Company.

Brake parts show many improvements. A feature of the Westinghouse Traction Brake Company's exhibit is a DH-20 bungalow type air compressor of aluminum. This compressor is operative and has a glass top in the crankcase and gear case cover to permit ready inspection of the method of lubrication. A governor for motor-driven air compressors shown by this company is of advanced design. New structural features have been introduced. Another feature of this company's exhibit is a demonstration to show the effectiveness of its brake cylinder protector. Two brake cylinders having glass windows permit observation, one equipped with a protector, the other without. These are mounted on a base with their non-pressure heads projecting into a dust chamber. When the brakes are applied and released and dirt is agitated in the chamber, it is drawn into the cylinder upon the return stroke of the piston. In one, however, it is prevented from reaching the cylinder walls by the protector. Another rack is used to demonstrate how air brake cylinder pressure is adjusted automatically with the variable load brake as car weight changes.



Lightweight bungalow type air compressor, arranged with glass to show operation. Westinghouse Traction Brake Company



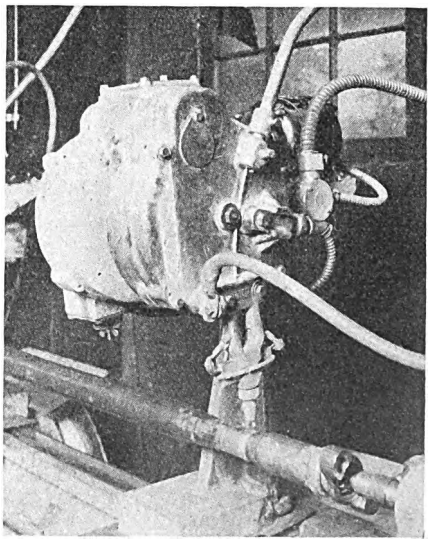
Forced draft and ventilating arrangement used by Cincinnati Street Railway and furnished by the De Vilbiss Company

An improved type of hand brake developed particularly for electric locomotives is shown by the National Brake Company, Inc. This has a 16-in. wheel and will develop a braking force of 8,800 lb. on the chain. A special $\frac{1}{2}$-in. chain is used to withstand the heavy duty.

An exhibition rack containing air brake equipment is a feature of the General Electric Company's display. The equipment shown includes aluminum alloy castings for the frame, frame head, crank chamber cover, oil distributor and cylinder head of the air compressor. It is shown in operation with a glass cover. The weight of the compressor is 28 per cent less than one made of cast iron. A second innovation is rubber-cushioned suspension bolts where rubber in tension is used to reduce vibration and noise. A flexible discharge pipe prevents transmission to the carbody of the noise and vibration. The air intake strainer is of the centrifugal type which tends to throw the dirt and dust to the outside of the strainer body from where it drops out by gravity.

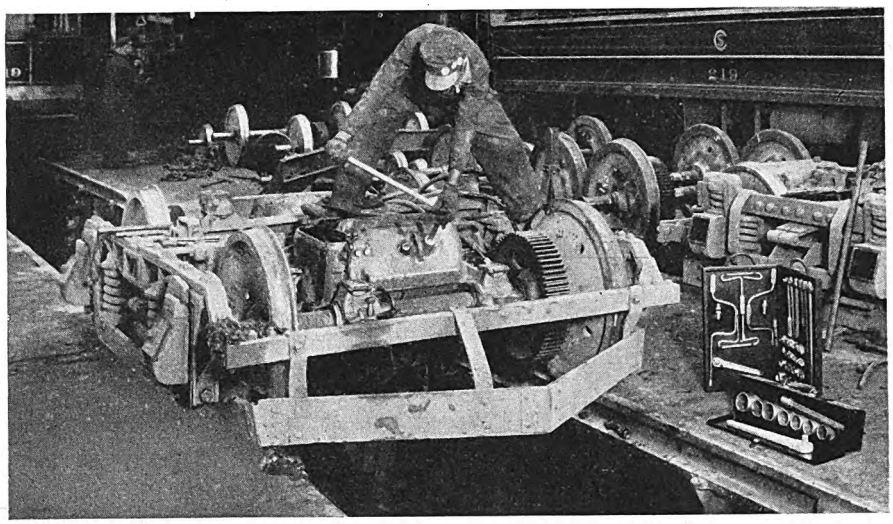
An exhibition table in this exhibit contains a motorman's valve piped to a pneumatic contactor. This is part of the electro-pneumatic brake equipment furnished the Boston, Revere Beach & Lynn Railway. The motorman's valve is similar to the standard valve for automatic variable release air brake equipment except that it has additional parts for operating the pneumatic contactor. This latter controls the action of magnet valves mounted on the triple valves throughout the train. A display of compressor parts illustrates the precision with which these parts are manufactured, the generous proportions of the bearings and such details.

Demonstrations of paint and spray painting equipment are interesting A working model of the new car exhaust system for spray painting as installed in the shops of the Cincinnati Street Railway is shown in the



The Una-Goodspeed automatic welding head gives uniform feed to electrode wire

Digitized by Google



Using a Snap-On wrench set for truck overhauling

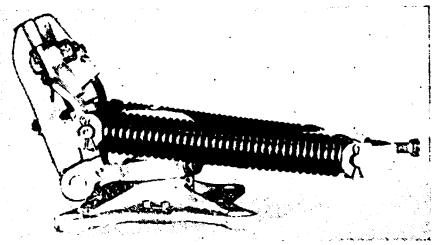
exhibit of the De Vilbiss Company. Constant increase in the use of lacquer paint and of high-speed spray guns has brought about a need for an improved exhaust system. The control of air currents is so delicate that considerable research work has been required to develop this exhaust system. Both blowers and exhaust fans are used with this exhaust equipment. Draft is induced from outside and forced up from the floor where it collects the spray vapor as it passes up the side of the car. The air is picked up from this point by overhead suction fans which force it out through the roof to the outside of the building. The input air ducts in the floor are parallel to the track and are arranged with vents and baffles so that the air is distributed evenly on both sides for the full length of the car. The arrangement is such that the air is forced out in a direct line along the side of the car, forming a wall of clean fresh air taken from the outside atmosphere.

The canopy exhaust overhead is provided with special 42-in. exhaust fans and is equipped with sprinklers. Both the closed head and the open head types are used. The latter is for flushing. The hinged panels on the under sides of the canopy can be moved by small ropes and pulleys, so that the operator can work on top of the car with the same protection as when working on the sides.

Compensating-series lamp fixture shown by Electric Service Supplies Company

Railway enamel, roof enamel, headlining enamels, inside finishes and late developments in G.M.F. and Ripolin systems are demonstrated by the Glidden Company. The latest developments are shown for finishing cars and buses with this company's product. In addition, panels show many other types of finishes.

The Binks Spray Equipment Company shows a complete line of spray finishing and ventilating equipment.



Light-weight, aluminum trolley base of R. D. Nuttall Company

An improved spray gun, inclosed type window fans and motor agitated pressure material containers are featured.

Speed in application and drying of a new oil-base undercoat system is demonstrated by the R. F. Johnson Paint Company. This is claimed to have the economies of old-time processes with the speed of pyroxylin added and uncertainties eliminated.

Among the maintenance tools shown are several by the Martindale Electric Company. This includes a commutator slot cleaning outfit with a heavier shaft and sheath, one foot longer than previously supplied. The Growler is a new Martindale product. It is used to test small motor armatures for shorts and grounds. A hinge at the base permits it to be opened and closed to fit various armatures, and the amount of iron and winding also may be varied. Its windings are inclosed in a metal case and protected from mechanical injury. All live metal parts are inclosed. The commutator-slotting equipment shown by this manufacturer includes several improvements. Armature repair tools shown include rawhide mallets and hammers, wedge drivers, insulation scrapers, feeler gages for armature air gaps, and a coil tamping tool.

There is a tremendous amount of wrench work in connection with the maintenance of car equipment. To provide for speeding up this work, the Snap-On Wrench Company shows its complete line of socket wrenches for hand operation. This includes a new line of thin-walled sockets designed for work in close places. Some railways report a particular saving in time through the use of this type of wrench, and the company also stresses the importance of the safety features of these tools. When floors of shops are slippery, serious accidents sometimes occur from a wrench slipping off the nut.

A new self-contained 200-amp., one-man arc welding outfit shown in the Westinghouse booth is distinguished by its simplicity, compactness and ruggedness. Many parts that usually identify arc welders, such as the bed plate, truck frame, array of knife switches, and rheostat contacts have disappeared. Total inclosure of the top and sides protects the machine from dirt, drip and falling materials. The new line-start type of dual-voltage motor and starter are used. It is portable and its narrowness and short wheelbase make it easy to move in restricted places.

A head for automatically feeding the electrode wire in arc welding is shown by the Una Welding & Bonding Company. The Una-Goodspeed head, as it is called, consists of two single dry plate clutches driven by a constant-speed motor through a worm reduction gear. One of these clutches, which revolves in such a direction as to move the electrode wire away from the work is engaged constantly by three coil springs. The other clutch, controlled by a solenoid across the arc, revolves so as to move the electrode wires toward the work. The solenoid is connected permanently across the arc. Due to the balancing of one clutch against the other, the electrode wire is fed down with a steady movement.

The Walter snow fighter

Bus Accessories and Garage Equipment

Many new devices for reducing operating and maintenance costs have been developed. Parts for buses are shown by a number of manufacturers

SECOND only in interest to the bus bodies and chassis, in so far as bus operators and maintenance men are concerned, are the exhibits of the accessory manufacturers, covering a wide range of apparatus displayed in a most interesting manner. A number of new and unusual developments are shown and it is quite evident that substantial progress has been made in many departments.

Bus front and rear axles, both bevel and worm gear, and in a variety of sizes, are shown in the exhibit of the Timken-Detroit Axle Company. An interesting feature of the display is a worm gearing that is said to have been operated for 585,000 miles in bus service and which, apparently is good for many additional miles.

Multiple-disk clutch facings, brake lining, fan belts, waterproof straps, webbing, hood lacing and tow lines are included in the display of the Russell Manufacturing Company.

The Johns-Manville Corporation is displaying its full line of woven and molded brake lining, clutch facing, packings, asbestos ebony for control panels and electrobestos.

The model KU-10 transmission set up in the booth of Fuller & Sons Manufacturing Company cut away to show full operation of clutch and transmision, is designed for trucks of 1½ to 2-ton capacity, maximum chassis weight 4,000 lb. when used in connection with six-cylinder engines of 249 cu.in. piston displacement.

A complete line of heavy-duty spring bumpers and body guards, designed especially for use on buses and taxicabs is being shown by the C. G. Spring & Bumper Company.

In the exhibit of Continental Motors Corporation a sectional bus engine will be shown in operation, so arranged as to afford a clear view of all moving parts. This company is also showing its latest and stock model engines designed for buses, trucks and a variety of industrial purposes.

Waukesha Motor Company is showing two bus engines of 75 hp. and 120 hp. rating, a recently developed high-powered six-cylinder engine, together with parts and accessories for all its standard equipments.

The wide uses of aluminum are illustrated by the extensive display of products exhibited by the Aluminum Company of America. Of special interest to bus men are the various cast and forged parts incorporated into the bodies and framework of the Versare and Twin Coaches, and an all-aluminum chassis, built in 1920 and now driven over 200,000 miles in service.

Included among the three heavy duty six-cylinder L-head engines exhibited by the Hercules Motor Corporation is the one recently developed by this company for the Twin Coach Corporation and used in the latest buses produced by that company. This exhibit is supplemented by crankshafts, pistons, bearings and connecting rods.

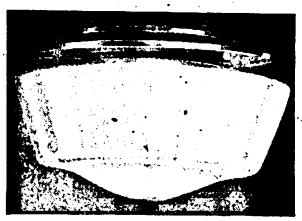
The Robert Bosch Magneto Company has a comprehensive display of spark plugs, voltage regulated generators, horns, windshield wipers and spot lights. The type FD horn, made in 6-volt and 10-volt sizes, is said to have an unusually clear and penetrating pitch and tone, and to be free from troubles arising from vibration.

The Willard Storage Battery Company is exhibiting a standard line of heavy and medium plate bus batteries as well as batteries for oil switch operation, power and signal work.

The actual operation of and lighting effect produced by its Tilt Ray headlamp, as well as a practical demonstration of the proper aiming and focusing of headlamps is a feature of the exhibit of the Guide Motor Lamp Manufacturing Company. Illuminated displays are used to demonstrate the company's dome lamps, marker lamps and tail lamps.

Those who are interested in ball and roller bearings will find much to interest them in the several displays in the exhibition hall. Both in street

Digitized by Google



Electric Service Supplies Company's Keystone-Ivanhoe bus lighting fixture

car and in bus service it has long been recognized that to the precision and delicacy with which bearings are adjusted much of the success of the transportation industry is due. The display of the Timken Roller Bearing Company consists of a mountain scene with a city street in the foreground, showing a miniature electric train in operation, with toy buses, autos and trucks moving up and down the streets. It bids fair to be one of the distinctive features of the exhibition.

The Norma-Hoffman Bearings Corporation is showing its precision ball and roller bearings in a variety of open and closed types, suitable for use on buses, trucks, street cars and steam railroad cars or in electrical machinery of various kinds. Working models stress the importance of protecting the bearings against dirt and grit.

A complete line of ball bearings in double row, single row, radax and magneto types is being shown in the booth of the New Departure Manufacturing Company. The double row bearing, a patented design, is of particular interest, with two rows of balls and two sets of ball raceways, mounted in such relation as to sustain loads and stresses from any direction. The magneto type bearing is designed to carry end thrusts as well as radial loads.

The exhibit of the Ahlberg Bearing Company will feature a display known as the "One Ball" demonstrator, which shows the accuracy of ball and race grinding which goes into the make up of their bearings. The exhibit includes the CJB master ball bearing and the Ahlberg ground bearing.

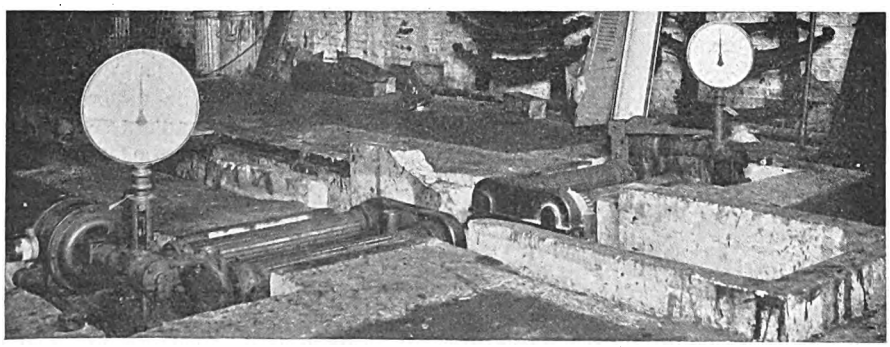
The Hannum Manufacturing Company is represented by a display of bus and motor truck steering gears, with working models illustrating the various features by which the product of this company are distinguished. The Hannum steering gear uses the Timken tapered roller bearing instead of the ball thrust assembly and has a variable ratio which is claimed to permit of faster and easier steering in normal driving range and increased leverage in the extreme steering position. The models also demonstrate how adjustments can be made without removing shims or the gear from the chassis.

The paint and varnish division of the Pittsburgh Plate Glass Company has on display a set of panels showing decorative effects and color schemes for street car painting. The glass division is featuring its Duplate glass, a clear, non-shattering glass for automobile and street car windshields and windows.

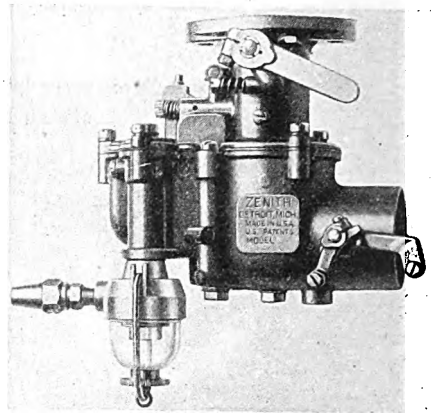
Among the new apparatus being shown for the first time by the Electric Service Supplies Company may be enumerated the type DBG-918 Golden Glow Headlight, a bus combination rear and stop light, new types AK and SK Keystone-Ivanhoe bus lighting fixtures, and a number of new types of Hunter illuminated signs. This company has also adapted many of the appliances long familiar in the street railway field to use on buses.

Branding irons operated by electricity, gasoline, and gas and air, as well as blow torches and soldering irons are to be seen in the booth of the Everhot Manufacturing Company. This company has also brought out and is exhibiting a combination interchangeable route sign for buses or cars.

A new model brake drum lathe, demonstrated by expert mechanics in the exhibit of the South Bend Lathe Works, is of interest to bus and truck fleet operators as it is said to eliminate the common forms of brake drum and wheel truing troubles. The self-centering mandrel is credited as being the key to this accuracy. The wheel or drum when mounted on this mandrel and placed between centers of the lathe will run true, and all machining will be concentric with the axis of the hub. Bearing adapters and mandrels are made in sizes to fit any type and size of front wheel of bus or truck.



Cowdrey brake testing apparatus in position

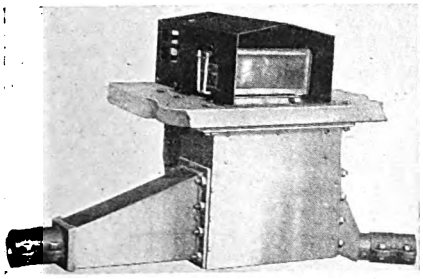


Carburetor and fuel filter exhibited by Zenith Detroit Corporation

Carburetors and fuel filters of various styles and designs are on exhibit by the Zenith-Detroit Corporation. A filtering element made up of spacers and washers is held together on a stem, each stem representing one filtering element with an equivalent fineness of 120-mesh wire gauze. It is said to be easily cleaned and adjustable and is adapted for use on heavy duty trucks, buses and marine engines. Among the carburetors displayed are the 70 series, made in 1¼-in., 1½-in. and 2-in. sizes. This is a heavy-duty type with concentric float mechanism, which enables it to be operated on angles up to 40 deg. without interfering with carburetion. The 910 carburetor is the heavy-duty type, made in the 2½-in. size only.

The Westinghouse Traction Brake Company is exhibiting both types of its automotive brake—the pressure type and the new vacuum type. Among the improvements embodied in the pressure brake apparatus is a compressor having better oil distributing system, centrifugal air cleaner, and unloader head with automatic governor. The vacuum type automotive brake was developed for buses and the lighter type of commercial vehicles to meet the need for eas-

Digitized by Google



Nichols-Lintern floor-type auto heater

ier and more effective control than is possible with the ordinary foot brake. The brake unit comprises an operating piston, a simple valve mechanism, and an ingenious leverage system. The force actually applied to the brake drums is a combination of foot pedal pressure and power generated in the brake unit. In addition to the detached units and sectioned model of the vacuum brake there is a demonstration chassis by means of which it can be effectively shown how this brake reduces the physical effort of braking.

The Bragg-Kliesrath Corporation is showing its vacuum booster brake which utilizes vacuum of the intake manifold for power application.

Bus, truck and trailer air brakes and vacuum air brake apparatus is also being shown by the Christensen Air Brake Company, while the Bendix Brake Company is featuring its Bendix Four Brakes. The American Brake Materials Corporation is represented by a line of its thick and thin types of brake blocks for heavy automotive vehicles and industrial machinery.

Developed with the idea of making brakes better the apparatus of the Cowdrey Brake Tester Organization is used not only by a considerable number of bus and truck fleet operators but has been installed on the production lines of many of the large automobile manufacturers. The apparatus, of which a No. 11-A model dynamic tester is exhibited, is said to be of great value in determining the retarding force in brake sets and in eliminating the uneven wear in brake lining and tires. The device is designed to chart mechanically the relationship between motor vehicle weight, retarding force and retardation.

The National Railway Appliance Company displays a number of the products which it handles, among them being the NSD gong ringer, the Godward gas generator, Garland ventilators, the Bell fare box and Tapley brake-testing meters.

Brake drums of furnace gun iron are being shown by the Hunt-Spiller Manufacturing Corporation.

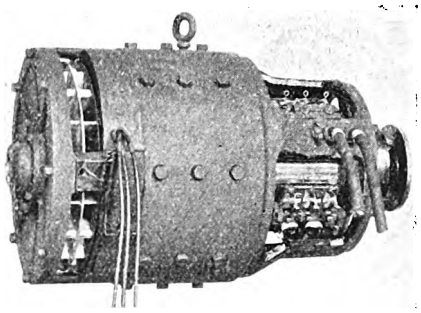
The Gunite Corporation also has an interesting display of brake drums, clutch plates and gears cast of its gunite metal or graphitic steel. The manufacturers assert that the use of this alloy metal in brake drums not only gives a smoother wearing surface but one that will show unusually long wear.

A complete line of heavy-duty electrical equipment for bus service including generators from 220 to 800-watt capacity, starting motors, ignition units of all types of drive, motor driven and magnetic horns,

Spoksteel dual rear bus wheel, exhibited by Motor Wheel Corporation

voltage regulators and junction boxes is being shown by the North East Electric Company. They are also displaying an arrangement which illustrates how the electrical system of a bus functions. The exhibit includes service and test equipment for electrical maintenance.

The Walter snow fighter on display is mounted on a special motor truck with positive drive to all four wheels from a 100-hp. six-cylinder motor. The units have dump bodies or wrecker bodies, as desired, so that they can be made available for service in construction work throughout the entire year.



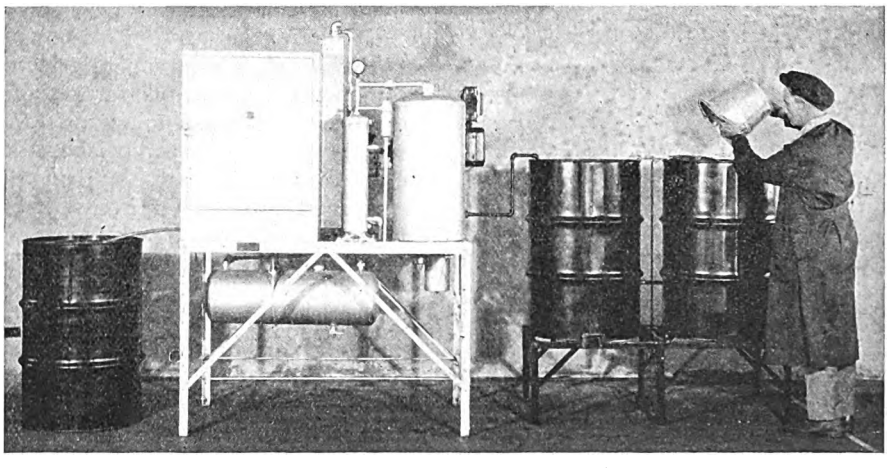
DT-1121 generator for electric drive, exhibited by General Electric Company

The Arco Company of Cleveland is demonstrating its process of coach body finishing by the Arcozon pyroxylin system, whereby a gloss finish is secured without polishing.

De Luxe light-weight gray iron pistons for bus engines are being exhibited by the De Luxe Products Corporation. The claim is made that these pistons will stay perfectly round under the heat of the engine and will keep cool under severe operating conditions.

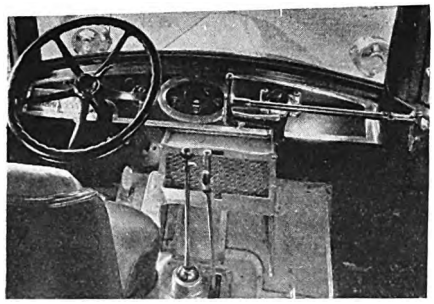
Bronze-back babbitt-lined connecting rod, and main and crankshaft bearings, both standard size and undersize, bronze bushings, piston pin bushings, babbitt metals for shop maintenance and connecting rod work will comprise the display of the Federal-Mogul Corporation. Federal bronzes and bearing metals have been developed for a variety of uses. A number of boring machines produced by this company are also in the exhibit.

Appreciating that carbon monoxide is present in exhaust gases to a dangerous degree the Nichols-Lintern Company has developed a heater that is said to absolutely prevent any gases from entering the coach body. A high



The Skinner Automotive Devices Compan's oil reclaimer

Digitized by Google



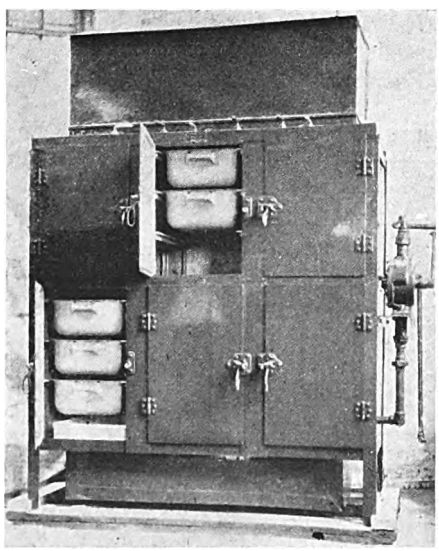
Tropic-Aire heating unit is located under instrument board in forward end of the bus

heating efficiency is obtained through the use of seamless-steel finned tubing which allows concentration of a large heating surface in a small area. The heater is intended for location near the center of the coach. Nichols-Lintern is also showing a cast aluminum "Stop" signal lantern for mounting at the rear end of a bus with the view of preventing rear end accidents, and a roof ventilator made of Armco galvanized iron, designed to provide a high exhaust at low speeds.

The Cleveland Pneumatic Tool Company is showing a complete line of Gruss and Westinghouse shock absorbers for use on buses.

The increasing weights carried on buses and motor trucks, has brought many problems to the wheel makers, and intensive research has been necessary in order to keep pace with the demands.

The Budd Wheel Company exhibit shows the method of mounting a 20-in. and a 24-in. diameter wheel on the same hub; also the double cap nut method of mounting which permits of clearance around the stud when changing tires.



The Johnston & Jennings Company's type F 6 Alten oil reclairmer

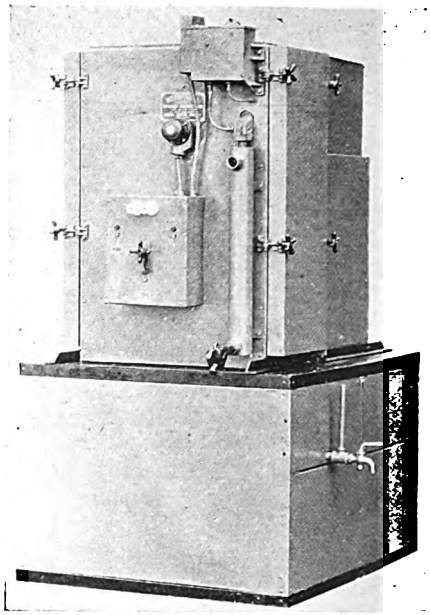
The Motor Wheel Corporation, whose product is marketed under the trade name of Spoksteel, has a display of bus and truck wheels both dual and single. The spider or spokes are of one-piece, high carbon, drop-forged steel. Various tire sizes can be mounted on the same hub, using the same brake drums, which should simplify matters where a quick change is necessary.

Both the Westinghouse and General Electric companies are exhibiting motor and generator equipment for the gas-electric drive of buses. The Westinghouse display includes a type V-92-F motor and type 177-F-2 generator. The General Electric exhibit includes a standard motor for dual motor drive where the engine capacity is 95 hp. This is the motor supplied for buses with the DT-1121 generator, and is in service on the Yellow coaches supplied to the Public Service Co-ordinated Transport and the Philadelphia Rural Transit Company. The DT-1130 generator and the GE-1140 motor, of light weight and intended for service on gas-electric taxicabs is also displayed.

Bonded asbestos brake lining, for use on buses and on street cars equipped with automotive brakes is shown in the exhibit of the Ferodo and Asbestos Company, Inc.

Those interested in the reclamation of crank case, shop and transformer oils will be attracted by the several appliances for this purpose that are included in the exhibit. The Skinner Automotive Device Company, Inc., is demonstrating an automatic electrically-operated oil reclaimer with a reported capacity of 5 gal. per hour at an expense of about 8 cents per gallon. The Johnson & Jennings Company has a working exhibit of its type K Alten and its type F-6 Alten oil reclaimers, as well as specimens of crank case, shop and transformer oils, new, dirty and reclaimed. The Hilliard Corporation is showing its Refineroil, an automatic electrically-operated apparatus for reclaiming used crank case oil, which was developed by the research laboratory of the General Electric Company and is manufactured under license from that company.

A motor-generator set and display stand showing a bus type of voltage regulated generator in operation constitutes a part of the display of the Leece-Neville Company. The generator is arranged so as to show the charging of a motor coach storage battery, using glass cells and demonstrating the harmful effects of a



The Refineroil, an automatic electrically-operated oil reclaimer manufactured by the Hilliard Corporation

current-regulated generator, also the operation of a voltage regulated generator without storage battery. The company is also showing starting motors, ignition units, overload breakers and remote control starting switches.

An accurate device for measuring engine fuel consumption on motor buses is shown in the exhibit of the Economy Electric Devices Company. The meter has been designed to produce a rugged, dependable integrating meter registering and recording the actual fuel consumption of an engine to the nearest tenth of a gallon.

The exhibit of the C. H. Wills Motor Corporation shows the complete installation of a Tropic-Aire heating unit, including the rear end unit intended for installation in large capacity buses.

Recording gasoline meter developed by Economy Electric Devices Company

MORE COMMODIOUS SEATS
In Evidence for Cars and Buses

Luxuriousness, comfort and durability are features of new products. Numerous developments are made in upholstery fabrics and leathers

DEVELOPMENTS in car and bus seats are keeping pace with the splendid strides made in body design. Attention has been focused on passenger comfort and has resulted in revisions in spring work and frame assembly details. Aside from comfort the designers of seats have paid particular attention to attractiveness and prolonged durability of their products.

The individual, special bucket type seats of the kind used in the Pittsburgh experimental cars, are displayed by Hale & Kilburn Company. This seat is almost semi-circular on the outside. The chair backs are covered on the front surface with canvas-lined rattan and on the rear with painted sheet steel. A round leather cushion in each seat is mounted on a formed steel pan, which in turn is fastened to the pedestal brackets at three points spaced on a triangle, so that when the cushion is worn on its front edge it can be mounted in two other positions to prolong its life by distributing the wear. Easy cleaning is made possible by a clearance of about ¾ in. between the cushion and the surrounding back frame. The cushions and back are pitched to a comfortable seating angle.

For interurban needs, Heywood-Wakefield has designed the new model 327-M seat. Incorporated in this design are deep, double-spring cushions which are shaped to allow more leg freedom. The mechanism rails are set in and the backs, which are individual, are pitched for comfort. Another interurban type of seat put out by this company, No. 55 PX, consists of a two-passenger chair mounted on the recently developed revolving base. This base requires no greater spacing than the stationary type. The chair revolves easily by pressing the pedal located on the base.

Two new parlor car chairs, patterns No. 16 and 35, have been brought out by Hale & Kilburn. No. 16 has a high back and side arm, giving unusual comfort. General improvements made in chairs produced by this company comprise certain changes in the spring work and frame assembly. Other interurban chairs shown in this company's exhibit include one of comfortable proportions with an intermediate arm rest and upholstered in combination leather and plush, a double rotating chair suitable for use in double-end interurban cars, a double rotating chair with collapsible division arm rest and upholstered in a combination of leather and plush.

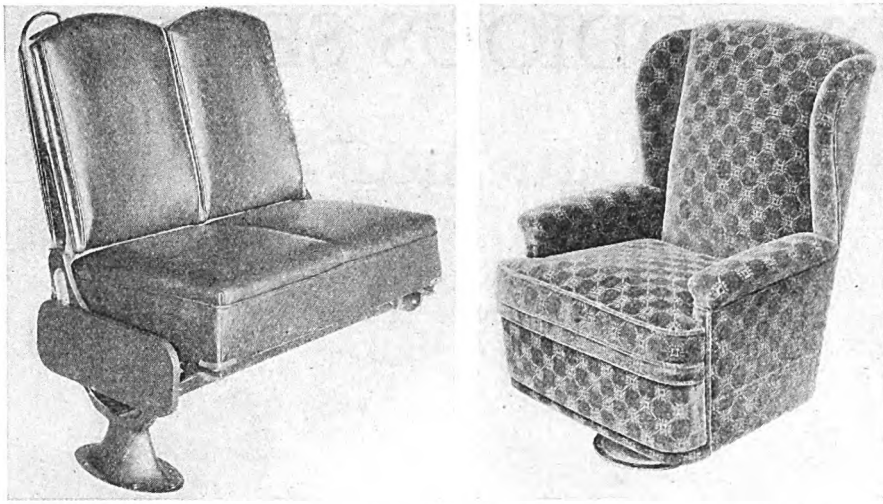
At left, individual chair designed by Hale & Kilburn for the Pittsburgh Railways. At right, parlor car chair of the same manufacturer for interurban service

Heywood-Wakefield is exhibiting a luxurious chair of fine woven fiber. It has removable spring cushions over deep, built up springs. The shaped spring back pads are removable. This chair is made with only one arm rest to increase comfort and seating space without adding to the over-all length. On the back is a 10-in. deep kick pad of carpet. The frame is made of ash held with dowels and has double-clawed, malleable iron legs with shock absorbers. The 55-P special is a high-back, all leather chair built to stand up under hard usage. The chair is strongly braced with malleable iron castings at all points where strain is apt to come and is further reinforced with sheet steel. The high back affords more relaxation, a necessity on distance runs.

Cross seats made by this company include type 8C5 special, which has a double-spring cushion construction. The mechanism of the seat is made of pressed steel. By the supporting frame construction, from 1 to 2 in. have been added to the knee room available for the passengers. No. 8L5-A special rattan seat is designed for severe use. The cushion of this seat has a spring-edged front and well padded upholstering over strong heat-treated springs. The back is concave, with a riser in the center. Cross seats exhibited by Hale & Kilburn include Walkover car seats No. 392 for interurban service. This seat has a deep, double-deck, spring-edge cushion and a divided upholstery effect. No. 108 special bus seat of the cross type has a deep recess in the rear of the back to provide maximum knee space. The back is also cut in on the side, giving a wider aisle. The metal work is pressed steel with an oval pedestal base.

A special type of double motor-coach chair is included in this exhibit.

Digitized by Google



At left, Hale & Kilburn reversible cross-seat, city type. At right, a new Hale & Kilburn parlor car chair for interurban service

The rear back is also recessed and the aisle end of the back is offset to provide additional freedom in movement through the aisle of the bus. Other seats displayed by this company include chairs with light-weight steel supporting mechanism and a number in aluminum.

A number of the latest designs in bus seats are exhibited by the Art Rattan Works. Aside from wicker and fully upholstered parlor car and urban car seats, this company is exhibiting a new type of reclining back seat. This new seat has a simple toggle action, controlled by a short lever on the inside frame of the seat which releases the cams and allows the back to recline about 12 in. from full upright. The back has four positions which are regulated by full release of the lever, allowing the back to follow the passenger from full reclining to upright position by spring action. The back automatically goes to full upright when a passenger leaves the seat.

The frame is of cast, polished aluminum, all bushings being fiber to prevent rattle or metallic noise. A foot rest hinged at the top, lifts up, giving full leg room under the seat, and no cross bars or arms prevent free passage of heater pipes.

Upholstery is full leather, with deep cushion seats and backs.

That the street car and bus patron should have the same comfort while riding as he has in the easy chair at home is a tendency shown in the exhibit of the Sanford Mills. Here are seen for the first time many new developments in mohair upholstery fabrics. Likewise the staple year round grades are included. Due to the marked increase in luxurious bus and electric railway seat building, mohair has come directly to the foreground as one of the most permanent of travel fabrics. Chase Velmo, a fabric woven from the fleece of angora goats, is the leading mohair in this exhibit.

A leather-like upholstery fabric known as Chase Leatherwove is also exhibited by Sanford Mills. Some of the new showings in bus trim include seats with the sides and arms covered in Chase Leatherwove and the back and cushions of Chase Velmo. Adaptability of some of the lighter weights of Leatherwove for trimming within motor coaches or electric cars is also shown. These products are distributed by L. C. Chase Company.

Upholstering leathers for all mediums of transportation are shown in the exhibit by the Cleveland Tanning Company. The Eagle-Ottawa Leather Company shows in its exhibit a number of kinds of leather for motor coach trimming and upholstering. Kelton-Aurand Manufacturing Company shows in its exhibit a line of seating equipment for motor coaches and electric cars.

Radel Leather Manufacturing Company is showing a complete line of upholstery leathers in various colors and designs. Featured in this display are the new Calflyke leathers which are soft and pliable and are in unusual color shades.

Blanchard Brothers & Lane shows results of a new process which makes the leather uniform and insures a product which is especially pliable and of strong fiber.

The divided type backs of this Heywood-Wakefield seat are spring filled

Some of the recent seats developed by Heywood-Wakefield. At left, revolving interurban double chair. Center, double chair of luxurious design. At right, a high-back, all-leather chair built to stand up under hard usage

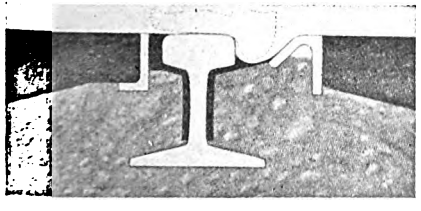
Notable Progress Shown in TRACK MATERIAL and DEVICES

New type of track structure, refinements in design of products of established reputation, and improved apparatus for construction and maintenance work are features of this year's exhibit

OF ALL the many factors involved in electric railway operation, none is more important than track. More than 25 manufacturers are exhibiting track material and equipment at the 47th A.E.R.A. Convention. Numerous new designs are being shown, as well as many refinements in the design of products already well known.

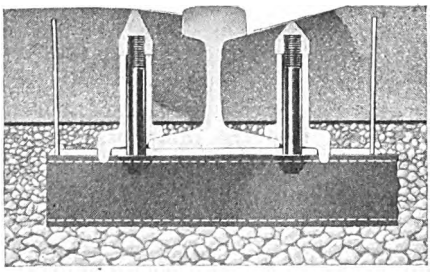
One particular significant development is a type of track structure for use in paved streets. This consists of International twin steel ties laid permanently in a concrete foundation, and equipped with long bolts and rail clips with long sleeves extending almost to the surface of the paving: Vertical steel strips parallel to the rail are welded near the outer ends of the ties. Thus each rail has its own individual paving strip. This rail channel can be excavated easily for putting in new rails by breaking out the pavement around the bolts. The latter are easily located by the lead tops flush with the pavement. Only the rail channel between the steel strips need be excavated, leaving the remainder of the paving intact. with this method of construction, concrete or asphalt can be used in the rail channels for sound deadening regardless of the pavement elsewhere in the street. If a rail works loose in service, it can be tightened down easily without disturbing the surrounding pavement. It is claimed, moreover, that track vibrations are confined to the rail channels and do not affect the adjacent road pavement.



Godwin paving guards are used in this track design to permit employment of low T-rail instead of 7-in. girder rail

Five types of steel twin ties for standard track construction are being shown by the International Steel Tie Company. The exhibit includes also a new heavy duty forged steel rail clip with a wide heel and high tensile strength bolt, as well as hot bent channels for canted type ties.

Another interesting type of track



New type track structure with International twin steel tie permanently imbedded in concrete. Rail clips with long sleeves are held in place by bolts extending upward from tie to paving surface. Vertical steel strips parallel to rail limit amount of paving affected by rail removal or other repairs

structure for paved streets is being exhibited by the W. S. Godwin Company. This involves the use of a low T-rail with the paving on each side strengthened and protected by a straight guard on the outside and a flangeway guard on the inside. This does not necessitate any change in construction below the base of the rail. It makes possible, however, a lessened height from the rail base to the paving surface. It is asserted that a saving of $5,000 per mile can be made in the construction cost of track in paved streets by the use of this method.

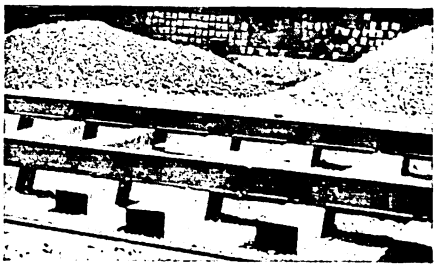
A different type of track structure is being exhibited by the Dayton Mechanical Tie Company. In this design the rail is supported on wood blocks held by the steel cross ties.

Wood ties preserved with ZMA are shown by the Curtin-Howe Corporation. This Zinc Meta-Arsenite preservative was developed by the Western Union Telegraph Company and is the standard material used for treating its pine poles, cross arms, etc. The Bethlehem-Keystone tie is being exhibited by the Bethlehem Steel Company. Elastite rail filler and track pavement are shown in the exhibit of the Philip Carey Company.

Recent developments in special trackwork design are being shown by a number of manufacturers. The Lorain Steel Company has a 200-ft. radius manganese steel tongue switch of the proposed American Electric Railway Engineering Association standard design. This is the first exhibit of a 200-ft. radius switch of this pattern. The same company is showing also a 100-ft. radius manganese steel tongue switch with the Taurman switch lock attached.

William Wharton, Jr. & Company are exhibiting the proposed standard A.E.R.A. tongue switch with 100-ft. radius. The exhibit includes also a solid manganese steel street railway over steam railroad crossing made according to the latest Beggs-Sayre design. Another interesting item is a manganese steel switch point similar to those installed by the Department of City Transit in the Broad Street Subway, Philadelphia. Other exhibitors of special trackwork include the Cleveland Frog & Crossing Company, the Buda Company and the Bethlehem Steel Company.

Rail bonds and bonding appliances feature the exhibit of the American Steel & Wire Company. Continuous



Track structure in which Carey elastite rail filler is used to damp vibrations

Digitized by Google

Kerosene-heated tar kettle of the White Manufacturing Company with hand pump and sprayer

joints and special plates of the latest design are being exhibited by the Rail Joint Company. A feature of the line of bonds being shown by the Electric Railway Improvement Company is a new gas weld bond with all-copper terminals for use on high-tension systems. The exhibit of this company also includes interesting welding and brazing equipment. Rail bonds of various types are being shown by the Ohio Brass Company. A tapered rail joint shim designed to remedy low joints is displayed by the American Fork & Hoe Company.

An a.c. and d.c. welder built on the dynamotor principle is being exhibited by the Una Welding & Bonding Company. This is intended for use on 60-cycle three-phase 220- or 440-volt alternating current systems. It is built in 300 and 500-amp. capacities. One of the special advantages claimed for this welder is that it will maintain any set current continuously for several hours. Automatic welding rods, die rods and a coated rod for welding high manganese steel are other features of this exhibit.

Material and equipment for thermit welding rail joints together with a complete layout showing the method of installing welds and examples of completed welds are shown by the Metal & Thermit Corporation.

Feralite rail welding portions complete with all accessories such as sand cores, thimbles, mold boxes, patterns, butt welding clamps, crucibles, etc., are contained in the exhibit of the Feralite Corporation. In addition to this is an interesting preheating apparatus mounted on rubber tires and designed to operate from any 550-volt d.c. power line.

Equipment for the construction and maintenance of track is shown in large variety. Based on field tests made after the last A.E.R.A. convention, the model A compression tamping machine, built by the International Steel Tie Company, has been carefully redesigned. The new machine has 19-in. standard electric railway wheels and a mechanism to raise and lower the two sets of tamping arms. The rack and pinion gear which does the lifting also provides for adjusting the tamping arms for rails from 5 in. to 7 in. height. The drive is from a 2-hp. 550 to 600-volt d.c. motor by means of a completely inclosed worm reduction gear running in oil. The machine is propelled along the track by means of a hand-operated chain drive to the rear axle. The latest model DSR track layer, a one-man machine for fastening twin steel ties to the rails, is also being shown by the same company.

Oil burning torches, tar kettles, concrete mixer heaters and switch heaters are being shown by the White Manufacturing Company. The tar kettles are equipped with self-generating vaporizing kerosene burners, which produce sufficient heat to make pouring possible a few minutes after lighting. These kettles are supplied with a hand circulating pump and sprayer.

Track greasing device designed by the Railway Track-work Company

An innovation in track department apparatus is a machine for greasing the rail. This device is made by the Railway Track-work Company. It consists of a pair of wheels, which follow the rail, a tank for the lubricant, and a handle to guide and operate the machine. A hand pump is provided to furnish pressure to force oil through the feed pipe and brush to the guard rail. The same company is also exhibiting reciprocating track grinders, the Eureka radial rail grinder, the Vulcan rail grinder, an improved Atlas rail grinder and the Ajax electric arc welder.

Miniature track spraying equipment is shown by the Reade Manufacturing Company, featuring its non-poisonous weed killer.

Dump cars and dump trucks are on display by the Differential Steel Car Company. Another item of this exhibit is the Clark concrete breaker.

An actual demonstration of a switch point being thrown electrically by the latest type Cheatham switch is the outstanding feature of the exhibit of this company. Improved and shorter type ground boxes, patented spring holding mechanisms, an improved circuit changer with or without locking attachment to prevent splitting of switch points, and an improved lightweight contactor are also shown.

The Nachod & United States Signal Company has a variety of signals on display. Among the new items in this exhibit are an annunciator signal, a turn-right signal, and a highway crossing signal with single-track car counting, or non-car counting control. Models of other signals are also shown, as well as headway recorders, flasher relays and overhead trolley contactors. The Union Switch & Signal Company is showing automatic block signals controlled by alternating-current track circuits.

Noiseless rail fastenings are a new development being exhibited by the Chase Appliance Corporation. These are designed particularly for use with steel ties. Two shaped blocks are welded to the tie, one on each side of the rail. Wedges shaped to fit the inside of the blocks and the fishing surface and base of the rail, are then inserted between the blocks and the rail. Other devices in this company's exhibit include silencers, rail insulators, and anchor tie plates.

New Things in POWER and LINE EQUIPMENT

Numerous improvements in line materials have been made. Latest designs in supervisory and power apparatus are shown in the exhibits

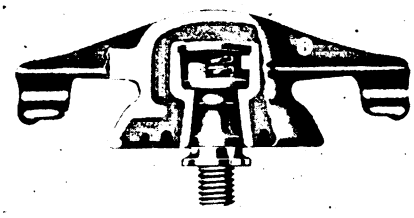
SEVERAL improvements in line apparatus have been made during the past year. Hangers have been made stronger, trolley ears have been made lighter and more durable, trolley frogs have been materially improved and outstanding changes have been made in insulator materials and design.

A departure from the usual practice of constructing trolley ears has been followed by the Westinghouse Electric & Manufacturing Company in producing the Champion ear. An alloy web and boss is die cast or hot molded on a runner punched and shaped from sheet bronze. With this it has been possible to obtain lips of uniform thickness and high conductivity. It is also lighter and is said to reduce arcing materially, with the result that it will outlast former types of ears.

The Scott ear is also a new design made by this company. As the trolley wheel comes in contact with the approaches at either end it travels on flanges constructed along each side of the ear. Thus the wheel does not ride the lips at any time. The life of the ear is thus considerably lengthened.

A new Westinghouse aligning trolley ear suspension is so constructed that the body which supports the ear is free to rotate while the yoke remains fixed to the cross span wires. This permits the ear to be in exact alignment with the trolley wire. A new molded material is used to hold the stud in the body of the suspension.

In a lock hanger made by the Ohio Brass Company there is always a tight joint between hanger and ear without the use of shims or other devices outside of the hanger itself. The ear is screwed on to the stud until it makes contact with the hanger and then is screwed still farther in the same direction until it lines up with the trolley ear. This is provided for by the limited vertical movement of the thread against a heavy spring inside of the hanger. The mechanism inside the hanger is materially



The joint is always tight between the hanger and the ear of this O-B lock hanger

stronger and there is a longer leakage path between the stud and the shell.

A new O-B duplex trolley frog with a renewable body has an overlapping runner suitable for any degree of turnout and a detachable suspension yoke and clamp which hold the trolley wire in a fixed position in the span independently of the frog body or pan. The suspension yoke and clamp becomes a permanent part of the overhead line. The body only is replaced when necessary. Quick replacement is made without disturbing the supporting span or trolley wire, and without losing the exact location of the frog being removed. This eliminates the necessity of adjustment. The suspension yoke of this trolley frog is supported by a cross span wire, for which two eyes are provided. To the yoke is bolted the clamp which holds both trolley wires in relative positions. The frog body or pan is in turn attached to the yoke by two bolts. Only the two bolts and the cam tips are removed when replacing the frog, the yoke and trolley wires remaining in position. The current is collected in the groove of the trolley wheel and not on the flanges. The frog body and suspension are made of Flecto malleable iron, hot-dip galvanized. The same yoke is suitable for both right and left hand frogs.

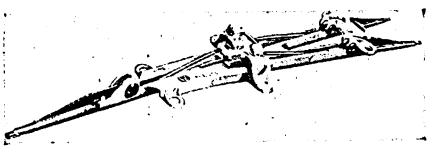
This Westinghouse Champion trolley car is light and materially reduces arcing

A new secondary rack is shown by the Oliver Iron & Steel Corporation. Its back is of one piece of rolled open-hearth steel, while the points are drop forged. The design of the back eliminates the need for washers under the bolt heads when mounting. The point is so arranged as to eliminate scoring of the line wires during their installation. All small parts are eliminated, thus giving greater resistance to rust.

A new cap and cone type insulator is shown by the Westinghouse Electric & Manufacturing Company. It is claimed that it will not chip or crack when handled by tools for installing, is not damaged when accidently dropped from the tower car, is not affected by heat and because a phenolic-resin binder is used in manufacturing, it does not absorb moisture and soften under intense heat. This company also shows various pin type porcelain insulators for use on 6,600, 11,000, 13,500, and 45,000-volt systems, also suspension type insulators for high voltage and several types of strain insulators for high voltage use.

A new feeder dead end clamp assembly for use with low voltage feeder cables, concentric or rope lay, of any size between 500,000 and 1,000,000 c.m. has been developed by the Ohio Brass Company. Its compactness permits installation from the pole, making use of ladders or staging unnecessary. The feeder cable may be cut off and dead ended in the clamp, or carried through for proper connection to another feeder, either below or on either side, or above the clamp. The clamp clevis is in line with the center of the cable. This permits a straight pull from the feeder to the pole or other structure and avoids any kinking or bending of the cable under strain. The insulator assembly of this clamp consists of two interlocked wet ware porcelain insulators, an eye fitting for attachment for clevis of clamp, an intermediate fitting between the insulators, and a clevis fitting for attachment to eyebolt in supporting structures. The clamp and fittings are of Flecto malleable

Digitized by Google



A renewable body is the feature of this duplex trolley frog made by the Ohio Brass Company

iron, hot-dip galvanized. The saddles are of bronze. The ultimate strength of the clamp exceeds 12,000 lb. Other new devices which are exhibited by the Ohio Brass Company are a renewable under run section insulator, spangrip clamps and lashings and new pole sleeves.

Catenary overhead materials furnished the Boston, Revere Beach & Lynn Railroad are included in the exhibit of the General Electric Company. The special feature of this material is that the castings are nonferrous. In addition, there is an exhibit of standard line material.

A new method of connecting composite cable is featured by the American Brass Company. A strong large cable of four layers is used, the first and second layers consisting of nineteen wires of Calsun bronze, and the third and fourth layers comprising 42 wires of Anaconda hard-drawn copper. The individual wires have a diameter of 0.1245 in. The weight of the complete cable is 2,920 lb. per 1,000 ft., its maximum breaking strength, 57,000 lb., and the outside diameter 1.121 in.

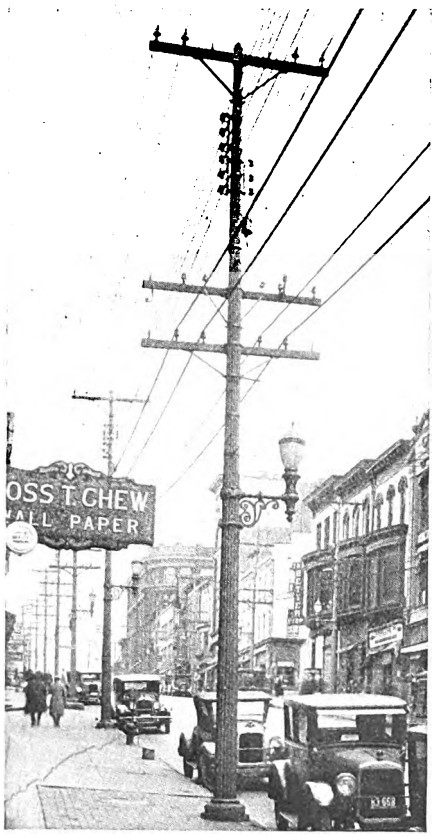
Two inner tubes are swaged together in the form of a double tube connector. This double tube connector is drawn on to the inner layers in one operation by a single die. The outer tube is drawn over the double tube connector, and also over the third and fourth layers. These Anaconda seamless connectors of the double tube or single tube variety may also be used on smaller composite cables.

Anaconda preformed cable is another feature of this exhibit. The individual wires are formed into a helix prior to being stranded together. As a result the wires do not unravel or fly apart when the cable is cut. This is of special advantage when high-tempered alloy wires are made into messenger cables used for guying poles, or for cross spans on trolley lines and in the electrification of railroads. For such purposes the cable is cut into comparatively short lengths, and the stringy strands would fly apart unless tightly bound before cutting. The elimination of binding saves trouble and expense during installation. Anaconda hollow conductors and composite cable are other features of this company's exhibit.

The Okonite Company exhibits samples of rubber-covered and varnished cambric insulated wire and cable, friction and rubber insulating tapes and Okocord. A new process makes it possible to buy Okocord with the name or initials of any railroad molded into every foot, which positively identifies the property. The Okonite-Callendar Cable Company is exhibiting samples of impregnated paper and super-tension cables, splicing materials, junction boxes and splices.

Various types of fluted steel poles are featured by the Union Metal Manufacturing Company. These poles are of particular value in cities where beautiful appearance makes them a ready means of building good will. The shafts of these poles are fabricated from heavy open-hearth deep-drawn stock steel. There are no horizontal joints or splicings. The bottom end of the shaft is flanged with the flange extending under four foundation nuts. These poles are set directly on a concrete foundation, and secured by heavy anchor bolts. For ornamentation and additional protection against corrosion an ornamental heavy steel casting is used as a base. Removal of the screw holding one of the four ornamental leaves in position gives immediate access to the foundation bolts. Ventilation through the poles is provided by the base, thus eliminating inside condensation or sweating. Due to the foundation method of setting these poles it is a very easy matter to line up the poles after the loading has been applied, thus assuring positive alignment at all times.

A new rolled steel one-piece back and drop-forged points are combined in this secondary rack made by the Oliver Iron & Steel Corporation



On these Union Metal poles in Wheeling, W. Va., are mounted all of the wires formerly supported on several sets of poles, as well as the ornamental lighting system

An earth boring machine and pole setter is offered by the Highway Trailer Company. It is claimed that this machine will traverse and operate in thick underbrush, in ditches, knolls, hollows, embankments, and require no skids. It reaches and digs, as well as sets the pole in any kind of soil. In addition to digging straight holes it will dig at any angle suitable for all types of anchors. In actual line construction work an average of a pole in the ground every 5½ minutes is the record recently established by this highway earth boring machine. The feasibility of setting the pole at the time the hole is dug, also the possibility of dragging the pole to a position so it can be hoisted, is possible by using the cable from the winch which is controlled from the driver's seat. The winch is driven from the power take-off. The pole derrick of this machine is 17 ft. in length, and made of 3½-in. diameter 40-carbon seamless steel tubing, and is capable of setting poles 45 ft. long. The boring machine is largely used with a 20-in. auger, but is capable of handling augers from 8 in. to 24 in., the latter under favorable conditions.

A complete line of poles, line hardware, and construction specialties are

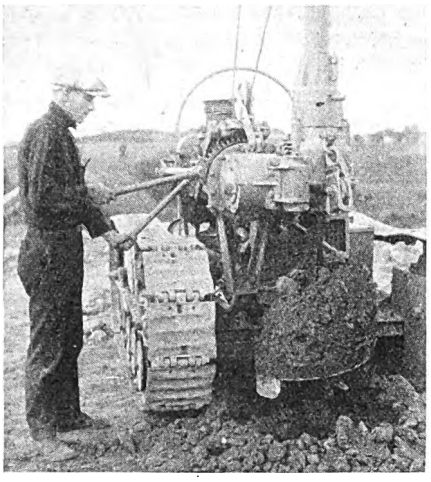
Digitized by Google

featured in the exhibit of the Oliver Iron & Steel Corporation. All line material is galvanized by the new exclusive Fassinger process of double dip hot galvanizing. This process gives a bright finish, uniform coating with no spelter to clutter up threads, great resistance to rust, and longer life. This exhibit includes anchors, anchor rods, braces, brackets, clevises, pins, and cross arm straps.

A cross section of a type LV autovalve lightning arrester is shown in the exhibit of the Westinghouse Electric & Manufacturing Company. This is an inexpensive arrester that gives protection and yet is light in weight and easy to install. It requires practically no attention after being installed, and furthermore, when something goes wrong the arrester will disconnect itself from the line. Permanence of the arrester element and housing is assured by a porcelain casing.

Supervisory equipment of the synchronous selector type is exhibited by the General Electric Company. This equipment provides a means of the control of various types of switching equipment at remote points, gives visible indication of the position of these devices, and draws attention immediately to any change in the status of the controlled apparatus. Its chief advantage is the co-ordination of any number of units under central supervision. This system is normally at rest. Any impulse either to actuate a device or to report an operation starts a sequence which is continued

These Union Metal fluted steel poles installed in Steubenville, Ohio, support traffic lights, the trolley line and the ornamental lighting system



This earth boring machine and pole setter made by the Highway Trailer Company digs holes in any soil or location

until the action is completed and the proper indication given, after which the equipment returns to its starting position ready for the next operation.

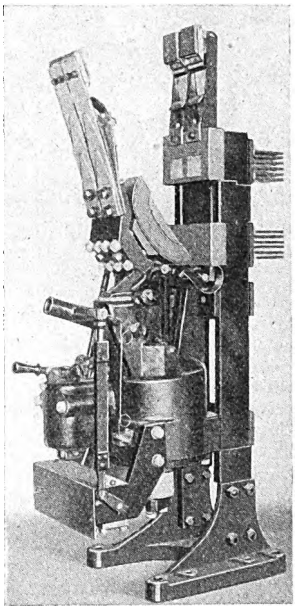
This supervisory system has been designed to operate over four wires extending between the dispatcher's office and each outlying station. In the exhibit this supervisory control has been arranged to operate a rectified current type of telemetering equipment arranged for selective reading of four current values, an MC-2 air circuit breakers, an FKR-55 oil circuit breaker, an RK-6 disconnecting switch and a JR-25 high-speed breaker.

Rectified current telemetering is a simple system for transmitting the readings of alternating current or voltage for a considerable distance over telephone lines, or supervisory control wires, without interfering with the use of the lines for other purposes. The alternating current or voltage is transformed to a suitable value, rectified to direct current, and transmitted over the line to be read by a milliammeter which is calibrated in terms of the alternating current or voltage which is to be read. The readings may be continuous, or as in this exhibit, transmitted by the supervisory equipment as desired.

The MC-2 air circuit breaker is a panel-mounted solenoid operated interrupting device. It is different from the ordinary switchboard breaker in that it is provided with an arc chute with blowout coil and metal arcing tips. Due to the light moving element, the heavy contact pressure used, and the efficient arc chute and blowout coil, it is said that this breaker is about four times as fast as an ordinary panel-mounted carbon arcing tip breaker. It may be arranged to trip on direct overload, rate of current rise, or a combination of both.

A complete new line of 7,500 and 15,000-volt 400 to 3,000-amp. high interrupting capacity indoor oil circuit breakers for moderate and heavy duty service at any altitude is formed in the type FKR-55. The essential features of these circuit breakers are the enclosing of three phases in a single sturdy, round tank, the positive alignment of all moving parts, and simple, compact construction which permits easy installation, inspection and maintenance.

A distinct advance in design of direct-current high-speed circuit breakers is made in the General Electris JR-25 high-speed breaker. Due to its high speed it affords protection



This Westinghouse carbon circuit breaker has been designed to meet the requirements of automatic and semi-automatic substations

to commutating apparatus, which has made possible many radical improvements in direct current switching. The breaker is self-contained and may be closed either electrically or pneumatically. It is held closed magnetically against the action of powerful springs. The breaker is tripped by the direct action of load current which reduces the holding flux. An additional feature is that the tripping circuits are so arranged that a lower value of tripping is obtained on rapid rates of current increase than with slowly increasing currents. The breaker is also trip free when closing against a short circuit or overload.

Two types of circuit breakers for

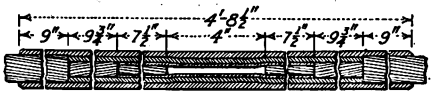
Digitized by Google

railway substations are exhibited by the Westinghouse Electric & Manufacturing Company. The type HS high-speed breaker is an air break switch of the contactor type. It is designed with a movable contact of solid copper bridging two stationary contacts and held closed by an electromagnet. When protecting conversion equipment in railway substations, it is connected in the machine circuit and differentiates between legitimate overloads and short circuits, provided the holding in coil of the breaker is excited from some force of fairly constant potential, preferably the machine terminals. The opening of the high-speed breaker keeps the current within the commutating capacity of the machine by cutting in resistance.

The transformer used in this Westinghouse oil testing outfit is of the three-legged cross type

The widely increasing use of automatic and semi-automatic substations has brought the need of a circuit breaker that is stronger mechanically and that will interrupt large overloads a greater number of times and still be in condition to carry a load without overheating or be in need of repairs or cleaning than any previous type of circuit breaker. These characteristics are embodied in the design and construction of the type CH carbon circuit breaker exhibited in the Westinghouse booth.

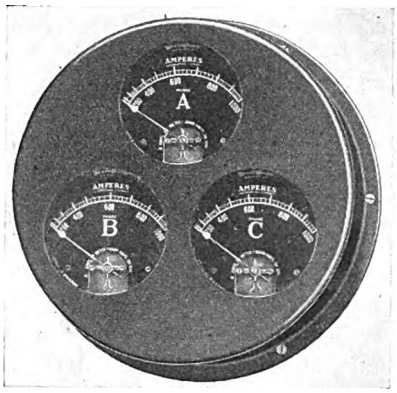
This breaker is mechanically trip free from the closing magnet or closing handle. A wide opening between arcing contacts, its high interrupting capacity, freedom from expansion for arc gases, pedestal or panel mounting, and a mechanically free trip are its distinctive features.



Sectional drawing showing the manner in which Anaconda seamless connector is applied to composite cable in making a splice

The difference in voltage and power conditions on the lines of the Cincinnati Street Railway brought about by the installation of nineteen automatic substations is shown on a map of the system by means of a miniature train and lamps in the exhibit of the Collier Construction Company.

Westinghouse is showing three types of indoor current transformers. Type KO, with a rated voltage of 4,600 volts, has a single watthour meter burden, and for higher meter burdens up to 12½ volt-amperes. A higher-degree of accuracy than with ordinary current transformers is obtained in the NA transformer, rated at 7,500 volts, due to the use of a new steel, Hipernick, in place of the usual silicon steel. Hipernick is non-aging, and therefore there is no change in the characteristics of the transformer over a period of time. The type KB current transformer shown is similar to the type KA, except that it is insulated for service up to 15,000 volts.

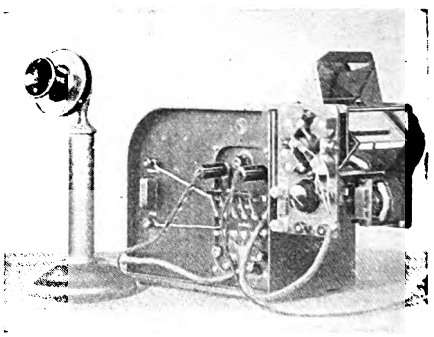


Triplex instruments arranged by Westinghouse for use on three-phase circuits indicate the load on each phase

The plug type current transformer shown is rated at a primary current which gives 5 amp. secondary. It is compensated for 12½ volt-amperes load at 5 amp. secondary. The coils in the primary can be connected in either series or parallel or in series-parallel by means of connecting plugs in order to obtain a suitable ratio. The transformer is insulated for use on 2,300-volt circuits and is contained in a covered wooden case with handle.

A portable oil testing outfit has been made by Westinghouse for use in periodically testing oils of electric equipment in outlying districts where a more elaborate testing outfit is not justified and eliminates the necessity of sending samples to a centralized laboratory. This set consists of a small testing transformer enclosed in a cast aluminum case, covered by a micarta panel which carries the voltmeter and control equipment. Two high-voltage bushings are brought through the panel and form the support for the oil testing cup. The voltmeter in the panel, which is calibrated in kilovolts, indicates the breakdown value of the oil.

Westinghouse is showing a complete line of a.c. and d.c. instruments for general testing purposes, including typical portable volt-ammeters, volt meters, ammeters and watt-meters. One of the features of this exhibit is triplex instruments arranged with three dials for use on three-phase circuits to indicate the load on each phase, or the voltage between the ground and the lines. By means of an instrument named the Osiso, a visible reproduction of an invisible phenomena is made possible. The novel arrangement of this practical mechanism actually shows how the voice looks when a person talks. It demonstrates how it is possible to see the invisible current chasing an unseen voltage in an electrical circuit. This portable instrument is valuable for recording system stability during a chance disturbance, and for other studies in connection with the power system.



The Westinghouse Osiso is a valuable portable instrument for recording system stability and for making studies of power systems

The Aluminum Company of America is exhibiting aluminum and its strong alloys in semi-fabricated condition and as fabricated by other concerns. The use of aluminum for bus bars is one of the many features.

News of the Industry

Preparing for 7-Cent Fare in Los Angeles

The Los Angeles Railway Corporation, Los Angeles, Cal., has taken steps to put into effect by Sept. 22 the temporary 7-cent rate allowed by a recent federal court decision. Coupons are to be issued to passengers which may be redeemed for the difference between the advancd fare and the present 5-cent fare in the event the city and state succeed in having the temporary 7-cent fare voided. They have set in motion legal machinery necessary to block this rise.

Under the federal court decision the company is permitted to charge 7 cents for a single fare with four single fare tokens for 25 cents and free transfers and half fares for the school children. The federal court has just enjoined the State Railroad Commission from enforcing a recent order denying the railway company's petition for the proposed increase in its rates.

The first move for an increase was made in 1921. The commission steadfastly refused to grant the increase and the company started injunction proceedings in the federal court early in 1928, contending that the refusal for permission to increase the fare to 7 cents was tantamount to confiscation of the property. Attorneys for the railway told the federal judges that the company was operated at a loss of approximately $7,000 a day and was indebted to the Henry E. Huntington estate in the sum of $9,000,000 for moneys advanced by Mr. Huntington.

By unanimous vote the Los Angeles City Council has requested City Attorney Jess E. Stephens to appeal to the United States Supreme Court from the injunction restraining the commission from interfering with the proposal of the 7-cent rate asked by the railway. The appeal, which will be made by the city and state authorities, will be based upon the corporation's contract with the city which guarantees a 5-cent fare and upon the assumption that the only body that has jurisdiction to set aside the guarantee is the California Railroad Commission.

No Stay in Baltimore's Depreciation Case

The Maryland Publice Service Commission has been refused in its plea for a stay in rehearing the depreciation issue affecting the United Railways & Electric Company, Baltimore. The case was heard by Justice Brandeis of the United States Supreme Court. He held that the commission should hear the case, in compliance with the decision of the Maryland Court of Appeals. This portion of the case was remanded by the Maryland Court holding that the commission should have based the annual depreciation allowance for the company on the present value of its property instead of the cost of this property. The United claims a $2,200,000 annual depreciation allowance. In its original decision granting a fare increase from 7½ cents to 8⅓ cents the Public Service Commission allowed a depreciation reserve of only $883,000.

Nov. 15 has been set by the commission as the date to open hearings on the disputed point. In the meantime H. Carl Wolf, chief engineer of the commission, is making a survey of the company's property in order to have the figures ready by the time the hearing opens.

Increases on Certain New York State Lines

Authorization was given the New York State Railways on Sept. 12 to make certain increases in its various fare rates connecting Forest Park, East Utica city line and Little Falls. The rates are to remain in effect until Nov. 1, 1929, and thereafter until otherwise ordered by the commission. According to the order the company may sell strips of ten tickets for 75 cents for transportation between points in any two connecting zones between stops 11 and 36. Further provision is made for round-trip tickets and one-way cash fares.

A memorandum by Commissioner Brewster and approved by the commission stated it was clear from the evidence that the petitioner was not earning an adequate return on the value of its property. A return of less than 7 per cent on $1,000,000 of valuation was realized in 1927. Even allowing the contention of the communities that no depreciation should be charged against income the return would still be inadequate on any possible valuation.

Big Crowd in Broad Street Tube

THE number of passengers carried on the new Broad Street subway, Philadelphia, totaled 564,460 in the first week of operation, Chairman Ainey, of the Public Service Commission, announced on Sept. 16. The number includes all riders—cash fares, tokens, exchanges and free transfers.

The peak load of the week was carried on Saturday, Sept. 8, when 101,110 passengers used the subway. On the first day, Sunday, Sept. 2, the number was 62,507.

Golden Brown Favored in Color-Conscious Nebraska

In a local beauty contest which elicited 35,000 opinions on color design the "Nebraska" obliterated its competitors and established itself among the residents of Omaha and Council Bluffs as mechanically reliable and esthetically satisfying. Down to defeat went the "Fontenelle" of pigskin brown body, light cream sash and gray roof; "Ak-Sar-Ben" of green body, yellow sashes and red roof; "American Legion," red body, white sashes and blue roof, and the "Omaha," the present yellow car now in use. As a result of the majority vote in favor of "Nebraska" all cars of the Omaha & Council Bluffs Street Railway will strut a golden-brown body, cream sashes and gray roof. While the cars are gradually being repainted, they will also be equipped with modernized safety devices.

The public as a jury had been inspecting the four new color designs during the summer when the cars ran for several days at a time on every Omaha line, first for exhibition purposes and later in regular passenger service. The four competing cars were reconditioned in the car shops and, besides the color changes, featured a number of safety and convenience devices such as sun visors for motormen, automatic safety stops and automatic air gongs.

The street car color vote is just another step in the company's policy to take the public into its confidence, manifested recently when the skip-stop election was held. However, 10,000 more registered their ballots on the color question than on the former question.

This program, stimulating good feeling for the local management, has been projected by J. N. Shannahan, who went to Omaha from Newport News, Va., several months ago and has already done much to sell street car service as a commodity essential to the life of the city. He not only changed the token rate from six for 40 cents to a basis of three for 20 cents, but he even made the token "smile" at the buyer. So "Service with a Smile" became more than a slogan. Recently in *Street Car Topics*, the company pamphlet, the railway pledged to continue to be governed by the car riders' wishes in giving ample and efficient service in the two cities.

New York & Queens Hearing to Be Continued

The hearing on the application of the New York & Queens County Railway for a 7-cent fare on its so-called Steinway line will be continued Sept. 24, an adjournment having been taken by Transit Commissioner Leon G. Godley

Digitized by Google

to allow both the railroad attorneys and the city to submit memoranda on the case. Michael J. Shugrue, Commissioner of Public Works in Queens, represented Borough President Patten at the hearing, and voiced opposition to the application. Mr. Shugrue asked that the hearing be adjourned so that Mr. Patten might have a chance to appear personally to oppose the higher fare move, but Commissioner Godley told him that the hearings would last long enough for the borough president to have ample opportunity to be heard.

Joseph A. Devery, assistant corporation counsel, claimed the commission lacked jurisdiction in the fare question.

Increased Service Sought in Southeast Kansas City

An appeal has been made to Powell C. Groner, president of the Kansas City Public Service Company, for increased service in the southeast section of Kansas City, Mo. According to W. H. Launder, president of the South Troost Development Association, 90 per cent of the residents of this section are small home owners or renters, and are present or future street car patrons. They request additional railway service and a bus line which would connect with four other lines.

Higher Fare on New Jersey Line

Application of the Cumberland Traction Company, Millville, N. J., to increase its fare from 7 cents a zone or four tickets for 25 cents to 10 cents a zone or three tickets for 25 cents has been approved by the New Jersey Board of Public Utility Commissioners. The increase carries with it a decrease of from five to four in the number of zones between Bridgeton and Millville, where the company operates. In asking for the increase it was contended that the company never had paid a dividend and that there was an accumulation of current bills amounting to $19,000 which could not be met except from an increase in operating revenue.

Oklahoma Employees Called It a Joy Ride

Passengers boarding Oklahoma Railway cars and buses in Oklahoma City, on Sept. 13 found lids on the fare boxes and were handed a card. One side said: "Good Morning! No fares collected this trip. Your ride is with the compliments of Rorabaugh-Browns, whose thirteenth anniversary celebration begins today. Be sure to drop in and see Oklahoma's greatest store in action." The reverse side of the ticket read: "The value of our service to you as a shopping convenience is increasing daily —it pays to save. Ride the street cars and buses. You will save the difference. Oklahoma Railway, H. R. Hudson, president."

Trainmen said the smiles of the public made each trip a sure-enough joy ride.

Something New in Outdoor Advertising by North Shore Line

An attractive innovation in outdoor advertising has been introduced by the Chicago, North Shore & Milwaukee Railroad, which has erected at important traffic points on its lines artistic statues as a medium for carrying its message of service to the public.

These statues present the figure of a town crier of early American days striding along with a bell in one hand and a scroll in the other. On the scroll are inscribed in large letters the words:

Town crier has new calling

"Did you ever travel 80 miles an hour?" —emphasizing the high-speed operation of all-steel North Shore Line trains between Chicago and Milwaukee. The figure of the town crier is 7½ ft. and appears to be carved out of marble. It stands on a 7-ft. base, which is finished to represent light gray granite. On the four sides of the base are large North Shore Line emblems in bas-relief, and placques telling of the territory and leading communities served. The statues are constructed of a solid composition that will withstand the elements.

Ten of these statues are being erected by the North Shore Line, and eight are already completed. The accompanying illustration shows the statue at Briergate Station on the Skokie Valley Route.

Traffic Survey for Cincinnati Suggested and Approved

The Cincinnati Chamber of Commerce approved a majority report of its rapid transit committee on Sept. 12 calling for a comprehensive survey of the entire traffic of the city, including study of a project for a downtown underground belt line or loop to serve the congested area and to relieve heavy traffic.

The report was written by John Weld Peck, former U. S. district judge; Charles A. Bosworth, local bank president, and Charles J. Nelson, wholesale jeweler. They found the future success of a rapid transit system in Cincinnati "uncertain." They said:

> The margin between success and failure as disclosed by the Beeler report (an earlier survey) is so narrow that your committee is unwilling to advocate the expenditure of $13,000,000 additional necessary to complete the system and carry it through the first five years of operation, until there has been a complete study not only of the proposed route but also of the entire city by a disinterested local engineering board. In the meanwhile, no substantial loss is incurred by allowing the work to stand as it is.

The committee commended the Rapid Transit Commission for having provided a boulevard to Brighton, a suburb, over the tube that is ready for the rails, and urged its extension.

In his minority report D. C. Keller recommended prompt completion of the system in accordance with the Beeler report. Another survey would result in more disagreement among experts. Any new rapid transit project could not be expected to be profitable at once. Traffic comes only from opportunity.

The Chamber of Commerce committee has been at work several months studying the feasibility of completing the system. A score of hearings have been held at which city officials, railway experts and interested citizens advanced their views.

Seattle Survey on Paving Problem

Demanding that immediate action be taken by the City Council on the problem of paving between the tracks of the Seattle Municipal Railway, Seattle, Wash., community club leaders in the city, backed by the Seattle *Daily Times*, have appealed to Mayor Frank Edwards for help. The Mayor has announced that he will immediately order a survey to determine how the pavement may be financed, and also to hasten its beginning. There are miles of unpaved street car trackage all over the city. Mayor Edwards calls attention to the fact that the railway system, held responsible for this paving, has not the funds with which to do it, but declares that "this must not deter the city from seeing that it is done."

Two widely different but almost equally definite plans have been offered. Robert B. Hesketh, president of the City Council, advocates completion of the paving at the expense of the city's general fund. Roy E. Furse, assistant superintendent of the Seattle Municipal Railway, declared that if the City Council would authorize a sufficient bond issue for rehabilitation of the railway system and Seattle citizens would buy the bonds the street cars would soon pay their own share of the paving. He declared that with a bond issue of $4,000,000, the entire Seattle street railway system can be put on a well-paying modern service basis, and be enabled to handle its share so that at least a majority of this unfinished paving could be completed.

More Parking Plans Under Consideration in Chicago

Further relief from traffic congestion in downtown Chicago, Ill., is contemplated in a plan now being considered by the City Council committee on traffic regulation which would bar all motor trucks from the Loop district between 4:30 and 6 p.m. daily except Sunday. According to sponsors of the project, it will not be accomplished by legislation, but by inducing transfer companies and other large truck operators to arrange delivery schedules which will eliminate the necessity of their trucks being in the Loop during the evening rush hours.

A no-parking ordinance has been in effect in the downtown district since Jan. 10.

Counting School Rides in Baltimore

School pupils in Baltimore, Md., will take more than 3,500,000 5-cent car rides during the present school year, according to the United Railways & Electric Company. The company sells the 5-cent fare tokens for pupils between the ages of twelve and twenty years who attend public, private, parochial and night schools. In the last school year, according to the United, the day school pupils took a total of 3,613,577 of these 5-cent rides and 71,852 were taken by pupils of night schools.

Would Have Subways Handle New York Mails

The planning and research committee of the postal service, of which Joseph Stewart is chairman, probably will take up with postal officials in New York City the question of using the train service of the Interborough Rapid Transit Company for the transportation of mails, it was stated orally at the Post Office Department recently.

This committee was recently appointed by the Postmaster General, Harry S. New, to study improvements in the postal service. The committee has no program mapped out for it, but the statement was made that because of congestion of traffic in New York City, the postal service must find other means than those at present in use for transporting its mails. While he was Second Assistant Postmaster General, Mr. Stewart had this question up with New York postal officials, but no progress was made toward obtaining a mail contract with the companies operating subway train service.

According to some members of the committee, the department should renew negotiations for a new system of transporting mails in New York City. The committee has in mind a plan for the construction of its own subway system in New York City, but because of the great cost it is more than likely that its plan will be abandoned, it was said. The committee, however, is going ahead with its plans for increasing its mail facilities in New York City and no doubt will attempt to make a contract for the carrying of mails on the subway routes, it was stated.

New Decoration for St. Louis Cars

A new monogram to take the place of the two-letter combination used by the United Railways, the predecessor to the St. Louis Public Service Company, St. Louis, Mo., is now being placed on all cars in service. The company called upon the artists and student artists in the Art School of Washington University to enter a contest to produce the new monogram. Following the announcement of the awards the management adopted the design submitted by Miss Grace Nelson, shown in the accompanying picture. However, Miss Nelson did not win the first prize. That was won by Miss Florence Boeffer. Both received the same reward of $75. Under the rules of the contest the management reserved the right to make the final selection regardless of the prize winners agreed on by a contest committee. Thus the management after the first, second and third prize winners were named by the committee gave preference to the Nelson drawing as the one best suited to its purpose. The names of the prize winners, accompanied by a reproduction of the Boeffer design, were published in the March 31 issue.

Cars in St. Louis carry this decoration

Further Discontinuance Pleas of New York State Railways

A hearing was held before the Public Service Commission on Sept. 4, on the application of New York State Railways for consent to the further discontinuance of the operation of its cars upon a portion of its Auburn Avenue shuttle car line in Utica, N. Y. Discontinuance of this operation has been permitted for temporary periods heretofore and the present request is for an extension of the non-operation period to July 1, 1929. The territory covered by the application is now being served by a bus line of the Utica Railways Co-ordinated Bus Line, Inc.

A public hearing will be held on the application of the New York State Railways for permission to discontinue the operation of cars on its railroad in North James Street in the city of Rome until Sept. 1, 1929. Temporary discontinuance of this service to Sept. 1, 1928, was authorized. Bus service is now being furnished by the Utica Railways Co-ordinated Bus Line, Inc.

Chicago Report Expected Oct. 1

Michael J. Faherty, president of the board of local improvements at Chicago, Ill., has announced that the committee of engineers and architects that has been working out a general scheme for a subway would submit its report about Oct. 1. Thus Mr. Faherty hopes to be able to have the other committees begin work immediately afterward, so that the detailed plans may be ready within the following three months. The board of local improvements will then hold public hearings and begin the spreading of assessment rolls.

Ernest R. Graham, architect, is the chairman of the committee that was named at a conference in the offices of the Chicago Plan Commission several weeks ago.

Ban on One-Man Cars in Oakland to Be Reconsidered

Postponement of reconsideration of the one-man car ordinance, defeated at final passage recently, was voted by the Oakland City Council, Oakland, Cal., on Aug. 24 over the opposition of Mayor John L. Davie. Reconsideration of the ordinance, which would permit operation of one-man street cars by the Key System Transit Company, is to come before the Council.

Eugene K. Sturgis, commissioner of revenue and finance of the city, who proposed the ordinance, told the Council:

There seems to be considerable misapprehension as to the purpose of this ordinance. The effect will be to increase the number of cars operating and increase the service on certain lines without additional cost and thereby gain additional passengers and revenues for the company. The purpose is not to lay off men. I was and am in favor of this ordinance because I believe it will make for better service to the people of this city, because practically every large city in the country has such type of service and because I do not believe in a receivership which will foreclose a large number of small stockholders to the benefit of a few large bondholders and to the further benefit of large fees to a few receivers.

Among a series of questions which the company answered was the following: Will a permanent solution of the financial problem of the Key System result from the operation of one-man cars?

It replied:

Such operation will be a very large step toward a permanent solution. It is in the opinion of the present management extremely desirable that permanent, and hence necessarily sound, solution should be found.

The present management has evolved a program (in which one-man car operation is an important step) which it believes will be a permanent solution. It therefore asks an opportunity to demonstrate the effectiveness of this program.

Experience has shown that the solution furnished by bankruptcy and the wiping out of securities is not permanent, is unjust to innocent investors, and would deter the investment of new capital in these communities.

Talk of Maine Project Revived

Events which have been the subject of record previously in ELECTRIC RAILWAY JOURNAL are reviewed by the editorial correspondent of the New York *Times* in Boston, who asks whether they are the forerunner of a new railroad for Maine. As the writer in the *Times* sees it, the warrant for the project is the enormous area of untouched timber lands which thus might be brought into the market, said to be the largest such area east of the Rocky Mountains.

The vehicle to this end would be the Quebec Extension Railway, frequently called the Gould Railroad, for which Senator Arthur R. Gould some years ago obtained a charter to build across northern Maine from Washburn, a point common to the Bangor & Aroostook and the Aroostook Valley to the Canadian border, a distance of about 112 miles. Recently Senator Gould turned over all his rights in the Quebec Extension Railway including the charter, to R. H. Wheeler of Sanderson & Porter of New York City, and affirmed his faith in the construction in the near future, at a cost estimated at $4,000,000.

To eliminate the fire hazard in the timberlands the road would be operated by electricity. At one time the Bangor & Aroostook opposed the construction of the new line, but a decision by the Interstate Commerce Commission removed its main objections and thus far the way is clear. After hearings on the application of Senator Gould for the required certificate of "public convenience and necessity," the I.C.C. "allowed the road," with the condition that the Bangor & Aroostook must be given the same joint rates, as favorable freight divisions and car supply, and be treated in all other ways on a precise equality with the Quebec Central. The latter is a subsidiary of the Canadian Pacific and with it the projected Quebec Extension would connect at the Canadian border. For years there has been speculation in Maine as to whether this road will be built; today there is more talk about it than in a long time before.

Are the Insull interests, now strong in the water power development of Maine, about to acquire possession of the Maine Central Railroad? This also is a subject just now of extensive speculation in the Pine Tree State. One fact of general knowledge is that the Central Maine Power Company, which is an Insull corporation, endeavored to induce the railroad to electrify the whole or a part of its system, and that experts were employed to investigate and report on the proposal.

Ohio Village Favored in Improvement Dispute

That the village of Eaton, Ohio, had the right to prescribe the conditions under which certain improvements were made, and which concerned, among other things, the paving of part of the line of the Dayton & Western Traction Company, is held in a recent decision of the Court of Appeals. The railway was operating on a franchise allowed by the county, but when the village extended its lines, the trackage was included and affected by some paving improvements. Judge E. P. Middleton, hearing the issues at trial, decided in favor of the village, and the Court of Appeals, in rendering its decision, sustained him.

Tokens Replace Tickets in Binghamton

In place of the paper tickets metal tokens are in use since Sept. 2 on the lines of the Binghamton Railway, Binghamton, N. Y. They are sold at the same price, that is, four for 30 cents, or thirteen and a carrier for $1. The change in the method of collecting fare on the railway lines is not effective on the buses.

Recent Bus Developments

Rehearing on Pacific Electric Petition Refused

The California Railroad Commission has denied the petition for rehearing of the application of the Pacific Electric Railway for authority to discontinue railway service on its Upland-Ontario line in the city of Ontario, and to substitute motor coach service. This rehearing was sought by certain protestants against the commission's action. An extension of time until Oct. 6 has been granted to the company to make the substitution.

Another Bus Line in New Rochelle

The Westchester Electric Railroad on Aug. 30 applied to the Public Service Commission of New York for approval of the substitution of buses for trolley cars on its East Main Street line in New Rochelle under a consent of the city dated Aug. 15. The company says the change is for public benefit.

Change in Bus Service in Salt Lake City

Application to discontinue bus service to the Val Verda district, north of Salt Lake City, has been filed with the Public Utilities Commission of Utah by the Utah Light & Traction Company. The application states that this line is being operated at a considerable loss. Discontinuance would not affect service to Centerville and Bountiful.

Court Approves Grant for Seattle-Everett Highway

After a previous reversal for an error of facts by the Department of Public Works at Olympia, Wash., Judge John M. Wilson of the Thurston County Court recently affirmed an order of the department granting a certificate to B. Krakenberger for passenger and express service by bus over the new Seattle-Everett Pacific highway, and denying the application of the Northwest Traction Company. Judge Wilson flatly disagreed with the reasoning of the department, but declares it has wide discretion in such matters, and that there was not sufficient evidence that the department had acted arbitrarily or capriciously.

Hay Ride of Yesterday Becomes Bus Trip of Today in Buffalo

The International Bus Corporation, a subsidiary of the International Railway, Buffalo, N. Y., reports that increased use is being made of its rent-a-bus service for private parties. A pamphlet has been issued under the title, "Remember the Ol' Straw Ride," in which attention is called to this service for picnics, athletic contests, real estate trips, historical tours, school and church services, conventions, lodges and clubs, transporting workmen, parades, sales conferences, industrial tours and theater parties. For this service, the International Bus Corporation is using its city type gas-electric buses.

Contrasting this service with the old hay rack parties of twenty years ago, the company says in part:

We have learned that it is not necessary to put up with the hardships that prevailed before the turn of the century. With a full knowledge of the demands made by the public on modern travel, Mitten Management now operates a de luxe bus service which can be rented at a low rate and which answers the needs of all types of group movements.

St. Louis Company Offers to Supply Service

The St. Louis Public Service Company has applied to the Missouri Public Service Commission for a certificate of convenience and necessity for the operation of a bus line between Maplewood and Kirkwood in St. Louis County, Mo. A 30-minute schedule would be maintained on the proposed route.

The De Luxe Bus Company now operates buses between Maplewood and Kirkwood. In recent weeks complaints have been made that the service offered by this company was neither satisfactory nor dependable. Formal charges against it were filed recently with the commission.

Financial and Corporate

$1,188,960 Net Income on Brooklyn City

Revenues from transportation on the Brooklyn City Railroad, Brooklyn, N. Y., were $11,428,812, a decrease of $31,772 compared with the year ended June 30, 1927. Other operating revenues decreased $7,496, the total operating revenues being $39,269 less than last year. These facts were disclosed in the annual report of the company for the year ended June 30, 1928. Operating expenses for the year decreased $4,630 despite the fact that the cost of operation of cars increased $109,677, this additional cost being almost entirely due to the 5 per cent wage increase effective April 15, 1927. A special provision of $45,500 from income credited to the reserve for legal expenses, caused the general and miscellaneous expenses to increase $43,852. During the previous year no provision for this purpose was made. Other items of operating expense decreased $158,160.

INCOME STATEMENT BROOKLYN CITY

	Fiscal Year Ending June 30, 1928	1927
Passenger revenue	$11,428,812	$11,460,569
Other car revenue	.....	15
Total transportation revenue	$11,428,812	$11,460,584

	$514,370	$563,066
Net income	$1,188,960	$1,120,587

The accident prevention bonus plan put into effect in August, 1926, whereby motormen and conductors receive cash awards for the operation of their cars without accidents, has substantially reduced the number of accidents. The past year showed a decrease of $241,291 in the actual cost of accidents compared with the previous year and the actual expenses were $203,993 less than the amount set aside for this purpose and charged to operating expenses. As of July 1, 1927, the tax levied by the state of New York on the gross earnings of the company was reduced from 1 per cent to ½ of 1 per cent which accounts for the saving in taxes.

Increase in Brooklyn Net Income

For the two-month period ended Aug. 31, 1928, total operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., were $8,032,408 against $7,813,429 for a similar period ended Aug. 31, 1927. Total operating expenses increased from $5,325,525 to $5,414,027 in 1928. After the consideration of income deductions the net income for the 1928 period was $869,496 against $775,929 for the two months ended Aug. 31, 1927.

Stone Mountain Line Discontinued

Following an order from the Georgia Public Service Commission service on the Stone Mountain interurban line between Atlanta and Decatur, Ga., has been discontinued and Decatur has been made the terminus of the line. Under the new schedule, cars leave at 5:27 in the morning from Decatur and run at hourly intervals to Stone Mountain until 11:27 in the evening, when the last car leaves. Passengers on inbound cars are given transfers over the two Decatur lines to Atlanta.

Canadian Control for British Columbia Company

Net profits of the British Columbia Electric Railway, Vancouver, B. C., for the fiscal year ended June 30 last after the payment of all charges, including bond interest, British income tax, etc., are understood to have been sufficient to pay a dividend of $2 a share on the 1,000,000 shares of Class A stock of the British Columbia Power Corporation, the newly formed Canadian company which secured control last spring.

The annual meeting of the company takes place in London during the second or third week of December. It is possible that at the meeting proposals will be brought forward to dissolve the British company. This will eliminate the heavy income tax payments of the British Columbia Electric to the British Government, thus enabling the company to make a larger return to British Columbia Power. It is not known what method will be adopted to dissolve the British Columbia Electric Railway, but the simplest would be the transfer of all assets and undertakings of the company to the British Columbia Power Corporation. This being done, the charter of the old company could be surrendered and the whole enterprise become Canadian.

Another Owner of St. Paul Southern

The much sold St. Paul Southern Electric Railway, Minneapolis, Minn., has changed hands again. Its latest buyer is B. W. & Leo Harris Company, a firm of that city which deals in construction machinery. The purchase was made from Paper, Calmenson & Company, St. Paul, who bought the road in August at receiver's sale in Hastings, Minn., southern terminus of the line. By order of the court the line is out of commission but its final disposition has not been announced.

Toronto System Does Well

Municipal system serving metropolitan district of Canadian city makes good showing. Modern methods contribute

RESULTS of operation by the Toronto Transportation Commission, Toronto, Ont., Canada, for the year ended Dec. 31, 1927, were satisfactory, according to D. W. Harvey, general manager of the commission. Revenue increased and operating expenses were still further decreased. In the sixth annual statement of the commission Mr. Harvey stated that in accomplishing the reduction in operating expense, an important factor was the extended use of one-man cars, which resulted not only in operating economies but in improved service. The class of transportation chiefly responsible for the increase in gross revenue was emphasized. General Manager Harvey explained that year by year it is becoming increasingly obvious that city transportation services

COMPARATIVE STATEMENT OF REVENUE ACCOUNT OF TORONTO TRANSPORTATION COMMISSION

Income:	1927	1926
Passenger earnings:		
Railway and bus transportation	$11,640,481	$11,362,690
Motor coach transportation	568,275	300,811
Income from sundry other sources	426,562	386,802
Gross income	$12,635,320	$12,050,304
Expenditure:		
Cost of electric current, including operation and maintenance of substation	$1,181,634s	$1,173,581
Expenses of operation, maintenance, repairs, administration and taxes, including accrued charges and operation of motor coaches	6,424,446	6,335,334
Total expenditure	$7,606,080	$7,508,915
Net income available for fixed charges	$5,029,239	$4,541,388
Fixed charges:		
Interest, less interest on idle funds	$2,180,458	$2,233,494
Reserves on capital account:		
Redemption of debenture debt	1,086,717	1,039,550
Reserve for replacements	1,323,708	998,911
Reserves on operating account:		
Reserve for unredeemed tickets	50,000	.....
Reserve for workmen's compensation and public liability	125,000	132,480
Reserve for contingencies	138,000	60,000
Reserve for doubtful debts	8,700	.....
Organization expenses	.....	.....
Total fixed charges and reserves	$4,912,583	$4,464,437
Net income carried to surplu	$116,655	$76,951

December	17,139,494	16,807,597

are no longer a local problem only; that if the commission had adopted the policy of providing transportation only for those citizens of Toronto who desire to be carried from one part of the city to another, the gross passenger revenue in 1927 would have been less than it was in the year 1923 instead of (as a matter of fact) exceeding the revenue of 1923 by approximately $565,000.

Motor Coach Development Exceeds Expectations

The development of motor coach transportation exceeded all expectations. In 1925 a revenue of $132,080 was obtained and in 1927 the gross revenue had increased to $568,275. All of this revenue is additional to the normal street railway revenue. The commission adopted the method followed by many of the larger railways operating buses and coaches and in June, 1927, created a company known as Gray Coach Lines, Ltd., with an authorized capital of $1,000,000. The commission then transferred to this company the existing investment in motor coaches. Use of the name "Gray Coach Lines," it is believed, has a distinct commercial value in advertising and publicity for this branch of transportation.

After providing for all operating expenses and depreciation on the coaches and other reserves the Gray Coach Lines returned 5 per cent interest on the investment as shown in the revenue account for 1927. The great expansion in motor coach transportation is seen in the commission's statement. Total operating expenses for 1927 were $7,606,080, an increase of $97,164 compared with the expenditures in 1926. An analysis of these figures shows, however, that this increase in operating expenses is due to the great expansion of motor coach transportation and that the expenditures for operating the street railway and buses of the commission were actually less than in 1926 by approximately $100,000.

Record of Revenue Passengers Satisfactory

The mileage operated by street cars and buses, but not including motor coaches aggregated 25,970,091 miles in 1927, an increase over the mileage in 1926 of 436,198. Extensions of track built in 1927 totalled 3.105 miles and the net addition to trackage was 0.799 miles.

The accompanying table sets forth the number of revenue passengers carried on the street railway and buses of the commission for each year since 1921, exclusive of the passengers carried in motor coaches. The number carried in 1927 was 187,757,023, a gain of 4,262,947 passengers compared with the previous year. The record of 189,143,145 revenue passengers established in the year 1923 still stands as the highest for the commission.

Suggest Names of Interborough Directors

At a meeting of voting trust certificate holders of the Interborough Rapid Transit Company, New York, for the purpose of nominating directors, nominations did not take place because of the lack of a quorum. It was recommended, however, that Frank Hedley, president and general manager, and H. M. Fisher, secretary and treasurer, whose terms expire this year, be re-elected.

A second meeting of the Interborough took place, at which bondholders were to nominate a director. This meeting also lacked a quorum. Bondholders present, however, suggested re-election of Frederick H. Ecker. Other directors whose terms expire this year are Abel E. Blackmar, one of the public directors, and Bertram Cutler, representing the Manhattan Railway.

Traffic Increase in Edinburgh

The total revenue for the year ended May 15, 1928, on the combined electric and bus systems of the city of Edinburgh, Scotland, Transport Department, was £880,788, compared with £874,055 for the year previous. Passengers carried numbered 152,077,901 compared with 143,836,772 for the year ended May 15, 1927. The number of railway passengers carried for the year increased 4,380,002. These facts were disclosed in the report and analysis of income and expenditure for the year.

R. Stuart Pilcher, Transport Manager, states that the success of the transport industry should not be judged by the amount of available balance or the total receipts earned, but rather by the number of passengers carried and the charges made for travel. Despite the fact that during the past year the department carried more than 8,000,000 additional passengers, the operating costs per car mile was reduced over the similar cost that was recorded for the previous year.

The net surplus on the year's working was £4,027. This being a disposable balance the committee resolved that this be appropriated as a special contribution toward the liquidation of debt. The surplus on the bus operation was £4,576.

Improvements during the year included an order placed Oct. 27 for 23 buses, the change in a number of cars to upholstered seats on the upper deck and the treatment of 2¾ miles of track with the "in situ" process.

Hearing Closed on Plan to Take Philadelphia Underliers

The underlying companies of the Philadelphia Rapid Transit Company fixed the value of their holdings at $151,000,000 at a hearing before the Public Service Commission on Sept. 5, and the city's petition for appraisal was taken under advisement.

The Mackey Administration has accepted the $136,000,000 valuation of the underliers fixed by Charles C. McChord, utilities expert, as a basis for its program of acquisition, and doubt was expressed that the city would proceed to condemn if the commission in its appraisal upholds the increase of $15,000,000 in the contemplated purchase price.

The city plans to take over the underliers' holdings and substitute itself as franchise lessor to the P. R. T., which pays those companies more than $8,000,000 annually in rentals. Under the McChord plan, it was estimated that the city, by elimination of tax payments and other charges, could save $4,500,000 a year by such an arrangement.

Counsel for the underliers argued that the theory that the underliers had no tangible property and only franchise rights was illusory. It was pointed out that the Philadelphia and the Union Traction Companies have provisions in their leases to the P. R. T. whereby, in the event of default of rentals, the underliers can take possession of the lines leased to the P. R. T.

Mayor Mackey said after the hearing that the appraisal decision and the agreement between city and company on that figure, or a compromise amount, would have to be concluded in time to have the proposal placed before the voters at referendum in November. He is quoted as follows:

> Otherwise the administration will abandon the entire project. There will be no appeal from the commission's valuation on the part of the city. If the figure is feasible, economical and acceptable to both parties we shall proceed. If the underliers balk at the appraisal rendered and take an appeal from the commission's decision to a higher tribunal, then we shall withdraw.

As a first move on the part of the leased lines to block condemning and purchasing the underliers of Philadelphia Rapid Transit Company suit was filed on Sept. 10 by the Thirteenth and Fifteenth Streets Passenger Railway, which alleges the city is without legal power to condemn the underliers. It is the first action of the kind. A permanent injunction to restrain the city from condemning and purchasing the company's property is sought in the suit filed in Court of Common Pleas No. 4.

Revenue Passengers on Decline in St. Louis

The St. Louis Public Service Company, St. Louis, Mo., carried 1,147,923 fewer revenue passengers in July than during the similar month in 1927, but gained $10,896 in revenue, due to the increase in fare from two tokens for 15 cents to 8 cents straight for adults. In

Digitized by Google

July the railway system transported 19,362,810 revenue passengers, compared with 20,499,824 in July, 1927. Revenues for July were $1,507,364 compared with $1,496,467 in July last year. During the month the number of car-miles was reduced 75,483, the system operating 3,451,361 car-miles against 3,526,844 miles in July, 1927.

Railway Net Earnings Consistent in Salt Lake City

The electric power, light and gas properties of the Utah Light & Traction Company are leased to the Utah Power & Light Company for 99 years from Jan. 1, 1915. The Utah Light & Traction Company operates its street railway property. The company's service thoroughly covers Salt Lake City and extends into all the important suburbs and suburban towns. The statement of earnings of the company contained in the annual report of the Electric Power & Light Corporation is given in the table above.

COMPARATIVE STATEMENT OF EARNINGS OF UTAH LIGHT & TRACTION COMPANY FOR YEARS ENDED DEC. 31

	1927	1926	1925	1924
Gross earnings from operation of railway department	$1,865,661	$1,871,689	$1,841,060	$1,852,762
Operating expenses, including taxes, of railway department	1,459,356	1,483,450	1,447,310	1,479,155
Net earnings from operation of railway department	$406,305	$388,239	$393,750	$373,607
Other income (including rentals from lease of electric and gas properties)	595,782	585,191	560,080	536,755
Total income	$1,002,087	$973,430	$953,830	$910,362
Interest on bonds	841,765	841,765	841,765	841,765
Other interest and deductions	175,838	147,170	123,261	82,757
Balance	*$15,516	*$15,505	*$11,196	*$14,160

*Deficit

The estimated population served by the Utah Light & Traction Company at Dec. 31, 1927, and certain traffic data for the twelve months ended on that date, compared with the two previous years, follow:

	1927	1926	1925
Population served	156,000	155,000	153,000
Passengers carried during twelve months	30,613,897	32,191,522	34,750,262
Car-miles	16,016,105	5,959,358	5,887,653
Car-hours	586,915	590,491	605,562
Average number of cars operated	81	81	83
Miles of street railway (single track equivalent)	*121	*135	146

*Decrease due to abandonment of certain track in suburban districts in Davis County and Salt Lake County.

Traffic Increase in Brazil

The tramway department of the Brazilian Traction, Light & Power Company carried 584,055,133 passengers in 1927, compared with 552,078,727 in 1926, and 526,240,551 in 1925. The car-miles (tramways) run totaled 51,249,269 in 1927, compared to 48,968,857 in 1926. In spite of a continuance of depressed industrial conditions, throughout the greater part of the year there were substantial increases in all departments of the business, with consequent increased receipts in Brazilian currency. These facts were brought out in the annual report of the board of directors for the year ended Dec. 31, 1927.

During the year, 1927, the sum of $11,955,309 was expended by the company in meeting the current capital requirements of its subsidiary companies. Of this amount, $2,975,046 was used for transportation purposes. In both São Paulo and Rio de Janeiro, proposals include the construction of rapid transit lines partly underground and partly on private right-of-way, the extension of the service to new districts, double-tracking of single-track lines, additions to rolling stock, substitution of closed for the present open type of passenger cars, and other improvements on the tramway and bus systems. All these are dependent upon receiving substantial increases in fares and various modifications in the concessions.

During the year, 16.37 miles of track were constructed and approximately 44 miles of track were reconstructed. Additions to the rolling stock comprised 43 cars of the closed type.

The number of competing buses increased during the year, but many of these have since been withdrawn from traffic, the number now in operation being approximately 130. In São Paulo the company acquired ten buses from the competing concern, but otherwise no additions have been made to its fleet. The future of this service is mainly dependent upon the decision to be taken by the Municipal authorities on the company's proposals dealing with the traffic problems.

Merger of Ohio Companies Planned Under Allied Power

Announcement was made on Sept. 17 of a plan to merge the Penn-Ohio Securities Corporation and the Northern Ohio Power Company with the Penn-Ohio Edison Company, controlled by the Allied Power & Light Corporation, as a measure to simplify the corporate structure of this public utility group. An offering of rights to stockholders of Penn-Ohio Edison to purchase new stock to the extent of 10 per cent of their holdings is an important part of this proposal.

At the present time Penn-Ohio Edison is controlled by Penn-Ohio Securities, and in turn the Edison company controls the Northern Ohio Power Company. By completely merging the three properties the capital structure of the system will be greatly simplified and the management co-ordinated.

The news of the merger is contained in a joint letter to stockholders of all three companies, signed by R. P. Stevens, as president of Penn-Ohio Edison and Penn-Ohio Securities, and by B. C. Cobb, as president of the Northern Ohio Power Company.

The outstanding 7 per cent bonds of the latter company in the amount of $3,283,100 will be retired, removing all funded debt except that pertaining directly to the Penn-Ohio Edison Company.

Personal Items

L. Wainman in Porto Rico

Lon Wainman has been promoted to the position of superintendent of distribution of the Ponce Electric Company, Ponce, Porto Rico, from that of assistant superintendent of distribution of the El Paso Electric Company, El Paso, Texas. He had advanced through various positions with the latter concern from Aug. 11, 1921, when he was first employed in the distribution department. At one time he was connected with the Texas Power & Light Company, the San Joaquin Light & Power Company and the Department of Public Service, Los Angeles, being connected with the bureau of power and light on substation work.

Named on New Jersey Commission

Governor Moore has named William F. Hoffman, of East Orange, and John Mantell, of Jersey City, to the North Jersey Transit Commission. They succeed James O. Bettelle, of Newark, and Daniel A. Garber, of Ridgewood, resigned. The term of office is for three years.

Sixty Years With Louisville Railway

Col. Jacob Fishback, one of the pioneers in the Louisville Railway organization was sketched recently in one of a series of interesting interviews with prominent men, as run in the Louisville *Times*. Colonel Fishback, in this interview, tells of the early days when there were three railways in Louisville, and a fight for supremacy in which many miles of duplicate track was laid, a condition from which the present company is suffering. The management has discontinued some of the parallel lines the past few years in trying to reduce operating expenses. Among other things the *Times* said:

Colonel Fishback has worked for the Louisville Railway nearly 60 years. In

Digitized by Google

point of service he is its oldest employee. He takes a month's vacation every year and travels as far as possible. He has covered the United States from Boston to San Francisco, the Canadian line to New Orleans, and his observations have led him to the conclusion that the entire country progresses in pretty much the same way. He has seen businesses which commenced modestly in one-room establishments grow to successful and tremendous landmarks and says the same thing is true of the railway.

Through many years of effort from motorman, assistant night foreman at one of the carhouses to foreman, and finally to assistant superintendent of the entire Louisville Railway, Colonel Fishback's record shows diligence and effort.

N. W. Bolen Will Wear Gold Service Button

Newton W. Bolen, executive assistant, Public Service Corporation of New Jersey, has completed 25 years of service with that organization. He started on railway work in 1883 with the Brooklyn City Railway as a hillboy at the Broadway Ferry, towing cars up the hill with horses. Mr. Bolen became inspector foreman of carhouses and later western division superintendent for that company. On Aug. 1, 1903, he went to New Jersey and was appointed superintendent of Hudson and Passaic divisions for Public Service. About three years after that he was made superintendent of transportation and in 1911 general superintendent of transportation. On Nov. 1, 1923, he became executive assistant in Hudson and later of the Bergen divisions.

W. S. Penfield has been appointed superintendent of the motor bus division of the Key System Transit Company, Oakland, Cal. This new post was made necessary by the recent organization of a separate bus department to handle the increase in that branch of the company's service.

C. N. Posegate, former railroad engineer of the Illinois Commerce Commission, has been appointed chief engineer. He succeeds C. G. Bennett, resigned.

Henry Cordell, master mechanic of the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., has been elected chairman of the Transportation Section of the Wisconsin Utilities Association.

Obituary

Hartford T. Brobeck, superintendent of the transbay division of the Key System Transit Company, Oakland, Cal., died recently. He entered the employ of the company as a motorman in 1902 and advanced through various positions being appointed superintendent of the transbay division in 1924. Mr. Brobeck was born in Rochester, Pa., 54 years ago. He was a brother of the late W. I. Brobeck, San Francisco attorney and formerly chief-counselor for the railway.

Manufactures and the Markets

Timken Steel & Tube Company Formed

Announcement has just been made by the Timken Roller Bearing Company, Canton, Ohio, of the incorporation of a new company, known as the Timken Steel & Tube Company, which will take over the manufacture and selling of Timken steel and tubing. The headquarters and mills are in Canton, Ohio, with sales offices in Chicago, Los Angeles, Detroit and New York. The officers are: H. H. Timken, chairman; M. T. Lothrop, president; J. W. Spray, vice-president; A. J. Sanford, vice-president in charge of sales; J. E. Daily, vice-president in charge of operations, and J. F. Strough, secretary and treasurer.

Ellcon Company to Handle Peacock Brakes

Under an arrangement which becomes effective immediately the Ellcon Company of New York City will be general sales representative for Peacock Staffless Brakes in the United States, Canada and foreign countries. Announcement to this effect has been made by Frank D. Miller, president of the National Brake Company of Buffalo, N. Y., manufacturer of the Peacock brakes. The addition of this device extends the field of activity of the Ellcon Company which since its organization in 1910 has specialized in passenger car equipment devices. The Peacock brake, although widely used on passenger cars, is used also on freight equipment. William Wampler, president of the Ellcon Company will devote particular attention to this phase of the company's activity.

Coated Abrasive Products Simplification in Effect

Following the approval of a tentative simplified practice recommendation for coated abrasive products, by a general conference of all interested elements of the industry, the Division of Simplified Practice of the Bureau of Standards, U. S. Department of Commerce, circularized the producers, distributors and users of the commodity for signed acceptances to the recommendation.

The Division of Simplified Practice has just announced that this project is now in effect, as of Sept. 1, 1928, since a sufficient number of signed acceptances, representing at least 80 per cent by annual production, have been received from the industry. At the time the project was considered by the general conference, it was stipulated that industry would have until Jan. 1, 1929, to get rid of stock manufactured previous to the promulgation of the simplification, which is known as simplified practice recommendation No. 89, coated abrasive products.

Manufacturing Production Higher

Manufacturing production in July, after allowances for the usual seasonal variations, was greater than in either the preceding month or July, 1927. The output of minerals likewise recorded advances over both comparative periods. Pig-iron production, though showing a decline from June, making no allowance for differences in working time or seasonal conditions, was greater than a year ago. The output of steel ingots was also lower than in June but larger than in July of last year. Automobile production showed a slight decline from the preceding month but was considerably larger than in July a year ago.

The output of crude petroleum showed a decline from last year. Bituminous-coal production was larger than in either the previous month or July a year ago. Copper production showed gains over both periods. The production of cement showed practically no change from either the preceding month or the corresponding month of 1927.

Sixteen Buses for Louisville

Kentucky Carriers, Inc., a subsidiary of the Louisville Railway Company, Louisville, Ky., has just purchased sixteen new 21-passenger buses, fourteen of which are Studebakers, the other two being Macks. These buses have been purchased in connection with the plan under which buses will be used for local stops on Broadway, the electric cars operating under an express service, and only making stops at the crosstown intersecting lines, other than in the congested downtown district. This service is to be started on Sunday, Sept. 23.

Westinghouse Sales Up

Sales of Westinghouse Electric Manufacturing Company, Pittsburgh, Pa., are greater than a year ago and reports from all branches indicate continued improvement in volume during the remainder of the year. The company has spent $40,000,000 on plant improvement in past six years. This expansion will make it unnecessary to make additional plant investments for some time. Greater efficiency is making it possible to secure a larger output from production units.

Action!

YESTERDAY the 47th convention of the American Electric Railway Association came to a close. Today it has become history. We can therefore for the first time look back upon this memorable week in Cleveland and see in bold relief some of the high spots that stand out from a busy routine of meetings, conferences, discussions and inspections of new ideas in equipment.

The general program was built around three central topics, and a day was devoted to each. First was the subject of economics. Then came modernization, and finally a serious attempt to get an outside viewpoint of the industry. This covers a wide range of thought. When to the American Association program are added those of the four affiliated associations, the many topics at the luncheon conferences and the varied ideas suggested by inspection and discussion of equipment developments, one gets some conception of the varied angles from which the industry's problems were approached.

Regardless of the starting point, however, all currents of thought seemed to lead to one central idea. As the sessions progressed on the first day it seemed a strange coincidence that there should be this general agreement of thought. On the second day the apparently inevitable trend toward a common conclusion became more striking. This continued and persisted as speaker after speaker expressed his views until at the final fall of the gavel there no longer could be the slightest doubt but that the road to the solution of the present local transportation situation had been exhaustively surveyed and definitely charted.

There was almost universal agreement that the road to recovery and increased usefulness for the local transportation industry is that of service improvement. The slack in public transportation development resulting from the strangling effects of restrictive public control in the face of greatly increased costs must be taken up to avoid collapse of this essential community service under the pressure of increasing competition from the private vehicle. Definite evidence of the possibilities for making common carrier transportation attractive to the public must be provided before a full measure of public co-operation and patronage can be expected.

Testimony was given by those who have tried them of the operating economies, increased revenue, improved public attitude and strengthened employee morale to be obtained through the replacement of obsolete cars with modern equipment of types now available. There seemed to be general agreement that it is a hopeless struggle to continue fighting 1928 automobile competition with cars that have become antiquated through several decades of hard service. There was indorsement likewise of the advisability of utilizing equipment of types now available instead of holding up improvement programs to await the outcome of the several promising design experiments now under way.

All of this interest in cars did not detract from the realization of the importance of the many other factors that enter into improved service: smooth track, reliable power, loyal and well-drilled employees. There was no diversion of attention from the improvements being made in buses, or of interest in the progress being made in finding their proper place in the general scheme of transportation. If anything, interest in these many other phases of service improvement was augmented rather than decreased by the quickening of the pulse of transportation men who finally begin to see light ahead for their properties.

But there was something more in this convention. There was agreement beyond passive indorsement of the route to be followed toward recovery for the industry. There was general insistance on the need for immediate movement. There was a common warning of the dangers of delay. There was a call to action. This was repeated again and again by speaker after speaker, until it echoed and re-echoed through the ranks of delegates with an effect not unlike the bugle's strident notes piercing the quiet of morning's early hours to arouse an army ready for a general advance.

Action! Enough of waiting; let's go! Enough of discussion! Enough of debating the future! Success lies ahead if we will but follow the route established by those pioneers who have shown the way. There was no mistaking this call to the local transportation industry that comes from the 47th convention. There was no mistaking, likewise, the warning that unless the past five years of thought and study are now translated quickly into definite progress there is danger that there will be little left to save.

CONTINUING MEMBERS OF THE A.E.R.A. EXECUTIVE COMMITTEE

47th Convention Most Successful

Addresses, discussions and work of committees show change of thought from wishing to doing. American sessions replete with excellent addresses

ONCE more the American Electric Railway Association has held a notable convention at Cleveland —the third in succession—and has shown the material progress as well as the growth of faith and confidence in the ability to perform. Last year the plan of eliminating the committee reports from the American Association program was carried out successfully. This year the same plan was adopted, but in addition the session of the executive committee held last Saturday, at which these reports were presented, was made open to the delegates, so that they were able to review the work of the committees if they so desired.

The plan of opening the exhibits Saturday was continued, but they were all in place and the doors were thrown open at 9 a.m. instead of at noon. This materially increased the opportunity for inspection by those particularly interested in the developments of the year.

The formal opening of the convention took place Monday morning. Since the north wing of the Auditorium has been completed, it was possible to hold the meetings in a new ballroom on the third floor, doing away with the confusion and delay of past years, when opening exercises were held previous to the Monday morning session.

President R. P. Stevens, in opening the convention, called on City Manager W. R. Hopkins, who for the third time welcomed the delegates to Cleveland. Mr. Hopkins brought out that we are now living in the age of research, and up to the present time we have only touched the possibilities. This convention was particularly welcome, he said, not only because it represented an industry that gives great service to the public, but it was one that gives great promise of advancement. He expressed a hope that the convention would do much to strengthen the confidence of the public in transportation.

Mr. Stevens, in his presidential address, brought out the point that under the banner of public service we have carried on for many years, even though the industry has had to change greatly the conception of the nature of its business.

During the morning session the delegates listened to three other significant addresses. Henry I. Harriman, chairman of the Metropolitan Planning Board of Boston, spoke on the economics of and the need for public participation in city transportation.

Lewis E. Gettle, chairman of the Railroad Commission of Wisconsin, spoke on the regulation of transportation and its aims and trend. He went into great detail in

expounding the principles of regulation which apply to public transportation companies.

The final address of the morning was on the problems of urban transportation rates, by Judge William M. Wherry, Jr., of Wherry & Wight, New York City. Mr. Wherry pointed out that for some time the public transportation industry has been in something like the position of one of the famous characters in "Alice in Wonderland." It has had to run hard to stay where it is. There is no agreement, no contract, he believes, that is fixed for all time. With the great changes in conditions and in money value it is necessary to make adjustments.

Modernization the Theme

Wednesday morning the American Association listened to a group of exceedingly significant papers. The general trend, modernization, was carried through the addresses of all the speakers.

Managing Director Lucius S. Storrs reviewed in his annual report the progress that has been made in the past five years and the change in sentiment the industry has undergone in that time. The briefs submitted in the Coffin Award competition, he said, give concrete evidence that the neutral attitude of electric railway executives which was evident at that time has completely changed. From a digest of the presentations it is apparent that the excellent results are obtained from a careful study of all elements of the problem. No one panacea stands out pre-eminently. Without exception the companies have carried to a conclusion merely those things that all have emphasized.

As a result, continued Mr. Storrs, these efforts have included the entire range of the activities of the industry. First, favorable public opinion has been obtained; second, cordial relations exist between employees and the corporation; third, constantly improving income statements are resulting. Fundamental customs and methods have been completely revolutionized. Track conditions have been improved and considerable mileage of unprofitable rail-car operations has been supplanted by bus services. Old types of rolling stock have been replaced either with new cars or by renovating the better class of existing cars. Service betterments have been made possible and operations conducted at noticeably lower costs. Balance sheet improvements have been made that have resulted in obtaining the necessary new money at more attractive rates.

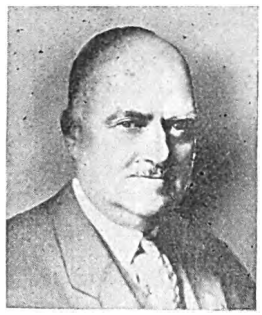
There are still plans that have not received broad acceptance which are bringing satisfying results where operated, said the speaker. The value of an interchange of experience between companies in connection with technical methods is startlingly portrayed in that group of companies whose equipment officials exchange monthly figures and meet frequently for free discussion of their problems. This method of exchanging ideas has brought about economies that are running at an annual figure of about $500,000. At the same time the number of miles operated by each car without necessity of removal from service is so startling as to be almost unbelievable. There is no question but that a similar effort at getting combined experiences for serious adoption on individual properties should be directed to other branches.

The one place where most saving can doubtless be effected, in the opinion of Mr. Storrs, is the transportation department. The failure to increase the average speed of cars is one of the major factors in preventing an increase in business. With higher speed as the goal several properties have made outstanding records even in these days of congested traffic arteries, reaching schedule speeds of more than 11 m.p.h. When one realizes that the average speed in most cities is as low as 9 m.p.h. the incentive for improvement must be apparent, both from the standpoint of economy in lessened car-hour requirements to fill schedules, but even of greater importance, in the increased use of the service. Mr. Storrs concluded:

> It seems to me that we have all been fact-finders, a function of the engineer, until now most if not all the essential facts have been quite clearly defined. Is it not, therefore, time for us to undertake the final constructive task that will lead to the complete solvency and stability of our vitally essential utility? Let us all return to our appointed tasks determined that 1929 shall see us rolling up a still greater record of accomplishment.

Frank R. Coates read the report of the committee on nominations and the convention proceeded to the election of officers.

James P. Barnes, president Louisville Railway, was elected president of the American Electric Railway Association for the coming year. Other officers elected



N. D. Cochran

E. H. Sniffin

were Paul Shoup, San Francisco, first vice-president; J. H. Hanna, Washington, D. C., second vice-president; C. E. Morgan, Brooklyn, New York, third vice-president; G. A. Richardson, Chicago, Ill., fourth vice-president, and Barron Collier, New York, treasurer. J. W. Welsh, New York, was appointed general secretary. R. P. Stevens of New York, the retiring president, becomes junior past-president, vice W. H. Sawyer of New York.

Executive Committee: Operating members, three-year term: H. B. Potter, vice-president United Railways & Electric Company, Baltimore, Md.; W. A. Draper, president Cincinnati Street Railway, Cincinnati, Ohio.

Manufacturer members, three-year term: Carroll Burton, president Lorain Steel Company, Johnstown, Pa.; E. D. Kilburn, vice-president Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; Wm. M. Wampler, president Ellcon Company, New York, N. Y.

In the absence of H. G. Bradlee, his address was read by George H. Clifford, the subject being, "What Are the Financial Results, Achievements and Future Needs of Modernization?" Following this Alonzo R. Williams spoke on the justification of modernization and its financial results so that the addition of capital can be secured for this purpose. Mr. Williams pointed out forcefully that railway men must do aggressive work in modernizing if they are to keep up with the times. W. T. Rossell considered the opportunities of modernization and economies to be effected by mass production. He showed how tracks can be built, overhead line reconstructed and vehicles repaired with the assistance of quantity methods.

Applying modern merchandising and sales methods to

Digitized by Google

transportation was the subject of a paper by Charles Gordon. He laid stress on the necessity for modernizing our conception of the nature of our business, but he indicated that no merchandising or advertising can succeed unless the product justifies it. It is futile, he said, to expect that the growth of congestion will serve as a means of driving the public back to the street cars. It is necessary for the railways to provide service of a character the people will be glad to use.

C. F. Kettering spoke on the subject of prosperity and the automotive industry. The term "Modernization," he held, is just a way of saying that changes have not been made in keeping with the normal growth of the demands on the industry. The speaker cited the present status of the automobile industry as illustrative of the value of research in modern business methods, and stated that the purpose of research was to provide ideas a few years in advance of demand for them by the public.

What Others Think of the Industry

The viewpoint of others on the electric railway industry was the general subject of the closing session of the American Association program. The addresses at this session, however, also included the views of a number of men prominently identified with the industry.

Speaking as the head of the editorial activities of the Scripps-Howard newspapers, N. D. Cochran, editor-in-chief *Scripps-Howard News,* outlined the viewpoint of this group of newspapers relative to the general problem of transportation. He dealt particularly with the relations between municipal political governments and public utilities and pointed out that the newspaper, in the interest of the public it serves, attempts to get all the interests to co-operate. He said, in part:

> I believe that any municipality's transportation problem can be solved with justice to all concerned if they go about it in the right way. But some of the old methods will have to be abandoned. Instead of dealing with the public through lawyers, politicians, lobbyists and so-called publicity experts, the transportation system should use practical operating officials in trying to adjust public relations; and their best weapons are candor, fairness, honesty and open-and-above-board dealing. I know this is the best way to approach the average newspaper, and feel just as confident that it is the best way to approach the public. Knowing that transportation experts are human beings like all the rest of us, I think they would prefer to tackle the job in that manner.

Another approach to the general problem of improving transportation service and putting the industry on a sound business basis was made by E. H. Sniffin, assistant to the vice-president, Westinghouse Electric & Manufacturing Company. Mr. Sniffin held that it rests with the street railways of the country to manage the transportation business of their communities. Their money was invested for that purpose, and it is to the interest of all the people and of all business, that this capital be conserved.

The street railways must not remain fixed and isolated from the universal character which city and interurban transportation has acquired, but must embrace it and make it their own. The present competition and duplication and general inefficiency of this service in our cities is a heavier burden on the public than it realizes. In New York City there are something over 20,000 taxicabs, two-thirds of them individually owned and operated. The individual who owns and operates his own cab works twelve to fifteen hours to eke out a bare living.

Mr. Sniffen believes the present seems like a very auspicious time for the railways to take the leadership on this question. The traffic congestion of our streets makes it imperative that a far reaching plan be laid down that will embody something different from the present haphazard and unrelated methods of moving people about. This condition is common to all our cities. The average citizen wonders, as he sees it becoming worse, how much longer we can tolerate it, and is today receptive to a plan of relief. That solution, in his opinion, must come from electric railway experts whose business it is to work it out.

When the railway man is fully prepared to go before his community with a definite plan that will afford adequate service, showing what he can do, and making it plain what the community must do, he probably would have quite a little to tear up before he had a property whose quality and character fitted the modern necessities. When his company is no longer the one that runs some street cars and maybe some buses, but is the transportation company of the town or district, one should expect to see the talent and skill of his organization, no longer shackled and depressed as it now is by its present anomalous condition, rise to its great opportunities.

Other speakers during this Thursday session included E. F. Wickwire, vice-president Ohio Brass Company; P. S. Arkwright, president National Electric Light Association and president Georgia Power Company, who heads the large street railway properties in Atlanta and vicinity. Mr. Wickwire, speaking as the chairman of the committee on co-operation of manufacturers, expressed his views on "some phases of the electric railway situation from the manufacturers' viewpoint." Mr. Arkwright talked on the opportunities for improving the quality of local transportation service. Both of these addresses are abstracted elsewhere in this issue.

The high spots of the association's functions and service to the industry, from a national aspect, were outlined by W. H. Sawyer, past-president and president of Stevens & Wood, Inc., New York City. Mr. Sawyer's address is likewise abstracted elsewhere in this issue.

The Chicago, North Shore & Milwaukee Railroad was designated as the winner of the *Electric Traction* speed contest by G. A. Richardson, vice-president in charge of operation Chicago Surface Lines, who presented the committee's report. In accepting the award for his property, J. R. Blackhall, general manager, expressed his appreciation of the honor conferred and of the effort to stimulate higher operating speed. He said that the public has in recent years been brought to a new conception of speed and that electric railways, if they would grow in public favor, must improve their performance in this as in every other respect. Mr. Blackhall emphasized the part which the employees of his company had played in improving the performance of the property and pointed out that the effort to increase speed on the North Shore property had by no means been made at the sacrifice of safety. On the contrary, he said, the effort to operate faster had been an inspiration to greater caution, with a result that the accident record during the past two years has been markedly superior to that of previous years.

President-Elect Barnes Installed

New officers of the association for the ensuing year were invited to the platform by President Stevens, who in turning over the gavel to President-Elect J. P. Barnes. acknowledged the work that had been done by the several committees of the association and particularly by the group of committees which had handled this 47th convention.

Themes of Convention Luncheons Momentous

Importance of employee contact in public relations stressed. Merchandising methods discussed—Car financing, traffic, education and safety among other important topics

UP-TO-THE-MINUTE discussions of important subjects made the Round Table Luncheon Conferences a vital part of the A.E.R.A. Convention. Among the outstanding developments in these conferences was that derived from the discussion of employee contact in public relations. Offer the best service you can provide, secure the confidence and the support of every employee and you are certain to develop a friendly public. This was the general feeling expressed by delegates who attended the public relations luncheon, sponsored by W. E. Wood, president Virginia Electric & Power Company.

An unusual contribution was a talk by Mr. Payne, a motorman of the East St. Louis & Suburban Railway, who was called on to give the views of the platform men in public relations work. By request Mr. Wood told of his company's experiences and gave two important points to be remembered in public relations, "first, don't brag about your service unless you have service to brag about; second, get the confidence of your employees."

Closely supporting the developments of the public relations luncheon were the thoughts expressed at the luncheon conference on education, sponsored by Edward Dana. Several speakers obtained best results by getting the men acquainted with problems outside their daily work, but a discussion of operation problems as encountered is most essential. For trainmen the handling of passengers quickly, the use of courtesy and caution and familiarity with equipment are necessary.

Barron G. Collier, original sponsor of the merchandising luncheon, was not present at the convention, but his place was ably filled by W. H. Boyce, commercial manager Pittsburgh Railways. E. B. Sanders, manager commercial department Kansas City Public Service Company, the first speaker, outlined at length the extensive advertising program carried on for the past two years.

J. L. Alexander, general manager Houston E'ectric Company, took charge of the new cars luncheon. It was quite apparent from the experiences related that the public wanted comfort and speed and that if they could not get it from the street railway they would supply their own transportation.

Executive heads of the several principal car builders, together with electrical and air brake manufacturers, participated in the luncheon conference on car financing. Charles Gordon, editor ELECTRIC RAILWAY JOURNAL, acted as sponsor. Discussion by the manufacturers indicated that favorable terms of financing are now available.

G. H. Clifford outlined the experience of the Stone & Webster properties which have installed new equipment during the past two years to replace heavy rolling stock. The effect of the new cars upon riding and upon gross receipts has also covered the carrying charge in some cases. Mr. Clifford said that the installation of this new equipment has helped to convince the public that electric railways are not decadent.

The consensus of opinion at the luncheon devoted to management appeared to be that the time had arrived when more railway properties should undertake the purchase of one or more of the newest cars in order to make of their properties a laboratory for experimenting. The experience of the Brooklyn City Railroad in setting aside in its budget a predetermined amount for research work in co-operation with car manufacturers, was related by C. E. Morgan.

J. P. Barnes, president Louisville Railway, declared that he had been impressed all through the convention with the fact that all discussions seemed to get back to the car problem. If any one department of the electric railway industry has fallen down it has been on vehicles.

General agreement as to how street traffic can be regulated most effectively was evident among the delegates attending the luncheon conference on traffic. Opinion appeared to be unanimous that the progressive type signal is most advantageous, although the reversed synchronous sometimes may be satisfactory.

What is greatly needed now is to convince the public and the municipal authorities of the necessity for adopting traffic regulations and installing efficient control signals. G. A. Richardson explained how this had been done in Chicago.

Discussion at the bus luncheon conference, sponsored by A. M. Hill, developed in lively fashion. Several speakers raised the question of the need for a ticket clearing house, not only in the interest of the operating systems themselves, but for the benefit of their passengers.

Street Railway Commissioner C. M. Ballou of Cleveland said that the original idea was to keep rail and bus lines in Cleveland separate, but that was impossible and unfair. Mr. Sawyer agreed with Mr. Ballou that it was not fair to say that a bus line was a failure where it had replaced a street car line that did not pay.

The fares luncheon was sponsored by W. W. Holden, general superintendent San Antonio Public Service Company. The topics selected were the weekly pass, the nickel pass and zone fares. They were introduced respectively by A. C. Spurr, vice-president and general manager Wheeling Traction Company, W. H. Burke and G. H. Clifford, both of Stone & Webster, Inc. Professor A. S. Richey summed up the discussion by giving a dissertation on the economics of fares.

That electric railway operation in the smaller cities and towns presents problems altogether different from those encountered in the large cities was clearly brought out at the "Small Town" luncheon conference under

the sponsorship of A. C. Spurr, general manager Wheeling Traction Company. How one small property was revived and made profitable was told by H. E. Wayman, general manager Levis Tramways, Levis, Quebec.

Active discussion was called for by the topics presented at the luncheon conference on manufacturers, at which E. T. Wickwire was the sponsor.

J. P. Barnes, president Louisville Railway, presided at the safety luncheon, at which C. S. Springer of the National Safety Council briefly outlined the program that had been prepared for the annual convention of the council which is to be held next month in New York City. He was followed by Colonel W. V. Bingham, personnel director of the National Research Federation, who related experiences which had developed from a recent study of accident records in Boston and elsewhere.

Considerable interest was evoked at the taxation luncheon conference on the subject of the gross-net tax. After G. G. Brownell explained in considerable detail the provisions of the revenue act of 1928, Chairman W. A. Jackson called on F. W. Doolittle for a discussion of the gross-net tax, particularly as to the bill which was introduced in the Wisconsin Legislature, but which was not enacted. Leslie Vickers spoke briefly on attempts to enact a somewhat similar law in California.

The situation of the interurban lines is desperate, but by no means hopeless in the opinion of a number of representative interurban operators at the interurban luncheon. D. W. Snyder, Jr., vice-president Illinois Traction System, presided. A. W. Brady, receiver Union Traction Company of Indiana, spoke briefly on the efforts his company had made to retain its passenger business and build up its freight. C. H. Jones, general manager Chicago, South Shore & South Bend Railroad, told of the success that had attended the modernization methods that his company had put into effect.

James P. Griffin, vice-president Texas Electric Railway, has modernized the service on his line but this has not stopped the decline of passenger business. Recently an intensive drive for freight has met with considerable success. J. R. Blackhall, general manager Chicago, North Shore & Milwaukee Railroad, stated that on his property modernization of passenger equipment had reduced operating expenses and pulled the road out of the "red."

Pick-up and delivery was the principal topic at the freight luncheon, presided over by L. M. Brown, vice-president Interstate Public Service Company, Indianapolis. He called on H. A. Nicholl first, general manager Union Traction Company of Indiana, who explained how the competition of motor trucks had cut deeply into the business. M. B. Lord, vice-president and general manager York Utilities, Sanford, Me., described a successful store-door delivery system in effect on that property. James P. Griffin, vice-president Texas Electric Railway, told of the pick-up and delivery service on his property which had resulted in a substantial increase in revenue.

Virginia Electric & Power Company

Wins Coffin Award

1928 prize goes to Stone & Webster property in old Virginia, at Advisory Council meeting. B. C. Cobb, chairman, reviews industry's situation. Owen D. Young stresses economic and social importance of solving the local transportation tangle

PERHAPS the most coveted honor in the electric railway industry, the Charles A. Coffin Award, was presented for the year 1928 to the Virginia Electric & Power Company, in recognition of its accomplishments toward improving local transportation for the convenience and well-being of the public and for the benefit of the industry. The award was presented by President R. P. Stevens at the Advisory Council meeting at the Cleveland convention on Tuesday night. W. E. Wood, president of the winning property received and acknowledged the award in the name of his company and employees.

B. C. Cobb

In its report, the Coffin Award Committee epitomized the accomplishments of the winning road. Through demonstrated efficiency and confidence won by fair dealing, this property converted a former bitter public in several closely associated communities to an attitude of friendly co-operation. As a result, extended and complicated franchise controversies that had existed for a number of years were settled. Bus and trolley service was co-ordinated, extended improvements were made in facilities, and an intensive merchandising program was conducted which, in turn, led to an increase in the number of passengers carried by both street cars and buses, increases in gross and net revenue, and in the return on the investment in the property.

Accomplishments by this property extended beyond merely operating improvements. Through corporate consolidation the number of subsidiaries was reduced. The financial structure was simplified and strengthened, and local financing was made less expensive. With capital thus available new and modernized equipment was provided; and finally employee co-operation was enlisted and favorable financial results achieved for the entire program.

Six Contestants in 1928 Competition

A total of six properties competed for the 1928 award. This was the sixth successive annual contest for the medal which is donated annually by the Charles A. Coffin Foundation, established by the General Electric Company, "To that electric railway company in the United States which during the year has made the greatest contribution toward increasing the advantages of electric transportation for the convenience and well-being of the public and for the benefit of the industry."

In addition to the medal to the winning property, the award includes the sum of $1,000 for its employees' benefit or similar fund.

The committee pointed out in its report that during the six years that this contest has been in effect its benefits have been far-reaching. It has been the means of bringing to the attention of the entire industry the step by step improvements made by individual properties in their readjustment to meet the far-flung changes in the conditions under which the industry's operations are conducted. The successes achieved by each property have served as stimulating examples to others, with the result that since this contest was established there has been a marked acceleration in the entire industry's progress.

During the six years of the Coffin contest, a total of 64 briefs have been submitted by 48 different companies. In 1923, the first award was won by the Chicago, North Shore & Milwaukee Railroad. In succeeding years the winners were as follows: 1924, the Northern Texas Traction Company; 1925, the Pittsburgh Railways; 1926, the Pennsylvania-Ohio Electric Company; 1927, the Grand Rapids Railroad.

The six contestants this year included the El Paso Electric Company; Gary Railways; Northern Texas Traction Company; San Antonio Public Service Company; Shreveport Railways and the Virginia Electric & Power Company, the winner. The Northern Texas Traction Company, of Fort Worth, Texas, which was the winner in 1924, has continued to be a contender each year. The El Paso Electric Company participated in the contest for 1923, 1925, 1926 and 1927. The Shreveport Railway was a contestant in 1924 and the winner in 1927.

Five of the six contesting companies listed are located in the South, three being in Texas. It is noteworthy that of these six companies, three are under the executive managment of Stone & Webster and one of them was a previous winner in the contest.

Several of this year's contestants showed evidence of major accomplishments which were cited by the committee in its report. The El Paso Electric Company succeeded in developing satisfactory service under the difficult conditions presented by the requirement of dealing with people of two nations and two languages. It increased its net revenue in the face of severe automobile competition under climatic conditions favorable to maxi-

mum automobile usage. Improved service was established through the operation of new and modernized rolling stock. In its safety work the record of 1926 was bettered, in which year it won the Anthony N. Brady Safety Medal.

Feasibility of one-man cars was successfully demonstrated by the Gary Railways. This property succeeded in bringing its operating costs down to a low figure despite a relatively high wage scale. Improved service was developed through the application of new rolling stock and the modernization of older cars. Rail and bus service was co-ordinated. Public relations were improved, and a simplified and strengthened financial structure developed. Employee morale was built up and 100 per cent of the employees are owners of the company's stock.

A winner of one Coffin Award and a competitor six times, is the enviable record now established by the Northern Texas Traction Company. This property increased its revenue through a new and equitable fare structure. Operating costs were held at a low figure.

In the city of San Antonio, the San Antonio Public Service Company co-ordinated car and bus service for serving a population of 265,000 spread over 65 square miles. In this process it established sound economic principles of transportation merchandising as the basis for rendering a complete transportation service to a growing community. A well-worked out zone system combined with tickets and a nickel pass provides an example of scientific fare structure almost unusual in the industry. Service was improved with higher car speed and by close supervision of operation by a telephone dispatching system which permits a central dispatching office to keep in close touch with every operating unit on the street. All of these activities increased revenue and public satisfaction.

New and modernized cars operated on good tracks in Shreveport, and maintained on frequent and regular schedules, helped the Shreveport Railways to develop improved service. The accident cost on this property is very low. Public co-operation was won through demonstrated efficiency and friendliness. Jitney competition was eliminated.

One of the important events of the evening meeting of the Advisory Council was the report by B. C. Cobb, its chairman, abstracted elsewhere in this issue. He held that the greatest immediate need of the industry is increased travel and was hopeful that this would shortly be the result of the efforts to stimulate traffic which have been made during the past seven years.

An outstanding feature of this year's Advisory Council program was an address by Owen D. Young, which is also abstracted elsewhere in this issue. Mr. Young held, first, that the business of local transportation should be a monopoly, publicly regulated as to rates and service, with a fare adequate to attract private capital if such fare can be obtained. The second principle enunciated by Mr. Young regarding the local transportation industry was that it should be conducted under private ownership in all cases where it can meet the needs of the community. Finally, the local transportation company, whether it be publicly or privately owned, should use the means best adapted for the most efficient and economical transportation of the public which it serves. The speaker declared that he held no brief for the use of electricity. Research and engineering under the impetus of a new spirit in the light of a pressing need, should be drafted into service to redeem an industry and an art which has been able to survive during the last fifteen years only by reason of the courage and determination of the men who have administered it.

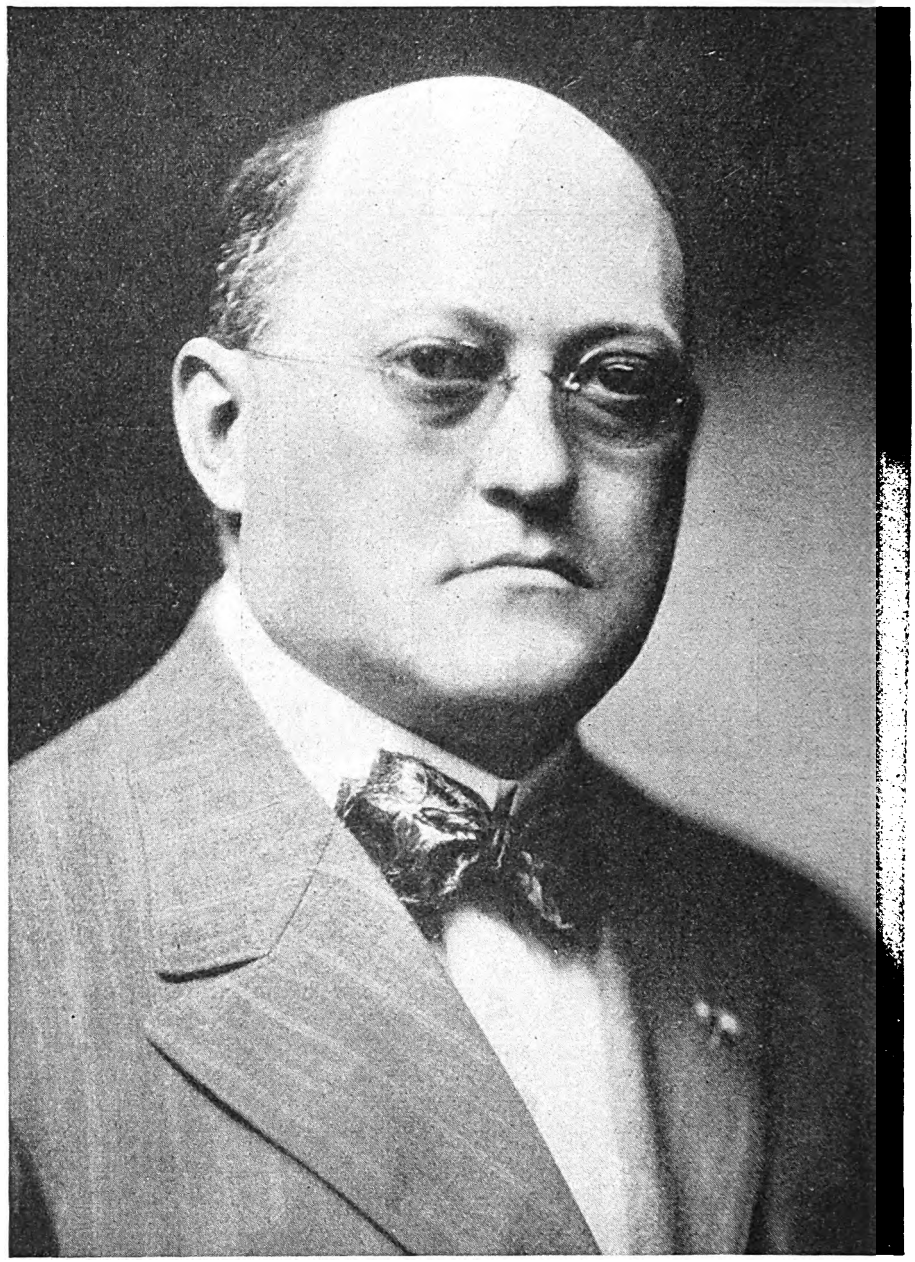
James P. Barnes

Newly Elected President A.E.R.A.



JAMES PHILIP BARNES, newly elected president of the American Electric Railway Association, has long been an active worker in the interests of that body and various state and sectional associations. Before his election to the presidency of the American Electric Railway Association at the convention just ended Mr. Barnes served for four years as vice-president, advancing successively from fourth vice-president to first vice-president year by year. He has served on many of the important committees of the association, including the executive committee and the committees on policy, Coffin award, convention contract, convention location, subjects and meetings, public speaking and industrial relations. He has also served as president of the New York Electric Railway Association in 1916. In 1923 he was president of the Central Electric Railway Association. Two years later he was elected president of the Kentucky Association of Public Utilities.

Mr. Barnes assumed his present post of president of the Louisville Railway in 1920. He has had to contend against tremendous odds there, but the record of his accomplishments stands well revealed in the rehabilitation of the physical property there, the return of the company as a dividend payer, the co-ordination of car and bus, the passage of a modified operating grant, the organization of the "Cardinal Flyers" and the winning by his company of the Brady safety award. While he and his associates in the company were doing all these things, Mr. Barnes has made himself a real factor in local community activities.

Mr. Barnes was born at Syracuse, N. Y., Jan. 26, 1881, and was educated in the public schools of that city. After he was graduated from high school he attended Syracuse University for two years as a special student in music. Then he entered the Massachusetts Institute of Technology from which he was graduated in 1905 with the degree of bachelor of science in electrical engineering.

Following his graduation from M.I.T. he spent nine months with Pass & Seymour in Syracuse, as a designer of electrical apparatus. The lure of transportation soon caused him to leave that occupation, however, and he joined the engineering staff of the Oneida Railway. During the six years he spent with this company he took an active part in the electrification of the West Shore Railroad between Utica and Syracuse. In 1908 he became electrical engineer for the Syracuse Rapid Transit Railway. While associated with the latter company he was responsible for the layout and construction of its Wolf Street shops. When the New York State Railways took over the Syracuse Rapid Transit Railway in 1912 Mr. Barnes remained as chief engineer of the consolidated lines.

In 1913 he transferred his activities from the engineering to the operating end of the electric railway business and became general manager of the Syracuse & Suburban Railroad, operating an 18-mile line to Fayetteville and Manlius. Subsequently, he occupied the position of general manager with the Buffalo, Lockport & Rochester Railway and with the Schenectady Railway. As stated previously his connection with the Louisville Railway began on July 1, 1920.

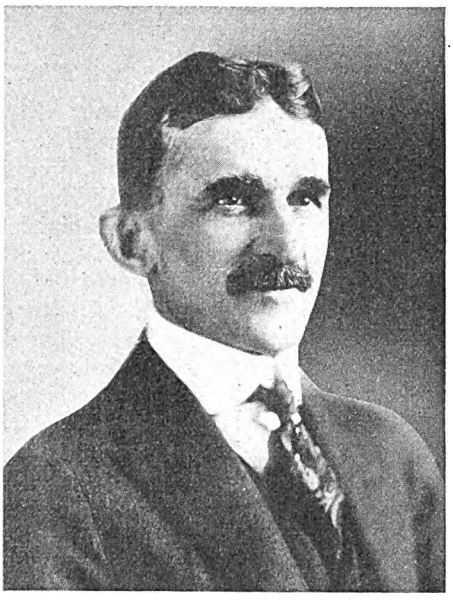
Engineers Are Seeking More Efficient Methods

Speeding up track construction, improving design of bus garages, economies of labor saving machinery in shops, energy saving by resistance heating and dynamic braking were subjects of lively discussion

BETTER engineering methods were the prime consideration of the delegates and speakers at the 47th annual convention of the American Electric Railway Engineering Association, held at Cleveland Sept. 22-28. On Monday and Wednesday separate meetings were held by the power, way and structures, purchases and stores and rolling stock divisions. On Thursday a general meeting of all engineering divisions was held. While the topics discussed by the various committees and speakers covered a wide range of subjects, the dominant note was the necessity of attaining greater efficiency in the work of the power, track, rolling stock and stores departments.



R. H. Dalgleish

The present year is the first during which the Engineering Association has functioned in four divisions. A start was made in this direction in 1926 by the creation of the standing committee on way and structures with numerous special committees to study individual subjects. Last year a similar change was made in the rolling stock division. The same plan has now been extended to the entire association. From the experience of the last three conventions, it appears that this reorganization has been eminently successful. The present method of voting on standards by letter ballot, inaugurated at the same time as the new committee system, eliminated much of the routine work which formerly occupied valuable time at the convention sessions.

New officers of the Engineering Association were elected at the Thursday afternoon session. They are:

President, Frank H. Miller, vice-president and general manager Louisville Railway.

First vice-president, W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore.

Second vice-president, L. D. Bale, superintendent of power Cleveland Railway.

Third vice-president, Charles H. Jones, general manager Chicago, South Shore & South Bend Railroad.

In addition to these the executive committee will consist of P. V. C. See, superintendent of power and equipment Northern Ohio Power & Light Company; F. McVittie, electrical engineer New York State Railways, Rochester; E. M. T. Ryder, way engineer Third Avenue Railway, New York; Howard George, superintendent of research, Cleveland Railway.

Economies to be effected by the use of labor-saving machinery was the theme of the general meeting of all engineering divisions held Thursday afternoon. A paper on this subject by W. T. Rossell, general manager Pittsburgh Railways, is published in abstract elsewhere in this issue. W. G. Gove, superintendent of equipment Brooklyn-Manhattan Transit Corporation, opened the discussion of Mr. Rossell's paper. He told of the methods used by the rapid transit companies in London, Paris and Berlin and also described in considerable detail the new shops recently built by his company. It was his contention that inspection and maintenance work should be done better than is customarily the case and that there should be less tampering with equipment after it has been overhauled and placed in service. A viewpoint somewhat different from that of Mr. Rossell was presented by J. B. Stewart, general manager Cincinnati Street Railway, who expressed the opinion that line production methods for maintaining street railway rolling stock are not altogether satisfactory.

In opening the meeting President Dalgleish complimented the busy men of the association for the attention they had given to the solution of the many perplexing problems confronting the industry. The reports of the committees this year, he said, contain much interesting information that is of value to all. He also congratulated the program committee on its excellent work. According to the president, new types of equipment and new drives for street cars are steps in the right direction that eventually will produce a car that is not only attractive and comfortable, but that will operate quietly over the well-built track now being installed by many of the railway companies. Power and distribution have also shown improvements. The work of the association he feels is of benefit to the railways as it is enabling them to make riding on street cars more popular. Attention also was called to the motor bus and the problems it has brought with it in order to secure the maximum advantage.

"We have a great deal to learn about buses and their operation," said Mr. Dalgleish, "and it is only by the

Digitized by Google

hearty co-operation of all of us that the best results can be obtained. I cannot too strongly recommend your co-operation with the association in an effort to solve some of the problems in connection with bus operation."

The reports of the executive committee and of the secretary-treasurer were read. In the absence of W. W. Wysor, chairman, F. H. Miller presented the report of the committee on constitution and by-laws. An abstract of this report is published elsewhere.

The report of the committee to co-operate with the American Engineering Standards Committee was read by G. C. Hecker. This outlined briefly the changes which have been effected in the organization of the American Standards Association during the past year.

A resolution was passed by the meeting extending the sympathy of the Engineering Association to Past-President L. C. Datz, on account of the recent tragic death of his son.

The meeting concluded with the installation of the new officers for the coming year and the presentation of the past-president's badge to Mr. Dagleish. Mr. Miller, the incoming president, expressed his appreciation of the honor shown him by the association and asked for the co-operation of all the members during the coming year He spoke particularly of the need of interesting young engineers in the work of the association.

Way and Structures Division

Presentation of the report of the standing committee and the reports of the various special committees were made at the Monday afternoon meeting of the way and structures division. H. H. George, chairman of the standing committee, outlined briefly the work that had been done by the division during the year and explained the status of the reports of the several special committees. The special committee on track ballast and drainage did not find it practicable to make any very definite recommendations. The results of its study were explained by S. Clay Baker, chairman. In the absence of Chairman Adrian Hughes, Jr., the report of the special committee on bus garage design was presented by A. J. Blackburn, architect, Boston Electric Railway. An abstract of this report is given elsewhere.

In discussing this subject, R. C. Cram recommended that careful consideration be given by the committee to the matter of garage lighting.

Co-operation between the special committee on track construction specifications and the American Society for Municipal Improvement was discussed by C. L. Hawkins, chairman. The reports of the special committees on alloy steel for special trackwork and track paving were not completed in time to receive the approval of the standing committee prior to the convention. For that reason they were not officially presented but the progress of the work was outlined by the chairmen, A. T. Spencer and A. E. Harvey. In the absence of L. A. Mitchell, chairman, Mr. George read the report on special trackwork foundations. C. F. Gailor, chairman of the special committee on arc welding, told of the work being carried on in co-operation with the American Welding Society. No reports were presented by the committees on joint railway and bus terminals and track checking gage.

A lively discussion followed the presentation of the report of the special committee on rail corrugation. In the absence of W. W. Wysor, chairman, this report was read by D. D. Ewing. An abstract of this report appears elsewhere.

The relative merits of the flat-head rail slightly canted and the round-head rail were discussed by C. H. Clark, R. C. Cram, A. T. Spencer, E. M. T. Ryder, J. H. Haylow, Roy Brokaw and H. H. George. There was general agreement as to the desirability of securing the greatest possible area of contact between the wheel tread and the rail head. No agreement was reached, however, as to the means by this object can best be accomplished.

The meeting was briefly addressed by R. H. Dalgleish, president American Electric Railway Engineering Association. He spoke of the enthusiasm with which the committees of the association have attacked their problems during the past year and of the good work accomplished. A resolution was passed extending the sympathy of the way and structures division to E. B. Entwistle, who was prevented by illness from attending the convention this year.

Way and Structures Division

Problems of track construction, particularly those connected with the maintenance of rail joints and special trackwork, occupied the attention of the members present at the Wednesday afternoon meeting of the way and structures division. Recent developments in arc welding rail joints were described by H. C. Heaton, superintendent of tracks United Electric Railways of Providence. An abstract of this paper appears elsewhere in this issue. The discussion was led by J. H. Haylow, who spoke of the experiences of the Memphis Street Railway. Use of the bolted rail joint in paved track was the subject of a paper by B. P. Legaré, engineer maintenance of way and construction Market Street Railway, San Francisco, which was read by Chairman H. H. George. Mr. Legaré's paper appears in abstract elsewhere. R. C. Cram, Third Avenue Railway, New York City, led the discussion.

Speaking on Reduction of Noise in Special Trackwork, P. B. Harris, manager engineering, Los Angeles Railway, said in part:

> The Los Angeles Railway has carried on numerous experiments and tests to reduce noise from special work. Either the rails were raised or other methods employed to give the car a through rail over special work. We have tried cushioning the intersections by having the centers made deep and not fastened but free to work up and down and at the same time resting upon a cushion of rubber or other shock absorbing material. Although we developed a very successful type we did not get the results desired.
>
> We have found that we can accomplish noise reduction best by: (1) using flange-bearing special work that is kept up in the very best possible condition; (2) allowing no loose or uneven joints; (3) allowing no low or beaten down centers. The arc welder has done much toward helping out this problem. Wheels with as wide a tread as possible should be used, as these save the wear on special work.
>
> Good conditioned special work and cars must go together if we are to get results. Poor special work will soon make noisy cars, and cars with bad wheels and loose trucks, etc., won't help your special work.

How track construction work can be speeded up was told in a paper by Oscar Williams, superintendent of way and structures Pittsburgh Railways. An abstract of this paper appears elsewhere. In discussing this subject, H. F. Merker, Brooklyn City Railroad, brought out the fact that it is frequently desirable to have track construction done by outside contractors.

Prior to the reading of these papers, reports were presented by three special committees; namely, those on engineering manual, wood preservation, and rail markings.

The report of the special committee on special track-

Digitized by Google

work was not officially presented because the work of the committee had not been completed in time to be passed upon by the standing committee prior to the convention. E. M. T. Ryder, chairman of the special committee, briefly outlined what had been done.

Bus garage design evoked lively comment. A paper on this subject by H. M. Steward, superintendent of maintenance Boston Elevated Railway, was read by A. J. Blackburn of the same company. An abstract of Mr. Steward's paper appears elsewhere. John Ross, Department of Street Railways, Detroit, Mich., and C. R. Harte and A. D. Knox of the Connecticut Company, participated in the discussion of this subject.

President Stevens of the American Association dropped in at the meeting and spoke briefly on the good work being done by the Engineering Association.

The A.E.S.C. sectional committee on specifications for materials for use in the manufacture of special trackwork and design of 7-in. plain girder rails for use in paved streets presented a report to the American Electric Railway Association which is the sponsor body. This report contains specifications for special trackwork materials. The committee recommended that the specifications as presented be approved by the sponsor body, and following such approval the specifications together with the complete report be submitted to the American Engineering Standards Committee for approval as tentative American specifications.

Rolling Stock

Improvements in rolling stock that give promise of bringing back lost car riders were stressed particularly in reports and discussions at the first meeting of the rolling stock division of the Engineering Association. President Dalgleish said in his address that this was the greatest problem to be solved. Better lighting arrangements and increased illumination was reported as one means of attracting riders, the use of more comfortable seats was another, and a third and most important one that of reducing noise.

The report of the committee on noise reduction brought out a large amount of discussion showing the great interest that is being taken in this important subject. The committee reported on tests of one car where the noise as recorded inside the car was reduced 47 per cent by changes in gearing, use of padding on gear cases and under flooring, use of rubber mounting for trolley base and the substitution of resilient wheels for the standard rolled steel type. The reduction of noise on the same car was 18 per cent as observed from the street curb when the car was passing.

In addition to the written report, presented by various chairmen and abstracted elsewhere in this issue, a number of committees presented verbal reports of progress. These contained no recommendations for action and were received only as progress reports. One which was of particular interest was that of the special committee on car design. H. H. Adams, chairman, told of the work being undertaken in its study of different units of gearing. A number of these are now ready for testing by the Bureau of Standards in Washington, and it is thought that the first equipment will be tested during the next month. A sub-committee of this committee has been making a study of the economics of the high-speed motor. A number of installations with the new type of gearing are now in service and these are being studied.

Improved lubrication and trends in car design were discussed by the rolling stock division of the Engineering Association at its second meeting. Investigations and tests on lubrication as made on the cars of the United Railways & Electric Company, of Baltimore, were described in a paper by Dr. W. B. D. Penniman, consulting chemist, Baltimore, Md. He advocated the use of lubricants with low viscosity and high oiliness. An abstract of this paper will be published in a later issue.

In the discussion on lubrication, H. H. Adams, of the Chicago Surface Lines, told of tests made on his property during the past nine months with oil having a viscosity of 56. There was a decrease in general bearing temperature of 57.8 per cent and a decrease in kilowatt-hours per car mile of 7.15 per cent. He summarized the advantages of using a low viscosity oil as (1) more free moving of equipment; (2) lower bearing temperatures; (3) less wear of bearings; (4) better and longer life for waste; and (5) less energy consumption. Mr. Adams recommended trial installations of low viscosity oil before changing over an entire system.

John Lindall, of Boston, referred to some things that increase power consumption in cold weather. He said that dragging of brake shoes is more prevalent at low temperatures. Air brakes function slower, curve friction and wind friction is greater, and more passengers are carried. He considers the development of a bearing seal as described by Dr. Penniman as an important development, as it is very essential to keep dirt and water out of bearings.

J. S. McWhirter, of the Third Avenue Railway, New York, emphasized the necessity for keeping oil and bearings clean, and provision so that oil would be applied at the proper points. He referred to the splash method of lubrication which has been tried out on some European properties and to a design which he has worked up which consists of a wedge key to tighten and hold the bearings.

Future rolling stock must be quiet in operation, smooth and pleasant to ride in. It must be comfortable, convenient and easy to use. It must meet the automobile on its own ground. Charles Gordon, editor of Electric Railway Journal, thus summed up present trends in car design in a paper distributed at the Wednesday session of the rolling stock division but not read due to lack of time. An abstract will be published in a later issue of this paper.

Power

More than 80 power and line engineers assembled on Monday afternoon for the opening session of the Power Division, presided over by W. E. Bryan, superintendent of power St. Louis Public Service Company. The meeting was characterized by the prepared and lively informal discussions of the several reports. Following the report of the standing committee on power, presented by Chairman Bryan, the reports of the following special committees were presented: mercury vapor power rectifiers, power contracts (progress report), trolley wire wear, radio interference, overhead vs. underground feeders (progress report) and trolley voltage in congested districts (progress report). A feature of the program was an address by the president of the Engineering Association, R. H. Dalgleish, who referred to the great interest being shown in the various Engineering Association divisions and urged that all members who are asked to serve on committees accept the assignments.

Three important papers and five committee reports were presented at the meeting of the Power Division of

Digitized by Google

the Engineering Association held Wednesday afternoon. "Automatic Substation Installations in Cincinnati" was the subject of a paper by Harley L. Swift, superintendent of substations Cincinnati Street Railway. He described in detail the installation of the nineteen automatic substations and gave some interesting construction data. L. D. Bale of the Cleveland Railway supplemented the paper and emphasized three important features of the system, the supervisory control, the attractive buildings and the reduction in labor costs. F. W. Peters of the General Electric Company spoke on the important elements in the design of this system.

The second paper, presented by A. W. Baumgarten, division engineer Chicago & Joliet Electric Railway, concerned the energy-saving effects of resistance and dynamic braking heating. He outlined the advantages of dynamic braking and told of the work that had been done on the Joliet property. He supplemented this information with actual results of the system, which showed that real savings could be effected. Prepared discussions of this paper were given by W. C. Wheeler of the Chicago Surface Lines and W. A. Keller of the Pittsburgh Railways, who told of their experiences in car heating on their property. Mr. Wheeler discussed the need for construction detail and thermostatic control for reducing car heating costs.

Dwight L. Smith, electrical engineer Chicago Rapid Transit Company, presented the third paper, entitled, "Inspection vs. Repairs." He emphasized the necessity of inspecting inert objects as well as moving ones and stated that regular inspection properly carried out and followed up by necessary repair work will result in a reduction of failures in operation, a decrease in accident liability, an increase in the useful life of the property and the ability to make more accurate budgets. Mr. Smith's paper was discussed by J. F. Neild.

The five committee reports presented were engineering manual, catenary specifications, standardization of trolley wire reels, conduit specifications and ferrous vs. non-ferrous materials for overhead. Prepared discussions were given for each report.

Purchases and Stores

Monday's meeting of the Purchases and Stores Division was opened with an address by President R. H. Dalgleish—in which he showed his particular interest in the work of the Purchases and Stores Division. He pointed out that the purchasing agent can help reduce the cost of the work of the engineers by scientific buying. By scientific buying, he explained that the purchaser should get the best material for the price, but it is a question of quality more than price. There is a need, he said, for the younger men to take a more active part in the committee work.

In a paper on standard packages prepared by W. E. Scott, superintendent of supplies Philadelphia Rapid Transit Company, Philadelphia, Pa., the fact was brought out that there seems to be a majority opinion that the present methods of packing are obsolete, inasmuch as either weights or quantity are of such proportion that they prove very expensive due to the large quantities that must be bought to secure unit packages, or the additional handling costs involved if purchased in broken containers. Several have pointed out that in some instances containers weighing in excess of 200 lb. are received, and in the handling of material that is loose, through purchasing large bulk quantities, a potential loss of material is likely in the distribution within the organization. The consensus of opinion seems to be that material should be packed in standards of smaller quantities than now exist and container weights limited to a 100-lb. minimum.

Shall there be determined a standard package unit to be governed only by weight or bulk, or only by quantity, or must these three factors be considered.

When one considers that the number of items of material purchased and used by a group on small properties average 3,000 and on the large properties 30,000, and that some member companies have allied utility interest, whereby the total number of items is doubled and even tripled, the problem becomes more difficult and because of that more important to solve definitely.

A. L. Fisher

R. A. Weston

W. E. Scott

It is now hoped that since this work has been considered of sufficient importance to be assigned as a subject for committee planning and discussion, every effort will be made by the individual members to express themselves at sufficient length to give the benefits of their views to the committee members, and through them, the association shall actively assume an obligation to express these thoughts and views to the Department of Commerce, thereby effecting an economic result that will be far reaching and not restricted to only a few of the properties affected.

The committee in its final summing up is faced with the problem of determining which feature of the work should be eliminated, and from such elimination achieve the greatest result, not only to the manufacturer of the material, but also to the user of the material. The final result must be one of such nature, that it will give the greatest economic value in which both the maker and the user of the materials can equally participate.

If the individual members could but realize that work along these lines would accomplish price reduction through medium of manufacturers' reduced packing cost and elimination of waste in container varieties; lower handling costs by purchaser through elimination of varied containers, both in weight and unit lower cost through standardization of containers, making possible easier check of material, it is certain their co-operation with the committee would be full and complete.

In a written discussion by W. J. Walker the subject of standard packages was brought up from the manufacturers' viewpoint. In the general discussion A. A. Ordway stated that some manufacturers are offering material in bulk at reduced prices. Taking this into consideration, he wished to know how much the manufacturer would

Digitized by Google

charge for packing and if it would save money to resort to standard packages.

A. E. Hatton, West Penn Power Company, replied that he believed manufacturers would be able to put their material in standard packages on a production basis. The saving in checking quantities both by the manufacturer and the railway usually would pay the cost of the standard packages. He stated that his company spot-checked all standard packages received, and in his recollection there had been no instance of a short count.

A. B. Gibson, Westinghouse Electric & Manufacturing Company, stated that manufacturers are trying to get packages of convenient size for railway use and find that some railways wish small quantity packages while others which purchase large quantity lots object to the large number of boxes in each shipment. He emphasized the work of the committee on standard packages in establishing a suitable standard of quantity. George A. Cooper of the Department of Commerce offered the co-operation of the Division of Simplified Practice.

"Inactive Stock" was the title of a paper by A. S. Duncan, assistant director of finished stocks, Westinghouse Electric and Manufacturing Company. A very complete and effective method of handling and penalizing inactive stocks was outlined. In a written discussion by A. E. Hatton it was brought out that by this method of penalizing inactive stocks the losses are easily taken step by step and that it allows for the elimination of materials which do not turn over.

Relation of the purchaser to the stores department was the title of a short address given by A. L. Fischer, purchasing agent Cincinnati Street Railway, Cincinnati, Ohio. He brought out the fact that the purchaser derives his usefulness in being able to centralize, that is to group and classify, and in being able to visualize, that is to look ahead provided he is placed high enough to do this. Formerly mercantile and manufacturing concerns and even public utilities, had each department head act as his own buyer. This method however led to much waste and duplication, so that skilled buying is now done by one man who knows not only the needs of one, but all departments in his company.

The purpose of a stores department in its simplest analysis is (1) to have supplies on hand when needed, (2) to administer these supplies so as to prevent duplication, waste, depreciation and obsolence and (3) to procure supplies to the best advantage. The first two purposes are functions of the stores officer. The third purpose is the function of the purchaser.

The purchaser, it seems, is the provider, and could be likened to the head of a family. The storekeeper is the distributor of the supplies provided. As all well regulated families succeed by working in harmony, so should purchaser and storekeeper work in closest co-operation.

The 1927 report of the purchases and stores committee recommends that the departments of purchases and stores should be co-ordinated so as to operate as a unit. This can be accomplished, it goes on to state, by having a supervising officer who is responsible for both.

Getting down into detail, if the requisition, the invoice, and the tracer are considered the authority for stock they are found to be bridges, as it were, that connect the two departments, and make for the closest co-operation.

The purchasing officer will watch the investment in stock, the rapidity of turnover and the cost of handling supplies in which the storekeeper should give him the closest co-operation. While a monthly report showing balance on hand with receipts and issues is usual, it would not be a difficult matter to have a daily report if such were found to be necessary.

It is unfortunate that the purchasing and stores departments too often operate as separate units. A remedy for this condition is to have a director or a supervisor of purchases and stores, who will be responsible for both departments, or in the case of smaller companies to have the storekeeper report to the purchasing agent, who will account for both departments.

In the absence of Mr. W. S. Stackpole, his paper on handling supplies for Buses, was presented by C. A. Harris. A complete description was given of the handling of supplies for buses and other automotive equipment, and the marked differences between handling these supplies and those for electric railways were pointed out. The remarks in this article were confined to operations where a large percentage of vehicles were automotive. A written discussion by J. T. Foster was read by A. S. Duncan.

Joint Session

The joint session of the Purchases and Stores Division and the Accountants' Association held Wednesday afternoon opened with the reading of the report of the standing committee on purchases and stores and the committee on stores accounting by John Y. Bayliss, covering the joint work of the two committees.

John Fleming, chairman of special committee No. 1, Engineering Manual, then gave the report of that committee, which included a revision of the recommended method of handling freight and express bills at present in the 1926 report of the purchases and stores committee. It also was recommended that the simplified invoice form approved by the 1927 committee on purchases and stores be included in the Engineering Manual as the recommended form. Revisions were also made in Manual section P.S. 100-24 and section P.S. 106-27.

In the absence of W. E. Scott, chairman of special committee No. 2, unit piling and standard packages, A. S. Duncan gave a progress report.

Progress was also reported by C. A. Harris, chairman of committee No. 3, Investment in materials and supplies and the cost of operating stores and the committee on stores accounting, whose chairman is R. A. Weston. Recommendations of these committees were in accordance with a number of questionnaires sent out to operating companies during the past year.

Special committee No. 4, price records and pricing materials and supplies, presented through A. A. Ordway, chairman, a tentative report for the consideration of recommendations of methods and practices for keeping price records and pricing materials and supplies received and issued.

"The cost or price of materials," said R. A. Weston, special accountant, of the Connecticut Company, New Haven, Conn., "should logically include all the expenses connected with the same up to the time of use. It is, however, impracticable to include all these costs in the unit price of material items and some other method is necessary. With overhead expenses eliminated no troublesome questions arise in the pricing of new materials purchased." Mr. Weston outlined three methods for storeroom pricing, the lot, average price and latest representative price methods. He also discussed the necessity of tieing the description of each item with its price, the pricing of second-hand material, the listing of used and repaired bus assemblies and the attitude of departments with respect to using second-hand materials.

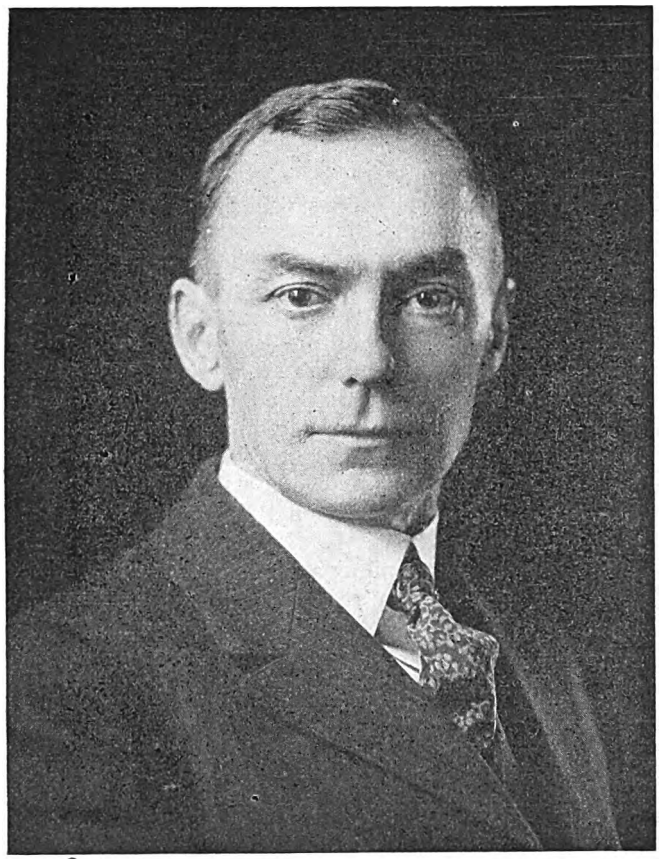
Frank H. Miller

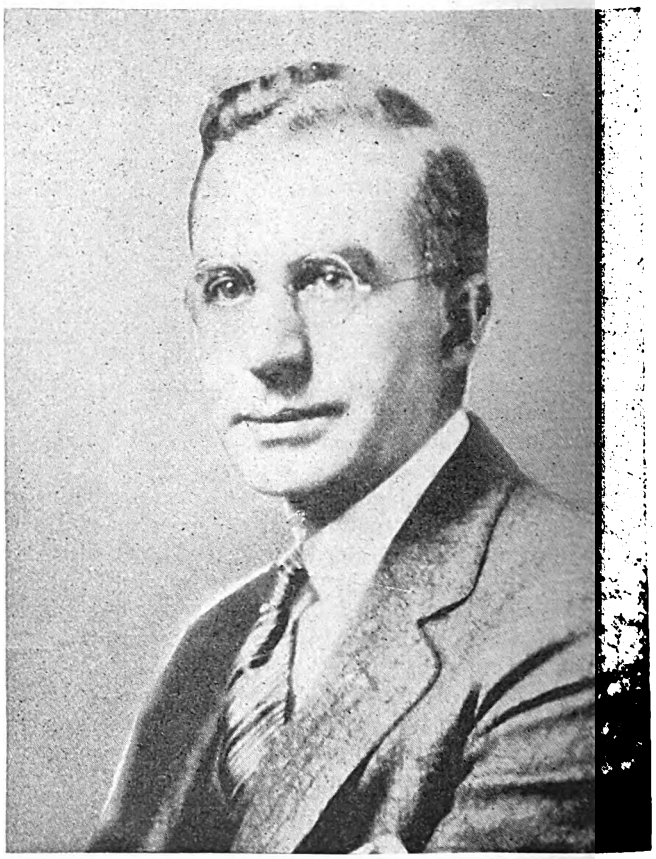
NO MNEMONIC devices are necessary to bring to mind the name closely tied in with J. P. Barnes in his progressive transport policies in Louisville, Ky. His associate and co-operator in that work is Frank H. Miller, elected president of the Engineering Association, 1928-1929. When in the early part of 1925 the title of general manager was conferred upon F. H. Miller, the first official of the company to be so designated, it must have made him reminiscent of a day 33 years ago when he started in the car repair shop of the company, and successively occupied the positions of timekeeper, storeroom man, car tester, truck repair man, assistant shop superrintendent, superintendent of wire work, and superintendent of power stations.

When eight years ago Mr. Barnes took over the presidency of the Louisville Railway, Mr. Miller became vice-president in charge of engineering and maintenance and in 1925 was made vice-president and general manager, for this practical operator had real achievements to his credit.

Mr. Miller was born in 1874, near Louisville. He was graduated from Rose Polytechnic Institute in 1895, and afterwards, through post-graduate work at Rose, took the degree of electrical engineer and later mechanical engineer.



F. H. Miller



W. H. Boyce

William H. Boyce

WILLIAM H. BOYCE, the new president of the Transportation and Traffic Association, obtained first-hand contracts with the every-day man as a meter reader and a motorman. His first real executive position came in 1909 when he was made superintendent of the Beaver Valley Traction Company. Soon he became one of the most influential citizens of the community as a "joiner" and a good doer.

Even in those days, Mr. Boyce was a strong believer in what has now become known as "public relations," "safety first" and "riding salesmanship." And what he preached he practised successfully on the Beaver Valley property.

As general manager during the World War years, he secured one fare change after another after giving every possible consideration to the views of his customers. Eventually he developed a plan of 5-cent short haul fares and weekly passes.

His big opportunity came with the reorganization of the Pittsburgh Railways early in 1924. As the Beaver Valley Traction Company was also a member of the Philadelphia Company group, the directors were well acquainted with his extraordinary success as an administrator and public relations man, and he was made commercial manager.

The record of the commercial department of the Pittsburgh Railways has proved that the Boyce system works just as well in a big city as it did in the Beaver Valley.

L. F. Wynne

ONE might characterize the experience of L. F. Wynne, elected head of the Claims Association 1928-1929, as more intensive than extensive, for he has confined his activities to Georgia and more particularly to Atlanta, its principal city. There he was born on March 11, 1884, and there he became affiliated with a utility which was to offer him many opportunities for constructive work in the claims department.

Early in his career Mr. Wynne was graduated from law school, and on Dec. 26, 1905, entered the service of the Georgia Railway & Electric Company, owner and operator of the railway lines in Atlanta. Six years later he was made general claim agent. In 1912 the Georgia Railway & Electric Company was taken over by the Georgia Railway & Power Company and Mr. Wynne served as general claim agent of that company and continued to serve in the same capacity for the Georgia Power Company, the successor organization, doing a large railway business in Atlanta and numerous other smaller communities, also a light, power and gas business in some 200 cities and towns in Georgia.

In 1922 he was similarly honored for his association work by being made a vice-president of the Southeastern Association of Claim Agents, which includes among its members claim agents of steam railroad, electric railway and power companies.

L. F. Wynne

O. H. Bernd

O. H. Bernd

THE man who will head the American Electric Railway Accountants' Association for the year 1928-1929 is O. H. Bernd, practically all of whose business life has been devoted to public utility enterprise. Since 1912 Mr. Bernd has been serving as secretary and general auditor of the Des Moines City Railway and the Des Moines & Central Iowa Railroad. He went to Des Moines from Springfield, Ill., where he had served the Springfield Consolidated Railway, the Springfield Light, Heat & Power Company and the Springfield Gas Company.

Mr. Bernd is a product of Illinois soil. He was born in Peoria and was first employed in 1900 in the freight department of the Chicago, Peoria & St. Louis Railroad, a steam line at Peoria. Three years later he left the steam railroad business to become statistician of the the Peoria Gas & Electric Company, now the Central Illinois Light Company, and was appointed auditor of that company in 1906. Three years later he was transferred to Springfield.

Mr. Bernd has been active in association affairs since 1914. During the years 1926 and 1927 he served as chairman of the committee on freight accounting and at the present time he is a member of the American Association's committee on insurance, being appointed to that committee in 1924.

T. & T. Covers Many Subjects

Employee relations, traffic problems, speed with safety, service betterment and bus operation came up for discussion at well-attended meetings

"SO OPERATE your car or bus that today's patron will be tomorrow's customer." Taken from a framed motto hanging in the trainmen's quarters of one of the country's largest traction systems, this expression summed up the spirit which pervaded the meetings of the Transportation & Traffic Association. Speed, comfort and safety must be provided, but above all, the spirit back of them all must be service on the part of the operating company, from the general manager down to the trainman on the cars.

No longer is the trainman who, through bad luck or momentary carelessness had an accident, to be summarily "fired." Instead, psychology is to have an important part in deciding the case, with the strong probability that instead of trying to place the blame his superiors will seek to determine the causes back of the unfortunate occurrence. The matter of traffic congestion which, as one speaker expressed it, is not an evil but a problem, also came in for consideration, as did motor bus operation, maintenance and accounting practices. Quite evidently the man in charge of service is not entirely satisfied with the present methods of accounting practice as applied to bus operation, and is going to have something to say as to the basis to be used in the allocation of expenses.

Edward Dana

Opening the sessions of the Transportation & Traffic Association, President Edward Dana called the meeting to order and delivered the annual address Monday afternoon.

In his introductory address President Dana reviewed briefly the progress of the Transportation & Traffic Association since its organization 21 years ago and paid tribute to the wisdom of those who had carried on the work of the association during the ensuing years. He touched upon the high points of the committee reports which were to be presented in abstract, urging his hearers to read and study the complete reports and to see that they were given the widest possible circulation among those who were unable to attend the meetings in person. In summing up the outstanding problems of the industry he dwelt briefly upon the traffic problem, the control of accidents and the necessity of inculcating the principals of salesmanship into those in direct charge of the operation of the cars. He reminded his hearers that the way was prepared and the stage all set for constructive accomplishment, and urged that they go back to their properties with the determination to do things, not merely talk about them.

Following General Secretary J. W. Welsh, who briefly outlined his annual report, Samuel Riddle presented the report of the committee on nominations. The following men were unanimously elected to hold office for the ensuing year:

President, W. H. Boyce, commercial manager Pittsburgh Railways, Pittsburgh, Pa.

First vice-president, Samuel Riddle, vice-president and secretary Louisville Railway, Louisville, Ky.

Second vice-president, P. E. Wilson, vice-president and secretary Cleveland Railway, Cleveland, Ohio.

Third vice-president, George B. Anderson, manager of transportation Los Angeles Railway, Los Angeles, Cal.

Secretary-treasurer, J. W. Welsh, general secretary American Electric Railway Association, New York City.

Executive committee, R. N. Graham, manager of railways Penn-Ohio System, Youngstown, Ohio; F. L. Butler, vice-president in charge of operations Georgia Power Company, Atlanta, Ga.; Richard Meriwether, vice-president in charge of operations Dallas Railway & Terminal Company, Dallas, Tex., and William E. Wood, president of the Virginia Electric & Power Company, Richmond, Va.

The report of the committee on traffic and safety was presented by R. W. Emerson. He was followed by E. J. McIlraith, who spoke briefly covering various outstanding points on the report which had just preceded. It was Mr. McIlraith's view that the characteristics of accidents prove men should be sufficiently well known by their inspectors and supervisors before it becomes necessary to submit their performance to statistical analysis. He urged the necessity of daily and hourly training and inspection, and made it a point that the management must impress the men by its own treatment of matters relating to safety so as to merit their confidence. In his opinion there is a parking problem but no parking evil, and railway managements would best serve their own interests by an endeavor to move all traffic in hopes of thus enlisting the support of automobilists, truckmen and others engaged in "free-wheel movement" over the city streets. Before making too much of a drive on traffic offenders, railways should put their own house in order and see to it that track repairs, overhead repairs and the like, should be performed after business hours. Mr. McIlraith referred to the model municipal traffic ordinance prepared by the Hoover Committee and urged that an effort be made to put the regulations which the new code contain in effect in the cities where they operate.

A paper on "Parking," which was to have been read by F. W. Caley, secretary of the Cleveland Automobile Club, was presented by George B. Anderson.

Mr. Caley, in his paper, reminded his auditors that the day of the hitching post in front of the country store is past; the country store itself has made way

Digitized by Google

for the big city emporium, but the traffic problem, like the poor, is always with us. And because it is a problem it has been made the subject of reform waves that have led to many absurd suggestions for relief and much foolish legislation. "But," continued Mr. Caley, "it isn't a question for half-baked self-styled experts and civic reformers. It's a question for men of traffic experience, and preferably for those who are deeply concerned from the viewpoint of their business pocketbooks." Of all interests, perhaps none is so much concerned as the street railway, the importance of which is tremendous, as is quickly made apparent when street car service is tied up for any length of time by storm or strike. Accordingly, the speaker pointed out, the transportation of individuals by common carriers should be given preference, within congested districts, over the movement of vehicles engaged in individual passenger transportation as well as those engaged in the movement of goods.

While recognizing the undoubted advantage of double-decked streets and the expenditures of great sums of money in the construction of super-highways, Mr. Caley gave it as his opinion that much simpler measures of relief were available, based upon the normal tendencies of city development. These measures he cited as follows:

1. The well-recognized requirements for more and wider streets.
2. Emphasis by the authorities upon the movement of traffic, giving it preference and entire right of way over the motionless vehicle.
3. A definite policy for the elimination and regulation of parking, to be worked out gradually over a period of time.
4. The encouragement of the investment of private capital in commercial parking space.
5. Provision for adequate short-haul as well as long-haul transportation by street car or rapid transit.
6. The establishment of adequate by-pass routes for motor vehicle traffic, so that people who merely want to get from one side of the city to another can do so without passing through congested districts.

Mr. Caley stressed the importance of keeping all legislation within practical limits and avoiding grandiose remedies. Plans for parking relief and traffic regulation should be within pocketbook limits; they should not disrupt the natural habits of the city, they should be definitely related to normal progress and, above all, they should be definitely and carefully thought out and consistently put into effect.

Another paper, by R. F. Kelker, Jr., on "The Effect of Passenger Automobiles on Mass Transportation Traffic," was read by H. O. Allison.

Managing Director Lucius S. Storrs was called to the platform for a few remarks and gave it as his opinion that the industry had passed through the age of wonderment and urged the necessity of co-ordinated research. In the discussion that followed short remarks were made by W. H. Boyce, Colonel W. V. Bingham, personnel director of the National Research Federation, G. B. Anderson, Alonzo R. Williams and others.

The day's program was concluded by the showing of the safety motion pictures which had been prepared under the direction of the advertising section of the American Railway Association.

The report of the committee on service betterment, abstracted elsewhere in this issue, was the subject of discussion at the Wednesday session. President Dana defined the substance of the report as indicating means of improvement without capital expenditure, and cited such elements as increase of speed with safety, adoption of one-man cars in so far as circumstances would permit, and education of the personnel in the principles of salesmanship and service to the public. J. W. Kneckt, general superintendent Grand Rapids Railroad, explained the method employed in Grand Rapids of educating its train force through the agency of monthly meetings which were addressed by officers of the company. He credited much of the success which had been attained to the frankness of the company officials in explaining the financial status to the trainmen. He gave it as his opinion that when the operating force understood the difficulties of the situation they were more than ever inclined to exercise care in avoiding accidents. C. W. Chase, president Gary Railways, Gary, Ind., told of the success that had followed the 100 per cent adoption of one-man cars on his property. He feels that to this, more than any other factor, is due the present financial solvency of the company.

W. W. Holden, manager railway department San Antonio Public Service Corporation, San Antonio, Tex. spoke in favor of the telephone dispatching system adopted in that city, which has given both a reduction in expenses and a decided improvement in service. He urged it upon the association to get back of an intensive research program in order to develop further some of the ideas set forth in the committee report.

W. H. Burke, southwestern manager Stone & Webster, Houston, Tex., took the membership to task for failing to take action on the very excellent recommendations which had been made by the committees of the association in the past. Taking up the report of the present committee on service betterment he pointed out several of its salient features as worthy of special commendation and urged those present to take some of the suggestions home with them and put them into effect. Mr. Milener, research engineer of the American Gas Association, complimented the committee for the thoroughness of the report and proceeded to read the paper which had been prepared by Alexander Forward, managing director American Gas Association, in which he reviewed the accomplishments of the industry which he represents

Digitized by Google

in changing over within a few years from a 90 per cent lighting load to a 92 per cent heating load and at the same time increasing its sales nearly 400 per cent. He stressed the importance which research and study had played in bringing this about.

"In this age of science," stated the speaker, "it is true in all other great industries as in the public utility field that the correct measurement and appraisal of the exact facts of the past and present afford the truest index of the future. Those who realize the vital necessity for measurement are equipped for present-day needs; the others are not. Recognition of this fact is one of the outstanding developments of our time." He cited a statement that came out at the last Imperial Conference of Statesmen of the British Empire to the effect that scientific research is no longer a luxury, but a necessity, and proceeded to show how this tied in with the present status of the electric railway industry. He also called attention to the extent to which the gas industry was co-operating with various governmental departments at Washington in determining facts essential to its future.

Mr. Bowman, district commercial manager for the Ohio Bell Telephone Company, detailed the methods used by his company to determine the future growth and development of communities, illustrating his talk by lantern slides.

A playlet, "Rules Is Rules," produced by talent from the operating personnel of the Public Service Co-ordinated Transport, Newark, N. J., displayed real dramatic ability and made a big hit with the audience.

Bus operation, maintenance and more particularly, bus accounting, was the principal order of business at the Thursday afternoon session. The report of the committee on bus operation, abstracted elsewhere in this issue, was the basis of a discussion which was participated in by a number of the delegates. That bus-hours rather than bus-miles should constitute the basis of accounting seemed to be the consensus of opinion, although it was apparent from the report of the committee that few member companies are using this method.

F. C. Kells, West Penn Railways, approved the principle of segregation as set forth in the report and quoted from his own experience in support of its advantages. It was his opinion that men in direct charge of bus operation as well as the accountants should have something to say regarding the allocation of costs. C. W. Stocks, editor of *Bus Transportation,* went even further in suggesting that each route, each type of service, each make of vehicle, should be the subject of a separate cost study, and expressed the opinion that the extra cost would be more than justified by the results. Morris W. Rew, research department, Cleveland Railway, approved the suggestion of the committee as to the establishment of the bus hour as the correct basis of cost study and suggested that date of purchase be also made an item of consideration.

D. L. Fennell, superintendent of transportation Kansas City Public Service Company, deplored the lack of detailed information, particularly on experimental work, and suggested that the committee for next year make a further inquiry among member companies into their practice as to the establishment of bus lines into new territory. Drawing upon his own experience, he expressed the opinion that people are willing to pay higher fares for bus than for similar trolley car service. Alexander Shapiro, assistant general manager Washington Rapid Transit Company, suggested further investigation into the best methods of employing men for bus service.

Others who spoke were R. F. Meade, Peoples Motor Bus Company of St. Louis, and L. H. Palmer, vice-president Fifth Avenue Coach Company, New York City.

Speaking on the subject "Relations between Manufacturer and Purchaser after the Purchase," Charles H. Wondries, manager of the commercial division, Studebaker Corporation of America, explained the methods pursued by his company in keeping in touch with its customers after a sale had been made. A corps of trained field men is maintained, working directly under the service and engineering departments, to examine into the operations of all purchasers, consult with them as to their needs and advise them in the event of trouble. The reports made by these men are carefully tabulated and circulated among all interested parties in the organization with the view of getting at the root of all trouble that develops and avoiding a recurrence.

"In our dealings with our customers," says Mr. Wondries, "we at all times endeavor to maintain the following relations: Frequent factory contact with the operator so that we will know his problems and co-operate with him in solving them; prompt attention to service complaints; assistance in providing a proper accounting set-up; free architectural service in the planning and building of service stations, garages and bus terminals; a friendly welcome to suggestions from operators, and the services of an up-to-date service school which is maintained at the factory. Every effort is made to convince the purchaser of our equipment that his problems and ours are the same, and that it is to our mutual advantage to see that they are satisfactorily worked out."

Company Publication Editors Meet

PROBLEMS connected with the publication of house organs and methods of co-operation between the association magazine, *Aera,* and the various company publications were discussed at an informal luncheon meeting held on Thursday at the Hotel Hollenden. In the absence of J. H. Hanna, chairman of the committee on publications, John A. Miller, Jr., editor of *Aera,* acted as sponsor. It was the feeling of the company publication editors present at this meeting that some sort of organization should be set up whereby they would have better opportunities to discuss their problems during the annual convention of the American Electric Railway Association and whereby they might also co-operate more effectively with each other throughout the year. Among those present were E. D. Hale, Louisville Railway; Robert Dougan, Capital Traction Company; R. W. Garvin, Monongahela West Penn Public Service Company; R. R. Retan, Grand Rapids Railroad; E. E. Slick, Union Traction Company of Indiana; Frank Wert, Pennsylvania-Ohio Electric Company; C. Thorburn, Pacific Electric Railway; E. B. Atchley, Northern Ohio Power & Light Company; E. B. Sanders, Kansas City Public Service Company; J. F. Wooley, Jr., Utah Light & Traction Company, and H. H. Norris, Boston Elevated Railway.

Proceedings of the Accountants and Claims Associations will be reported in a subsequent issue.

Adequate Fare Needed to Create Ample Credit for Transportation Companies*

By Owen D. Young
Chairman of the Board General Electric Company

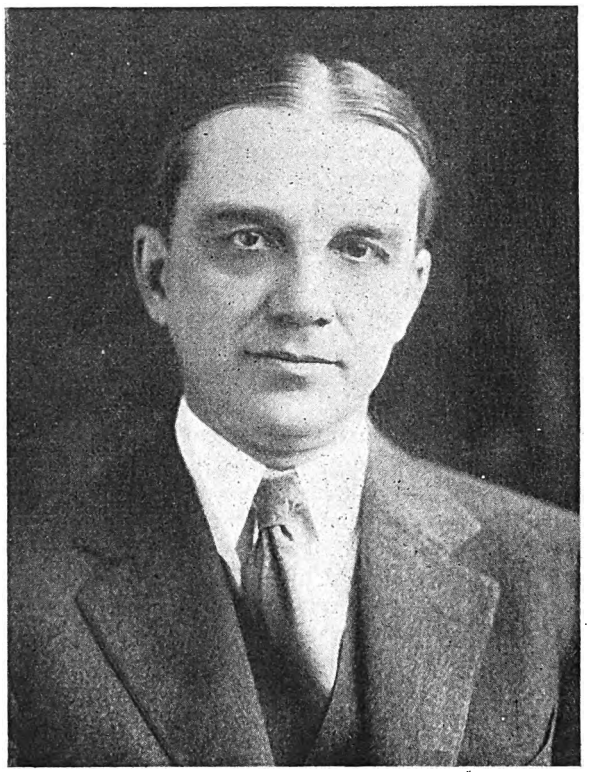
DETERMINATION and allocation of the agencies of transport, in a way, is the simplest and the easiest part of the huge problem facing the electric railway industry. Much more must be done. If new and adequate facilities of transportation are to be provided, money must be found to pay for them. By and large, I believe that our means of local transportation are more inadequate and unsatisfactory than any other part of our modern machine. That means that the facilities should be in substantial part rebuilt, and that they should be vastly improved and extended. That requires large sums of money. Now there are only two ways of securing capital for such an enterprise. One is to create a situation where private capital will voluntarily invest. The other is to take the capital away from the individual involuntarily through taxation and provide facilities by public ownership. It is vastly more important to the public to get the job done than to debate forever how, as between these two systems, it ought to be done.

Private Capital Should Provide Funds

Let no one misunderstand that statement, whether it be applied to railways or to other public utilities. I believe it to be in the interest of the community that such facilities should all be provided by private capital. It is not because the government could not build, manage and operate these systems. The government can. It is because there can be no economic check on the enterprise unless it has to go into the market for its capital. Unless there is an economic check on the enterprise there is no real way of measuring the value of its service.

There are those who believe that in this country we can substitute the political check for the economic one. I do not. Whenever public facilities are to be provided, it is the safest for the community as a whole that the cost should be commensurate with the need, and the best way to determine that is see whether people will pay enough for the service to attract the capital to that enterprise. Then you have a constantly working referendum. If, however, you delegate that question to a few politicians, they will be acting upon the political expediency of the moment, and they have the power to take the capital out of the individual pocket involuntarily.

Therefore, I say that insofar as the community can secure the public service needed through private ownership and private capital, it is wiser and more economical in the long run for the community to do it so. Even if the private capital gets 1 or 2 per cent more than it should, it will still be more economical for the community as a whole. It will be the part of wisdom to resolve the doubt on the side of good credit as an insurance of ample capital supply, even in the worst of times, and therefore of service at all times.



Owen D. Young

I want to make sure that you understand me. I am not opposed to government ownership because the government cannot do the job. I am opposed to it wholly because there is nothing but a political check on expenditure. And I think we have learned pretty well in this country, at least, that a political check on an economic situation is inadequate to protect the community. The only kind of check on an economic situation is an economic check. If the public desires to go into the business of the ownership and management of utilities, I think it should be precluded from drawing upon the state treasury or the public treasury and thereby drawing on your pockets involuntarily through the power of taxation to support those enterprises. If the state or municipality wants to go into the business of running public utilities, let it go into the market for capital on the basis of the credit of the utility itself. Then we will know by the

*Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

reaction of the market whether or not the municipality or the state can do it better than the private owners. If it can go into the market and get cheaper capital, if its accounting is better and shows better results, then we must all retire in favor of the state, because we cannot maintain ourselves in a position of doing an uneconomic and unsatisfactory job. But if, conversely, our balance sheets are better, then I think equally we ought to ask public ownership to retire from the states.

Now I must hasten to say, too, lest I be misunderstood, that there are some public services which have such large social significance that they cannot be translated into economic terms, and therefore private capital cannot be called upon to meet such needs. In such cases I shall always be in favor of taking the capital involuntarily from the taxpayer, because in a country as rich as this we must keep our social machinery in line with our economic resources.

I think our facilities for local transportation should be paid for by private capital, at least until it is demonstrated that our social needs for distribution of the population are so great that we cannot get the results through our usual financial machinery. By and large, I think in this country we are still able to get private capital to do the job, but that means co-operation on the part of the public authorities, with those who understand the business of transportation, to create a situation in which the credit of local transportation companies can be established and maintained, in order that private capital may be acquired.

What are the elements necessary to establish such credit? First, the rate of fare must be such as to provide a gross income adequate, after operating expenses, including maintenance and reserves, to yield a fair return on the capital required for the facilities. Second, that situation must be insured by satisfactory franchises for such a period as will warrant permanent investment. Third, in my judgment, a monopoly should be established of local transportation facilities of all kinds, and the rates and service should be regulated by the government so as to give to the public the best service and lowest rates, consistent only with such return as will always enable them to get the capital desired for their needs. Unless we have a monopoly and public regulation, we must do the job by competition, and I believe that in this field of transportation competition is not an effective regulator; it is merely a destructive one which can come to nothing else but government ownership in the end.

So I say let us provide ample credit for our transportation companies. Let us give them sound fares. Let us demand from them adequate facilities. Let us build up a situation where we get sufficient capital to meet all of our transportation needs, and let us do it quickly in order that the horrible congestion which now exists in some of our great cities, which is not only uneconomic but immoral, shall be abolished from this country, which at least is rich enough to provide, one way or another, decent transportation facilities for its people.

All of the financial water has been drained off the railways as a result of the experience of the last few years. Some part of the substance has gone, too, but the values which now remain are, in my judgment, reduced to the lowest terms and should furnish a sound basis for new capitalization and new capital, provided satisfactory conditions for the future are granted by the public. In a word, I am not pessimistic about the street railway values which are left. It is now time to build on them the new structure which the public needs and which the initiative of you men skilled in the business must provide.

If we can determine what agencies are the best for the job and if we can determine how we will pay for them, whether by public or private capital—and if by private capital, at the lowest rate obtainable—then we shall be on our way toward a real solution of this vexing question which at present is a disgrace to the intelligence of the American people. May I mention some of the slogans which bar the way? First and most persuasive of all, the 5-cent fare for all distances and under all conditions. The 5-cent fare is the disease of our coinage and our fluctuating price level. It is the attractive germ by which politicians inoculate the public with an apparently incurable and progressive ailment.

Let us look for a moment at the justice of this fare question. The average increase in the general price level of this country between 1913 and 1928 is approximately 60 per cent. In other words, it takes at least $1.60 to buy goods today which could have been bought in 1913 for $1. If this same percentage of increase were applied to street railway fares it would mean that an 8-cent fare is now, measured by commodity prices, only the equivalent of a 5-cent fare before the war. This is, as a matter of fact, the general average now attained, but unfortunately this does not answer the whole question. Everyone knows that the law lags behind economic change. Increase in costs and competition from the motor industry did not wait upon the deliberations of public service commissions; increase in the fare necessarily did. The result speaks for itself. I need only say that, as a consequence, there is an enormous slack to be taken up, and the inevitable losses of the past few years, not so much to stockholders through the suspension of dividends as to the service through depletion of funds for maintenance and reserve, make adequate rates today all the more imperative if the service is really to be restored.

Even this is not the whole story. For example, the level of wages in this country has increased during this same period on an average, not of 60 per cent, but of 120 per cent, and it is a fact that the price of labor is a much more important item in transportation costs than the price of commodities. If we were to apply that percentage of increase to the 5-cent fare, we would find that 11 cents now is no more than the equivalent of 5 cents in the earlier days. So it may not be far out of the way to say that somewhere from 8 cents to 11 cents is the equivalent of the old 5-cent fare. This only assumes, of course, that the service of today shall be no better than the old service, but we all know that improvement is demanded, and rightly demanded, everywhere. High-speed service, overhead service, underground service, more reliable service, is the rightful expectation and demand of the public. Improvements can be made and will be made, but it is neither wise nor just for the public to make demands and then set up obstacles to performance. And now I say that, in my judgment, it is just as bad for the railway managers to make promises to the public which they cannot perform. They make it under the coercion of the situation. My advice to the railway managers of the country is, to stand on the fair valuation of your property, ask for a fair return, render such service as economic conditions will permit you to render, but do not compromise with the inevitable by promising to do something that can't be done.

Certainly the farmer in 1928 does not expect to feed

Digitized by Google

his horses half the oats he did in 1913 and yet get the same service from them. That is exactly, however, what the public is demanding where it still insists on the 5-cent fare. If a 5-cent fare is insisted upon where on the average it costs 8 cents to transport, why talk about private capital doing that job? It simply cannot be done. Nor can it be done any cheaper by public capital, but we can tax the community instead of the individual rider to make up the difference. To all advocates of a 5-cent fare when it costs 8 cents to transport I say, not in the interests of the street railway industry but in the interest of the public, be fair with your slogan. Do not expect private capital to do the job under those circumstances. Frankly say that you are for government ownership and that you intend to tax all people to give riders carriage for 3 cents less than cost. Let us cut out the nonsense and get down to business. The fare, however, cannot be such as to defeat the very distribution which is necessary to the social needs of the community, and when it does we shall have to take the social penalty or go to government subsidy or ownership.

I shall be bold enough to speak of one more condition affecting the electric railways of the country which has tended to create some confusion in the public mind, and has perhaps to some extent delayed both the public and the industry in meeting the basic issues involved in adequate street railway service. I refer to the practice of unifying, either in fact or in treatment, the investment in the local railway service with that of the light and power service. In such a case, if the light and power rates provide a satisfactory return on the total investment, there is no great pressure on the part of the owners to force the issue with the public of a sound economic rate of fare on the railways. By and large, it is conducive to the comfort of the local utility management and to the comfort of public authorities to permit the continuance of a low rate of fare on the railways which will be locally popular, and continue the light and power rates on a higher level in order that they may supplement the return on the railway investment.

Now, I do not mean that this situation results from bad faith on the part of anyone. In many situations in this country the railways and the electric power and light properties have been combined for many years. The naturalness of the combination is self-evident. The consolidation of these properties very largely took place prior to the time of large unification of power properties. Consequently, during the last fifteen years it has frequently been impossible for the power companies to acquire important units of local distribution in their systems without buying at the same time the local street railway property. Having acquired it, they naturally and very appropriately wanted a fair return on the invested capital.

The point which I wish to make is that they were not greatly concerned whether each property stood on its own economic bottom. Being human, they were willing to acquiesce in an uneconomic railway situation if the valley of the railway net could be made up by an adequate peak in the light and power earnings. For many communities I am not saying that this was a bad method, certainly not as a matter of expediency. The harm came to the industry when the fares on such unified properties were compared with the railway fares in some other community where the transportation property was not unified with the power and light service.

There is no more persuasive argument against an increase in fare than to point out that another community, perhaps of about the same general size and having similar operating conditions, is paying less for its transportation than either the present or a proposed new rate. So there are today throughout the United States certain railway situations where uneconomic fares are being charged without protest by the owners, and, of course, with the full approval of the public authorities. These situations naturally tend to delay the complete rehabilitation of the railway industry as a whole, and are therefore regrettable.

By and large, I believe it will be better for the industry and for the public to face frankly the question of providing an adequate return on its transport capital either from fares or through a frank subsidy from the public treasury. To levy a special tax on power and light users to supplement an inadequate railway fare is, in my judgment, unsound in principle, and will in the long run delay the best development of both industries. If that be true, then each community should provide for each service such rates as will yield a fair return on the investment in that particular service. It would be highly unfair in cases where they have acquiesced in unification to reduce the power and light rates without providing at the same time an adequate return on the railway investment. Perhaps that is too much to expect of politics, but, I, for one, shall never lose faith in the soundness of judgment nor the fairness of spirit of the American people if problems are put to them frankly and clearly. Secrecy and confusion are the enemies of confidence. Confidence is the basis of business. It is the sound insurance of fair treatment extended to men and money that render a public service.

The public must know that while it can exhaust the capital now sunk in the industry by unfair treatment it cannot by such means induce new capital to go in. That, unfortunately, is our situation in many places today. This must be corrected, and I have confidence that the masses of the people, even over the heads of their political leaders, will insist on its correction if the matter be properly represented.

If I may summarize the things which I believe in, they are:

First, That the business of local transportation should be a monopoly, publicly regulated as to rates and service, with a fare adequate to attract private capital if such fare can be obtained, and if not, then the distribution needs of the community should be satisfied through the tax levy, either under public ownership or as a contribution to the deficit in private ownership.

Second, That private ownership be adopted in all cases where it can meet the needs of the community, and when adopted that the conditions be made such that the safety of the capital be adequately insured and the rate of return be as amply provided for as in any general business in order that the cost of the capital may not be greater for these enterprises than for others.

Third, That the transportation company, whether it be publicly or privately owned, use the means best adapted for the most efficient and economical transportation of the public which it serves. I hold no brief for electricity, except that if it cannot be used in local transportation it will have met its first great defeat. If it can be used advantageously, then our research and engineering, under the impetus of a new spirit and in the light of a pressing need, should be drafted into service to redeem an industry and an art which has been able to survive during these last fifteen years only by reason of the courage and determination of the men who have administered it.

Our Faith Has Been Justified*

Encouraging progress made during past year. Public opinion has become more favorable. As we improve our service we can feel confident of winning the rewards to which it is entitled

By R. P. Stevens

President American Electric Railway Association

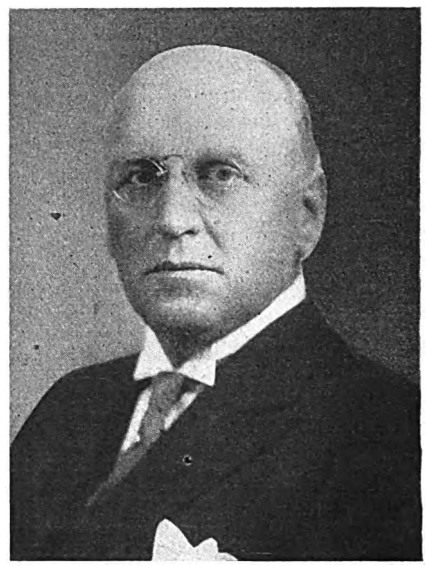
MUCH to encourage, much to inspire, will be found by all of us in the progress made by our industry and our association during the past year. Our industry is moving definitely forward toward overcoming the many difficulties with which it has been beset for more than a decade. Many of the obstacles that once seemed almost insurmountable are gradually giving away before the determination and spirit with which transportation men are attacking them. Under the banner of public service, we have carried on when the outlook seemed dark indeed. For a time, the very public we serve seemed against us. But we were convinced that public transportation is a necessity in our modern civilization, and we struggled to find the solution to our problems despite great and prolonged discouragement.

Our faith has been justified. Slowly, but surely, one difficulty after another is being overcome. Our rate of progress during the past few years has been more rapid than seems apparent to us when we are engrossed in the many complexities of daily operation. When we glance back over the road we have traveled during the past few years; when we review mentally the difficulties that have been met and largely overcome, we begin to grasp the full significance of the truly remarkable progress that has been made.

The program of this year's convention tells its own story: Modernization! Improved service!, Merchandising! These subjects are in sharp contrast with any intimation that the public transportation industry has outlived its usefulness.

Nothing has happened in the past year to change our firm conviction that the electric railway industry is a permanent, basic industry. Nothing yet has been devised that can take the place of the electric car in handling expeditiously and economically the local transportation of the masses in our large and medium-size communities. Nothing is apparent in the immediate future that will affect seriously the permanent value of our industry to the communities which it serves.

The public itself is slowly, but nevertheless surely, coming to realize the essential nature of the service which we render. It is coming to understand better than formerly something of the economics of public transportation. It has learned—sometimes after costly experiment—that there is a great difference between a responsible, community-wide transportation service, and "wildcat," spasmodic operations by individuals or irresponsible organizations that are unwilling to take the lean traffic along with the fat. It has learned that competition of that kind with a responsible and established



R. P. Stevens

carrier is actually a parasite on the community and that such operations are unwilling to carry the full responsibility for maintaining the kind of a community-wide service which is the first requirement of a public utility. Unfortunately, the public in some cities failed to understand these principles until irreparable harm had been done. After permitting "wildcat" operations of jitneys or irresponsible buses to starve their transportation systems out of existence, these communities learned all too late that their neglect to curb irresponsible competition in transportation had cost them a basic and necessary utility service.

But fortunately instances of this kind are now limited only to a few misguided communities, where public officials have failed to recognize their full responsibilities to the public which they represent. The same is true with respect to other basic conditions which have handicapped our industry in the past. There is a definite trend in progressive cities to revise the former rigid and inflexible franchises, in favor of service-at-cost and indeterminate grants which permit adjustment to meet changing conditions. There has been a steady increase in the rate of fare to meet the higher cost of giving service. The average cash fare for the country is now 8.17 cents and the fixed 5-cent fare has almost disappeared along with the 5-cent cigar, except in a very few communities where public officials refuse to recognize that the public suffers most when transportation is starved to the point where first-class service becomes impossible.

Except for comparatively few instances where these necessary basic changes are still in the process of being worked out—and they will be worked out if public transportation in those communities is to continue—there remains only one major question regarding the future of our industry. The private automobile has become so common a means of personal transportation that many

**Abstract of presidential address at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

who formerly used our service, now ride in their own vehicles for daily travel. Consequently public transportation agencies, for a number of years, suffered a sharp falling off in riding.

This has been felt most in the smaller communities. In the larger cities, limitations in street capacity are causing a very definite reaction. Traffic congestion has become one of the most serious problems with which these cities have to contend, and many of them have come to realize the importance of the part played by mass transportation agencies. Manifestly it is economically impossible to provide sufficient street space for all to travel in individual vehicles, and the cost of individual transportation is beyond the reach of great masses of our population. This situation is reflected in the traffic figures of local transportation companies. The average for more than 100 companies reporting for the seven months ending July 31, 1928, as compared to the corresponding seven months of 1927, shows a decrease of less than 1 per cent. Of these companies, many show considerable increases for several years.

But that is not all. The industry is completely changing its own conception of the nature of its business and of the measures needed to meet the desire for comfort and luxury brought by the automobile. The program of this year's convention, and the cars and buses being displayed in the exhibit, tell the story more convincingly than I can put it into words. We have struggled with the problem of the automobile for a number of years, but we are finally about to meet it upon its own ground. We are in the process of developing equipment with which to meet the competition of the individual vehicle.

A few years ago the bus was considered a threat against the established transportation agencies. But that is no longer true, for we have ceased to remain merely electric railways, in that practically all the companies belonging to the association are operating buses in conjunction with their rail service. Growing experience with the bus has gradually indicated its proper economic place. It is becoming clearer each day that, while the bus offers a valuable adjunct to rail lines for certain classes of service and under certain operating conditions, it has its limitations as well as its advantages. Its field is not in the replacement of rail service in heavy traffic territory, but in furnishing service in sections where rails cannot be supported; in providing crosstown and feeder lines, and in distinctive classes of service at different rates than those charged for mass transportation. Even the taxicab is being taken into the fold by some companies where conditions make this possible, and the progress toward unification and co-ordination of public transportation facilities has been definite and rapid.

There no longer exists a serious question regarding the replacement of electric railways with buses. Where that question does exist today, it is within the industry, and involves merely the substitution of one vehicle for another on specific lines where the economic conditions dictate this move in the public interest.

It is significant that the extension of new rail lines and the additional service provided by local transportation companies with buses, far exceeds in mileage the total of all suspensions or abandonments of individual pieces of trackage due to shifting population or other local economic changes. This pruning and adjustment is a healthy process. It results from the examination of individual lines and routes with a view to eliminating wasteful operations that hold back the progress of an entire transportation property. But it is notable that the few abandonments of entire rail properties that have occurred are limited to only very small communities where it is questionable whether they will support any form of public transportation—either by street car or bus.

The spirit of salesmanship is rapidly permeating our entire industry. If there ever was a public-be-damned attitude on the part of management it certainly does not exist today. Every progressive operator is thinking in terms of improving service, developing a more cordial attitude on the part of employees toward passengers and the public, and application of modern merchandising methods to increase the use of public transportation.

The interurbans, which as a class have been among those hardest hit by automobile competition, are working in this same direction and, in addition, are turning their attention more seriously to the development of freight business. There has been some inertia in the improvement of facilities for handling freight and in the degree of co-operation between various companies that is essential for developing a satisfactory volume of interchange freight business, but definite progress is being made and the future for most of these properties looks brighter than it has for a number of years. Some of them have already gone ahead to a point where remarkable increases in traffic have resulted. These properties are pointing the way for those that have held back.

When we stop to view the future for our industry in the light of our experience during the past few years, there is ground for real enthusiasm. At the rate of progress which the industry has been making in changing its viewpoint and its conception of the measures needed to meet the changed conditions under which the public transportation business must be conducted, we may look forward to a truly remarkable improvement during the next five years. We are concentrating on the development of equipment which will attract riders; equipment that will be in keeping with its surroundings in the modern city; that will look better, ride better, accelerate faster, operate more quietly and more economically than the equipment which we were accustomed to look upon as satisfactory. We have made considerable progress in the modernization of our facilities and our thinking, but we have by no means exhausted the possibilities. We are in the midst of great fundamental changes within the industry. Until we complete the process, management has not discharged its full responsibility, and the public will not have had the opportunity to judge in proper perspective the part which public transportaion plays and may be expected to continue to play in the economic and social life and development of the nation.

We are now at the beginning of another association year. I believe it will be more prosperous than any year of the recent past. Surely an industry that can weather such storms as we have weathered during the last ten years, has proved its staunchness and stability—its right to live and serve. Not only that, but it has proved that there is a basic need for the service which it renders. With the industry now aroused to a better understanding than ever of the change in public expectations; with a change in its point of view and rapid progress toward the improvement of its facilities and service under way; with public good will manifestly becoming more favorable; and with a growing determination by every executive, operating official and, yes, every employee, to strive toward the ideal of the highest possible efficiency and courtesy in its service, we look forward with rising expectations, confident of winning the rewards to which such service is entitled.

Success Will Reward

Continued Improvement of Transportation*

By B. C. Cobb
Chairman of the Advisory Council American Electric Railway Association

ANOTHER year has run its course—another lap in the space of time has been put behind us—and we of the electric railway industry are once more, and for the third successive year, gathered together in Cleveland for conference and communion. In our effort during the past year to so conduct ourselves as to merit commendation from the citizens of this great country of ours, I am sure we have been measurably successful—successful not only in our comportment but also successful in telling our story to the people. We have told this story in many ways; viz., by advertising in the press, by addresses delivered to the public and to the industry itself, by remarkable exhibits at our conventions of our transportation vehicles, and last but not least, by an honest effort to render at all times a courteous and convenient service.

The exhibits of transportation vehicles at the last few conventions have been really extraordinary. They have been not only educational to the industry but also to the public, and they surely have borne witness that the manufacturers and the industry itself are striving in every way possible to improve the service and make comfortable, convenient and safe the carriers in which the people ride.

We who are charged with the carrying on of the transportation business in which we are interested still feel, as we have always felt, that our service is an essential and a necessary thing. We are not unmindful of the convenience, the luxury, and I may say extravagance which have been provided and caused by the privately owned automobile. We recognize these things and do not resent or criticize them except in so far as they are detrimental to the public good. To injure or hurt the automobile industry in any way would be a calamity, for the automobile business has become if not the greatest, then nearly the greatest, industry in our midst. The use of automobiles has become a necessary thing in our daily life, and we who originally and for many years carried passengers only by electric tram have learned that the auto bus is of distinct advantage in our transportation service.

Neither we nor the public should, however, forget that the constantly increased use of privately owned automobiles has had a very marked effect upon passenger travel in public transportation vehicles. To say that the privately owned automobile has always been wisely used would be to speak untruthfully. To curb its use by drastic laws and unwise regulations would be harmful. There must be some middle ground, however—some safe and sane method of control—covering the use of this form of vehicle which will be helpful to all concerned. Sooner or later—and I am not going to dwell upon this subject, for it has been discussed quite fully in former reports—the parking nuisance is going to be abated, not because it will benefit the transportation companies but because the people themselves are gradually recognizing the evil that it does in many other ways.

We think it is generally conceded that all communities of any size need public transportation service of some kind—either electric rail, auto bus, taxicab, or something similar. We of the industry, however, are still firmly convinced that mass travel in urban centers can be handled to better advantage and greater efficiency on fixed rails and by electric cars than in any other way.

The past year has not shown any appreciable increase in the number of passengers carried. Sixteen billion is the approximate figure, and this figure has remained almost stationary for several years. The wonder of it all is that there has not been a decrease resulting from the constantly increasing use of the privately owned automobile. Last year the American people owned and operated 20,500,000 passenger automobiles, or one automobile to every 5.5 inhabitants of the country. Just what the record will be at the end of 1928 I do not know. Most likely it will be about 23,000,000 units. When we consider this development, which is largely competitive, I ask you, is it not unjust to say that our industry lacks courage and has not had foresight or been brave in its efforts to stem the tide which set in against it once the automobile became a generally accepted mode of travel? What this industry needs today is not criticism but constructive suggestion and help from the communities in which it operates. Except in a very few instances, the industry has received just this sort of thing—I mean help from the citizens and authorities in getting over many of the rough spots in the road.

Higher Fares Necessary

The greatest help that authorities and the communities have given is their willingness to increase the rates of fare that may be charged for passenger travel. The average city fare today is approximately 8 cents. While such rate of charge may be sufficient in some of the larger cities, my own opinion is that, if the companies are generally to become prosperous—and this I am sure is what everyone wants—a 10-cent fare will have to be the standard. If we are to continue the standard of living adopted in this country since the close of the late

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

war—I think no one wants it otherwise—why is it unfair, why is it uneconomic, to accord the railway companies of the country the same treatment that has been accorded all other industries and all other people—I mean the right to charge a higher rate than formerly was charged for the service rendered? Generally speaking, rates of charge for public utility service for several years have been gradually decreasing. These decreases are largely, however, confined to the gas and electric industries, where considerable improvement has been made in the art of generation, which to some extent has lowered the cost of production. In addition, these industries have not been adversely affected by serious competition such as the automobile. This one thing alone has so held down increases in the number of passengers carried—which means curtailment in gross earnings—as to practically wipe out, or at least minimize, savings, economies and improvements in the service rendered.

The public utility industry has many times been jumped on good and hard. Maybe some of us have sometimes deserved such jumpings. Mostly has this criticism and attack come from self-seeking politicians with little to lose but much to gain. The people generally, however, when once they understood the situation, have been fair in their treatment and ready with their help. We have been told many times to tell our story, and this we have endeavored to do. We think this story has been well received. We have often been told that we were poor salesmen. Perhaps this charge or comment has been in many instances true. Nevertheless, I do not think at the moment that such criticism can be substantiated, and I am quite sure that all fair-minded people will recognize the efforts that have been made by our industry to improve its service and sell it to the public.

The electric railway industry during the past ten years has taken many bumps. It has been down in the valley of shadows and darkness. Its era of prosperity was in a few short years changed into an era of dire straits. It has gone through this last era sometimes wavering but generally manfully and bravely, so it is not an overstatement to say that progress from the period of adversity is gradually being made. This does not mean that we have reached the crest or that the era of prosperity has again returned. Such is not the case and we would be unfair to ourselves and likewise unfair to the public which we serve if we made such a statement. We still need help. We still need higher fares. We still need denser travel if we are to prosper.

During the past year some companies have gone into receivership. Happily, however, enough others have come out so as to make the score about even. In this connection, those companies that have been most greatly troubled in this way are the interurbans, where competition from unregulated carriers continues to be severe. This sort of competition is manifestly unfair, not only to the regulated carriers but to the people themselves, who must pay the capital cost of constructing roadways as well as the cost of repairing damages done by commercially operated vehicles.

During the past year the industry lost—and at a young age—one of its outstanding and most competent men. When Robert I. Todd passed into the great beyond only a few weeks since, he left an aching void in the hearts of many who loved and respected him.

The principles enunciated by your council two years since are just as fundamental today as they were then. I will not repeat them, as they must be familiar to you all. Your council, as stated last year, still stands for and believes in those principles.

Finally, the greatest need of the industry is increased travel. This we are hopeful for and it is something which I personally think we shall shortly see. With increased travel, a reasonable rate of fare, and with a better understanding—which surely is the situation now existing between the companies serving and the people—there can be only one answer—SUCCESS—and this means much to everyone.

How Can Modernization Be Justified From Its Financial Results?*

By Alonzo R. Williams
First Vice-President and General Manager United Electric Railways, Providence, R. I.

Alonzo R. Williams

CAN anyone conceive of a business man other than a street railway man who has lived the street railway life for years asking the question, "How can modernization be justified?" At the very outset the question assumes the truth of the present situation, namely, that the street railway companies of the country with but few exceptions are antiquated and behind the times both as to methods of operation and conditions of equipment. This condition of mental and physical stagnation has done as much as anything else to bring about

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

the condition in which the street railway industry finds itself today. Can we justify our action in being up to date? It is absurdity itself to ask such a question. Of course modernization is justified. Modernization as I define the word is being up to date, keeping pace with the times, being just one jump ahead of our competitors, sensing the public pulse and catering to it. If the street railways of today keep pace with the times, if the street railways of today are just one jump ahead of the other fellow and if the street railways of today truly sense the public pulse, modernization must of necessity bring financial results. It cannot fail. Population is increasing. The people seek and must have transportation. Do financial results justify modernization? No one will deny that the automobile industry today is financially stable because it is modernized transportation. It is going forward with leaps and bounds. Can anyone deny the stability of the great electric power industry of today? No. Why? Because it is a modernized development of natural resources. In every case where industry has failed to modernize it has faced financial ruin.

From what I have been able to gather from various publications, some street railway companies in this country have already modernized their methods and their equipment and the financial results have justified the expenditures made. In the case of the United Electric Railways of Providence, R. I., the process of modernization is going on and its effect is already being reflected in the financial statements. If financial results justify modernization will such results attract new capital? Capital is always ready to invest in a business ably managed along modern lines and any business so managed must of necessity furnish a financial statement attractive to the financier. Modernization is a recognized necessity. Improvement in the financial results must follow and capital will respond.

The modernized and up-to-date street railway executive has before him a superhuman task in overcoming the antagonism of his heritage. But a truly modern executive can overcome that plague. He can come out victorious only by a sublime faith in the public, in his company, in his men and in himself, and spurred on by that faith, press forward with unbounded enthusiasm.

A modern executive must pull down those battlements and those walls which separate his predecessor from his men and from the public at large. He must fling his doors wide open and must remove those who bar the entrance to those who would consult with him. The boys in blue upon the cars and upon the motor transport lines have at their disposal a wealth of valuable information gained through years of experience on the lines. He should consult with them in his private office. He should help them by personally listening to their suggestions. He should work with them, work for them, encourage them, compliment them for deeds well done and do it, not through a selected agent, but do it himself. The boys in blue are the salesmen in the field and no salesman can enthusiastically sell his wares unless he has faith in his calling and faith in his management. Isolation and secrecy breed contempt. When these men upon the lines have that faith, when they have that understanding, when they feel the power of that leadership, when they feel that they are truly a responsible part of the great whole, then will they go out into the highways and byways and sell the goods the street railway has to offer to a willing and appreciative purchaser.

The public today knows what it most desires and is almost unlimited in its power and ability to satisfy those desires. The advent of the automobile has brought to the door of the citizen today two things, speed and comfort. The people can have both, and will have both, and their patronage will go to him who furnishes both. This is modernization and this is the result of modernization. You can fool all of the people some of the time and some of the people all of the time but you can't fool a car rider today and get away with it. You can tell a man on the street to go to the devil but you can't say that to a trolley patron today for there are too many places for him to go instead, and if he does take your advice and goes to the place where his Satanic majesty hangs out you will find it will be at the door of your competitor. The public of today has drunk deeply of the refreshing stimulant of prosperity. It has inhaled the delightful perfume of luxury. The modern street railway man must needs study this psychology, interpret it correctly and be able to meet its requirements. It is one of the big problems of modern times and only a modernized executive can cope with the situation.

Modernization is the antithesis of the practices of the past. Modernization is nothing more or less than this: Quick, comfortable and frequent service rendered by contented, courteous, helpful employees to an understanding, satisfied and appreciative public. That it pays goes without saying. It has paid in Rhode Island. From a study of the curves of passenger earnings from January to June of 1927 and 1928, it is found that in January of this year the decrease in gross amounted to $71,871, whereas in June the curves had so approximated as to show a difference of but $24,203. The curve for 1928 was flattening out and in a state where the industrial situation is none too good and the weather peculiar to this year has kept people within doors. Under such a showing capital is ready to help. It is unnecessary to talk of modernization, it needs no discussion. Less talk and more modernized action should be the watchword of the future.

"WITH the industry now aroused to a better understanding than ever of the change in public expectations, with a change in its point of view and rapid progress toward the improvement of its facilities and service under way, with public good will manifestly becoming more favorable . . . we look forward with rising expectations, confident of winning the rewards to which such service is entitled."

How the Association Helps the Industry*

It acts as spokesman for the electric railways in national affairs. It gathers statistics on all phases of operation and answers thousands of inquiries every year. The co-operative effort of the members is of inestimable benefit to all

By W. H. Sawyer

Past-President American Electric Railway Association
President Stevens & Wood, Inc.
New York City

EVERY electric railway operating or manufacturing company needs all the available cash, brains and energy which it can obtain. Few have any surplus to divide. They must conserve to the extreme. Why, then, have an electric railway association which admittedly takes money, time and energy? Why not devote all our resources directly to solving of our local problems? Why be concerned with national activities and the industry at large? Why worry about the other man's troubles, as it were?

We should approach this question from a selfish viewpoint. What has our company to gain by such an association? This is a natural question. It is a question which to my own knowledge has been seriously raised many times. But visualize, if you will, what it would mean if there were no association—what it would mean not only to the industry at large but to each member company—to us as individuals. Visualize what it would mean if there were no clearing house for vital data on fares and wages. The association collects this information, verifies it, analyzes it and sends it out over the country. It becomes common-place knowledge to us. We do not stop to think what it would mean if each of us had to depend on his own initiative in order to get this most necessary information.

Your first thought may be that a great deal of this information is not necessary for you and that you really know what the situations are elsewhere enough for your own need. But how do you know what you do know? It is because the association directly and through the technical press has scattered these statistics until we absorb them. We accept them without conscious realization of where we get the information. Too often we do not stop to think of the importance of having available definite, reliable, statistics as to the cost of living and all similar factors entering into the problem of treating our employees fairly. We could not even give our public reliable information as to fares and wages elsewhere so that they might judge as to whether or not we were operating efficiently and economically. Certainly it is sound business acumen to collect, correlate and disseminate these statistics through the medium of just such a national organization as ours.

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

W. H. Sawyer

We often think of the association as furnishing certain bulletins, pamphlets and committee reports. Too few of us recognize the broader aspects, the broader possibilities of utilizing the association. I care not what your problem may be locally, the association can be and desires to be of help to you.

During the past year there were over 18,000 inquiries asking for information, asking for facts, for data. The majority of this information was at hand and went forward by telegram or by letter immediately. Some of it required research but the association staff understands that it is there to serve the industry and all information asked for is given prompt and efficient attention.

To every company there comes a time when it must appear before a commission or rate-making body in connection with franchise valuation or rates. What a handicap it would be if there were no association headquarters to which one could turn for full and complete information as to the history of the art, as to the facts and findings in other cases. Some companies have not taken full advantage of the valuation and rate data, information, advice and counsel available at headquarters

Digitized by Google

but they have been the losers thereby. It has, nevertheless, been invaluable to the progress of the industry.

Taxes and special imposts are at times vital questions with the local company. One of the most important measuring sticks is comparison with other companies, with other industries. At association headquarters such information is available and, moreover, available after having been analyzed by experts who have given these matters detailed study.

Statistics a Valuable Guide

We often refer to our statistical department. Every month you receive statistics as to passengers carried by other member companies. You have come to regard these as essential. You compare your results with others in your territory. You compare your figures with others nationally. This is a valuable guide and yet this service is but a minor routine feature of the work of the statistical department.

If it is your thought that such work is probably of some value but really does not mean much to you or to your company, let me say to you that, if that be true, it is because you are not taking advantage of the opportunity afforded you by this association. Let me say to you that you are not doing your duty to your company or to yourself. If you are not interested in this association, if you do not keep posted as to what it can and is willing to do for you, you can expect to receive only comparatively meager benefits. The company or the individual that gives most freely and willingly to the association receives the greatest benefits. You cannot escape that fact. The value of the association to you lies in the use you make of it.

We have our short comings as an association but I believe that there is no similar association that has its data and information more available or more helpful to its members than the American Electric Railway Association. We are not perfect. Your own company organization is probably not all you would wish it to be. You constantly feel that there are changes which should be made but you do not always make these changes. We are all human, but all in all, the American Electric Railway Association is being conducted not only honestly but efficiently—efficiently from a cold-blooded business standpoint. The dues of the association are appreciably less than those of other comparable associations.

Association Dues Nominal

If it be true that the association is a necessity, if it be true that the association is operating efficiently and economically and is furnishing information absolutely essential to the industry, what possible reason is there why every electric railway in the country should not whole-heartedly support it? The only reason that I can conceive is that even without belonging to the association one can reap many of its benefits.

There are some who possibly cannot afford to pay the association's dues, but if that be true, their next move is to cease operation. Then there are those few who operate a number of companies and get the benefits and service by having one or two of their smaller companies belong to the association. The good work done by the association and the spirit of fair play has reduced the number who take advantage of this possibility to a very small percentage. I consider that association dues are just as normal and requisite a part of operating expenses as are the salaries of executives; both are essential.

As to manufacturer members, there is probably no other comparable association where the manufacturers and the operators work closer or with more co-operation for mutual benefits derived. So far as I am concerned, the manufacturer who does not belong to and support the association's activities thereby signifies to me that he is not interested in the industry and does not want any of our business.

There may be those among you who do not question but that there should be an association but do question its methods, the extent of its activities. The association is operated on the basis of majority rule. Under our present setup it is the association that primarily represents the industry and it must adapt itself, its constitution and its methods, best to meet the problems of the industry as a whole. The history of the association shows, however, that no major move has been made without fully taking into account even a small minority. We must work together as a unit and if after compromises have been made, we are all of one accord with the exception of a small minority, a progressive, constructive program approved by the great majority must prevail.

Association Speaks for Industry

The association's strength lies in its ability to speak for the industry with a single voice of authority, thus enabling it to carry more weight on subjects of vital importance to the industry than could be exerted by individual companies. There is always legislation pending of national importance to the industry, such as that now pending for the regulation of interstate buses. Some organization must speak with authority for this industry. There must be a concerted movement. There must be somebody to appear, to give definite facts as to the electric railway industry. If conditions vary locally, these facts are always brought out. The association does not act to the detriment of any local company, but it does act constructively for the entire industry. It must continue so to function.

The Interstate Commerce Commission is giving thought to new regulations as to depreciation. There must be direct representation on the part of the electric railway industry. The commission must have a clearing house to which it can go for all facts and data regarding our industry and to ascertain the effect on it of any rules or regulations which might be promulgated by the commission. Our national relations committee has analyzed these problems from a national standpoint. Its representatives have appeared, when called upon, to speak for the industry. We have no lobbyists at Washington but the industry must have, when called upon, machinery whereby it can give pertinent facts to Congress, to the Interstate Commerce Commission and to any other such body.

All of Us Profit

It is the American Electric Railway Association that the industry looks to for definite, clean-cut facts, unprejudiced and unbiased. No other agency can fulfill this obligation. We all profit by the inspiration of those whose accomplishments are superior to our own and it is in a mutual association such as ours that we all have an opportunity to profit. The progress of the industry is cumulative and dependent on the extent to which we garner of the fruitful experience of our associates.

The Economics Of and Need For

Public Participation in City Transportation*

By Henry I. Harriman

President Boston Chamber of Commerce and Chairman Metropolitan Planning Board Boston, Mass.

Henry I. Harriman

WITH each advance in mass production there is an increased tendency for the concentration of population during the hours of work and an increased need of adequate and fuller transportation facilities, so that when work is over people may live at a substantial distances from their labor where land values are less, where real homes are possible and where living conditions are safe and sane. The advent of the automobile has also greatly increased the congestion of the modern city street and made more difficult the rapid transportation of passengers by surface trolleys. Thus all of the great centers of population are faced with the necessity for increased street capacity, either in the form of wider surface streets, overhead ways or underground routes.

I see nothing inconsistent in considering a subway for rapid transit trains as an underground street. There is nothing inconsistent in limiting the use of our streets. We frequently bar trucks from certain streets. We regulate traffic in some streets to the right, and in other streets to the left. We set aside a part of each street in the form of a sidewalk for one class of users, the pedestrians. What is there inconsistent or unreasonable in setting aside an underground street for the conveyance of passengers by rapid transit trains?

In the past the surface street has been paid for by the community as a whole, with occasional local assessments if property values were substantially increased. If we were to follow this analogy then the underground street which is built for the rapid transit train should likewise be paid for by the community. That, however, was not the rule established when the first elevated roads and subways were constructed. There were obvious savings in the cost of transportation resulting from such elevated roads or subways and the precedent was established of either granting a franchise to a local transportation company to construct such routes, or for the community itself to construct them and rent them to a local transportation company at a price which would pay both interest and sinking fund on cost. This was but another way of placing the burden of cost upon the car rider, for obviously the rapid transit company that must pay a rental for its subway must increase its fares to cover such rental.

Thus there have been established two divergent methods of paying for streets. Our surface streets have largely been paid for by the community. Our underground and our overhead streets have been paid for by the persons using them. It therefore behooves us to analyze the real equities of the case and see upon whose shoulders the burdens of additional subways should be placed. Should they be paid for by the community; should they be paid for by the car rider; or should the cost in some way be divided between the various parties interested?

It is generally conceded that the construction of rapid transit lines benefits in varying degrees five distinct groups:

1. It benefits the community as a whole. No one can doubt that it is for the moral, social and economic welfare of a community to make transportation between the place of business and the home easy and rapid.
2. It benefits the car rider, the man who travels daily back and forth from factory to house.
3. It benefits the transportation company by enabling it to carry its passengers more expeditiously on fast subway trains than by surface trolleys.
4. It benefits, in a particular way, certain real estate lying within a reasonable distance of the rapid transit lines.
5. Finally, the automobilist and, in a lesser degree the pedestrian, benefit through the lessening of congestion resulting from the removal of surface cars from the streets.

It is generally conceded that future rapid transit subways will be built and owned by the community and that they will be considered a part of the community's street system. Very elaborate formulas have been worked out defining the portion of the carrying charge of such subways which should be paid by the five parties in interest. The planning board of which I am chairman has had that matter under most careful consideration in connection with metropolitan Boston's need of improved rapid transit, and while we should like to see a diversion of the cost made between all of the five parties in interest, we have concluded that from a practical standpoint there are very grave difficulties in ascertaining the real benefit to certain of the parties.

If there was any definite way of determining the exact betterment resulting to each piece of property from the construction of a given subway it would be most desirable to make special assessments. Any lawyer will tell you that there is great difficulty in such determination. Property near a given subway station is usually benefited more than property at a distance and yet there are instances where local stores have been greatly damaged

Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

by the construction of a new rapid transit line, as the people who formerly purchased at the local center thereafter ride to the big city and do their purchasing in the large department stores. It is also true that ultimately rapid transit lines will be built in all directions, and that in the last analysis all of the large subdivisions of urban populations will have their rapid transit lines, and thus the benefit to specific properties will merge into the benefit to the city as a whole.

While therefore recognizing the theoretical fairness of special assessments, our planning board has concluded the practical difficulties are so great that it is wise to omit them, though we recognize that where a state constitution permits special benefits to be assessed on a zone rather than on specific properties, they may be both fair and practicable.

There can be no doubt of the great advantage that accrues to the automobilist from the removal of surface street cars, but likewise the automobilist is benefited by every street improvement, whether it be a street widening, the opening of a new route, the resurfacing of an old way, or the removal of trolley tracks.

Our board feels that it would be unwise to impose upon the automobilist any specific tax to cover the cost of subway construction. We would rather impose a specific gasoline tax which will give to the cities and towns help to pay for the improvement of their highways, of which the underground highways for rapid transit are a part.

There are thus left three parties in interest on whom, in our opinion, the carrying charges of new subways should be assessed, to wit, the general public, the car rider and the transportation company, and the benefit to the last two parties can best be assessed in the rental which the transportation company is to pay for the use of the publicly built subways.

Let it be assumed that the sum to be paid to the city as subway rental is 4 per cent per annum for interest plus 1 per cent for a sinking fund which, at compound interest, will retire the cost of the subway in about 40 years. How shall this total of 5 per cent on the construction cost be divided between the general taxpayer and the rental which the transportation company shall pay? I know of no definite scientific formula. Undoubtedly the benefit to the community as a whole, or to a particular zone of the community, is greater for some rapid transit lines than for others. However, our board has concluded that a simple and effective rule is to divide this interest charge of 5 per cent into two equal parts, the transportation company paying a rental of 2½ per cent to the community and the community collecting the remaining 2½ per cent in the form of a general tax.

In the most recent act passed by the Massachusetts Legislature, providing for the extension of the Boylston Street subway, such a provision for the equal division of the carrying charges was enacted, and it is hoped that this principle may be continued in future transit acts. Whether the formula of equal division will work satisfactorily in all cases remains to be seen. If, as in the case of New York, the fare is restricted to 5 cents it will be necessary for the community to bear a larger part of the carrying charges of subways than above indicated, but for the average metropolitan center I am inclined to think that a 50-50 division is reasonably fair, simple of execution and will not impose an undue burden, either upon real estate, the car rider or the transportation company.

Increased rapid transit facilities are a vital necessity in Boston and in many other large cities. It takes years after work is started to complete a subway. In the meantime population is increasing, congestion is growing and the trend to the tenement and the apartment increasing. The vital necessity is for immediate action and the imperative need is that the dirt should fly. Let us not make the mistake of too prolonged debate upon theories of payment while the people of our great urban centers are suffering from lack of better transit facilities.

Regulation of Transportation*

By Lewis E. Gettle

Chairman Railroad Commission of Wisconsin, Madison, Wis.

RECENT statistics indicate that about 100,000 common carrier motor buses and some 3,000,000 motor trucks are operating in the United States. Of the trucks perhaps no more than 40,000 are common carriers. For some time after their advent it was thought that the activities of the trucks and buses would be confined to short hauls, but since rapid transit bus passenger service is offered between New York and Chicago, and Chicago and Los Angeles, and buses are beginning to offer dining and sleeping service, railroads are beginning to look with considerable apprehension on this young but aggressive and optimistic competition.

The general public seems to have been little concerned about regulating these agencies as to numbers, charges or service. Legislation seems to have been promoted chiefly by those engaged in bus and truck operation, who wanted protection in prior occupancy of the field, and by railroads and railroad employees who felt that their interests were threatened. In Wisconsin, until two years ago, buses and trucks were operated in a chaotic fashion. Regulation, when undertaken, was a cautious compromise and yet it has accomplished the establishment of reasonable good, safe, dependable service at some approach to non-discriminatory charges. Taxes are levied upon the basis of passenger capacity and rated tonnage. License fees and fees for the cost of administration are exacted. But no one seems to know as yet what is the just compensation for highway use or what charges should be demanded by the state to equalize costs with those of rail carriers. To the extent that paved highways are used at less than cost to the state the taxpayers are, of course, subsidizing these common carriers.

While the courts have held that the state may exact from interstate carriers taxes or fees for damage or use of the state highways and such carriers are subject to local police powers, routing, charges, revocation or denial of right on highway and like important questions are clearly for the jurisdiction of somebody with interstate powers. Congress has thus far rejected all proposals to regulate interstate trucks, and appears reluctant to pass the bill practically agreed upon by various interests, including state commissions. Congress is no doubt re-

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

flecting the obvious popularity of truck and bus service and the widespread belief that trucks and buses are entitled not only to business which rail carriers cannot normally reach, but are also entitled to all the business they can take away from the railroads. This attitude ignores the whole question of costs and does not reflect sound economic conclusions. There is being repeated here a process of thought and legislation strikingly similar to that evidenced in the evolution of railroad and utility regulation.

The task of ultimate adequate control is somewhat appalling but is by no means impractical or impossible. It is quite clear to many of us that while from a number of aspects secondarily there must be the exercise of power by a federal agency, the primary functions of the coming regulation should be exercised by state commissions or groups of such bodies. The Interstate Commerce Commission is most able and efficient, but is shorthanded in many departments because Congress does not provide adequate funds. Even if sufficiently financed that body would, with bus and truck regulation, become unwieldy, its energies attenuated and possibly its functions deteriorated. Buses and trucks are accepted as highly convenient and necessary to the economic growth of the nation. It will be the job of regulative jurisdiction, wherever finally entrusted to mold and fit this young, but awkward, giant into the mosaic of a scheme for properly allocated and related national transportation.

The street railways present the most intricate and varying problem of all the forms of transportation. With us street railways in cities of less than 50,000 population do not, and under present municipal regulatory powers seemingly cannot, earn a reasonable return on the necessary investment. Even with some slight relaxation of municipal requirements, and with fare schedules as high as the law of diminishing returns will permit, the urban railways are having a severe struggle to keep up their roadways and frequency of service in adequately comfortable cars. Yet many thousands of people now depend and must continue to depend on street cars for their daily transportation.

In our state, the Railroad Commission seemingly has all the regulatory powers over street railways which a state body should normally exercise over a service essentially urban in character. The state commission cannot regulate the speed of the cars, cannot determine the routes of the tracks, cannot control other competitive transportation or co-ordinate it with the railway service. Taxation powers lie either with the city authorities or the state tax commission. Paving requirements and changes of grades, except separation at grade street railway crossings, lie wholly within city control.

In a city-wide survey made a few years ago in Milwaukee by the engineers of our commission, it became glaringly apparent that reasonably adequate street railway service to meet present requirements involved many matters lying within local jurisdiction and policy; that metropolitan service covering numerous contiguous cities and villages involved concerted and synchronized action by all of these units of local government. Obviously, a state commission may not be invested with power to grant street franchises, to widen streets or to lay out new streets, to speed up or retard vehicular traffic or divert such traffic from one channel to another.

The commission ordered the company to supply many new cars, fixed standards of loading, directed double-tracking, decreased headways and permitted use of one-man cars, but even the outlay of $1,500,000 required for the improvements and betterments could only ameliorate, but not satisfactorily solve, the plain transportation needs.

Under these circumstances the company proposed at its expense an exhaustive study of the situation by a committee composed of city representatives, company members, representatives of the state commission and a citizens' committee. This committee of twelve controlled the survey and supervised the report. About two years were required to complete the study and make the report.

The actual survey was made by highly expert engineers assisted by the committee, whose knowledge of local conditions was intimate and comprehensive. One of the outstanding phenomena found by the survey was the rapid development of areas which for many years had been considered outside of practical city residence districts. Many of these developments were beyond the city limits and beyond its jurisdiction for any purpose. Later these areas will be taken into the city. The committee found that the traffic congestion in many business areas was so pronounced that the average speed of street cars and buses was barely 10 m.p.h. and this average speed was decreasing.

The remedy proposed is that better vehicular routes be provided, purely a municipal function, and that improved mass transportation facilities be afforded, which is a question for the company and the commission. The report clearly recognizes that numerous local government units must be harmonized and brought into co-operation and that the citizenship must be educated to tolerate changes that will involve hardships and sacrifices for the sake of the general growth and welfare.

It is frankly recognized that the comprehensive plans will require large sums of new capital, to attract which fares, franchise conditions, and all other matters having to do with a fair return must be approached and settled in a spirit of liberality rather than by antagonism.

In Milwaukee the company has no serious problems of common carrier competition. It was alert in supplying necessary bus service and has successfully held that field. I think it will be conceded as fundamental that the whole system of the transportation of a municipality should be under single ownership and control, or at least single operation and control.

Where there is not such unity of ownership, there should be the fullest possible interchanged use of tracks and other facilities, and the regulating bodies should have ample power to compel such joint use expeditiously where it is unreasonably refused. The Wisconsin Commission has such general power and has employed it in several instances. The first case of this character involved a rather long and vigorous contest, centered chiefly on the proper compensation to be provided. Recently a similar case arose, apparently much more complicated than the earlier one, but after several heated preliminary skirmishes before the Common Council and the Commission, what promised to be a protracted and sanguinary war was settled amicably by the parties, guided largely by the principles laid down by the Commission in the earlier case.

I have not spoken at such length of the Milwaukee efforts to approach this problem in a sane, non-political, scientific way, from provincial motives. It is merely a presentation of concrete conditions that should indicate a departure from the ancient, fruitless wrangles, which recognizes that adequate fares and schedules must be provided by the regulating commission to produce, if possible, a fair return on the investment.

The Effect of Automobiles on Mass Transportation Traffic*

By R. F. Kelker, Jr.

Kelker, DeLeuw & Company,
Chicago, Ill.

R. F. Kelker, Jr.

IT IS beyond question that by reason of the tremendous number of automobiles in use the public transportation agencies are carrying fewer passengers than they otherwise would be. There is no doubt that in cities with a population of a million or less the automobiles have caused serious decreases in traffic, but in the larger cities the loss in traffic due to automobile competition appears to be inconsequential.

Failure to expand the rapid transit facilities in Chicago is a factor which has had as much, if not more, effect on the traffic carried by urban mass transportation lines than the private automobile. Statistics showing the growth in Chicago suburban traffic are not readily available for all suburban lines, but the number of suburban passengers carried to and from the central business district on a typical week day by only one of the important steam railroads increased over 140 per cent during the past ten years. This is another indication that the private automobile is not responsible for some of the traffic losses of the urban transportation lines.

The accompanying table compiled from reports on fairly recent traffic surveys made in various cities is a good criterion of the relative importance of the private automobile and the urban mass transportation agencies.

It will be seen that the private automobile carried from 22.3 to 28.5 per cent of the passengers, the average being 25.2 per cent.

It is interesting to note that studies made show that the use of the automobile by patrons of stores in the central business district varied from 8.1 per cent in Chicago, a city of 3,000,000 population located in the center of a large metropolitan district, to 24 per cent in South Bend, Ind., a city of about 85,000 population located in and surrounded by an expansive agricultural district. It would appear from this that where mass transportation facilities are conveniently available they are used instead of the automobile. The density of population in the smaller cities rarely ever warrants the operation of a system of mass transportation lines which makes the service conveniently accessible to the entire population of the city itself and it is certain that the service cannot be made accessible to the surrounding rural districts at a popular rate of fare, hence the greater use of the automobile. On the other hand, in the larger cities, a sufficient number of lines to make the service convenient can be operated if the transportation system as a whole is on a profitable basis. Street railways make the central business district easily accessible from practically every section of Chicago, and, in addition, the rapid transit lines make it easily accessible for persons residing in about 20 per cent of the area of the city.

We find from further studies that 12.6 per cent of the persons canvassed in the central business district of Baltimore used the automobile, compared with 21 per cent in Detroit, the great automobile manufacturing center. It is interesting to note that in both cities the percentage of automobile users in the outlying districts was only slightly in excess of that in the central business district even though, as it is reasonable to suppose, parking spaces in the outlying districts were more plentiful.

There is good ground for the belief that as traffic congestion increases and less parking space is available, the mass transportation agencies will retrieve a certain portion of their losses in traffic caused by the use of the automobile. If, however, losses are to be turned into increases, it will be necessary to offer a service that is as fast, convenient and comfortable as is consistent with a reasonable rate of fare.

TABLE I

Counts of passengers entering and leaving the central business district of several cities, showing number and percentage using private automobiles and urban public transportation facilities:

City	Passengers		Per Cent	
	Private Auto	Street Car, Taxi and Bus	Private Auto	Street Car, Taxi and Bus
Baltimore.....	209,794	539,582	28.0	72.0
Chicago.....	325,524†	1,132,030*	22.3‡	77.7
St. Louis.....	142,819	353,474	28.8	71.2
San Francisco.....	176,891	516,493	25.5	74.5
	855,028	2,541,579	25.2	74.8

*Elevated railroad (rapid transit) passengers included.
†This number would have been smaller and the number of passengers carried by public transportation agencies larger had taxicab and private auto passengers been counted separately.
‡Per cent greater than it would have been had taxicab and private auto passengers been counted separately.

How can such a service be provided?

One of the first steps should be the development of plans for the replacement of obsolete rolling stock. There is today, throughout the nation a large number of street cars in operation that are so obsolete and inefficient that maintenance charges are excessive and their continued use makes for poor service, with its consequent loss in traffic.

Such plans, along with the development of a program having as its objective the most efficient operation should be prepared and carried out.

*Abstract of a paper presented at the annual convention of the American Electric Railway Transportation and Traffic Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

Among other things, this program should provide for: (1) modern motors; (2) faster acceleration; (3) high operating speeds and good brakes; (4) the elimination of avoidable delays due to defective equipment; (5) a reduction to the minimum of delays caused by street traffic or by improper routing of street car lines; (6) a reduction of loading and unloading time, by providing sufficient entrance and exit and platform space on cars and by installing loading zones, facilitating the collection of fares and the issuance and collection of transfers, and the elimination of non-essential service stops; (7) abatement of noises due to loose parts on rolling stock, and poor condition of track and roadway and (8) construction and operation of rapid transit lines where traffic densities warrant and where the cost can be allocated so as not to become a burden to the car rider.

In a word, the objective should be the operation of comfortable, clean, well-lighted and attractively-painted cars on good tracks at the fastest speed consistent with safety.

H. C. Heaton

Recent Developments in Arc Welding of Rail Joints

By H. C. Heaton

Superintendent of Tracks United Electric Railways Providence, R. I.

ELECTRIC welded rail joints came into use during the World War period when it was impossible to get money, labor or material with which to make proper repairs to track. It was thought that by the insertion of short pieces of rail, commonly known as "dutchmen," having the same wear as the adjoining rail and fastening these pieces by welding at the top and bottom of long plates, that quick and satisfactory repairs could be made. However, owing to the impossibility of obtaining dutchmen having exactly the same wear as the existing rail, and obtaining perfect contact in the fishing section, they soon became loose, the welds broke in the seams and the joints were a failure.

Electric welding of joints was then tried on new rails. At first dependence was placed on the welds themselves; consequently bolts and nuts were removed after the plates were welded. Within a short time this practice was changed and since then the bolts and nuts are left in place and the ends of the bolts spot welded to prevent loosening of the nuts.

In the first plates used the location of the plates with respect to the web was very much the same as the bolted plates then in use. There was a bevel at the top of the plate and a single rod was laid in the groove under the head and under the lip of the rail and welded into place. Another rod was laid at the bottom of the plate and welded so as to form a contact with the plate and the base of the rail.

A few years' experience showed it was difficult to weld under the head and under the lip; therefore the plates were moved outward and the beveled slope was changed to a ledge. The theory of this change was that the recessed ledge under the lip and the head provided better means of locating the seam metal properly. This recessed ledge provided in the seam weld for more of the ductile welded rod metal and less of the embrittling rail metal, which contains a high amount of carbon.

About the same time, the length and position of the welds were changed, and the rods were fed by hand. At the top, the welds were stopped 3 in. from the ends of the plate, and at the bottom no welding was done for a distance of 1½ in. each side of the rail ends, but the welds were carried from these points to within ½ in. of the end of the plates. The hand feed method of welding permitted a lower welding current, a greater puddling and refinement of the arc, and a greater quantity of welded metal. Furthermore, the seams were more efficiently located by this method for the operator had greater control of the welding process. The hand feed method therefore produced welds which were vastly superior to the former methods. The next change was, that in the top seam for a length of 10 to 12 in. in the center of the plate a second layer was placed and likewise one on the bottom seam beginning at the end of the weld near the rail ends, and extending for a distance of from 5 to 6 in. This second layer strengthened and annealed the first layer so that the weld was more homogeneous.

Originally great stress was laid on preheating the rail and joint plates along the line of the seams and post-heating the seams after the job was completed. On account of the larger amount of metal used in the seams, and consequently the longer time needed to make a complete joint, opportunity is given for the heat to spread almost entirely through the plates and for a considerable distance through the rails at the joints. This means that the cooling will be more gradual and the resultant stresses smaller.

Many plates were originally planed from flat bars but for the last three or four years manufacturers have been rolling plates for this purpose. They have an advantage in that the ledge in the top can be rolled slightly beyond the outside vertical face of the plate and also a greater fishing surface can be obtained, both at the top and bottom. This gives not only an improved mechan-

*Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

ical joint but also provides better welding conditions as the welder has a clearer view of the base seam weld at all times.

From the beginning, some engineers used base plates in connection with welded joints, and others claimed their use was entirely unnecessary. Today with the almost universal use of tie plates, base plates are now regular practice and they are welded to the base of the rails for 10-12 in. from the center of the plate. These seams are also double welded about one-half of the distance each side of the rail ends.

The best practice today is as follows: Rails are obtained which are slightly undercut, at least from beneath the head. Rolled plates are installed and partly bolted. Drift pins are now driven to force the rail ends into the closest possible contact; bolts are then fully tightened and the ends of bolts and nuts spot welded to prevent loosening. Rails and plates at both top and bottom are preheated by drawing an arc along the face. Welding is now started, care being taken to begin on the seam which will bring the joint to the most perfect line and surface. On the top seams, double welding is placed from 10-12 in. in the center. In the bottom seams, double welding is placed starting near the rail ends and extending about one-half the length of the welds. With the plate seams completed, the base plate is welded. In the seam along the base plate, double welding is done about equally each side of the rail ends for a distance of 5 to 6 in. The best designed plates provide that no two welds shall begin or end in the same vertical plane.

Soon after the welding is completed, the surface of the rail should be ground with a grinder.

In 1925 an experimental installation was made of a new type of joint by Mr. Moisselle, the inventor. The joint used a series of rods, each with an offset loop opposite the rail ends. The first rod was placed on the outside of the base, the next on the fillet connecting the web and base and then two rods on the web above the base with offset loops horizontal. The rail was P. S. Co. 90-200, 9-in. flat tram girder, which had been in service about 30 years. The track was laid in the center of an old turnpike. Continual resurfacing of the shoulders had built them up so that the track was the lowest point and acted as the gutter for the entire street.

We installed sixteen of these joints. The rods used were 1 in., except for the rod in the fillet connecting the web and base, where owing to the corrosion on the base it was necessary to install a ½-in. rod. These joints were placed during the late summer of 1925 and were removed during the summer of 1926.

To my surprise only one out of the sixteen joints failed and that broke through the web and base a short distance beyond the ends of the rods. When removed the other fifteen joints were in much better condition than any other joints in this stretch of track. The majority of the joints were bolted plates, some second hand and some new. Owing to the excessive wear on the head, it had become bent over and the wedging effect of the plates cracked the head of the rail through the thin fillet under the gage line.

In May, of this year, 176 of these joints were installed in Providence, R. I., on various rail sections, all of which had been in service from ten to fifteen years. So far all of these joints are in excellent condition. In all joints better results will be obtained if the head of the rail is ground with a reciprocating type of grinder for a distance of 3 or 4 ft. at the joint.

Opportunities for Improving Quality of Service*

By P. S. Arkwright

President National Electric Light Association and President Georgia Power Company, Atlanta, Ga.

THERE was a time when only the rich rode in carriages and there were not many of them, either. That was when street railways had their beginning. The street car was called the poor man's carriage. It had to fix a low rate of fare, and it had to have low operating expenses to come within the low rate of fare.

When the lines were electrified, the principles of the horse car, the low fare and the flat fare, regardless of distance, were continued and other burdens were added. When the war came and lifted the level of our costs, we were fixed in the public mind with a low rate of fare, and our efforts to keep that fare sufficient to cover our costs led us to greater efforts at saving. Coincident with that came the swift-running automobile that everybody wants.

It has only been recently that we have changed our own attitude toward our business. During the last three or four years there has been more improvement in street railway operations than in the whole history of the industry, since the advent of electric motive power. We have come to the one-man car and the light-weight cars, economies that do not injure the service. We have come to the faster running car, to the car with the quicker pick-up, to the higher paid and better qualified employee. We are coming rapidly to the brighter colored car. We are giving more attention to frequency and reliability of schedules.

It is a little difficult for people that have been engaged in a non-competitive business to get the sales spirit in business, but we are getting it in the electric railway industry. One of the troubles we have had is to get away from the original idea that we must curb expenses, regardless of the effect on service. The American people will pay extravagantly for other forms of transportation. They want luxury in travel. They don't want a poor man's carriage. They want transportation that they need not be ashamed of.

The street car certainly affords the safest transportation in the city. It is safer for the person, safer for the pocketbook, and safer for the reputation than if people ride in automobiles with strange people. It is a transportation that relieves passengers of all worry. It is getting so that it takes less time to go down town in the common car than it does in the private automobile with the congested streets. We should have no trouble in getting paid for the right kind of service. Let us come into our own with an attractive method of transportation and insist on getting sufficient remuneration to pay for it.

Applying Modern Merchandising and Selling Methods to Transportation*

By Charles Gordon
Editor *Electric Railway Journal*

Charles Gordon

MODERNIZATION as a general topic has now been before the industry for four or five years. When the word was first introduced, it was quickly taken up in discussions of the industry's problems. But for a considerable period—several years in fact—modernization was a general and an abstract term that sounded good, seemed to describe an objective for which we should all strive, but failed to register in the minds of the big majority of railway men.

Modernization in Its Broadest Sense

Although modernization seemed to be something desirable for the industry we failed at first to interpret this general term into its concrete applications to transportation management and operation. But by far the great majority of the industry is now alert to its problems and has a much clearer understanding of the part which modernization should play in the several branches of our business than was true several years ago. In fact, we are modernizing not only our equipment and our service and our personnel, but we are modernizing our conception of the nature of our business. It is not strange, therefore, that we find the subjects of merchandising and selling on the program of a railway convention. But how strange they would have sounded even as recently as ten years ago!

Most of us know what these terms mean generally, and we accept without serious question the statement that sales promotion and distribution technique are vital factors in modern business. In fact, we have already accepted the need for advertising—one phase of merchandising and selling—and have had enough experience with it to realize that to be used successfully in the transportation business advertising must be directed with an intimate knowledge of the business itself, and expert understanding of advertising technique. But we do not have a clear conception of the several other phases of merchandising, or just how to go about their application to transportation. Only a few years ago, we were debating the justification for the use of advertising. So today, some of you may not agree with me on the need or the importance of some of the other merchandising measures I am about to discuss.

Merchandising includes the entire field of distribution. It includes not only selling, but the determination of the character of product that can be sold, the price which the customer can be induced to pay, the appeals that will lead him to buy and the sales resistance to be encountered. Back of selling and of advertising, must be a merchandising plan, worked out with full knowledge of all conditions which may effect the distribution of the product. Unless such knowledge and such a plan exists, selling and advertising are at best merely spasmodic, ineffective and inefficient.

To proceed now with the further application of merchandising to the transportation business: First of all we want to know whether the transportation business justifies considerable expenditure of money and effort for merchandising activity. The first questions are, "What is the potential market for the product?" "Has it a certain 'natural' demand?" In other words, do people need it and want it, and do they buy it in considerable volume with little or no sales pressure? Is it a necessity or a luxury? Does it fill a real public need or is it merely a fad? It is generally accepted as a first principle that a product which fills a real public need and which is bought in considerable volume rather than sold offers the most attractive possibility for sales promotion effort. Obviously, transportation service meets these specifications fully and therefore properly planned merchandising effort may be expected to bring results.

We have talked about merchandising and selling to the extent that there are some who assume that the industry is now actually carrying out a complete merchandising program. As a matter of fact, there are only a few instances where even a good start has been made in this direction. Some of you may be inclined to the opinion that the industry has done all it can expect to do in winning back lost patronage and building new. I am convinced that to achieve its proper place in the sun of prosperity the local transportation industry, since it has

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

become a competitive business, must go further than it has gone or even now generally agrees is necessary toward applying modern methods of meeting competition.

Is there a railway property in this country that feels that it has cars which meet to the fullest extent practicable, the public's desire to ride in fast, attractive-looking, quiet, easy-riding, smooth-stopping and starting vehicles? We have made only a start toward providing that type of vehicle, and until we carry the job much further, we haven't made the product right, and therefore we haven't the primary requisite for successful merchandising. We have no other recourse. All talk of merchandising and selling is futile until we recognize that competitors who are constantly improving their product will continue to cut into our business unless we in turn provide a service which people will want to buy in a competitive market.

It is true that increasing traffic congestion is working in our favor, particularly in the larger cities. But it would be fatal for the industry to sit back on the assumption that congestion will ultimately drive business back to public vehicles. We all know that public transportation plays a vital part in the development of a community, and that it would be an economic blunder even to attempt to dispense with it. But it is important that we do our part in aiding our communities in the formulation of intelligent and economically sound traffic relief measures, and that at the same time we bend every effort toward increasing the popularity of public transportation through improvement of the character of service which it provides. In that way, and in that way only, may we hope to profit from the opportunity offered by growing congestion. We must make our product right. That is above all, the first step in merchandising transportation.

Next to making the product right, comes the question of determining the price at which it is to be sold. Low price alone is not sufficient. But it must have a proper relation to quality in order successfully to meet competition. Obviously, the determination of the minimum price at which a service of given quality can be sold involves an accurate knowledge of the production cost. Here we open a field which is prolific in possibilities for the transportation business. True, the price of our service is subject to the restrictions of franchises and regulatory bodies. But the testimony before regulatory commissions indicates no general accepted method, even among transportation men themselves, of determining the production cost of transportation service for various classes of customers or the prices at which it should be sold to each class of users. The merchandising of a utility service is distinctive in that the load factor as well as the total volume of business is extremely important in its effect upon the production cost. This is recognized in the making of telephone and power and other utility rates, but has been almost entirely neglected with respect to transportation. Furthermore, not only do we not apply generally the principles of a readiness-to-serve charge, or a maximum demand charge, or a reduced rate for quantity usage, but we go even further in the widespread practice of charging a flat city fare, and fail even to charge in accordance with the amount of service used.

Habitual recourse to expediency stores up trouble for the future. The local transportation industry today is suffering from the expedients of the past. It stands almost unique, in that the principle that the consumer should pay in proportion to the cost of the product or the service that he buys, is not recognized. When this simple economic principle is abandoned strange incongruities arise. There is little wonder that we find so much difference of opinion in attempting to fix an equitable and satisfactory rate of fare.

There is need for more attention to the problem of breaking down the cost of giving service in a way that permits comparison of the characteristics of different properties, and a determination of the effects upon transportation costs, of certain fluctuations in load. For example: fluctuations in the total number of revenue passengers on a city system are very misleading. An increase may be almost entirely in the rush hour; if it continues, we buy more cars, provide more maintenance space, add power and feeder capacity. For a very large part of the day all of this is idle. Gross revenue goes up slightly but fixed charges and operating cost go up more and net profit is lower. We can't take off peak service because the cars are jammed. So we fight the rising operating cost by trimming off-peak service and thus tend to encourage the very trend which is causing the trouble. That trouble is attributable to a progressively poorer load factor. Nevertheless, we do not have a generally accepted measuring stick for load factor on a transportation property and therefore it is obviously difficult to evaluate the actual effect of variations in the number of revenue riders or fully to determine the significance of fluctuations up or down.

There is some recognition given now, through the sale of various forms of passes, to the concession that should be made to wholesale users of transportation service. There is likewise some recognition given to the need for a differential in fare between week day, and Sunday and holiday riders. Through the sale of tokens or tickets there is some differential between the intermittent and the regular user's gate.

Some properties have made considerable progress in adjusting rates for various classes of riders so as to give at least some recognition to the cost of providing different classes of service. But the industry as a whole is still a long way from recognizing fully the various factors which affect the cost of service, or of devising uniform measuring sticks so that the conditions on two properties may be fully compared in a study of the rate to be charged. I recognize fully the practical limitations in a local transportation rate structure; the importance of simplicity and the difficulties of fare collection and accounting. Nevertheless, under the condition of severe competition which we now encounter, it is extremely important that we know more about the cost of service to various classes of customers if we are to be in a position to establish prices for our product which will permit it to be sold most successfully. So much then for the second item in merchandising, that of determining the price at which the product is to be sold.

There is still a third factor in merchandising and sales promotion that should likewise be interpreted into transportation terms; that is, "market analysis." The modern merchandising man studies the distribution of his product with a view toward determining the potential sources of new business. He wants to know something about the size of the market, the nature of the competition, the buying habits, the sales resistance, and the appeals that will influence buying.

There is nothing particularly new about this. It is a method long recognized among merchandising men in general business, and we must apply it to transportation if we are to merchandise our service successfully. First of all, we need to know something about the buying

Digitized by Google

habits of our present customers. We need to know for transportation purposes, where they come from, where they go, how they travel and when they travel, where they live and where they work, the routes they follow, how far they walk, and the reasons for using our service one day and not the next. We need to know as much as it is possible to learn about our present customers, before we can determine how to go about increasing our patronage.

We must visualize accurately the people to whom we are appealing. Any other procedure in merchandising, selling or advertising is extremely wasteful and foredoomed to failure. A successful merchandising man makes an analysis of his market. He classifies it in accordance with buying habits and preferences and then concentrates his effort on that class of prospects to whom his product will appeal most, whom he can serve best, and in whom he will encounter the least sales resistance. Who uses automobiles for ordinary transportation purposes in your town? Where do they live and why do they use their cars? That information may prove that it is entirely futile to launch out on a campaign to induce the auto users on a given line to leave their cars at home and use your service. Some change in the service itself may be needed before increased patronage from auto owners can be expected.

Without constant attention directed toward discovering potential sources of business, there can be no really intelligent merchandising. When losses are suffered from competition, there must be a careful study of the competitor's business as well as our own. I think one of the common fallacies regarding local transportation is that the prospective traveler makes a conscious choice each day of the kind of transportation he will use. A moment's consideration of your own experience will indicate that this is not true. He establishes a habit of using a particular agency and continues that habit until he is for some reason led to make a change. This applies to the use of an automobile for many purposes. In some instances the habit was established when the automobile was much more desirable and attractive than it is today because of less congestion and parking difficulties.

All of this comes under the classification of market analysis. We are not selling merely individual rides but are selling the habit of using our service. Every new regular rider means an indefinite period of transportation business from a regular customer. That is the basis from which, it seems to me, the industry should judge the justification for such work as I have just outlined.

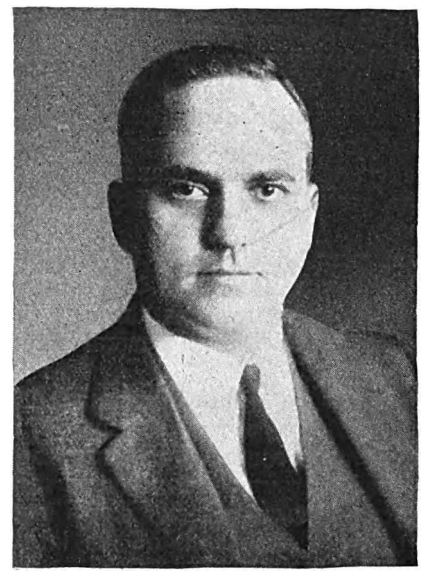
These then, are some of the high spots of the job of applying modern merchandising and selling methods to the transportation business. Repetition of these phrases will do us little good unless we translate them into transportation language and then proceed with the actual application to our industry of the methods that have been proved by experience in other business. I have tried to break down the term merchandising into some of its more important factors, and to illustrate what its application to the transportation business involves.

The local transportation industry is headed decidedly in the right direction. As it continues to climb we shall find it necessary to give constantly increasing attention to these questions of improving the quality of our product, determining proper selling prices and studying the characteristics of our market—all parts of the job of merchandising transportation.

Opportunities in Mass Production Methods*

By W. T. Rossell

General Manager Pittsburgh Railways
Pittsburgh, Pa.



W. T. Rossell

FOR the past ten years, the street railway industry has been struggling to maintain its position in the transportation scheme against many unfavorable factors such as fixed income versus rising costs and the fast growing competition of the private automobile and the public bus. But notwithstanding the encouraging strides that have been taken, the need for improvement in methods of maintenance and operation was never greater than at present, and in response to this demand, the methods of mass production must come more and more into use by electric railways. There is opportunity for a much wider application of these principles.

Track Construction Methods Well Advanced

In the track department the greatest advance in method appears to have been accomplished in the construction of new track, due to the relative simplicity of this operation. The successive steps involved in the renewal of a piece of track in paved street are generally well known. First the worn-out track is removed by the process of jacking out or lifting by some form of crane, this work proceeding at the head of the line. Next comes the steam or electric shovel to remove the grading, after which the ditch is trimmed and rolled. Then follows the placing of ballast, ties, rail, concrete, and paving, the pro-

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

cedure and order being dependent upon the method of construction.

In many cities, this work is done with commendable efficiency, each part of the job being carried on as a specialty by well-trained employees, while the flow of material keeps pace with the progress of the work. The construction gangs are, in general, well organized, each section carrying out its portion of the labor with dependability and dispatch. However, the dependence of one part of the work upon another is so marked that, if a breakdown occurs in any one part of the construction, the result is reflected in a delay of the work as a whole.

Thus within recent years the principles of mass production have been carried out with great success in connection with the construction of new track. In the maintenance end of trackwork, however, there still remains much to be done before the greatest efficiency can be obtained. The ordinary system of track maintenance uses small and isolated gangs of men, with a foreman in charge of each, who carries out the details of the job according to his individual ideas. These foremen report to a roadmaster or superintendent who is charged with the quality of the maintenance, but observation brings out the great inefficiency of this work as it is now performed.

Any detailed plan which might be laid out for the carrying on of this work would, of course, later be proved wrong in many respects through the method of trial and error. However, a general outline is suggested:

1. That the gangs be grouped into much larger units than at present, with a general foreman in charge of each of these larger groups, which may then be subdivided into smaller groups, each under a foreman.

2. That an engineer or inspector and a material man be assigned to work with each of the larger groups. That the engineer proceed ahead of the work, carefully laying out what should be done. That the material man, in conjunction with the enginer, then provide and place all necessary material where it is to be used.

3. That a careful study be made to determine what tools may be used in connection with this work, such as small cranes, welders, cutting torches, tamping tools, etc., and that these then be provided.

4. That such automotive equipment be provided as required to make this force of men and materials mobile.

5. That the organization of this force of men be along functional lines; that is, one group under a foreman to remove the paving, clear out the openings, clean the rail and prepare the work; another group to place the rails or joints, or such other work as is needed, doing all of the necessary trackwork, and another group to follow up, doing all such paving and cleaning up as may be required to complete the job. That the engineer then make a final inspection of the work.

6. That a plan be worked out whereby such a force of men pass over all the track in a given district or system at certain fixed intervals or periods.

Although this outline is necessarily incomplete, it nevertheless brings out the three essential factors included in the work: first, mobilization; second, specialization; and third, periodical overhaul. The similarity between a maintenance gang, organized as suggested, and a track construction gang, is very evident.

Although the work of the overhead lines department appears to be greatly different from that of the track department, they have in common the need of making the forces mobile. In new construction, the placing of overhead wires, feeders, poles, etc., considerable progress has been made, as in trackwork, in methods of mass production. It may be seen in the use of pole hole-digging machines and automotive equipment in stretching feeders and wires. In general, this work is well organized.

However, in the maintenance of overhead lines, as in track maintenance, there is usually found a woeful lack of organization. As recommended in trackwork, the organization of a larger force, under a general foreman, and the placing of an inspector and a material man with this group, are suggested. Careful inspection at periodic intervals of all overhead lines, and the follow-up by a specialized crew of workers, each performing his part, would show amazing results in the improvement of overhead line work and the reduction of costs.

Specialization Needed in Shops

In the maintenance of rolling stock, the many parts involved often give the work an appearance of great complexity, and cause confusion. It is consequently necessary to analyze the work to be done and break it down completely into its functions; then to organize the men and machines in such a way as to give the greatest possible degree of specialization. As an example of this, the work may first be broken down into: (1) car painting, (2) car body repair, (3) wood working and (4) sheet steel working. This, in general, covers body repair.

Again, the electro-pneumatic equipment may be broken down into: (1) benchwork, and (2) assembly on the cars. The truck may be separated into: (1) stripping, (2) winding, (3) motor assembly, (4) bearing department, (5) wheel and axle shop, and (6) truck assembly. In addition, there are the blacksmith shop and machine department, which do work for all other departments. Finally, there is the storeroom, responsible for the delivery of material.

These departments should be considered individually and further divided for specialization. Then, wherever there is sufficient volume of one kind of work, as in truck assembly, the regular production line similar to that used in manufacturing plants, should be established, and the number of men required for a definite production should be kept employed at all times, having the material and the truck move forward, reaching the end of the line completely overhauled. Descriptions of these methods have been published from time to time in the trade journals, and a detailed account of them would be superfluous.

As in other forms of mass production, these methods indicate clearly the need of special tools and jigs, a number of which have been developed. Automatic wheel welders, air-operated wrenches, jigs for pulling bolsters down into position and moving wheels and motors, have been devised on various properties. All methods should be checked for opportunities of specialization, since any change in method making for greater specialization is usually sound.

Opportunities in Carhouse Routine

In carhouse operation, the value of specialization is again unquestionable. The worthwhile results of bringing cars, so far as possible, to a central point for routine inspection, maintenance, and cleaning, and the use of tools such as vacuum cleaners, washing machines, cutting torches and special ratchet wrenches, are all too obvious to discuss.

Digitized by Google

Although this discussion has centered principally around the relation of mass production methods to maintenance and construction work, the methods and principles described are equally applicable to transportation department activities, to office work, or, in fact, to work of any character.

The first requirement in adopting mass production methods is a detailed analysis of what is to be done. Next it is imperative to organize the men and machines available for the purpose, to perform the parts of the work with the greatest possible degree of specialization. After the rates of speed on these different parts are balanced and brought to a common level, the work will proceed in harmony. Then the process becomes repetitive.

Through specialization and simplification of the different parts of the work, the need of additional machinery to replace labor, and the need of improved design, are emphasized. The necessity of seeing that an adequate supply of material is available, and that each part of the plan functions smoothly, and at an even pace with all other parts, requires more and more careful planning of detail.

For the development and improvement of mass production methods through organization, supervision must be open-minded and willing to try new ways, and must constantly plan to improve each part of the organization. The greatest asset that an organization or an industry can possess is adaptability to meet continually changing conditions.

What Are the Financial Results, Achievements, and Future Needs of Modernization?*

By Henry G. Bradlee

Stone & Webster, Inc., Boston, Mass.

SURMOUNTING of obstacles by the transportation industry during the past decade, and its ability to progress in spite of the many difficulties encountered, are conclusive proof of the fundamental soundness of our business and its vital position in the social and economic life of our communities. It seems axiomatic that any product or service vitally necessary to the comfort, welfare and convenience of the great masses of people can with proper management be sold on a remunerative basis. However, the transportation business as an industry is not doing this today. The results being secured by different companies vary from success to failure, but for the industry as a whole the results are not satisfactory. Comparatively little new capital has been secured from the public in recent years, but refinancing of bonds and other forms of indebtedness, and capital for improvements call for rapid restoration of credit. This is possible only through the adoption and execution of a plan which has for its purpose modernizing management, facilities and service in keeping with the changed condition in our industry.

Since the inception of urban transportation, several basic changes have occurred. Periodical improvements in facilities and service, and the results secured from each of them, furnish a background of great value in determining the program of the future. The first major problem, the transition from the horse to the electric car, was largely technical, involving engineering design and construction standards required to make electric rail service practical. This problem was solved by the geniuses who, with their worthy successors, are now masters of electrical and mechanical problems. Today's call is for the merchandising genius who can visualize the vehicle which will appeal to the public and which can be operated at a profit to the industry.

Next came the period of inflation, attended by increased wages, material prices and operating costs. These were overcome in a major way by economies secured through development of labor-saving devices, lighter-weight equipment, one-man car operation and improved maintenance methods. The third object was overcoming the fetish of the 5-cent fare and other objectionable requirements of franchises of the horse-car days and of the earlier franchises secured under highly competitive and speculative practices prevailing at the beginning of the electric railway period. Coincident with fare difficulties competition by the jitney and motor bus developed, but the unsoundness of a uniform or fixed fare and of competition as a substitute for regulation of rates and service has been fully demonstrated.

Present difficulties are the outgrowth of private automobile development which offers competition that stands as a challenge for convenience, speed, luxury and style. To meet this challenge requires new facilities, a more attractive service and the application of modern merchandizing methods which have been so successfully applied to the sale of products less attractive than public transportation. Service may be essential or highly marketable, but the profit to the seller must depend upon his efforts. One of the chief difficulties in our failure to retain or restore the position of our industry has been

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

the lack of a definite program to be followed. No field can be successfully invaded or its opportunities developed without a complete survey and vision of the results which should be secured by the application of individual effort and business methods. The future of our industry depends upon our ability to determine its needs and decide upon a general policy to be pursued by the management of the various companies in developing a definite program along which to work.

Modernization to meet future needs requires not only improved facilities and methods, but must include the rejuvenation of management and men. The printed rule must be replaced with individual interest and initiative. Responsibility for results must be charged to each individual employee. Each patron is a potential competitor who can provide his own transportation. He requires individual attention, his special needs and those of his neighbor must be studied, ascertained and provided for by whatever vehicle and with whatever class of service may appeal to him. Service which is required by one may not be practical for others. Therefore, various classes of equipment and service will be needed to provide for the requirements of everyone.

Speed is one of the essentials for every class of service, and to secure it traffic problems are encountered. The responsibility for traffic regulation is normally assumed by public authorities, but if satisfactory service is to be rendered by public transportation companies, our management must become a real factor in creating a public understanding of the mutuality of interest in conservation and utilization of the public streets.

Merely to ascertain and provide transportation requirements of present and potential customers does not necessarily mean that the maximum of patronage will be secured. Sales effort must be added.

Modern sales methods have greatly accelerated the use of private transportation, and for maximum results the same principles and effort must be applied to public transportation. Selling must extend beyond the solicitation of patronage. A major part of the merchandising program should be devoted to a public understanding of the kind and character of service which benefits the people as a whole. It should include inauguration of new types of service, adjustment of present schedules, abandonment of unnecessary rail lines, and rerouting of others, proper use of street space, the proper price which should be paid for a ride, and the convenience and value of the service as a whole. One of the mistakes of the past has been our dependence upon an understanding with the public authorities and their presentation of our problems to the public. A modern public should have its appeal, and the action of the public authorities should be relied upon as representative of public opinion.

Experience has demonstrated that modernized equipment, when properly merchandised, has increased the number of riders, or minimized the loss of traffic on lines where such equipment has been operated. Through modernization and co-ordination of the modern bus with rail service, public confidence is being re-established in the ability of the industry to provide a service in keeping with the present needs, and in response the public is regarding increased fares as being justifiable and necessary.

The six following objectives will form a working basis for development of a specific program, which is one of the chief needs of our industry:—

1. Provide a service which will be popular with the people and which will command a price commensurate with its cost. Experience has demonstrated that people are willing to pay an increased price for a higher quality of service. This fact definitely eliminates further attempt to develop the art of transportation to conform to a uniform fare. Short-haul riders do not require speed which is so essential to suburban residents. The furnishing of de luxe service necessitates logical co-ordination of bus and rail cars. Rapid transit is known only to the metropolitan areas, but the flexibility of the bus makes possible the operation of preferred service at preferred rates, giving the equivalent of rapid transit service to cities outside metropolitan areas.
2. Preserve the integrity of the present investment, but only to the point where its economic value will be utilized. Preserving the integrity of investment in permanent track and paving is an economic possibility and essential for preservation of the credit of the industry. The new creations in rail equipment now on exhibit have service and economic possibilities which justify their purchase. In their refinement and improvement every effort should be made to reduce rather than increase the initial price which, with some of our modern equipment, is more than operating results will justify.
3. Minimize non-productive capital expenditures. Street improvement programs and other burdens imposed by municipalities have required much unproductive capital which may in the future be reduced to a minimum by substitution of bus for rail service.
4. Combined rail and bus investment and earnings for the purpose of determining allowable return on the investment in the system as a whole. Unless developed as a unit the use of rail and bus facilities cannot be co-ordinated to best advantage in improvement of service, economy of operation, or for the preservation of credit needed to finance the co-ordinated plan. Retirement of abandoned property and provision of adequate reserves for current depreciation of buses and other property in use is not an impossible undertaking but will prove a severe test of the financial strength of many companies. To maintain its credit through this period the full economic value and earning power of a co-ordinated system is necessary.
5. The result of the program should be forecast over a period of at least five years, the soundness of the plan determined by the eventual effect it will have upon the balance sheet, and the credit position of the company in the security market. Re-establishing credit for the industry calls for the restoration of confidence of the investor, who depends to a great extent upon the banker. To convince the banker that the industry is entitled to credit a definite program forecasting annual capital requirements, net earnings from operation, the retirement of property, and the reflection of these in annual balance sheets will be necessary.
6. When the plan is developed it should be submitted to the public, and co-operation should be secured from the public authorities, thus enabling the full economic value of the program to be realized. In the establishment of new service, abandonment of unnecessary lines and the rearrangement of schedules, local opposition is inevitable. This can be overcome by application to the local difficulty of a general policy which is being pursued in the readjustment of the transportation system in the interest of the people as a whole. In meeting the problems of today and in planning for the future let us not forget that, although competitive, public service is essential, is salable, and that the extent of its development depends upon the planning, vision, confidence, courage, enthusiasm and effort of those responsible for its management.

MODERNIZATION to meet future needs requires not only improved facilities and methods, but must include the rejuvenation of management and men. The printed rule must be replaced with individual interest and initiative. Responsibility for results must be charged to each individual employee. Each patron is a potential competitor who can provide his own transportation.

Old Bill Wise Presents:

Some Phases of the Electric Railway Situation From the Manufacturer's Viewpoint*

By E. F. Wickwire

Vice-President Ohio Brass Company, Mansfield, Ohio

IN MOST lines of industry the manufacturers' effort is pretty much confined to serving his customers in such a manner that they will feel disposed to continue to favor him with their business. If the business of the electric railways of the country should gradually slip away from them, it follows that the business of the manufacturers would dwindle in proportion.

The outstanding factor in the problem that confronts the electric railway industry today might perhaps be expressed in these words: "The car rider of yesterday is an automobile rider of today.

There are now enough autos in use to permit every man, woman and child to ride at the same time, and pretty soon all the cars will be able to get gas simultaneously, if they keep on building filling stations. At the rate we're going, it's only a question of a short time when every pedestrian will either have a motor car or wings.

E. F. Wickwire

One enterprising automobile concern has taken the lead in advertising the necessity of every family buying a servant's car—they're even trying to take the servant business away from us. This concern evidently knows the value of advertising to stimulate the sale of its product. It is well for us to keep in mind the fact that trying to do business with the public without advertising is like "winking at a girl in the dark. You know what you're doing but nobody else does."

It might not be a bad idea for us to "take a leaf" from some of the tobacco people and do some testimonial advertising. If they can convince the public by testimonials that mild cigarettes are good for the throat, perhaps similar testimonials from prominent street car patrons will convince the public that the modern street car gives a restful ride for ragged nerves.

While the situation perhaps does not tend to stimulate an optimistic view of the future, certainly it is not hopeless, and does not justify the pessimistic view taken by some people connected with the industry. Each and everyone of us must develop our individual backbones in order successfully to carry on the fight to convince the public that the electric car is the backbone of mass transportation. We hear a lot of talk these days about chiropractors, the fellows that knead your spine. I think that I need my spine myself and I think that every operating man and every manufacturer connected with the industry needs his spine. If we all stiffen our spines and unite in asking for what we should have, I believe the public will finally see the justice of our claims and grant them.

Electric railway operators are realizing more and more that selling is a tremendous factor in every line of business today—and the product that the electric railways are offering to the public must be sold to them.

The progressive merchant realizes that he cannot continue to do a successful business unless he appeals to the public's "spending instinct" by offering attractive merchandise. If he happens to get caught with some merchandise that is not quite up to the standard, he doesn't let that discourage him—he simply applies a little more ingenuity to his selling and advertising effort, like the Swede who built a salmon cannery in Alaska. When ready to commence operations he discovered that white meat salmon were the only fish available for canning on that river. So he pasted labels on his cans which read, "This salmon guaranteed not to turn pink in the can."

The average man who rides around in his 1929 model motor car is reluctant to transfer his "pampered anatomy" from the comfortable seat of his attractive looking automobile to an uncomfortable seat in a 1910 model trolley car. In fact, he feels a little "sheepish" about being seen riding in the latter. The automobile people are working all the time to make him dissatisfied with any means of transportation that is more than a few minutes old. The automobile owner trades in his old model for a new one, but there seems to be no market for second-hand trolley cars—unless we can succeed in disposing of some of them to collectors of early American antiques.

The electric railway industry has been criticized because of its slowness in creating and adopting new and improved equipment and better methods of merchandising. As Old Bill Wise might express it:

"I've driven this car," said the motorman, "by heck!
For twenty years and never had a wreck."
"You mean," said the motorist, as he backed up his 'Star,'
"You've driven that wreck and never had a car."

**Abstract of a paper presented at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

We see examples all around us of the fact that nowadays the public seems to take more kindly to "luxuries" than they do to "necessities"—and cheerfully pays more for them. Manufacturers of our principal competitor, the motor car—have sold their product to the public largely on this basis. And just consider what the manufacturers of ladies' wearing apparel have accomplished along that line. In the olden days it took three sheep to clothe a woman; nowadays, one good, ambitious silk worm can do it in an afternoon.

Many transportation companies are doing some very effective publicity work in the direction of pointing out the luxury of using street cars when they are really going somewhere and saving the automobile for rides where the cares of motoring don't blot out the pleasures. A great deal of good ammunition can be used to support this argument. For example, Old Bill Wise might start them thinking along the right line with something like this:

When tires blow out and gas is high
And you feel so low you could almost die,
The faithful old trolley gets you there
For the fractional cost of a tire repair.

A short, catchy card of this kind is more apt to appeal to the public's eye than a long-winded argument, which is usually just about as impressive as the Adam's Apple of a little neck clam.

The electric railway industry today is confronted with a hard struggle for existence even under the most favorable conditions. It needs every ounce of advantage that it can possibly obtain, not only in respect to adequate rates of fare, but relief from such things as taxation, paving expense and unjust damage claims. As Old Bill Wise says:

They paid their share when the old gray mare
Clattered o'er streets from park to square;
But today should trolleys pay pavement tax,
When they don't use nothin' but two little tracks?

Here is a sample of some good work that is being done by one railway company along this line. It is headed: "Suppose There Were No Street Cars?" and goes on to point out that "The motorist who has to stop behind a street car may at times feel that it would be better without trolleys on the streets. But if it were not for the modern street car, which carries so many people per square foot of city space, congestion would be so hopeless that progress through the streets would be impossible; downtown business stores and property would be but a memory," and the article closes with this line "The Street Car makes possible the use of your automobile."

The other day I saw a house being built to cost $5,000. Parked around it were $8,000 worth of automobiles which had brought the mechanics to work. Who paid for these motor cars, their operation and maintenance? I suppose it was saddled onto the poor fellow (and others like him) who is trying to save enough to pay for that home. Why don't these "self-appointed guardians" worry a little about that real burden which is loaded onto their "dear peepul?" But maybe they're just knocking our industry for political purposes. If so, we might treat them like a chap I saw the other day who drove up to a gas station and said, "Have you any of that gasoline that stops knocking?" The attendant said, "Yes." "Well," said the motorist, "give my wife a glassfull."

Perhaps some of the manufacturers do not realize how much they can help by continuing to co-operate with our committee in the proper use of the publicity material which we send to them from time to time. We must not forget that our own employees make up a substantial percentage of this "public." We can at least enlist the support of our own factory workers in our efforts to improve the industry and keep reminding them of the fact that they have a dollars and cents' interest in the welfare of the electric railways. With that thought in mind your committee is just asking our manufacturing company members to display a new "pay day poster," like the sample displayed here on the wall. With these posters we are sending each manufacturer a supply of "pay envelope stickers," printed in colors, the idea being that he will display these posters near the pay window and place a sticker on each pay envelope, carrying this appeal to our factory workers: "Filling the Electric Car Helps Fill Your Pay Envelope."

This tells the workman directly that he is interested in the prosperity of the trolleys, but sometimes it appears that it is only when the service is about to be taken away from him that the average citizen commences to appreciate the fact that the electric railway system in his community is a real benefit to him.

It seems to be up to us to find a way to demonstrate to the public the fact that they cannot expect the transportation companies to live on "red ink" and give "green plush" service, any more than they can feed a cow on sawdust and expect her to give shaving cream.

This applies even to people who are engaged in lines of business that are directly benefited by electric railway service. The manager of a large theater recently frankly stated to me that the loss of electric railway service in his community would be a decided blow to the amusement business. The business of the large department stores and various other lines would be seriously affected if there were no street cars. The first argument that a real estate man usually advances in trying to sell a piece of property is the fact that it is located on, or close to, an electric railway line. With these facts before us it does seem as though we ought to be able to enlist at least the moral support of those people who are engaged in lines of business that are directly benefited by electric railway service.

Ordinarily, these people are as indifferent to our troubles as the Scotchman who met a stranger stumbling through the wilderness around Loch Lomond. The stranger said, "I believe I'm lost. Can you help me?" The Scotchman asked, "Is there a reward for finding you?" When the stranger answered, "No," he said, "Well, then, you're still lost so far as I'm concerned."

In recent years electric railway operating men have had many cases where an effort to abandon service on lines which did not justify continued operation has been met by strenuous objection on the part of people living along the line. They kick even though they contribute nothing to the support of the trolley line. Like the Scotchman who wrote the editor that if any more Scotch stories appeared he'd quit borrowing the paper.

Old Bill Wise could appeal to such communities with this thought:

You never miss the sunshine
'Til it begins to rain.
You don't regret Welsh rarebit
Until it starts to pain.
The trolleys and their troubles
Don't worry you, but say!
It would double traffic trouble
Without trolleys here today.

So let's keep up our fighting spirit—and remember that "None but the brave deserve the fare."

Greater Justice in Urban Transportation Rates*

By William M. Wherry, Jr.
Wherry & Wight, New York

Conditions have changed markedly since most rates for street railway service were established. Recognition of this, establishment of proper fares, and relief from unfair burdens is essential

DEVELOPMENT of urban transportation presents a most fascinating and graphic picture. If ever there was an example of the fact that there is no fixity in social life, but constant growth and development, sometimes gradual, sometimes by leaps and bounds, surely we find it in this industry. In the span of one lifetime, the horse car is superseded by the cable, and the cable by the electric trolley. In a single generation, the gasolene motor is invented and developed with its tremendous effect on all social habits. During the same period, the increase in credit facilities, increased production of gold and the cataclysmic World War unite to produce a revolutionary change in the purchasing power of the dollar. The very medium of exchange has completely altered.

Nothing could be more impressive than such changes, and nothing brings out so forcibly the truth that law, too, must change and cannot be static. The social contract conception of law has been largely superseded in our time. Our profoundest legal philosophers conceive of law as ever changing. A body of law adequate for the civilization of today could not meet the demands of the civilization of tomorrow. No statute, no contract, no precedent in law, is fixed for all time, but, when conditions change, a corresponding change in the law will occur in spite of everything.

We have this illustrated over and over again in the field of public utilities. In 1876 the Supreme Court of the United States upheld the power of the state to regulate rates and stated definitely: "For protection against abuse by legislatures, the people must resort to the polls, not to the courts." In 1920, or nearly 50 years later, that very court held unconstitutional a statute giving a commission power to fix rates because there was no provision for submission of its decision "to a judicial tribunal for determination on its own independent judgment as to both law and facts." In the meanwhile, there were hundreds of cases in which this development was slowly worked out. At the beginning of the period, the court not only said no judicial review was necessary, but enunciated the doctrine of despair that no judicial review was possible. At the end of the period, the court held a judicial review essential, not merely of the law, but of the facts.

One might think this settled the matter, but the rule, though applied to cases under the Fourteenth Amendment of the Constitution, has not yet been applied to those under the Fifth Amendment, and the principle is today still bitterly contested and in many jurisdictions absolutely ignored.

William M. Wherry, Jr.

From the proposition as to the ever-changing character of law and the necessity that it adapt itself to economic forces and social demands, there follow two things of great importance in the problem of rate-making for urban transportation. First, there is no reason to despair because we find undue legal restrictions on an industry. Our efforts should be unremitting to change such legal obstacles, and the precedents show that such efforts will be rewarded in time. It is necessary, however, that any such campaign should be prepared most carefully and most thoroughly worked out. The facts must be ascertained. The principles must be studied and developed. The campaign must be conducted along the lines these principles indicate and buttressed by facts properly presented. Often the street railroad industry has suffered from a supine acquiescence in some bad precedent as well as in a failure properly to prepare and present its cases.

The second corollary is that the contract or franchise with fixed terms is obsolete and was founded on a false legal conception. Every contract for public service to extend indefinitely in the future must be flexible and contain provisions for both modification and adaptation to changes of every kind. The essentials of such a contract

*Abstract of a paper presented at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

are the continuity and development of the service and corresponding security of return to the capital necessary to be invested in the enterprise. Nothing could be more obvious during the past twenty years than the futility of efforts to fix either the standard of service requirements or the prices to be charged for service. The progress of the art has made obsolete methods and appliances for rendering service which were only a short while ago considered the very highest examples of the inventor's art.

The change almost overnight of the medium of exchange for measuring values made obsolete all previous fare arrangements. Yet there is something inherently attractive in the idea of a fixed contract. Stability seems so desirable, especially at the outset of any enterprise. At all times, there is an effort to define all the duties and obligations, all the rights and all the powers, of a public service company in fixed terms. The investor desires the certainty of definite assurances. The legislature is obsessed with the idea that once it passes a statute a thing is settled. These fixed contracts rose up to curse the industry at the time of its greatest need, just after the World War, when it was faced with intense competition and found itself bound by onerous provisions which took a long process to alter. Even today we find street railroads entering into contracts with municipalities in which an effort is made to fix a definite rate of return, a definite rate base and, in a modified form, commit the same mistakes that were committed in the short-sighted past. We find rate increases refused on the ground that stability of rates must be preserved at all costs, even to the sacrifice of service. In some states we still find constitutional and statutory provisions vesting in municipalities the power to make fixed contracts for fixed service on fixed terms, and ignoring the lessons of the past.

On the other hand, there are some striking examples of contracts made with flexible provisions, such as contracts for service-at-cost, where effort is made to adjust rates to changes—to fix a fare that will vary with costs. These contracts are based on a recognition of realities, but too many of them treat the present standard of value as if it were permanent, and attempt to peg or fix the investment, or part of it, for all time.

The idea, of course, toward which the whole public utility industry is working is the substitution of expert disinterested regulation for arbitrary and political interference.

Much progress has been made in freeing the management of all public service corporations from arbitrary restrictions, but the street railroad industry presents peculiarities not found in other branches of public utilities. To start with, nowhere else did we have the fetish of the 5-cent fare. Today, through bitter litigation throughout the entire country, the attempt to fix the fare and peg it at a definite unit has been gradually overcome. At the same time, the rule which has been established by the courts for the protection of the value of properties cannot be applied to the street railroad industry with the same success as to other public utilities. Under that rule, the utility should be entitled to charge the fair value of the service rendered so long as the aggregate net return does not exceed a fair return on the fair value of the property used and useful in rendering the service. This involves, of course, the determination of the value of the service. Here is the difficulty peculiar to the street railroad.

With other utilities, the value of the service is what it would cost today to reproduce it. With the street railroad this is not clearly demonstrable and in many instances obviously not true. The motor car and the taxi are competing factors so new that the question of how much can be charged and still attract the business requires the highest art of management. There are but few cases where a rate could be put into effect for a street car line high enough to produce a fair return on the fair value of the plant measured by the cost to reproduce it under present conditions. Prior to the war, the average rate of fare in the cities was less than 5 cents. Today it is somewhat more than 7½ cents, or an increase of about 50 per cent. This is a greater percentage of increase than in either gas, water or electricity, and yet the fare is not high enough to give the companies a net return which is anywhere near the net return secured by such utilities. Exactly what the value of the ride to the customer is, in view of the competition of the private car and other carriers, is not yet determined. But there is no question that the industry is entitled to a higher gross revenue and higher fares than even those at present secured.

In street railroad cases then, we have a situation not found in other public utilities. In fact, the street railroad is in the same position as the manufacturer or merchandiser who has competitive conditions to meet. It is not protected by its monopoly from competition with private cars or taxis. The principle, therefore, that management must be freed from arbitrary restrictions and that regulation must not usurp the functions of management, would demand that instead of an effort to peg fares at a fixed level, or to fix them in an arbitrary way, or to impose arbitrary regulations such as paving requirements, excessive taxes and the like, a greater freedom in all these respects must be accorded to the industry if it is successfully to perform its social function.

The courts have gone far in protecting street railroads from competition on their own routes by bus lines. The industry itself, through public service commissions and through its leaders, has gone far in combining and coordinating what would be competing carriers. Much remains still to be done along these lines; more comprehensive surveys should be undertaken and the results studied to devise the plan which ultimately must be followed.

In the field of the proper distribution of the rates, we find the street railroad behind other utilities. One is struck by the comparatively few attempts which have been made to classify fares. The car rider who thinks nothing of paying an increase in fare for each quarter of a mile ridden in a taxi expects to ride a few blocks or many miles for the same fare on a street car. Some efforts at zoning have been put in successful operation. Is it not possible that further development may be had along this line and that such efforts have been too readily abandoned?

The tendency today to classify street car riders as between transients and regulars is perhaps a more hopeful move. There we have a recognition that the regular customer takes a constant service and the transient a sudden or emergency service. This corresponds to the classification which has proved so successful in electricity and gas. A classification of fares based on this, namely, a cash fare to meet the needs of the transient rider and tickets or passes for the regular, undoubtedly is a move in the right direction. It gives promise of meeting one of the defects in past rate structures of street railroads, namely, the essential discrimination involved in a uniform fare. There is no question that a classification of street car customers which is not too complicated and which is

Digitized by Google

made with reference to the particular conditions and demands of the community would result in increasing the use of the service in such a way that each car rider would more nearly pay his fair share of the cost.

In this connection, a suggestion has been made that the street car furnishes a special service to the community itself separate and apart from the car rider, a service to the taxpayer and the shopkeeper and the property owner, which is theirs whether or not they choose to ride on the street cars. There is undoubtedly a community need for avenues of transportation. The difficulty is to ascertain the cost of the service to the community as a whole. Whether the recognition of this service and the charge to the community for it is practicable is a debatable question.

This brings us to another burden. Neither franchise taxes nor paving requirements are ordinary or normal costs of furnishing transportation. The street railroad should not be made a tax collector for the community. It should not be compelled to go into the paving industry. Its business is to render service to the car riding public, not to the taxpayer and property owner. We have the community not merely not paying for service which it receives, but charging for a service which is not rendered to the car riders. Surely, even if it does not pay directly for the special service, it might well omit the special burden.

Paving assessments against a street railroad have been sustained as special taxes and also as an exercise of the police power. If so, it is hard to conceive a more arbitrary exercise of that power than these paving burdens have become today. What was legal in this respect many years ago, I cannot help feeling, has, under changed conditions, become illegal, and that the cases sustaining these burdens are no longer good law because they violate common sense and proper economic principles.

The principle violated is that a company should not be forced to render a service to those who do not pay the cost of that service, because the burden of defraying such cost must either fall on other customers or result in unpaid service—which is the essence of confiscation. This principle applies to services rendered to property owners as well as to car riders who do not pay their proportionate costs. In other branches of the public utility industry, the principle has been recognized and franchises or contracts imposing the obligation of free service for municipal water or lighting have been held void. This principle certainly should be extended to similar impositions on the street railroad industry. No one should be compelled to pay for a service which he does not receive, nor more for a service than its fair value.

Wherever there are public service commissions regulating the street railroad industry, and the industry has a chance to present its problems to such tribunal and to challenge the regulating orders made by these tribunals in court, there is no question of the progress of the industry and its protection from arbitrary restrictions and burdensome conditions. The danger is where the company is forced by contract to assume burdens which could not be imposed upon it by legislation. Perhaps the most serious question now confronting the entire public service field is how far a state or municipality can go in coercing a public utility into the surrender by contract of constitutional guarantees. The courts have held that a state cannot make a contract surrendering its rights that is binding on it. Is it not equally a violation of the fundamental principles of constitutional law to permit an individual to be forced to give up a constitutional right? There are cases which recognize this principle and, in meeting the many problems confronting the industry, these cases should not be lost sight of.

Great progress has been made in freeing the street railroad industry from the conception of the fixed contract and removing from it arbitrary restrictions. Obsolete contracts have been altered and abandoned. The principle of flexibility of regulation has been more and more recognized. Rates have been raised and higher unit revenues produced. To some extent, rates have been more equitably distributed. Competition has been met by restricting competitors and to a considerable extent by combining and co-ordinating supplementary services. Excessive special taxes, paving assessments, unremunerative extensions and other burdens not related to the actual function of providing urban transportation have been denounced as such and some progress made in their elimination. The changes have been tremendous in fifteen years in spite of the almost insuperable difficulty presented by starting out with a clearly wrong legal conception. It is along the same lines that more work must be done. Co-ordinated and persistent efforts will undoubtedly reap as great results in meeting the present and future problems as they have in the past.

Prosperity and the Automotive Industry*

By C. F. Kettering

Vice-President General Motors Corporation, Detroit, Mich.

IF THE automotive industry has gotten into public transportation it has not been our fault. It began when an automobile was first used instead of a livery to take people to an adjoining village. But the hauling of passengers from one town to another in automobiles wasn't very profitable, because they were too small, and we were asked to build cars with bigger bodies. The bus business started in that way. We went into the bus business with the experience which we had in building automobiles. There is still a great deal of development work to be done. The most encouraging thing that I have heard is that you believe that we have started something.

For a great many years I have represented the part of the industry known as research and development. Scientific research is not new to any of you, especially in the electrical line, but the principles of scientific research have not always been correctly represented. A research laboratory has sometimes been regarded as apart from the regular line of industry, as a curiosity shop or as something with a high-sounding title for the advertising men to talk about.

The facts of scientific research in the automobile business, when placed on a business basis, are simply that we

*Abstract of an address presented at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

want to keep everybody reasonably dissatisfied with what he has got. If we can do this, we are going to keep on making better automobiles.

Industry Must Advance with the Times

Every unit of time carries with it a unit of change. Research aims to find out the consistent rate of change of the thing studied and to provide the essential elements of the machine or the art that will meet the demands for changes as they occur. When you use the word "Modernization," you are simply saying that you have delayed the normal rate of change making and now are going to make it in a hurry. That is a very expensive way of doing it. The great problem of any industry is to keep its change-making consistent with the changing items. Consequently, if there is a certain normal rate of change, and the industry changes at the same time, the change is made at the lowest price wage possible. This is the only way in which anyone can economically operate a competitive business.

Our great job, after all, is not so much to make you dissatisfied with what you have as to present to you the changes a little while before you become conscious of their need. If we didn't make those changes a little in advance of your consciousness, you would be asking for them within a year or two. Our whole story is to be in advance of what you are going to ask for and have it ready for you just before you become conscious of the need.

That is why the average research man detests the word "Standardization," for the simple reason that every time you standardize a thing you establish a series of practices as of today and you don't want to change. In other words, the industry is always looking for a park bench where it can sit down and rest after it does a certain amount of work. The only place where there are empty park benches is immediately in front of the undertaker's office. If you want to sit down, there is always room there for you to do so.

Development Must Be Constant

In a changing world you cannot make any particular development and rest on its merits for any length of time. Why? The day you were born, everybody was older than you were. But, one year later in the United States, there were 2,500,000 people younger than you are, and in ten years, there are 25,000,000 people younger than you are. With the influx of 2,500,000 new people per year you have to change at the rate of 2½ per cent a year if you are going to stay in the picture. Who buys the automobiles in your family—you? You just pay for them. Your wife and the "kids" buy the automobiles. That's who buys them! In other words, it is this younger generation, this new item which you don't ordinarily take into consideration in business that is the controlling factor.

There is another important factor that we research men stand for. As soon as there is crystallization in any organization or in any civilization the point is reached where needs and wants are synonymous, but progress is made only when wants are greater than needs. You may think that when we develop a new automobile we depreciate those produced the previous year. We do nothing of the kind. Your old automobile is just as good today as if that new one had never been produced. If you want to keep on using it, it will give just the same service as it would have done if the new one hadn't been produced. The only thing we do is to appreciate your mind as to what you would like to have.

I can give you an illustration. I might take a $2,000 automobile and put it in a glass case on the premise that it shall not deteriorate in any way, and write the price, "$2,000," on the inside of the case. A year from now it is just as good as when it was put in the glass case. Will you pay $2,000 for it then? No, you would pay less for it, and in ten years you may not be willing to pay anything for it.

What happens? In ten years the price of that automobile has depreciated without a single factor having entered into it. That is why the automobile business has gone forward, because we have tried to meet the tempo of the peoples' demands for individual transportation.

Give the Customer What He Wants

The great thing that I want to get over to you is the fear of standardization. I am willing to be inconvenienced by a customer. If he wants cars upside down, he is going to have them upside down. Remember that you or I get no place in the world except in proportion as we serve the fellow who pays for our dinner. We are going to be servants as long as we live, and red or black servants, so far as the bank is concerned, in proportion as we meet the applause of the public. A black bank balance is popular applause for your existence. A red balance is the hiss of the community.

If you want to sell a new idea to anybody, you have to talk to him four years before he recognizes you have ever said anything to him. If you are going to change your rates or schedules, you must begin to tell it to the public five, six, seven and even ten years before you are going to get it. The education of a people to a change in thought is the most difficult thing in the world and, after all, that is the biggest thing research has to do—to teach people that this thing ought to be changed long enough before so that you get it changed at the time it ought to be changed, not five or ten years later.

I AM not opposed to government ownership because the government cannot do the job. I am opposed to it wholly because there is nothing but a political check on expenditure. And I think we have learned pretty well in this country, at least, that a political check on an economic situation is inadequate to protect the community. The only kind of check on an economic situation is an economic check. —Owen D. Young

Bus Garage Design*

By H. M. Steward
Superintendent of Maintenance Boston Elevated Railway
Boston, Mass.

H. M. Steward

DURING the last five years there has been a rapid development with respect to the proper design for bus garages and a great deal of interest has been shown in this branch of the railway industry. It was realized that the problem with respect to housing buses differs from that with respect to housing trolley cars. A trolley car must necessarily operate along fixed lines on tracks, whereas bus operation is free and flexible. It is therefore desirable to design buildings to house buses which will allow for the freest movement of the vehicles. Experience has shown that modern garage design should provide for a building as nearly as possible in the shape of a square, with long spanned trussed roofs and with as few columns in the floor space as are necessary.

In determining the number of buses to be stored in any one garage, consideration must be given to the number of buses to be kept within any section inclosed by fire walls. This matter has always been considered in connection with carhouse design in order that the loss in equipment in the event of fire may not be too serious. At the present time, many of the state and city regulations limit the area of a garage section, if sprinklered, to 20,000 sq.ft. This area will permit storage of about 57 buses, which at, say, $10,000 per bus, represents an investment of $570,000 in buses alone.

Where possible, it is preferable to construct a building of one story only in order to provide natural light and to obtain suitable ventilation. Some of the earlier garage designs provided for buildings two and sometimes three stories in height and often with a basement. With such designs, considerable difficulty was experienced in providing natural light and proper ventilation. Buildings of more than one story also require columns which prevent the clear span which is particularly desirable. This is an important factor with respect to choosing the site. It is therefore advisable to select land outside of congested areas in order to have ample room for a one story building and adjacent yard which is desirable for proper operation.

The clear headroom depends on whether single or double-deck buses are to be used. For double-deck buses a clear height of approximately 15 ft. is sufficient and for single-deck buses not less than 12 ft. is desirable.

The floors should be of concrete finished with a hard wearing surface in order to resist wear when chains are used during the winter months and also to prevent dust. Garage floors present a serious problem with respect to providing a surface which will not absorb oil. Experiments should be made and information sought with respect to securing a material which will not only provide a hard wearing surface but will repel oil and grease.

Unless a very large number of buses are used in any one locality sufficient to warrant special machines or apparatus for washing purposes, the buses are usually washed on the garage floor, in which case the floor should be laid out in blocks of from 30 ft. to 40 ft. square, or similar dimensions, suitably sloped so that the water will be taken care of by means of standard floor drains having 4-in. outlets and provided with a large sand container.

Careful consideration should be given to the number and location of the entrance and exit doors to be provided. These factors will depend upon the size of the garage and its location with respect to adjacent street or streets. In addition to the doors used regularly for operation, consideration should be given with respect to emergency exits which would come into use in the event of fire. The doorways used for regular operation should be from 14 ft. to 18 ft. in width and at least 1 ft. higher than the highest bus to be operated. Doors of ample size will provide for quick entrance and exit and will avoid damage to both the doors and the buses.

Experience has shown that the ordinary swinging or sliding doors of wood, such as have been used successfully in carhouses and other buildings, are not suitable for garage use owing to their extreme size as the door gets out of shape in a short time, resulting in operating difficulties. It is therefore necessary to use doors constructed of all metal or metal and wood in combination. Doors which slide either horizontally or vertically are preferable to doors which swing, as they can be operated more quickly and are better suited to mechanical means of operation. With doors which are designed to slide horizontally, the best results will be obtained if the weight of the door is supported on large wheels running on a track in the floor, the top simply being guided, instead of following the old practice of hanging the doors at the top and guiding them at the bottom.

In garages of the latest design, it has been found advisable to provide some form of pit or runway construction upon which buses may be placed and work carried on underneath near the chassis. The runways can be constructed of steel, the space underneath the runways being opened continuously for the full width of the pit. Plenty of natural ventilation through shutters near the pit floor level and windows in the outside walls can be provided. Additional ventilation may be furnished by means of a duct carried across the head of the pits with a connection up through the roof to a ventilator.

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

The number of pits required for a given number of buses has not yet been agreed upon. While formerly two or three pits were considered sufficient for 100 buses, today the tendency is toward a considerable increase. Some of the more recent garage designs provide for eight to ten pits for each 100 buses. One of the pits may be used solely for brake testing and one for oil servicing. It is probable, however, that this ratio (eight to ten pits per 100 buses) may be sufficient for ordinary purposes.

The length of the pit to be provided depends on the length of buses operated. No pit less than 24 ft. long should be provided and possibly the maximum length ought not to exceed 35 ft. It is probable that all of the work on the underside of the bus can be handled in a pit having a length of approximately 30 ft.

If it is decided to provide a garage with means for making full repairs to buses, the following requirements are necessary:

A well-equipped machine shop and motor testing room located conveniently to the pits, provided with a suitable telpher system with which to handle the engines and heavy parts; a stockroom; tire storage space; tire repairing space; blacksmith shop; a wood-working shop; a paint shop with suitable storage space; oil storage; oil reclaiming; upholstery room; a battery room; a room for ignition testing and other electrical work, and cleaning equipment consisting of a dipping tank with an agitator or one of the pressure systems using air and oil, steam or other cleansing compounds.

Means for fueling buses have, in many cases, been placed inside the garage and sometimes near the entrance and exit doors. This practice should not be followed as it increases the fire risk. When located near the doors, buses entering and leaving the garage are delayed. The best practice is to locate the apparatus for fueling outside in the yard, preferably with the gasoline pumps located on a raised concrete platform, so located that the greatest number of buses can stand to fill at the same time without interfering with the operation of buses entering or leaving the garage. In such cases, the pumps and other apparatus should be suitably protected from the weather by an overhead canopy.

Suitable oil equipment can be provided by purchasing any of the standard makes of storage systems, the size of which will depend upon the number and kinds of oil to be carried, as well as the capacity required. In large garages, where a considerable quantity of oil is used, it will be found economical to reclaim the oil by a simple distilling process.

The method to be provided for heating and ventilating a garage should be carefully considered. The heating requirements do not differ materially from that of any large building area and satisfactory means can be provided by the use of direct steam radiation or by unit type heaters placed either on the floor or hung from the ceiling.

In addition to providing ample natural light, ample lighting both for general illumination and by means of portable lights should be provided. Satisfactory results for general illumination have been obtained by providing lights hung directly from the bottom chord of the trusses, using 100-watt lamps with 18-in. white enamel reflectors, the lights being spaced approximately 16 by 16 ft.

Ample fire protection should be provided by means of a standard wet sprinkler system, supplemented by hand fire extinguishers, sand pails and, in addition, portable foam type fire extinguisher engines. At least one of the portable foam type engines should be provided for each 20,000 sq.ft. floor area.

Speeding Up the Track Construction Program*

By O. Williams

Superintendent of Way and Structures
Pittsburgh Railways, Pittsburgh, Pa.

Oscar Williams

NECESSITY for more efficient and more economic methods in the electric railway industry arose from the pressure of competition. Street railways have awakened from their period of inactivity and have begun the development of cars, power transmission, track construction and maintenance methods, and greater efficiency in all departments.

Several years ago it became necessary for the Pittsburgh Railways to begin an extensive track renewal program to produce this efficiency and to bring the tracks and paving to the standard demanded by present-day traffic. Since this program was expected to include the reconstruction of approximately 30 miles or more of single track per year it was deemed advisable to investigate and improve the methods used for track construction to speed work and reduce cost to a minimum.

Previous to the reorganization the system had six maintenance divisions, each under a supervisor of maintenance in charge of from 100 to 150 men. When new track was to be built on any division the supervisor was notified to increase his forces. This necessitated the hiring of untrained men and caused a loss of efficiency not only on the maintenance work, but also on the construction work itself. This method was unsatisfactory also because the supervisor had innumerable maintenance problems which diverted his attention from the construction work. Trouble was experienced with the foremen, who, while fairly efficient in taking care of minor repair

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

jobs with a few men, were incapable of handling the larger forces of men. Very few labor-saving machines were available, another serious handicap.

After much study it was decided to separate new construction work completely from maintenance, and to form a new division. The new organization is headed by a superintendent of construction who reports directly to the superintendent of ways and structures. He has under him three general foremen who are capable of handling construction jobs of any size. Each general foreman has four foremen, each of whom is in charge of a crew of ten men under normal conditions. These crews are increased to sixteen men when construction work is at its peak. Each unit under a general foreman has its own equipment, an electric shovel, steel dump cars, eight-gun tamping outfits, concrete breakers, a roller, concrete mixer and other labor-saving devices.

A welder foreman with a crew for making all thermit welded joints reports directly to the superintendent of construction. A grinding foreman in charge of grinding all welded joints, a material man and a supervisor of methods also report directly to this superintendent. The duty of the material man is to see that all necessary materials go to each job as required. He also has charge of dispatching the crane car, rail car and other equipment used by the construction gangs. The supervisor of methods sees that each unit follows the same general plan laid down by the department head, makes arrangements for rerouting traffic, obtains special permits from municipal officials when necessary, acts as a general assistant to the superintendent of construction and supervises the trials of all new labor-saving equipment. With this organization no trouble has been experienced in building 30 or more miles of single track per year.

The procedure followed in most construction jobs is, in general, as follows: The night before the work is to begin, temporary T-rail crossovers are delivered by the crane car to the locations designated by the superintendent of construction or the supervisor of methods. They are placed approximately 1,000 ft. apart and are set the following day by the first crews of the construction unit. Overhead wires for the crossovers are put in and signal lights installed by the overhead lines division at the same time. As soon as the crossovers are set these men begin to take up the stone and excavate a small portion of the track in which the electric shovel will be placed that night. If the street under construction is one of the main thoroughfares and heavily traveled the grading is done at night, permitting work without interruption from the regular passenger cars.

When the excavation is complete ballast is delivered by motor trucks from local sand and gravel dealers with which the Pittsburgh Railways has contracted for this material. This is thoroughly rolled and the ties and rail are then delivered and placed. While this work is proceeding the electric shovel is finishing the grading to the next crossover. Rails are next spiked, tamped and lined, after which the welders make the thermit joints. By this time the shovel has completed its work and has probably started a job at a different location. The grading at the second location is usually finished by the time the welders have completed their work on the first job, so that crossovers may be moved and the shovel returned for the second stretch of digging without any delay. Thus, one construction unit is able to keep at least two and perhaps three jobs at different locations going at the same time. Proceeding this way, each gang of men becomes specialized in the work being done and consequently is able to perform it more efficiently. The use of temporary crossovers, electric shovels and air-tamping guns are the most effective producers of speed in the construction work.

Under the old system supplies for track construction were handled directly by the stores department; under the new system they are handled and delivered to a central point by the material man of the construction division. Ballast is no longer carried as stock material, except for the interurban division.

Work Scheduled During Construction Season

Another aid in speeding the construction program is the scheduling of all work to be done during the construction season. As 90 per cent of the track renewals are made at the same time the municipalities improve the streets on which the company has track, the scheduling of both the municipal work and the trackwork has become rather important.

In November of each year we submit to the city engineer a list of streets on which we have tracks in need of renewal the following year. This list includes approximately 50 per cent more track than we contemplate renewing. The city engineer checks the streets on the list to see which ones need repairing and then submits a revised list to the city council in February of the following year. The council usually approves the improvement of approximately two-thirds of the streets.

With the streets to be improved definitely determined we submit to the city engineer a tentative schedule showing the starting time and the number of days required for one track, together with the completion date. As the date for starting the second track will be determined by the date the city completes the paving of the first flank of the street, this is not decided upon until the tentative schedule is revised and approved by the city engineer. These revisions are generally made by the city engineer in conference with the superintendent of way and structures and the superintendent of construction.

Added to this list is another which comprises the improvements that are to be made by the other municipalities, the county or the state, upon streets on which we have tracks. These must be scheduled to fit into the city schedule and the plans of the municipalities. Some leeway is generally left in making the schedules to take care of any unforeseen work which may come up during the course of the year. The schedules are then given to the superintendent of construction and the engineering department, which immediately begins to make the necessary surveys, plans and drawings of special work needed on each job. Thus, the secondary engineering data and special work are available when the job is started.

At the time this construction system was put into effect there were six maintenance divisions with a total of approximately 600 men. This number has been reduced gradually until at the present time the maintenance is taken care of by three divisions with a total of 264 men. The three district supervisors in charge of the divisions are under the superintendent of maintenance. A new section was formed recently, the heavy maintenance section. It is under a separate supervisor and has a total of 48 men. This section takes care of all the heavy maintenance and installation of large special work jobs in any division on the system. Thus, total employees now in maintenance work number 312, compared with 600 men formerly, a reduction of approximately 50 per cent.

Handling Supplies for Buses*

By W. S. Stackpole

General Storekeeper Public Service Coordinated Transport, Newark, N. J.

HANDLING supplies for buses and other automotive equipment does not differ in the essentials from handling supplies for electric railways, but there are enough marked differences between the two to warrant careful study and consideration by those who may have to operate stores of both groups of material. Among the principal differences are the following:

Greater emergency demand for materials; larger turnover; more rapid changes in types and models; greater obsolescence; special care required of certain materials; more safeguards for commonly used materials; more experienced class of stores employees; smaller differences between parts; more frequent deliveries to using departments; gasoline and lubricants; more defective material adjustments; care in stocking replacement parts, and tires and tubes.

There are so many kinds of materials required to keep a large fleet of various types of buses in operation that a company cannot afford to keep in its storerooms all parts and enough parts to meet all demands at once. Yet, the required parts and supplies have to be provided if the equipment is to be kept operating, and it becomes necessary to set up an emergency order system whereby an operating garage or shop may be enabled to secure the necessary materials from a nearby service station or dealer as quickly as possible and with the least amount of red tape. It may be that the company's storeroom has the certain required materials in stock, but the point where it is required is so far away that it is cheaper to secure it locally and at once than to spend the time and money required to go several miles for it. It may be asked why such items are not kept on hand at the operating points. Our garages do carry on hand materials for which there is known to be a constant demand, but with automotive equipment the unexpected frequently happens and it is impossible to foresee all items of materials that may be required in case of trouble.

In setting up an emergency order system it should be as simple as possible and able to function quickly. It should be controlled by an emergency order clerk in the main storeroom who is familiar with parts and who will know what is meant when he hears them called by several different names and descriptions or by various signs made with the hands. He should also be familiar with just where the required materials may be procured and to the best advantage, and to this end should consult and co-operate closely with the purchasing department. No emergency materials should be secured without a purchase order number, or without getting a delivery ticket from the vendor to be turned in to the main store as evidence of receipt of material.

In the automotive industry there is a continual change going on in the types and models of equipment, and this results in greater difficulty in maintaining an adequate stock of materials. It will most always be found that every lot of vehicles acquired are considerably different in many details of engine, chassis or body from the previous ones, resulting in a long list of new and additional supplies and parts to be added to the stock. Then, too, many changes and improvements are often made in existing equipment. All of these changes and additions require that the storekeeper watch his stock more closely than ever before.

There are certain kinds of automotive equipment and material that require special care in storing. Crankshafts and camshafts cannot be thrown into a bin or even neatly piled on shelves in the usual manner. They must be laid so that all points of bearing will rest on the shelf, for otherwise they will spring out of true and be rendered unfit for use. Radiator cores cannot be kept on hand for a very long time without deteriorating, due to the effect of solder and acid on the metal, and small ignition materials must be kept clean and dry. For this purpose small glass jars with metal tops are excellent. They also enable ready identification of parts.

In addition to storing materials properly it is necessary and advisable to keep some of them which are of common use under a separate lock and key. The Public Service Coordinated Transport keeps ignition, carburetor, generator, starter and vacuum tank parts, as well as lamps, spark plugs, tools and general automobile accessories, in a separately partitioned section under a special lock and key, with one designated man therein. This largely removes temptation from persons who may have access to other parts of the store. Some of the items are very small but quite expensive, and too good care cannot be taken of them.

There are a great many automotive parts on which the differences are slight and not noticeable, or seemingly unimportant. Among such materials are wristpins and bushings, pistons, piston rings, valves, bolts, nuts, bearings, ignition parts, carburetor parts, etc. To assist the stock clerk in detecting differences of materials that vary slightly, so they may be checked and shelved correctly, it is necessary to supply him with gages, micrometers, catalogs, blueprints and samples of certain materials.

In street railway operation the replacement of defective parts is not ordinarily a large or troublesome item. With automotive parts, however, there is considerable replacement and it is necessary to provide a system to handle such matters expeditiously and without loss. Full data as to mileage, service, age, replacement order numbers, etc., are required by the vendors and manufacturers before allowing credits for defective materials and arrangements should be made to have these data furnished on all such material sent in to the storeroom from operating points and shops.

In organizing the bus stores department it is not wise to have a separate store for all bus supplies unless it is necessary on account of location. Rather, it will be to the advantage of all concerned, including stores department employees, to handle all purely automotive supplies in one section in or adjoining the railway store, and then storing materials that are used alike for railway and bus operation together. It will be found to be more economical to follow this plan, both as to cost of stores operation and the amount of money invested in materials and supplies. In other words, co-ordinate the supplies as much as possible.

Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.

What Is a Fair Measure of the Cost of Handling Materials and Supplies?*

By C. A. Harris

Chief of Stores the Philadelphia Company and Affiliated Corporations, Pittsburgh, Pa.

THIS subject, part of a study assigned to special committee No. 3 of the Purchases and Stores Division of the A.E.R.E.A., has been a much mooted question because while the method which is most logical in arriving at the cost of handling materials and supplies is uniformly accepted, it is not possible to use it as a comparison to measure the efficiency of the stores departments between companies, since there is a lack of accordance in the principles and practices which are the fundamentals of assembling these cost figures.

There are five ways of measuring the competency of the stores department, none of which by themselves are of much value. They have to be synchronized to produce an entity which shows the trend toward improved service. They are as follows: Cost of operation, stock shortages, percentage of turnover—low inventories, good housekeeping and harmony and good-will among employees.

While the first one mentioned is predicated on the other four, the second is the one of greatest importance.

On the properties controlled by the Philadelphia Company there is taken into consideration the actual labor and salary charges to Stores Expenses not only of the stores department itself, but a fair proportion of charges incidental to stores incurred by the purchasing and accounting departments on a set basis according to the earnings of the various underlying companies which benefit from the functions of such general departments. To this are added incidental expenses such as repairs and maintenance of stores equipment, stationery used within the department, light, heat, power, etc. Against this sum of total and actual expenses we consider the value of actual disbursements, not including transfers between stores, nor credits for returned or reclaimed materials, nor the value of purchases. The ratio between the two factors gives the cost of operating the department.

It is believed that the figure so obtained gives one angle of measuring the performance of the department. It varies with the load factor of business done but it does not indicate the true measure of service given, although it reflects in a way the volume of activity. It is a factor which in the manufacturing business forms part of the overhead and enhances the intrinsic value of commodities handled, being added to manufacturing cost in determining unit prices.

Such a plan is the most equitable way to arrive at construction and other costs rather than through the apportioning of such expenses so intimately connected with material costs on a percentage or fixed basis at the end of the fiscal year. It is agreed that freight should be added to the unit cost of materials. Why not the entire cost of the handling and delivery to jobs?

Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.

C. A. Harris

According to the proper definition, price means an equivalent given in exchange. Irrespective of how the cost of handling materials is allocated to departmental operation it is a price charged by the stores department for which the latter should give an equivalent in return, and that is service. A low figure denoting cost of stores operation is no proof of adequate service. An undermanned storeroom is very expensive to the departments served and inversely all the necessary personnel is of no use to customers if the stock is insufficient.

The A.E.R.E.A. has incorporated in its Manual an efficient method of stock control by the use of stock books which necessitates a monthly inventory. It is not the only means of achieving the desired result but it is one which several companies have found more effective than other systems and, incidentally, it is the basis of stock control on most of the steam road systems.

It has been said that stock refusals, like the poor, we will have always with us—but surely they can be kept to the minimum. One answer is the closest touch with the users of materials, who have just as much responsibility in making their wants known to the supplying department as the latter has in taking prompt care of those needs. Another answer is an equally close co-operation with the purchasing department. However, no matter what scheme is plotted on paper it is worthless unless everyone in the stores department realizes his responsibility to keep up the stock so that the using departments are not unduly inconvenienced by not obtaining what they want. The efficiency of the stores department from an operating point of view can be judged only by the service it renders.

Digitized by Google

It is just as disastrous not to have enough materials available as it is to have surplus stocks. A fair measure of this phase of stores work is the percentage of turnover, which may be arrived at by dividing the value of materials on hand at the end of the month into the value of materials disbursed during that month. These figures may be readily converted to show the number of days stock on hand by again dividing it into the number of working days in the year. Such a comparison over a period of months by years gives an excellent guide to show the trend of stock movement, particularly if the stock is classified according to the material classification which forms part of the association's Manual.

In the same measure that the stock refusals are a gage of efficiency from an operating point of view, so is the ratio of material turnover a like criterion from the angle of investment in unapplied materials.

It is difficult to make comparisons on this basis with other companies because of different policies at times predicated on financial status, prejudices, unwillingness to part with dearly beloved "old stuff," and a lack of definite organization, such as standards or obsolescence committees, etc.

A curve of such figures over stated periods shows the need of reviewing the stock for obsolete items. It gives the storekeeper his cue to gird his loins and battle with the department head for decision.

Indirectly such an effort makes it possible to reduce inventories to a normal level if such a thing is possible. Here again mere figures for the sake of comparison mean nothing. A low inventory from a storekeeper's point of view may be desirable, but it may be the means of rendering the poorest kind of service to the operating departments. There is a happy medium which should be strived for.

Good Housekeeping

Materials represent assets and should be so taken care of. After all, good housekeeping is the simplest and easiest way to reduce expenses. As a rule the majority of people prefer orderliness and only through negligent or inefficient supervison will they lose interest in neat work. It cannot be hoped to operate storerooms without cleanliness and care. Fortunately it is never too late to mend the lack of good housekeeping; it is the easiest thing to remedy. Its advantages are obvious not merely because of appearances but because of facility of handling materials and supplies.

Harmony and Good-Will Among Employees

An executive may have the best plans in the world to conduct his department, but if he does not possess the good-will of his employees, his work will not bear fruit. By the same token, to achieve the desired result he must imbue his men with the idea of intra-departmental cooperation. Harmony means in a true sense agreement in relations as well as in action. We pay a great deal of attention to cranes, tractors and other labor-saving devices and incidentally we pay a great deal for them. They are a necessary adjunct to a well equipped stores department, because they are a means of reducing handling costs and help us to give better service. We must not think any less of our employees and select them with as much care as our machinery. Good-will with and among employees is of paramount importance.

In the foregoing are five of the more significant ways by which to measure the efficiency of the stores department, bearing on the various operating functions in the manner that cost of operation is a guide for the stores department; stock shortages are a guide for the operating department; percentage of turnover is a guide from the viewpoint of investment; good housekeeping is a guide for material conservation and harmony is a means of achieving these results.

The Philadelphia Company and Affiliated Corporations have done pioneering work along the lines of improved stores service and are using the ideas advocated in this discussion. These companies are on the alert to improve the service and reduce expenses without impairing the latter.

Such, after all, is the duty of the storekeeper. Only in this manner will he foster the confidence, so indispensable to a department, which should be first and last that of true and unselfish service.

Inspection*

By Dwight L. Smith
Electrical Engineer Chicago Rapid Transit Company

Dwight L. Smith

PRACTICAL lives of some of the items of electrical construction on our property have been found to be: Third rails, thirty years; overhead feeders, twenty years; telephone cable, ten years; station wiring, twenty years.

These figures are offered not as ideals, but as figures actually found in past practice and to indicate the transitory character of what we regard as permanent construction.

In any complete construction, some parts of items may wear out and deteriorate faster than other parts. At some time during the life this deterioration reaches a point where a failure is liable to occur. Neglect in making repair or replacement of these weak links invites failures. Repair or replacement at the proper time not

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

only prevents failures but extends the life of the complete installation.

There is only one means of determining actual condition and that means is inspection. The mechanical man has for years inspected and repaired his equipment on some regular basis of time, car-miles or kilowatt-hours. The fact that the mechanical equipment was in motion seemed to demand such care.

How does one get intelligent inspection? First, carefully select the right men for the work. Not every man has the qualities to make a good inspector, and the fact that he is a good mechanic or a good workman is no criterion. A good inspector requires not only the perception to detect existing faults but vision to see the possibility of future ones.

Intelligent, easily understandable and complete written instructions for inspection are necessary. General questions such as "Is this installation safe and in good condition?" will not suffice, for they leave the answer to the judgment of the inspector.

The questions are extremely detailed ones about the condition of each and every part of each class of construction. They ask, "Are there three secure lags in insulator?", "Does pothead show signs of cracks?", "Is crossarm in good shape and sound?", "Is pressure of finger tip 16 pounds?". The question suggests the action to be taken if the answer is negative. Follow the question with a statement of the necessary action, "Are there three secure legs in insulator"—"If not, screw in present lags, replace with new lags or install necessary additional lags."

The proper men carefully schooled and coached in inspection quickly acquire the spirit and assume such decided responsibility in the matter that it is sometimes a problem how to hold down their enthusiasm for extensive work which is desirable, but which financial conditions may not permit.

The necessary frequency of inspection depends on several factors:

1. Class of work and expected liability to acquire defects.
2. Location—
   (a) As regards density of traffic.
   As regards seriousness of delays due to defects.
3. Original condition.
4. Age of installation and consequent condition.

Of these factors the first two are the most important and their relative importance depends upon the class of property. Such items as third rail and trolley wire wear in almost direct proportion to the density of traffic.

Written reports are made of all inspections, signed by the inspectors under a certificate reading:

We certify that this property has been thoroughly inspected in accordance with instructions for inspection and that:

1. All serious defects found were repaired and put in safe operating condition immediately.
2. All other defects found were repaired this day or will be repaired on the next working day.
3. All major defects have been reported to the foreman for work on them under his orders.

Throughout all our work we endeavor to instill into every man the idea that with proper maintenance there should be no such thing as trouble. Our men are not trouble men but maintainers, and it is their function to take such care of the property for which they are responsible that trouble will never occur.

As power and distribution men we realize that our part of electric railroading is only a means to the end of carrying passengers. Nothing that we do produces dividends in itself, but a careful inspection and maintenance program which eliminates service interruptions will be the means of preventing a loss of dividends.

Automatic Substations

Successful in Cincinnati*

By Harley L. Swift

Superintendent of Substations Cincinnati Street Railway, Cincinnati, Ohio

H. L. Swift

IN 1927 the Cincinnati Street Railway found its Pendleton plant in need of repairs, and its old system of distribution obsolete. It had besides the power plant 12 substations with a total capacity of 30,700 kw., 12,000 kw. of which were concentrated in two stations in the down town area. Four of the stations were 25-cycle, seven were 60-cycle and one was a combination 25- and 60-cycle.

A careful study of costs was made and a twenty-year contract entered into with the Union Gas & Electric Company for the purchase of all power at 13,200 volts 60-cycle, and the sale of the Pendleton plant.

The power distribution system was revamped, resulting in 19 full automatic stations with a total capacity of 29,200 kw., located approximately 1 mile apart. A complete system of central supervisory control was superimposed on every station.

For ease of maintenance the inside of the stations were made alike. Twelve new buildings were built and 5 remodeled. Particular attention was paid to ventilation and the recommendations on substation ventilation of the Power Generation and Conversion Committee of the A.E.R.E.A. were followed. All machines in residence districts were mounted on 3 in. of cork construction with hollow tile walls, with no openings above the floor line, and high ceilings were other methods used to eliminate noise.

Deceleco structures were decided upon in preference to concrete, brick or steel high tension structures because of their low cost and ease of erection. Deceleco is a

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

fibrous gypsum compound with practically the same strength as concrete and almost as workable as wood.

The Union Gas & Electric Company brings and maintains all incoming high tension cable to the pothead in the cell structure, space being provided in the structure for their metering equipment, transformers, fuses, etc.

Incoming power lines and outgoing feeder lines were brought into and out of the buildings underground from the curb line, the former through ducts and the latter through a tunnel and then up to the overhead lines through pipes and potheads on either side of the trolley pole.

The following give data on the new buildings:

Average cubic foot per kilowatt	27.8
Average square foot per kilowatt	1.18
Average building cost per kilowatt	15.60
Average cost per kilowatt	44.25
Square foot of ventilator per kilowatt	0.092
Square foot of air inlet per kilowatt	0.101
Average number days from breaking ground to placing in service	170.9
Average number of men employed per station on installation	15.0
Cost per kilowatt purchased, cents	0.82
Cost per kilowatt manufactured power, cents	1.13

It is expected to maintain and operate the system with 15 men at an annual saving of about $8,500 in labor over the maintenance and operation of the twelve old stations. The saving in power is estimated to be about $40,000 per year.

Nearly 43 miles of lead covered telephone cable, ranging in size from five to twenty-five pair, suspended from $\frac{5}{16}$-in., 6,400-lb. copper-weld messenger, fastened to the trolley poles with Hubbard clamps, were required for the supervisory cable.

The Bolted Rail Joint in Paved Track*

By B. P. Legaré

Engineer Maintenance of Way and Construction
Market Street Railway Company,
San Francisco, Cal.

IN 1911 the Market Street Railway adopted the bolted joint as its standard in all new construction. The type of track consists of rock ballast, redwood ties, Lorain sections 106-422 and 121-519.

This standard joint has two Lorain Bridge type splice bars for 9-in. rail. These are held in place by twelve 1-in. ordinary steel bolts. All joints are installed by the same crew, which consists of a foreman and three or four laborers.

Before attaching the plates the rails are butted together as close as possible by the construction crew (generally in the early morning when it is comparatively cool), the plates are attached and two bolts installed to hold the rails in place. After this part of the work is ready the special small gang takes off the temporary plates, bonds the joints with brazed concealed bonds and bolts them with the twelve bolts, six being inserted from one side of the rail and six from the other side. In tightening

B. P. Legaré

them, sledge hammers are used on the heads of the bolts and on the plates to drive the plates in, making a perfect fit. In this way if there is a slight inequality in the fishing section of the rail the plate is swaged in to fit the inequality. The bolts are then tightened again and the process repeated until the joint is apparently completed for operation. Cars are permitted then to run over the new joints for a few days after the first installation, after which the joint gang goes over the joints, while still under traffic, with wrenches and tightens up any looseness caused by the cars. This is done several times, the last time being just before the track is paved.

The head of the rail at the joint is then planed to make a smooth, even-running surface. If not planed, no matter how slight a difference there is, the rail will cup after a period of service; but when planed to a bright surface on both sides of the connection there is little chance of cupping.

Since adopting this standard joint seventeen years ago, there have been less than one-half of 1 per cent failures, all of which were caused by breaks in the rail ends, generally by cracks through the line of bolt holes. Occasionally we find the head of the rail split from the web which may have been caused by cracks present before using and so fine that they could not be discovered but developed after years of service by the pressure of the tightened bolts together with the action of the heavy cars. Where the cracks are in line with the bolt holes it is probable that several conditions combined are responsible. First there may be small checks caused from strains in the rolling and punching of the rail ends which are not detected. Then the brazing process for bonds heats the web to a white heat which in cooling may develop strains and checks. It is certain that this heating of the web at a local spot between the bolt holes with comparatively cool metal all around it cannot help but injure the rail ends. These causes, together with the strain put on the head and bottom flange of the rail by tightening the plate, are responsible, in my opinion, for such breakages.

In all we have installed approximately 22,000 joints of which 75 have been repaired. Of these 75 we have a record of only one where the bolts became loose; the others were all broken rails. We find that even the broken rail joint rarely develops under ten years service.

Year's Work Reviewed

by Chairmen of American Committees

Reports presented on street traffic economics, rapid transit, insurance, motor vehicle information, industrial relations and education

ON SATURDAY morning, Sept. 22, the executive committee of the American Association held an open meeting in the new ballroom of the Public Auditorium. President R. P. Stevens presided. The principal business transacted was a review of the year's work, particularly as it was presented in the reports of the various committees. Following the usual custom these reports were not read but only discussed briefly by the chairmen. Abstracts of the reports of the committees on street traffic economics, rapid transit, insurance, motor vehicle information, publications, industrial relations and education are given below. The report of the committee on employee-customer contact will appear in a future issue. No formal reports were presented by the committees on finance, subjects and meetings, publicity, national relations, membership, co-operation with motor vehicle industry, electric railway finance, motor bus depreciation, public speaking or taxation.

Street Traffic Economics

THIS year the committee on street traffic economics is submitting merely a progress report which gives some sample data in chart form indicating many of the lines of study of street traffic economics and which gives in appendix form a review of opinion on various phases of the subject. There has been no attempt made to reach conclusions or to establish principles. The most important purpose to be served by this year's report is to stimulate interest in the lines of investigation suggested, as well as interest in formulating the complete program of approach to this intricate problem. It is hoped that the members of the committee and other interested organizations may be able to develop similar data covering other cities and locations, so that later reports will have more complete basic data from which to develop authoritative conclusions or to establish sound basic principles underlying city development and adequate methods of caring for the traffic and transportation problems.

For the first year's program it was considered desirable to limit the investigation to a few subjects and to get sample data which would illustrate to advantage the kind of information that would be applicable in the study of the problems. Then, standardized methods of investigation might be developed which would permit traffic analyses to be made in all cities, so they would be suitable for comparison. With such data at hand later authentic statements of principles can be developed.

The committee adopted for the first year's consideration the following topics:

1. Discussion of reasons why people concentrate in cities and why there is concentration in central areas of cities.
2. Interpretation of the purpose of streets as public thoroughfares.
3. Legal history of the rights to use streets.
4. Present use of streets in various types of cities: (a) Service in maximum hours showing numbers and types of existing traffic, pedestrians included; (b) measure of the relative use of streets in each hour of the 24; (c) measure of the wastage of street use.
5. Principles of betterment of use of streets: This to be later subdivided into several items.
6. Betterments in actual practice.

Part of this has been covered. For the first three items the discussion is given in the appendix where quotations of opinion have been compiled. These quotations are the most competent statements available on the various topics.

The report is signed by J. H. M. Andrews, F. L. Annable, John A. Beeler, J. Rowland Bibbins, M. R. Boylan, Edward Dana, S. E. Emmons, E. P. Goodrich, R. F. Kelker, Jr., Miller McClintock, E. J. McIlraith, L. H. Palmer, C. E. Smith and G. A. Richardson, chairman.

Industrial Relations

THE committee believes industrial relations is concerned with five major items, namely, employment of suitable employees, education and training of employees, health of employees, thrift of employees and employee representation.

A greater number of suitable men will be attracted as applicants for transportation positions if there is a greater realization in a company of the regularity of transportation employment, the total annual wages received, and the general benefits under which employees work.

It is evident from the data submitted by the committee that the education and training of employees has had no extraordinary development. There is need for greater study, and particularly to differentiate between general education of the employee and the training for his particular job. One of the telephone companies recently issued a statement that two years ago it found, by observation, that 80 per cent of the transactions between its operators and the public resulted in some dissatisfaction to the customer. By noting the items of dissatisfaction and treating them generally with all employees, it has been able to reduce dissatisfaction to a point where observations indicate that only 15 per cent of the transactions create some unpleasant contact. The committee finds that there is a trend toward specific instruction, and believes that greater effort should be given to analysis of the job, particularly of platform employees, whereby specifications for specific instruction may be prepared.

It is found that the healthy employee is being given greater attention than in prior years. Initial physical examination is common, and companies reporting to the committee show that the physical examination of applicants eliminates many undesirables, as some companies have found that much illness of employees results from poor teeth, and they have adopted much more rigid dental requirements at the time of initial examination.

Opinions vary as to the extent of activities to create healthful environments. The committee finds, however, that many companies have benefit plans whereby the employee is compensated a fixed amount per week when he is off duty on account of sickness or accident. There is a trend also to create the most healthful environments as the same apply to good working conditions.

Many thrift projects are in vogue among companies reporting to the committee. Many studies are under way of employees' stock ownership, plans for saving, and organization of building and loan projects. In some cases these have been promoted through employees' benefit associations.

Appended to this report is the outline

Digitized by Google

as submitted to several companies so arranged as to show comments of these companies beside subdivisions of the outline.

The report was signed by James P. Barnes, S. B. Way, W. E. Wood, Thomas Fitzgerald, vice-chairman, and Joseph H. Alexander, chairman.

Motor Vehicle Information

IT HAS been the purpose of the committee to enlarge upon the report of 1927 by giving more specific information and by the addition of certain questions which were not included in the questionnaire for last year. No attempt was made to circulate the questionnaire among all railway companies operating buses, but rather to confine it to the eighteen members of the committee in the belief that their replies will be representative of the industry as a whole. The idea has been to obtain general rather than detailed information.

The general opinion indicates that there will be a continuation of purchases of buses by electric railways during 1928, but probably not to such a great extent as in 1927. Most of the new buses, particularly in the large cities, will be used for feeder and cross-town service, but in the smaller cities there will be some replacement of car lines by bus operations. In some cases tracks and paving renewals required by the city government have led the companies to replace street cars with motor coaches. In most cities bus service operated by other than electric railways has been reduced or eliminated, but interurban operation by other companies is still on the increase. Bus operation is not yet yielding a fair return on the investment, if considered purely from the standpoint of net income. If, however, it is considered from the standpoint of savings over cost of street car operation in similar districts, its operation is amply justified from the investment standpoint. The trend is toward larger and more luxurious coaches for interurban operation and higher powered and better coaches for city operation. The hauling of freight by motor trucks is on the increase. Opinion is divided with regard to the future of bus operation. In some sections there is a belief that there will not be very great development in the bus field, but replies from the majority of districts indicate that bus operation will be on the increase for some time.

Regarding types of equipment, the overwhelming opinion for all classes of railway service is to the effect that the single-deck street car type bus is the best. Most of the reporting companies feel that in the development of the bus as a means of mass transportation, it would be a mistake to adopt rigid standardization of equipment, for the reason that it would prevent beneficial experimentation and throttle initiative.

Speaking from the standpoint of economics, local conditions dictate the points at which bus service should be replaced by car service. The determining factor is the difference in cost between selling and operating street car service and the cost of operating a bus service. It is the common opinion that buses should not be replaced by street cars until the loads carried by the buses in the base hours are sufficiently heavy to warrant a fair headway on street cars. Reporting companies are about evenly divided on the question as to whether the street cars or buses are most popular with the public. Answering the question as to whether the 10-cent fare is too low to be adopted as a standard for bus operation, the opinion of the reporting companies is about evenly divided. One operator has suggested that the idea of the standardization of a dime bus fare is dangerous, and that the same situation that arose with the "nickel logic" on street cars should be anticipated and avoided.

The report was signed by M. R. Boylan, L. C. Bradley, F. G. Buffe, F. L. Butler, F. A. Cummings, B. J. Fallon, H. B. Flowers, M. B. Lambert, R. L. Lindsey, W. H. Lines, H. B. Potter, R. I. Todd, W. B. Tuttle, E. P. Waller, S. B. Way, W. E. Wood, D. W. Pontius, vice-chairman, and J. H. Alexander, chairman.

Education

DURING the past year the committee on education has concentrated largely on the following topics: (1) Course for training conference leaders in the transportation department; (2) course for training transportation leaders in the non-transportation departments; (3) educational luncheon conference; (4) conferences of personnel and educational directors; (5) training transportation employees already in service, including dramatization demonstration; (6) educational exhibit for the 1928 convention. The sub-committees handling these topics presented reports which are abstracted in appendixes. In connection with the training of present transportation employees the following recommendations are made:

1. The preparation of a key manual for use of the executive in charge of the training work. This manual to contain proposed procedures and methods as outlined together with a list of the indicative subjects.
2. The preparation of a series of manuals treating the foregoing subjects in a universal method as a preliminary step for use with either keymen or operating employees.
3. That more complete and detailed material on various subjects be prepared in the nature of a textbook that could be distributed (for a small fee by the association) to form the basis of class study on those properties so desiring.

In another appendix is given a bibliography of recent articles, pamphlets and books on employee education and training.

The report was signed by L. P. Baurhenn, A. C. Blinn, W. H. Burke, J. A. Dewhurst, H. H. Fenton, M. B. Lambert, M. McCants, F. H. Miller, H. B. Potter, A. J. Rowland, A. J. Sarré, C. D. Smith, H. H. Norris, secretary; J. S. Hyatt, vice-chairman, and Edward Dana, chairman.

Rapid Transit

INSTRUCTIONS to the committee this year were that it should review the reports of previous years and revise the information so it could be compiled in a single booklet.

The data included are illustrative only and do not attempt to present complete factual information such as would be developed in the making of an analysis of the possibilities of rapid transit in a specific location. The report points out that the use of transit thoroughfares at other than surface level is becoming necessary not alone from the advantage in creating rapid transit, but also in order to provide additional street space

without widening the streets in areas where the land values and existing structures practically prohibit street widening. Better results, improved transportation and improved vehicular flow come from separating the three classes of traffic as much as possible. The ultimate plan, that can be readily accomplished gives principally to vehicles the present level, creates a new sub-surface level to give the electric cars and trains an uninterrupted right-of-way and provides an intermediate level for pedestrians only.

In certain sections of the city the subway construction would be logically changed to the less expensive elevated road of the most modern type, operating either along private right-of-way or along the line of the alleys, so as to make a minimum disturbance to property values and to street utility and appearance. The costs of such developments are not prohibitive if the program is appropriately planned, suitable to the city and to the transportation and traffic needs.

The physical layout of all our large cities is quite inadequate to meet the modern needs of traffic and transportation in large cities unless new levels are utilized in the existing streets. The problem has, then, become one of immediate and urgent concern for city governments and for the business interests of the larger cities. The opinion is now very widely held by public officials and transportation organizations that it is impossible to produce adequate transportation in a city using rapid transit structures without spreading the cost equitably over all those who are obtaining benefits.

The report is introduced by a summary of the economics of rapid transit prepared by Leslie Vickers, economist of the American Electric Railway Association, and contains an invaluable compilation of statistical data, estimates of relative unit construction costs of various forms of transit facilities, and comparisons of the carrying capacity of streets and rapid transit structures. It also contains extracts from many reports, opinions of prominent transit authorities and public officials, bearing particularly upon the question of the equitable distribution of rapid transit construction cost among the several benefited groups in the community.

An unusual array of transportation executives and authorities on rapid transit matters made up the membership of this committee.

The report was signed by the following: H. L. Andrews, W. B. Bennett, Edward Dana, H. E. Ehlers, S. E. Emmons, B. J. Fallon, Thomas Fitzgerald, E. J. McIlraith, R. F. Kelker, Jr., W. S. Menden, D. W. Pontius, C. E. Smith, F. H. Shepard, J. B. Stewart, Jr., D. L. Turner, James Walker, J. H. Alexander, vice-chairman, and G. A. Richardson, chairman.

Insurance

FROM data compiled from questionnaires sent out to member companies the committee on insurance was able to report that the industry has had another year of small losses in comparison with the amount of property insured and the premiums paid. Its efforts to prevent fires, to eliminate its hazards, and to continue to deserve new rates have been sustained throughout the year. The questionnaire on which the insurance data was reported in 1928 was sent to more than 600 companies. The number of complete replies received is 325, as compared with 339 complete replies received last year. These 325 companies operate 64.98 per cent of the total trackage of the United States. The number of cars covered by the insurance is 53,681, approximately 70.29 per cent of all electric railway cars in use. The total amount of fire insurance carried by the 325 companies reporting this year was $694,833,900.

Motor bus fire insurance was reported by 140 companies, carrying a total of $19,962,850. The number of buses insured in 1927 was 4,745, which was 63 per cent of the total number of buses operated by electric railways that year. Public liability insurance of buses was reported by 79 companies for 1927, and property damage insurance by 68 companies. Other types of bus insurance, such as excess liability insurance, theft,

robbery, pilferage, collision insurance, hold-up insurance, were reported by a number of companies in scattered locations throughout the country.

The report was signed by A. Benham, O. H. Bernd, G. H. Bourne, F. L. Butler, R. S. Child, Stanley Clarke, N. H. Daniels, F. M. Hamilton, A. D. Knox, J. H. Moran, F. J. Petura, D. W. Pontius, J. P. Pulliam, H. M. Shaw, B. L. Tomes, P. E. Wilson, and H. B. Potter, chairman.

Depreciation*

ON JAN. 25, 1927, the Interstate Commerce Commission, by order number 19157, required the electric railway companies subject to its jurisdiction to appear and show cause why an order should not be issued "concerning depreciation charges of electric railways substantially the same as that entered with respect to depreciation charges of steam railroad companies" and specifying the classes of property against which depreciation should be accrued.

On Nov. 2, 1926, the Interstate Commerce Commission, by orders numbered 14700 and 15100, entitled respectively "Depreciation Charges of Telephone Companies" and "Depreciation Charges of Steam Railroad Companies," prescribed systems of accounting for depreciation for such companies. It is the system of accounting for depreciation prescribed for the steam railroad companies in order number 15100 which the commission proposed to apply, with minor modifications, to the electric railway companies subject to its jurisdiction.

The committee has been kept fully advised of the developments in connection with these hearings through Leslie Vickers, economist of the association, who was in constant attendance at these hearings. One or more members of the committee were present at a considerable number of these hearings.

On Oct. 11, 1927, the commission proposed a general revision of accounting rules for steam railroads for the purpose, among other things, of carrying into effect its order number 15100 prescribing depreciation charges for steam carriers.

It was obvious that the system of depreciation charges for electric railways tentatively prescribed by the commission in its order number 19157 would require extensive modifications in the present uniform system of accounting for electric railways, prescribed by the commission in 1914. The assistance and co-operation of the committee on standard classification of accounts of the Accountants' Association, under the chairmanship of M. W. Glover of Pittsburgh, therefore was invited.

On Nov. 10, 1927, Ralph R. Bradley, counsel for this committee, appeared in the proceedings and made a formal statement to the commission in behalf of the association. Mr. Bradley stated that the association did not consider it either advisable or desirable to introduce any evidence or to take any active part in the proceedings then pending with respect to the depreciation orders concerning the telephone companies and steam carriers until the entire case as to the steam carriers and the telephone companies was concluded.

It is impossible to overestimate the importance of the proceedings in the steam railroad and telephone cases to the electric railway industry.

The report was signed by F. W. Doolittle, M. W. Glover, Charles R. Harte, A. S. Richey, Richard Sachse, Charles E. Thompson, L. R. Nash, vice-chairman, and Thomas Conway, Jr., chairman.

Publications

TWO separate duties have been performed by the committee on publications during the past year. The first of these has been the supervision of the association's magazine, *Aera*. The second has been supervision of the work of the statistical department.

At the beginning of the present association year two important changes were made in connection with *Aera*. The first was to eliminate advertising from the magazine in accordance with the decision of the executive committee as announced at the 1927 convention. The second of these changes involved certain modifications in editorial policy. Rather than have *Aera* cover primarily the same field as the commercial press it was felt that there was an opportunity for it to perform a special service which only an association publication could do. It was decided that the magazine should serve as a means to inform members concerning the activities of the association and that it should also undertake the special task of appealing more directly to individuals, particularly those individuals below the rank of executive, with a view to arousing their interest and enthusiasm for the railway business.

The establishment and growth of the statistical department were brought about by the desire of the association to answer all of the requests for special information which were received from members. The following record shows the number of requests answered by bulletins and the number of special requests answered during the last three association years and by months for the first part of the present year:

	Requests for Bulletins	Special Requests	Total Requests
1924-25	9,747	817	10,564
1925-26	11,276	841	12,117
1926-27	12,191	913	13,104
1927-28:			
October	920	93	1,113
November ...	1,146	95	1,241
December ...	1,007	84	1,091
January	898	55	953
February ...	1,070	96	1,166
March	821	77	898
April	991	78	1,069
May	1,810	55	1,865
Total—Eight months	8,663	633	9,296
Same months last year....	8,017	653	8,670

Particular effort has been made during the past year to effect the best practicable co-ordination between the statistical department of the association and that of ELECTRIC RAILWAY JOURNAL. Substantial progress had already been made previous to this year, but the situation is one which, dealing with a continually changing body of information, requires constant attention, and the committee believes very definite progress has been made during the past year.

The report was signed by J. L. Alexander, G. B. Anderson, T. W. Casey, Charles Gordon, T. R. Langan, H. H. Norris, Prof. A. S. Richey, W. H. Sawyer, R. S. Tompkins, E. P. Waller, F. W. Doolittle, vice-chairman on statistics; H. V. Bozell, vice-chairman on *Aera*, and J. H. Hanna, chairman.

Engineers Discuss Work Done

by Committees During Year

Large amount of work completed by all divisions of the Engineering Association. Progress reports presented when work is to be continued. Heavy electric traction committee reports

COMPLETION of the reorganization of committee work of the Engineering Association was effected during the year by the formation of the power division and the purchases and stores division. The others are way and structures and rolling stock. The beneficial results of this system are shown by the progress made. Many committees did not present formal written reports as the work had not progressed sufficiently so that definite recommendations could be made, so the following abstracts do not include reports of all the committees.

Revision of Constitution and By-Laws

THE special committee, appointed by the president to determine the need for revising the present constitution and by-laws of the Engineering Association recommended that a number of changes be made in both the constitution and the by-laws to bring them into conformity with the latest revision of the constitution and by-laws of the American Association; to provide for other changes in procedure made desirable by the new committee rules recently adopted and put into effect; and to obtain clarity of expression where this seemed necessary. The principal revisions proposed are as follows:

1. The membership limitations have been revised to include types of transportation companies other than electric railways.
2. The method of voting on standardization recommendations by member operating companies has been changed from a *viva voce* vote on the convention floor to a letter ballot system; this revision also provides for the weighting of ballots cast on a basis of the amount of dues paid in accordance with the provisions of the American Association constitution and by-laws.
3. The order of business at meetings of the association has been revised to accommodate the needs of the new committee organization and procedure.
4. The method of amendment of the constitution and by-laws has been changed to provide for a weighted letter ballot of member operating companies.

Other minor changes were proposed in the interests of clarity and improved procedure and to obtain wherever possible, agreement with the corresponding section of the American Association constitution and by-laws. The committee recommended that the proposed revised constitution and by-laws be adopted.

The report was signed by F. McVittie, F. H. Miller, and W. W. Wysor, chairman.

Heavy Electric Traction

SIX subjects were assigned to this committee: Manual review, track and third rail bonds, branch line electrification, train operation with reference to articulated trains, train makeup and electrification progress.

Information on the use of supplementary negatives and also methods and extent of practice in reapplying bonds was collected and tabulated. Considerable data also were collected on recommended practice as to contact areas and resistances of rail contacts. The standard dimensions of various kinds of rail bond terminals were submitted by the American Steel & Wire Company, the Electric Railway Improvement Company and the Ohio Brass Company. Additional information was furnished by these three manufacturers as to the compositions and specific resistances of steel and copper alloy welding metals for the application of bonds. It is recommended that this study be continued and that this committee endeavor to secure the co-operation of the electrical section of the American Railway Association on the work now being done in connection with rail bond standardization.

Further information on the use, abroad, of substitute methods for bonding was obtained from the manufacturers selling the apparatus for spraying rail ends with molten metal, tending to show an increase in the application of this method. The committee has initiated several independent investigations abroad, and expects to have information through different channels which will allow giving an unbiased report of what is being done by this method. It is recommended that the subject be continued.

It has been difficult to make progress in the compilation of information concerning rail joint clearance and its effect on rail bond design owing to the great variety of designs of rail joints. Additional designs showing standard sections adopted by various railroads have been obtained during the year. Studies so far show that the variations in design are so great as to indicate that the space provided for bonds underneath the splice bars has been arrived at without any consideration whatever for concealed bonds. It is also found that the spacing of the bolts is highly variable, which feature together with the contour of the top of the splice bars requires considerable variation in the design of bonds for application to the head of the rail. An interesting illustration of the diffi-

culties in adapting rail bonds to many of the standard rail joints can be made after further study for presentation to the designers of the rail joints. It is hoped that ultimately some co-operation can be effected between the various committees interested in rail joint and bond design. It is recommended that this subject be continued.

Continued progress has been made during the past year in the introduction of motive power, other than steam, on branch lines and terminals. The self-propelled gas engine car is finding increasing favor in replacing steam engine operated trains of two or three cars on branch lines providing infrequent service. The operation of such cars has been successful. Previous steam operating costs have been materially reduced to such an extent as to pay for the car in some instances in a period of one to two years. The gas engine cars of later design show an increase in weight and power; more than half of those ordered in 1927 exceed 100,000 lb. in weight, with engines of 225 hp. or more. The development of the heavier and more powerful gas engine car is accompanied by the introduction of electric drive in place of mechanical gear shift, and all but six of the cars ordered in 1927 were of this type.

Locomotives of the straight oil-electric drive, or supplemented with storage batteries, have been installed in railroad terminals in an effort to find a type of motive power other than steam that does not require the installation of an overhead contact system and electric substations for its operation. The trend in motive power for terminals is not yet clearly defined, and the committee reports on several interesting types of locomotives installed during the past year which indicate that this development is still in the formative state.

The report includes tabulations of motor cars and trailers ordered from 1922 to 1927, inclusive, and recent electric locomotives built, in addition to giving descriptions of several oil engine and oil-electric units. It also describes three recent types of switching locomotives of unusual design.

The committee has obtained and tabulated additional information and data on articulated train units placed in operation during the past year. Information has been received from eleven companies that are operating articulated train units and it includes all available data for the United States, Canada, and Europe. The committee wishes to call attention to the increase in number of properties and the increased number of articulated units placed in operation during the past year, and has endeavored to explain the reasons for this increase by obtaining authentic information from companies operating this type of equipment over a period of years, which information is herewith submitted:

Articulated trains of from two car units with three trucks to ten car units with eleven trucks have been in successful operation for a period of more than ten years in England and elsewhere abroad, before its development and adoption in this country. For the past five years the development and adoption of articulated train units have been carried on in various parts of this country by properties operating subway and elevated lines, surface lines and interurban lines. It is, therefore, apparent that there are certain advantages in articulated train units over single cars with two trucks in trains made up of a group of double truck cars coupled together, which caused a number of operators to build and place a large number of trains of this type in service. Some operators, particularly those operating trains in rush-hour service only, have found it economical to rebuild old equipment, since peak hour service is the most economical way to use older equipment; whereas other properties having a preponderance of train operation during the entire day have designed and built new articulated units in large numbers for their particular service.

More fully to acquaint the transportation industry as a whole with this type of equipment, a questionnaire was prepared and sent to all companies operating articulated trains to obtain their reasons for development and adoption of this type of equipment, and to bring out the advantages and economies effected in their operation, as well as any disadvantages and their effect on operation. The advantages given in the summary of all information received are: Saving in platform labor, better distribution of passenger load, safety to passengers passing from one car to another, lower cost of construction due to omission of operating cabs on coupled ends, lower cost of maintenance due to one less truck per train and ommission of cabs, drawbars and draft rigging on coupled ends. It was recommended that further study and the collection of descriptive information and engineering data on articulated trains be made, and that the subject be continued.

The present practice in multiple unit train makeup and operation varies so widely among the numerous companies operating this type of equipment that the committee has deemed it advisable to give its attention this year to the preparation of a questionnaire which will cover the salient features of American practice in this subject. The questionnaire will be sent out next year to the various companies operating such equipment, and the replies tabulated. It is recommended that this subject be continued for the further collection and compilation of data.

The committee made an extensive report of the electrification progress in this country. It described the progress and plans of the Great Northern Railway, the New York Connecting Railroad, the Long Island Railroad, the New York, Westchester & Boston Railway, the Pennsylvania Railroad, the Reading Railroad, the Delaware, Lackawanna & Western Railroad, the Cleveland Union Terminal and the Boston, Revere Beach & Lynn Railroad. It also noted in detail the progress of many foreign railways.

The report is signed by A. H. Armstrong, L. W. Birch, S. B. Cooper, A. H. Daus, J. C. Davidson, J. H. Davis, J. V. B. Duer, H. H. Febrey, J. T. Hamilton, W. E. Huber, E. C. Johnson, J. S. Thorp, L. S. Wells, L. C. Winship, G. I. Wright, Morris Buck, secretary, J. M. Bosenbury, vice-chairman, H. F. Brown, chairman and F. H. Miller, sponsor.

Way and Structures Division

Way and Structures Special Committee No. 1— Manual Review

CHANGES in grade of a number of existing Manual sections were considered and the following recommendations offered:

That the following Manual sections be advanced from the grade of recommendation to that of standard:

W100-26—design for plain girder rails and splice bars.

W105-26—specification for solid manganese-steel special trackwork for girder rail.

W108-26—specification for plain bolted special trackwork.

W109-27—specification for rail-bound insert type special trackwork.

W110-21—recommended distances between tangent track centers through special trackwork layouts for all track gages

W114-24—design of solid manganese-steel crossings; steam railroad over electric railway (for angles 90 deg. to 60 deg. inclusive).

W115-24—design of solid manganese-steel crossings; steam railroad over electric railway (for angles 60 deg. to 40 deg. inclusive).

W116-25—design of bolted rail crossings; steam railroad over electric railway (for angles 90 deg. to 50 deg. inclusive).

W117-24—rules for determination of flangeways and gages on curves.

W118-24—design for 5½x⅞-in. track spike.

W119-24—specification for design and manufacture of tie rods.

W120-25—design for bolted rail crossings; steam railroad over electric railway (for angles below 50 deg. to 30 deg. inclusive).

W121-26—design of bolted manganese-steel crossings; steam railroad over electric railway (for angles below 45 deg. to 30 deg. inclusive).

That Manual section W101-15, protection of contact-rail where protected third-rail is used, be referred to the proper committee for study and if no revisions or modifications are required that it be advanced to standard.

That Manual section W111-25, car clearance easements with standardized frogs for various gages, be combined with Manual section W13-24, system of uniform track spirals and simplified system of single branch-off frogs, the combined section to be a standard.

That in Manual section W113-23, specification for street railway track construction, a footnote be inserted calling attention to the revised serial designations of other Manual sections.

That Manual section W200-23, rules and regulations for the government of employees of the way department, be withdrawn from the Manual but that a referendum page be substituted calling attention to its withdrawal with a reference to the Proceedings in which the information can be found.

That Manual section W119-24, specification for design and manufacture of tie rods and Manual section W16-24, specification for carbon steel rails of standard section be given further study next year.

That Manual section W112-22, specification for low carbon-steel track bolts be changed to conform with the A.S.T.M. specification for the same material. It is further recommended that the specification be then advanced to the grade of standard.

The report was signed by T. H. David, D. J. Graham, James S. Mahan, D. H. Walker, and W. R. Dunham, Jr., chairman.

Way and Structures Special Committee No. 12—Rail Corrugation

WORK of other associations and interests on the subject are digested in the report of special committee No. 12, rail corrugation. This digest indicates that the trend elsewhere is to put more emphasis on the matters of rail steel processing and physical qualities in an attempt to secure a rail steel which will be economic in cost and resistant to corrugation.

A brief on the subject of the "fatigue" qualities of rail steel is given. It indicates that if rail surface failure is to be avoided, the stresses in the surface fibers should not exceed 50,000 lb. per sq.in. with present rails and that this limit, known as the "endurance limit" is quite accurately given by the product obtained by multiplying the Brinell hardness number by 250.

A discussion on the subject of temperature stresses show that the stress induced in steel which is not free to expand or contract is 200 lb. per sq.in. per degree F. of temperature change and that daily variations may be as high as 6,000 lb. per sq.in. and seasonal variations as high as 20,000 lb. per sq.in.

The committee recommends that the investigational work on this subject should be continued with the aim in view of securing more definite information on the general subjects of rail stresses and corrugation phenomena.

Certain new data are given showing the growth of corrugations, also data relative to other physical characteristics of corrugations are presented.

An addition is made to the bibliography presented last year. No new conclusions are presented but a re-emphasis of those presented last year in which the basic thought was that of so increasing the resisting power of the track structure, or so reducing the loads imposed on the structure (or doing some of both) that the wheel rail contact stresses would be reduced below the limit above which failure of the rail surface results.

The report was signed by Chas. H. Clark, E. B. Entwisle, D. D. Ewing, R. B. Fehr, H. Fort Flowers, C. R. Kinnear, T. J. Lavan, E. L. Lockman, W. H. McAloney, K. W. McPherson, A. M. Nardini, J. Ormondroyd, J. T. Porter, H. Jackson Tippet, C. L. Van Auken, H. S. Williams, vice-chairman, and W. W. Wysor, chairman.

Rolling Stock Division

Rolling Stock Special Committee No. 4—Lighting

CAR lighting was studied this year with a view to improvements and economies due principally to standardization and uniform practices. Certain supplementary data on car lighting practice were prepared covering Mazda C automatic cutout lamps, headlighting and other accessory lighting. For the purposes of conciseness, completeness and freedom from confusion the committee recommended that Manual sections E119-27 and E218-27 now appearing in the 1927 Supplement and the supplementary data prepared during the past year be combined into a single Manual section and be approved as a recommended practice on car lighting. Certain corrections in Manual section E218-27 are also included. This proposed new Manual section is submitted as Appendix A.

An investigation was made of practices in shop, office and yard lighting. The results of this study are embodied in Appendix B which is submitted for approval as a recommended practice Manual section.

A table showing the comparative annual demand for street railway lamps together with other information on lamps and lighting of interest to the electric railway industry was prepared as Appendix C.

The investigation of car lighting practice was continued considering in particular the application of recently developed Mazda C automatic cutout lamps to electric railway service. A study was made of headlighting and miscellaneous accessory lighting. As a result of this study, descriptions of suitable lamps and lighting equipment for various applications were prepared.

The new proposed Manual section includes corrections of the present Table I of Manual section E218-27 as follows:

1. The 36-watt 105-130-volt, S19 clear bulb lamp has been removed from the table. 2. The 56-watt 105-130-volt, A21 inside frosted bulb lamp with 587 approximate initial lumens and the $4\frac{7}{16}$ in. maximum over-all length should be substituted for the 56-watt, 105-130-volt, S21 clear bulb lamp.

In order to permit standardization of car lighting equipment the committee proposed originally to include additional information on lamp holders and reflector glassware, but sufficient data were not available at the time of the completion of the report.

The committee was unable to reach any conclusions on desirable methods for inspecting lamps for a given system and, therefore, recommended that this item be studied further when more information is available.

Methods of lighting the shops, offices and yards of electric railway properties were investigated and recommendations for the best practice developed. Multiple lighting with 115 volts was found to be the most satisfactory system due to the availability of more satisfactory lamps and lighting equipment for the various applications. Sections 1, 2 and 3 of the Manual on Recommended Practice of Illumination of the Association of Railway Electrical Engineers are referred to as sources of references on illumination design when using such multiple circuits.

For installations where trolley voltage must continue as the lighting supply applications of arc resisting and other five-in-series lamps have been presented. A brief description of suitable reflecting equipment, suggestions on the arrangements of lighting outlets and a table of recommended lighting intensities have also been included.

All the information on shop, office and yard lighting has been prepared as a single proposed Manual section appearing in the report as Appendix B.

Subsequent to the assignment of subjects for investigation, it was suggested that the committee report on preventive measures for avoiding glare on the windshield to operators of motor coaches. It was the opinion of the committee, however, that this subject could not receive proper treatment unless other applications of motor coach lighting were also included. As its program would not permit such extra study this year the committee recommended that the entire subject of bus lighting be assigned for investigation next year.

As a result of its investigations the committee determined that the recommended lighting intensity of foot-candles on the 45-deg. reading plane for the interior illumination of an electric railway car can be obtained with proper applications of the Mazda C automatic cutout lamps. It was also determined that careful consideration should be given to the selection of proper types and sizes of reflecting accessories and adequate light sources for headlighting, rear-end marking and other accessory lighting, to assure safe and efficient operation of electric railway cars.

Adequate systems of artificial illumination for shops, offices and yards are quite important for the operations involved. The committee therefore believe that the information prepared should be made part of the Manual.

The subjects investigated during the current year will require further study and should be continued and in view of these conclusions the committee made the following recommendations:

1. That the material presented in Appendix A of the report be approved as a recommended practice Manual section on car lighting.

2. That Manual sections E119-27 and E218-27 be withdrawn.

3. That the material submitted as Appendix B be approved as a recommended practice Manual section on shop, office and yard lighting.

4. That all the subjects assigned this year be continued for further study.

5. That the new subject of lighting for motor coaches be assigned.

The report was signed by A. L. Broe, W. W. Brown, H. F. Deininger, E. E. Dorting, H. G. Lewis, J. P. Staples, H. A. Otis, vice-chairman, and R. W. Cost, chairman.

Rolling Stock Special Committee No. 8—Motor Brushes

THE report takes into consideration data collected on this subject by the manufacturers of railway motors; also that obtained by members of the committee. Before the formation of this committee the manufacturers had determined that side wear of carbon brushes on multiple-ventilated railway motors was caused by the abrasive action of dust taken into the motor with the ventilating air. Such observations have been substantiated by tests carried on by members of this committee.

Since the committee was first appointed, improvements in ventilation methods have increased the brush life from two to ten times that previously obtained.

The committee considered the following as having a bearing on the side wear of brushes: (1) condition of commutator, (2) maximum advisable wear of carbon box, (3) recommended limit of side wear of brush, (4) height of carbon box from commutator, (5) grade of brush and (6) spring pressure on brushes.

As the result of its investigations the committee reached the following conclusions:

1. That side wear of carbon brushes in multiple-ventilated railway motors is in the majority of instances caused by dust that enters the motor with the ventilating air. This dust, acting as an abrasive between the brush and the carbon box, causes side wear of the brush and roughens the brush surface of the carbon box.

2. Elimination of either dust or movement of brush in carbon box will prevent side wear of brushes.

3. In the selection of brushes for railway motors operators should not be guided solely by the brush mileage obtained but should give due consideration to the effect produced on the commutator and choose a brush that polishes without scouring. Such a brush will ride smoothly on the commutator thereby reducing movement in the carbon box to a minimum. A brush that does not polish but etches and roughens the commutator will not ride smoothly and will cause flashing

Brush action on commutator is cumulative, *i. e.*, either the surface improves with age or gets worse. This latter condition at times necessitates the removal of the motor from service for commutator turning.

4. The data collected by the committee shows that changes made in the past several years have greatly reduced side wear of brushes and to the extent that it no longer is the limiting factor in carbon brush life.

5. That it is not to be expected that brush mileage on multiple-ventilated railway motors will equal that obtained on series-ventilated or totally enclosed motors.

6. That the brush life obtained will depend largely upon operating conditions, being affected by the character of the dust

Digitized by Google

(*i. e.* abrasive or not) paved or unpaved streets, speed of equipment, etc.

7. That a brush mileage of 10,000 to 15,000 miles for multiple-ventilated motors should be considered satisfactory.

8. That unsatisfactory brush life should be brought to the attention of the motor manufacturer.

9. For the smaller motors, up to 50 to 60 hp., results indicate that the use of one brush per holder, with either one or two springs per holder, gives best results, both for the condition of the commutator and for brush life.

10. That the brush-holder spring pressure should be sufficient to keep the brushes on the commutator at all times.

To obtain maximum brush life, it is recommended that the motor be modernized in respect to ventilating features, that the motors be blown out frequently (every 1,500 to 2,000 miles) with dry compressed air, that careful consideration be given to the brushes used not being guided entirely by price and that only brushes that are graphitized be used.

Carbon boxes with the brush surface worn in excess of $\frac{3}{32}$ in. should be brought back to normal or replaced and the height of the carbon box from commutator should be from $\frac{1}{8}$ to $\frac{3}{8}$ in.

Brushes having side wear in excess of $\frac{1}{16}$ in. should be replaced. Commutators that have a rough surface or slight flat spots should be turned, carefully undercut and polished.

The report was signed by H. Childs, H. T. Hurlock, J. Markel, F. W. McCloskey, R. D. Voshall, R. A. Hutchins, chairman.

Committee No. 9—Noise Reduction

TESTS have been made on the value of wheel silencing schemes which show the resilient wheel to be the most silent, followed in the order of their effectiveness by the wheel with lead insert, and the wheel with bolted muffling pads. Tests were also made of the worm-drive truck which prove it to be quieter in operation than the conventional truck. Comparative tests between the ordinary wooden floor construction and composition flooring show the composition floor to be slightly better from the noise standpoint.

The committee made a plea for more perfect gearing as a noise preventive.

A series of tests on track constructed of steel ties and compressed concrete as compared with track on wooden ties and compressed concrete pavement show the wooden tie construction appreciably quieter. Tests were reported in which a noisy car was taken and by making successive changes the noise of the car is reduced 47 per cent, thus demonstrating that present cars may be made to operate without objectionable noise. The methods employed by the Market Street Railway of San Francisco to reduce noise are described. Attention is called to one of the basic principles which must be complied with if sound insulation is to be applied with maximum effect.

As a result of its studies the committee made the following recommendations in the interest of noise reduction in car operation:

1. Adoption and consistent use of higher standards of maintenance.

2. Added effort toward the design and use of lighter weight cars.

3. The reduction of unsprung weight.

4. Commercialization and use of this committee's methods of noise reduction as outlined in this and previous reports.

5. Use of track construction that will give an adequate measure of resiliency.

6. Reference of the association's gear defect gage to the rolling stock committee with the request that this be revised with due regard to noise. Also that standards covering the inspection of gears be considered, giving special attention to limits of warpage and eccentricity.

7. As the subject of noise reduction has not been exhausted, the committee recommends continuance of its work.

The report was signed by C. Bethel, R. S. Beers, N. R. Brownyer, C. J. Ellis, T. H. Minary, Robert M. O'Brien, E. R. Rath, R. D. Voshall, H. S. Williams, chairman.

Rolling Stock Special Committee No. 11—Current Collecting Devices

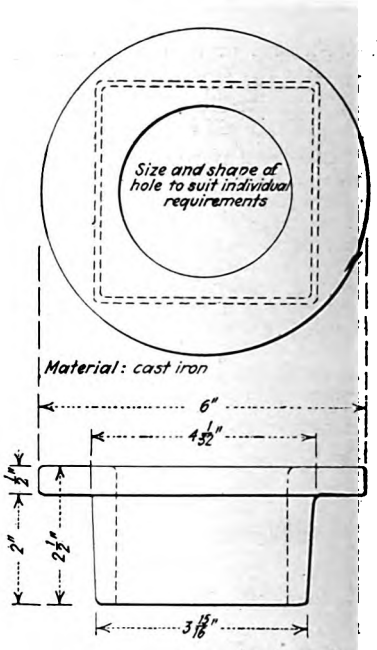
THE committee obtained data from 81 member companies operating a total of 28,000 cars. However, due to a lack of any previous information on standards for current collecting devices and the inability to obtain sufficient new

Digitized by Google

information, the committee is unable, at this time, to make definite recommendations for the adoption of the designs and specifications submitted. The report is confined to a study of the details connected with the designs of a trolley base, trolley pole, harp and wheel, the designs and specifications are submitted as information only to afford the industry an opportunity for criticism and to permit further study before a recommendation for adoption is made.

The committee recommended that the study of this subject be continued in order to take into account any criticisms of the material which is contained in the report and to complete the work of developing standards for a complete current collecting device and for associated parts.

The report was signed by W. C. Klein, H. S. Murphy, W. Schaake, Dwight L. Smith, R. E. Wade, and H. Savage, chairman.



Bushing for proposed standard wooden reel for trolley wire

Power Division

Trolley Wire Reels

VARIOUS proposals were discussed at two meetings of special committee No. 8 held during the year and three standards set up together with a standard bushing. These proposed standards were turned over to a sub-committee composed of manufacturer members to check up for shop practice, usefulness and capacity.

As the result of these investigations this committee has agreed that:

1. There apparently is a need in the industry for three standard reels for shipping and stringing trolley wire.

2. These reels preferably should be designated by numbers and should have the following capacity dimensions.

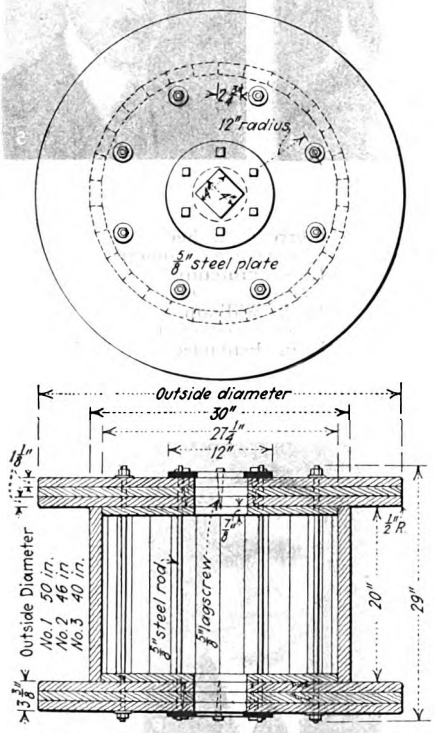
	Flange Diameter	Drum Diameter	Drum Width
No. 1	50 in.	30 in.	20 in.
No. 2	46 in.	30 in.	20 in.
No. 3	40 in.	30 in.	20 in.

3. There should be a single bushing for all three reels which should be standardized except for the arbor hole, the size and shape of which may be left to the discretion of the user.

4. The committee is of the opinion that in general the user will prefer to provide his own bushing.

The committee, therefore, has prepared drawings showing an end elevation and cross-section of a reel with dimensions for the three proposed standard sizes, details of the proposed standard bushing and tables showing the capacities and application of the proposed standard reels. One of the tables and the drawings are reproduced herewith.

The report is signed by W. H. Bassett, C. L. Hancock, Kirk J. Keith, A. J. Klatte, Dwight L. Smith and J. F. Neild, chairman.



Side elevation and cross-section through center of proposed standard wooden reel for trolley wire

Manual Review

SPECIAL Committee No. 1, Manual Review, contained recommendations that special committees be formed next year to consider the revision of certain Manual sections. It was signed by L. W. Birch, H. W. Codding, John Leisenring, George F. McClellan, Henry W. McRobbie, W. J. Quinn, A. Schlesinger, R. G. Winans and J. Walter Allen, chairman.

Power Rectifiers

DEFINITE statements concerning the various phases of the art as it exists at present were made by the committee. The results of another year of operating practice were studied and summarized, and suggested log sheets to make possible the securing of comparable information from different installations were prepared.

Among the statements made by the committee are the following: The phrase "mercury vapor power rectifier" is preferred to "mercury arc power rectifier" because it is more descriptive of the apparatus. The power factor of the

rectifier shall be measured on the input side of the rectifier transformer. With overload protection on the primary oil circuit breaker, the rectifier and its auxiliaries are not affected adversely by direct-current short circuit. Dielectric tests and insulation resistance tests should be made similar to those used in testing transformers for use on equal voltages. The voltage regulation shall be taken as the percentage variation of the direct current voltage, over the specified load range, with maintained primary voltage on the rectifier transformer. The regulation shall be measured using power from a source having low reactance. The efficiency shall be obtained by the method of segregated losses.

A questionnaire was sent to 26 operating companies in the United States and Canada requesting data on characteristics of their rectifiers and experience thus far obtained in operation, and 23 replies were received. It was found that information on interruptions, their causes and durations, was difficult to obtain. Accordingly, two log sheets were developed, one for daily reports and one for monthly summaries.

The 23 companies that replied operate 39 rectifier sets in 28 substations. Out of the 39 sets, 7 are operated in parallel with synchronous converters and 32 are not. Arc-backs or internal flashovers continue to be the single largest cause of interruptions to service, but from these usually no damage results to the equipment and it is possible to put the rectifier back in service at once. Aside from arc-backs, most of the interruptions were caused by troubles in the auxiliary equipment.

Operators of twelve substations stated their preference for the rectifier over the synchronous converter. One stated no preference and three stated that they had had insufficient experience to justify an opinion.

The report was signed by C. A. Butcher, C. L. Doub, A. M. Garrett, Otto Naef, F. W. Peters, W. S. Richhart, U. S. Thorp, G. I. Wright and H. W. Codding, chairman.

Purchases and Stores Division

Investment in Material and Supplies and Stores Accounting

PURCHASES and Stores, special committee No. 3, on the investment in material and supplies and the cost of operating stores, and the committee on stores accounting worked jointly in making a study of investments in materials and supplies and the cost of operating stores. A questionnaire was prepared by the committee and was sent to 39 member companies whose systems embrace 15,108 miles. Replies were received from 36 companies with an aggregate mileage of 14,181, or 93 per cent of the total solicited.

As a result of the replies the committee is of the opinion that all road material, shop material, power station material, articles in process or manufacture, fuel, power station and miscellaneous material, stationery, dining car supplies, all scrap and miscellaneous materials and supplies other than those for shops, maintenance of way and structure and power, should be charged as and when the invoice is approved for voucher to account No. 411.

Materials retired from property and equipment accounts but not released should not be charged to account No. 411 until released, and the committee suggests that if not inconsistent such charges be carried until released in account No. 420.

It is emphatically recommended that there should be a uniform material stock report that all railways would use to take the monthly materials and supply balances as carried on account No. 411; this stock report to show also the monthly receipts, disbursements, balances on hand, turnovers, etc.

The committee believes a fair measure of comparison for cost of handling to be

Digitized by Google

a ratio between the value of material on hand available to be used and the value of materials dispersed and charged to closed accounts. However, before comparisons would have much value, standard methods of material accounting are necessary and a standard practice for charges to stores expense.

The report was signed by A. S. Duncan, A. L. Fisher, W. P. McArdle, C. A. Harris, co-chairman; W. S. Stackpole, F. E. Wilkin, and R. A. Weston, co-chairman.

Manual Review

DISCUSSION of the method for handling freight and express bills by special committee No. 1, Manual Review of the Purchase and Stores Division, developed the opinion that some revision was necessary before agreement could be reached as to the inclusion of this method in the Manual. It was felt that the method recommended for handling the charges to the account should be revised so as to permit miscellaneous freight and express bills of small amounts to be handled through a suspense account for clearing periodically, if it is found to be more economical to do this. The committee recommends that the following revisions should be made in the method for handling freight and express bills now included in the 1926 Engineering Proceedings:

Eliminate the last two paragraphs under "Method of Handling the Charges to the Account" as shown on page 612 of the 1926 Engineering Proceedings, and substitute the following:

It is realized, however, that the feature of handling miscellaneous freight and express charges of small amounts through materials and supplies account No. 411 may in some cases be uneconomical, in which case these charges may be handled through a suspense account to be cleared periodically; or by direct charges of these expenses to the account to which the materials would ultimately be charged.

The committee also recommends that the simplified invoice form approved by the 1927 committee on purchases and stores be included in the Engineering Manual as a recommended form.

The committee studied Manual section P. S. 100-24, "Classification of Scrap Materials," with the idea of bringing the "Classification of Ferrous Scrap," included in this Manual section, more nearly into conformity with the simplified practice recommendation No. 58.

Recommendations were also made that the two following revisions in Manual section P. S. 106-27 be approved for inclusion in that Manual section: On page 71, stock records, "the word average might be eliminated in the last line, as many companies do not use average prices. Neither is it always necessary that a price record show all issues." On page 71, scrap material, the last line should read, "The scrap so accumulated should be sold by the purchasing agent periodically to the best advantage of the company."

The report was signed by C. A. Harris, A. E. Hatton and J. Fleming, chairman.

Price Records and Pricing Materials

SPECIAL committee No. 4, a joint committee, presented a tentative report on recommendations of methods and practices for keeping price records, and pricing materials and supplies received and issued.

This report covered price records and methods of pricing materials as applicable to purchased material only. It does not cover price records and methods of pricing materials manufactured by railway properties and touched lightly on salvaged material pricing.

4—**C. A. Harris**
Material and Supplies
5—**Albert A. Ordway**
Price Records

The suggestions of methods and practices for keeping price records were divided into (1) bin pricing records, and (2) other price records.

The committee reviewed the method of bin pricing now in use by a number of properties. The advantages claimed for this method are that clerical work in the office is saved in pricing the requisition; that errors in prices are lessened; as material may be wrongly identified in the office for pricing. This system familiarizes general stores stockmen with the value of the material; which has a good moral effect, especially in reference to quantities on hand and quantities to be ordered. It also has the same moral effect on sub-storeroom and maintenance employees who use the materials.

There are several other types of price records. Some are in loose-leaf form, some on loose cards filed in cabinets or trays, some are kept in price books which are re-written periodically by changing plates on an addressograph, and some are kept in so-called visible record equipments. This committee suggests that single item visible cards be used, inserted in frames to overlap so that the description and current price is always visible.

Price record may be written up by description, with items in alphabetical, numerical and size order, the same as stock book. In writing the description the noun should appear first, with full description following, for example: Shovels, long handled, round point.

Where the same items has many sizes, the description should appear first in alphabetical order and the sizes follow in numerical order.

Price records should be kept in stores department because of the following reasons:

1. Stores department employees are more familiar with the materials and therefore better fitted to apply proper price.
2. Employees continually accounting for and pricing materials become specialized in the work.
3. It provides a double check on pricing and accounting, because opportunity is given the accounting department to check the work.
4. It provides a short cut for doing the pricing and accounting, that is, with the least complication.
5. Results of pricing and accounting problems can be obtained more rapidly if work is performed at the stores department.

This committee did not recommend use of average price for all classes of material. Many railways do not use this method on account of amount of work required and liability of errors if decimals are used to any great extent. However, an average cost price may be obtained by taking the total quantity disclosed at last inventory, or last months balance, and adding current months purchases in quantity. Then deducting issues for current month based on previous months price, divide the value obtained by the remaining units to establish a new price.

Affiliated Association Reports

T. & T. committees present results of study on subjects of service betterment, bus operation and safety. Claims Association also reports on safety. Freight accounting methods discussed by accountants

FEWER reports than in previous years were presented this year by committees of the Accountants' and Claims Associations. The Transportation & Traffic Association presented three reports, as it has for several years past: They are published in abstract below, as is the report of the committee on safety of the Claims Association, and also that on freight accounting by a committee of the Accountants' Association. Reports of other committees of the latter body appear in the account of its sessions.

Service Betterment

EACH individual operator was urged by the committee on service betterment to analyze his own local problems. The value of visits of the personnel to other properties was also emphasized. Direct personal contact with others of the industry will be found productive of the greatest good.

Scientifically planned stop systems, increased frequency of service, spacing methods, traffic regulations, fare collection, superior equipment, instruction of trainmen—all are considered exclusively as sources of time saving.

Congestion, inadequate traffic ordinances, the slow-moving trucks and wagons, and the street cars are the chief causes of slow traffic movement in the large cities. The remedies in the cases of the first three apparently are radical ones, but the street car is perfectly capable of higher speed and need not remain in this category of delay producers. It cannot be too strongly emphasized that the problem of securing faster operation covers everything that happens to a car between terminals.

Means for the increasing speed of cars as recommended by the committee are: The elimination of stops, relocation of stops, the skip-stop plan, the staggered skip-stop, the creation of loading zones, express street cars with local bus operation, and express street car and local street car operation, the adoption of one-way streets, elimination of left turns, restriction of heavy loading on congested streets to certain hours of day or night and reduction in the number of passenger stops. Automatic electric signals, properly located, keep cars spaced and enforce schedules.

The stationing of a traffic officer or the installation of "stop" and "go" signals on congested streets would usually expedite traffic movements. However, if the traffic volume does not warrant signals, and if the signals installed do not conform with the coordinated facts, they may prove an obstacle to rapid traffic movement.

Authorities have agreed that the street space now available is not used to best advantage and that economic losses result from the unnecessarily retarded traffic movement. Streets are constructed for moving traffic, so that their use for storage purposes should be allowed only when such use does not interfere with traffic. In some cases adequate relief will be secured through the prohibition of parking during peak traffic movement. On the very busiest thoroughfares it may be necessary to prohibit parking entirely during the day. This may arouse opposition among merchants and automobile owners and an educational campaign may be conducted to show the advantage of a parking prohibition.

Cars can be operated with safety at higher speeds when regulations protect street car arteries from sudden intrusions of cross-street traffic. The boulevard stop plan, requiring all traffic to come to a complete stop before entering certain thoroughfares, gives this protection.

The loading and unloading of passengers is a factor in this phase of the problem which offers great opportunity for time saving. Wherever possible, passengers should be induced to buy tickets or tokens in quantities. This practice could be encouraged through publicity and by allowing a sufficient differential between the cash and the token or ticket fare. Some properties are using the pass in various forms. It has been found to be an agent for expediting movement of passengers through the elimination of cash and transfer transactions between operator and passenger. Motormen on two-man cars can sometimes be utilized to inspect passes and collect fares.

If increased speed is to be obtained, it is essential that all parts of the car should be designed to contribute to the rapid handling of passengers. The feasibility of reducing number of doors, as has been done in several instances, is also worthy of attention. The overemphasis on safety is particularly noticeable in the case of door operation.

It is believed that more light-weight, strictly modern cars, more power, and better maintenance are necessary to enable the railway industry to maintain its position or win back its lost ground. Ample motor capacity with the proper gear ratio to enable a car to keep in place in the fast moving traffic at all times is essential. Cars should be equipped to accelerate at least as rapidly as automobiles. To maintain high speed between stops brakes must provide rapid retardation. Automatic switches should be installed wherever possible and hand signals should be replaced by automatic signals.

Car operators must be trained to take advantage of every opportunity for rapid operation if full opportunities of increased speed are to be realized. The platform men are the salesmen of the railway industry, the mediums through which personal contacts between the public and management are made possible. No company can hope to render the best type of street car service unless it has a well-trained, interested, and enthusiastic corps of trainmen. If the sale of rides is as vital a matter as it is believed to be and the selling of these rides depends upon the ability and zeal of trainmen, then the industry is face

to face with the problem that educators have been struggling with since education became an organized effort—that of transmitting the necessary facts to the men on the cars and making those facts understandable to them in the light of their experience.

The report was signed by A. C. Spurr, J. L. Alexander, A. J. Boardman, J. F. Craig, L. J. DeLamarter, C. H. Evenson, D. L. Fennell, L. C. Datz, D. J. Graham, J. H. McClure, Joseph R. Ong, E. A. Palmer, D. A. Scanlon, D. A. Smith, Charles H. Strong, J. C. Thirlwall, W. E. Thompson, Claude L. Van Auken, C. W. Wilson, W. E. Wood, chairman; R. N. Graham, sponsor, and Paul E. Wilson, sponsor.

Traffic and Safety

FOR general convenience the work of the committee on traffic and safety has been divided into four subjects: (1) Men and their accident tendencies; (2) uniform classification of accidents; (3) standardization of street signs, signals and markings, and (4) speeding up traffic with safety.

In dealing with the first subject the committee finds that there are in street railway service a certain number of accident-prone men, whose accidents are not reduced by general safety methods. Accident-proneness may be regarded as something in the nature of a disease which has to be diagnosed and treated. The first step in treating a man is to find out why he has accidents. In the treatment of these accident-prone men psychological study can be of the most assistance, partly because these men obviously have some difficulty in doing their work and partly because the usual safety methods do not greatly affect the number of their accidents. The treatment of these men must make use of the company organization. Except for certain men the method to be pursued is special training which should consist in turning them over to the supervision of an instructor who rides with them in the daily routine of their work, showing them in what respect their operation is faulty and how to improve it so as to avoid accidents.

Selection of operators in street railway companies at the present time seems to be capable of considerable improvement. The usual procedure consists in an interview of the applicant by the superintendent of employment, tests of sight and hearing, and a medical examination, together with a check-up on previous record. It is the opinion of the committee that tests for the selection of new men should be based on experience obtained in dealing with high accident men already in the service. The tests which are found helpful in showing up the factors which cause the accident-proneness of these men could then be used in the selection of new operators.

Summarizing, the committee believes that in order to deal fundamentally with their accident-prone men street railway companies should:

1. Study their men's records and pick out and set aside for special treatment their accident-prone men.

2. Develop and organize some system for following-up new men and supervising the older employees with special emphasis on the aspects of operation which affect the safety and comfort as well as the convenience of passengers.

3. Combine under one division of personnel the work of selecting, training, follow-up, supervision, etc., so that the treatment of men may be consistent and continuous.

For purposes of comparison the committee, as have former committees, recommends the classification of accidents as recommended in the 1916 report. This classification can be subdivided to suit local conditions without affecting the general scheme.

The work of the National Conference on Street and Highway Safety disclosed the fact that a service of major importance could be rendered by the further development of a greater uniformity in state traffic signs, signals and markings. The committee recommends that the committee for the ensuing year concern itself with following the work of the national conference to the ultimate adoption of certain standards.

In the matter of speeding up traffic with safety the committee finds that in general there has been little improvement in abolishing the parking evil, which continues to be the greatest source of slowing down service and causing traffic congestion. When downtown merchants come to a better understanding of the stagnation of business caused by traffic congestion and the extent to which traffic tie-ups encourage decentralization of shopping areas they will reverse their present attitude and become the leaders in having downtown parking restricted.

The report was signed by H. O. Allison, A. W. Brohman, H. H. Dartt, John A. Dewhurst, S. E. Emmons, Charles H. English, A. J. Fink, Arthur Gaboury, Wm. W. Holden, R. J. Lockwood, E. K. Miles, C. S. Slocombe, Clinton D. Smith, E. C. Spring, George B. Anderson, sponsor; W. H. Boyce, sponsor; Richard Meriwether, sponsor, and R. W. Emerson, chairman.

Bus Operation

STUDY of the economics of bus operation with a view to arriving at some definite method which could be recommended to member companies for application to their particular situation has been primarily the work of this committee.

It is the opinion of the committe that the transportation companies are apparently not securing the information which they should have to analyze properly the economics of either their bus or their railway operation. It seems to be accepted that if an enterprise is producing more than the average cost of operation, the route is showing a profit. Simple analysis will indicate this to be untrue. The functions of cost vary with the investment required to do the work on the given route, the schedule speed, the topography and the traffic characteristics of the route. As a rule, the average cost of operation will not give the necessary information.

It should be at once apparent that this can only be done by an accurate and continuous knowledge of the actual cost of each operation. Most of the data required are already gathered in connection with statistics ordinarily set up by operating companies for obtaining the usual average operating cost. It is necessary merely to prorate these costs upon the proper, practical units which determine their variation. The proration and the analysis of operating costs by classification should be determined in collaboration with the operating department head who is familiar with the effect of the several factors controlling these costs. This method requires that each item of cost as prescribed by the classification of accounts be prorated over each route or group of routes on the basis of three units instead of being averaged solely on the bus-mile unit. These three units are the "bus," the "bus-hours" and the "bus-miles." Any item which may be applied directly against a given route or group of routes can be so applied, and thereby increases the accuracy of the record.

After all charges are prorated over the various routes they are reduced to a cost per mile unit for each route for convenient comparison with revenue per mile or other statistics and for a comparison of costs between various routes.

The routes can then be grouped in any manner desired and can show the results on those lines which may be expected to be profitable, as separate from those lines which are operated from other considerations, and can thus furnish all the information necessary for the guidance of the policy of the company toward the community served in regard to fare rates, extensions, curtailment, etc.

It is the opinion of the committee that such a system can be worked out in a satisfactory manner; that it should be adopted by all railway companies for their bus operations; and it is recommended that this work be assigned to the committee on bus operation for the year 1928.

Everyone in the motor bus industry recognizes the tremendous improvement achieved in recent years in chassis and motor design. Simplicity of construction, the accessibility and interchangeability of parts have been sought for and largely attained. Much has been accomplished also in the field of body design. Body lines and exterior finish, the interior arrangement and finish, all show a great deal of thought and artistic feeling. The seats and their upholstery, the ventilation and lighting, have all been tremendously improved.

While recognizing that there will always be specific matters which individual companies and operators may want to have incorporated into the body design of the vehicle which they purchase and, further, that certain of the improvements desired may tend to increase the cost of the vehicle, nevertheless, the conclusion has been reached that there is yet a wide field of study in bus body design which the manufacturers should undertake in co-operation with the engineering and operating members of the association, either

Digitized by Google

through the medium and with the co-operation of the existing committee or through the creation of a special committee to consist of operators, engineers, and manufacturers.

Simplicity of body construction, accessibility and interchangeability of parts are important. When a body panel is dented, it is desirable that it can be replaced quickly. Similarly, should a roof be dented, it is desirable to be able to repair it without ripping out a great deal of the interior finish. It is felt that more thought should be given these matters when the body is being designed.

The report was presented by B. W. Arnold, C. H. Chapman, J. C. Johnson, C. F. Kells, J. J. Mangan, M. G. Moore, T. W. Noonan, E. S. Pardoe, J. M. Penick, M. W. Rew, Leo Reynolds, A. Shapiro, J. L. Smith, C. W. Stocks, A. T. Warner, H. G. Weeks, Adrian Hughes, Jr., chairman, W. H. Boyce, sponsor, F. L. Butler, sponsor, and Samuel Riddle, sponsor.

Safety

STATISTICS on accidents of member companies were compiled for the years 1926 and 1927. Among the city companies from 60 to 70 reported. The figures in 1927 for these companies show in comparison with 1926 a decrease of 2.21 per cent in the total number of accidents, an increase of 9.62 per cent in total number of persons injured, a decrease of 38.24 per cent in passenger fatalities, a decrease of 0.14 per cent in total cost of claims, an increase of 5.14 per cent in cost of safety work. Other data were given, as well as corresponding statistics for interurban companies.

A digest was published of the principal factors in safety work as outlined by the seven companies in competition for the 1927 Brady Award.

A statement was included by the ex-registrar of motor vehicles in Massachusetts on the compulsory insurance law in that state. This law was passed not as a safety measure but to compel the operators of all motor vehicles to be financially responsible if they should injure or kill someone. The law has been very helpful in increasing safety. Before it went into effect probably two-thirds of those causing injuries were financially irresponsible. It discouraged the purchase of automobiles by persons who could not afford them and had the effect of keeping imperfect passenger cars and trucks off the road.

A summary of the laws of several states were given as to the liability for injuries caused by operators of "drive-it-yourself" cars. In New York and Rhode Island the owner is liable by statute. In New Jersey it is customary for the owners to arrange with the operator that the latter assumes the damage up to $100, and the owner above that amount. In Illinois it is customary for the owners to carry insurance. In the other states reported on, the operator only is generally responsible except when an accident occurs because of a defect in the machine.

The effect of the clause of the new Pennsylvania vehicle code prohibiting on highways advertising signs erected by private individuals was commended. All companies were requested to urge legislation requiring the licensing of drivers, and restricting parking in congested districts.

Companies were urged to co-operate with schools, automobile associations, boy scouts, safety patrols and similar organizations in the safety movement.

Attention was called to progress in the reduction of dangerous grade crossings, progress in the standardization of highway signs and the wide variation of the laws in different states as to the minimum age for a driver's license.

The report was submitted by Ancil D. Brown, H. E. Cady, J. R. Compton, R. H. Ferguson, J. W. Giltner, George H. Ingles, A. G. Jack, P. W. Klabunde, Trevor C. Neilson, John M. Orts, John J. Reynolds, and H. K. Bennett, chairman.

Freight Accounting

ELECTRIC railways located in Central Electric Railway Association territory recently arranged for an interchange of freight with the steam railroads in the Southern Freight Association territory. Freight can now be billed through from points in eastern Pennsylvania, Ohio, Indiana, Michigan, Illinois and Kentucky to any point south of the Ohio and east of the Mississippi River served by a steam railroad. This connection places the electric railways in a much better position than heretofore.

The accounting in connection with this interchange of business is governed by the Railway Accounting Officers Association rules, which have been adopted by the Central Electric Railway Accountants' Association in so far as they are applicable to electric railway freight accounting methods. The adoption of the R.A.O.A. rules is regarded as one of the outstanding achievements of the C.E.R.A.A. during the year.

A despatch freight express service, without pick up or delivery, has been conducted on passenger cars of practically all interurban railways for a number of years. The rates for this service are 1½ times the first class freight rate.

A collect on delivery service in connection with the despatch freight business was first extended locally by one of the Ohio lines early in 1927. The service proved popular.

C.O.D. service has recently been extended to interline, despatch freight business in C.E.R.A. territory. Accounting forms and methods are very similar to those used in the handling of local business. It is necessary of course to use an interline form of waybill providing space for C.O.D. and return charges. Extra copy of waybill is made by billing agent and forwarded by the Auditor of originating carrier to Auditor of destination carrier for checking purposes. The return charges or collection fees are reported by destination carrier on abstract of interline despatch freight waybills received in a separate column, and the total prorated for the present on a basis of 50 per cent to the originating and 50 per cent to destination carrier. This amount is reported in interline statement at end of month and included in draft settlement. The question of division of the collection fees has not been definitely settled.

The Electric Railways in C.E.R.A. territory are proposing to meet truck competition by offering a like service under certain conditions. A pick-up and delivery service will be given in cases where the tonnage received from one consignor or for delivery to one consignee, in one day, in a single transaction (as the case may be), equals a fixed minimum number of pounds and the revenue from which will equal a minimum number of dollars. The minimum weight and revenue on freight classified under official classification as first, second, third or rule 25 classes or higher will be less than that required for freight classified under rule 26 fourth and fifth classes. On mixed freight, the requirement will be based entirely on revenue and on the same amount as required for first, second, third and rule 25 classes. This service may also be extended to customers offering freight in less quantities than the minimum to be named, when specifically requested, the cost to be assumed by the customer.

The report was signed by F. I. Fleming, A. A. Healy, L. T. Hixson, A. E. Wafer and Walter Shroyer, chairman.

News of the Industry

Washington Hearings Closed

Although the District of Columbia Public Utility Commission closed its hearings recently on the petition of the Washington street railway companies for a higher fare, it is not thought that a decision will be rendered until Congress convenes in December. It is believed that the commission will gain time by insisting on a revaluation of the companies so as not to be put in the position of granting a fare increase before Congress has had an opportunity of passing upon the merger agreement.

Despite the protests of the people's counsel at the hearings that a fare increase at this time would be prejudicial to the unification plan, officials of the companies contended that the relief should be as speedy as possible because there is no assurance that Congress will approve the merger at all. Should Congress decide to accept the merger, they point out, the agreement specifies that the fare in effect at the time approval is given shall revert automatically to the present rate and remain so for a year. George E. Hamilton, chairman of the board of the Capital Traction Company stated at the last hearing that his company was losing $40,000 a month on the present fare rate.

Although the commission has not made a recent and complete valuation of the Washington Railway & Electric Company, it has estimated this amount at $18,000,000. Its valuation of the Capital Traction Company in 1925 was raised by the company's petition to the courts from $20,756,880 to $25,756,880. As the holdings of the Washington Railway & Electric Company are greater than those of the Capital Traction Company, it is generally conceded that the former company could have its valuation raised without much difficulty by application to the courts. Even on these apparently low valuations, the companies are not making more than a 5 per cent return at present. The District courts have ruled that utilities are entitled to a 7 per cent return.

Recently the commission ruled that the Washington Railway & Electric Company must become a party to the Capital Traction Company's 10-cent fare application.

Fare Lowered on Georgia Line

A new 5-cent rate was recently created by the Georgia Power Company between Avondale and Decatur, a distance of approximately 1 mile. The reduction amounts to 3 cents. However, passengers still have to transfer at Decatur, which is the terminus of the Stone Mountain line and take the North Decatur car into Atlanta. It has been proposed that the company extend its South Decatur line to Avondale so as to do away with this transfer.

Ordinance Introduced in Philadelphia

People to decide on $139,000,000 underliers issue. Commission values properties at $138,376,907

AN ORDINANCE was introduced in the City Council of Philadelphia, Pa., on Sept. 20, authorizing a referendum at the November election to determine whether the city shall acquire the holdings of the underlying companies of the Philadelphia Rapid Transit system by means of a bond issue of $139,000,000. This followed the publication of a report by the Pennsylvania Public Service Commission, placing a valuation of $138,376,907 upon the 55 underlying companies. The ordinance as introduced provides that the issuance of loans is contingent upon a court ruling exempting the $139,000,000 as a charge upon the city's borrowing capacity, the necessary petition to be filed within three months after the voters have approved the project. If the Court of Common Pleas decides that the funds borrowed are chargeable to the borrowing capacity, the acquisition proceeding shall be dropped. It is the city's intention to issue municipal bonds in exchange for the holdings of the underliers, and by substituting itself in place of the underliers as lessor of franchise rights to the Philadelphia Rapid Transit, to effect an annual saving which has been variously estimated from $2,400,000 to $4,500,000.

Commission View of Underlier Matter

TO US the most far-reaching consideration is what will be the effect upon the car-riding public, whose interests has been confided to us by the Legislature, and its interests will necessarily be given first consideration.

The valuation proceeding by the Public Service Commission had its beginning at the request of the city on May 31 last, when the commission was asked to assess and determine the compensation to be paid by the city for its proposed condemnation.

The report covered the entire question of the condemnation of the street railway transit facilities and franchise of all the underlying companies forming the P. R. T. system. The report referred to the retention of experts to make a study of the Philadelphia Rapid Transit situation. This report, according to the commission, filed in March, served to analyze and present clearly for the first time the premises of the problem and the resultant public benefits.

The commission estimated that the total yearly carrying charges on the bond issue to pay for condemnation would be $7,403,170, which would mean a saving of $2,441,892 each year for the city, compared with the carrying cost of the property under present leaseholds, provided that 50-year serial type bonds were issued. The commission divided the underliers into five groups classified according to the rate of return on investment to reach its total of the valuation of $138,376,907. This figure is $2,000,000 more than the estimated valuation of Charles C. McChord, public utilities expert. The valuation set by the underlying companies is $151,000,000.

No Nearer Settlement in Tacoma

The City Council of Tacoma, Wash., recently voted unanimously to reject the terms of the net franchise which had been outlined by S. M. Jackson and associates as necessary for a new Tacoma company which he proposed organizing to take over the properties of the Tacoma Railway & Power. Mr. Jackson had already informed the Council that he could not proceed further if the terms were not satisfactory, that he had not expected to make a dollar in the deal, and was acting in an effort to clean up a matter important to the progress of the city.

Receivership for the Tacoma Railway & Power Company was expected by city officials to follow the failure of the negotiations with Mr. Jackson. The Puget Sound Electric Railway, holding company for the Tacoma Railway & Power Company, is already in receivership, and holders of defaulted first mortgage bonds of the latter are said to be ready to foreclose.

In its motion to reject, the Council first expressed its appreciation of Mr. Jackson's efforts. It not only declared the proposed franchise terms not for the best interests of Tacoma, however, but stated that it was not going to discuss a franchise with anyone except a company in possession of the means for furnishing transportation for the city of Tacoma. Mr. Jackson's organization had not been formed and his associates were not known.

The franchise terms to which objection was made were: No gross earnings tax to be paid until after reasonable return on the rate base valuation and after depreciation: no free rides for city employees, and other provisions.

Cleveland Heights Ordinance Provisions Heard

Settlement of another suburban street railway franchise in the Cleveland, Ohio, metropolitan district appeared probable recently when a service-at-cost ordinance was given its first reading at a meeting of the Cleveland Heights City Council. It proposes to give the Cleveland Railway a rate of fare similar to that fixed for East Cleveland by a board of arbitrators. This is a sliding scale, at present 2 cents higher than the Cleveland rate, rising or falling as the Cleveland rate changes. The Cleveland Railway agrees to make rail extensions of all three of the Cleveland Heights lines and to operate through service to Public Square. Coach regulation and routes are left to subsidiary agreements to be enacted by the Heights Council, subject to the approval of the Cleveland Council.

The rate of fare specified in the existing Heights franchises is 5 cents. For three years, however, Heights riders voluntarily have been paying the Cleveland rate of fare in the hope of getting extensions. Following the recommendations made by the Metropolitan Transportation Commission, the Heights offered to pay 1 cent more than the Cleveland rate of fare in return for the extensions, but the Cleveland Council rejected a franchise on this basis, contending that the differential should be 3 cents.

The new ordinance was prepared after about three years of wrangling between the Cleveland and the Heights Councils. With the passage of the Heights ordinance embodying what amounts to a 2-cent differential, Lakewood will be the only major Cleveland suburb outside of the service-at-cost provisions of the Tayler grant.

Higher Fare Sought in Beloit

A petition to increase fares from 7 cents to 10 cents has been presented by the Beloit Traction Company, Beloit, Wis., to the Railroad Commission. Testifying recently before that body, J. M. Ellis, head of the company, asserted that service during the last year had been furnished to patrons at less than cost.

High Wage at Port Arthur and Fort William

The unanimous award of the Board of Conciliation, acting in the matter of the street railway men's dispute between the employees and the Public Utilities Commission of Fort William and Port Arthur, Ontario, lays down a higher wage scale for the men. Car operators of more than one year's seniority are to receive 62 cents an hour for an eight or ten-hour day, an increase of 4½ cents an hour. An increase of 2½ cents an hour is recommended for new operators for the first six months, or 52½ cents and 57½ cents an hour for the second six months, or 2 cents more than the old rate. Corresponding increases are suggested for men in the carhouses.

This scale is to be operative from May 1, 1928, to May 1, 1930.

Wage Increase in Boston

Eastern Massachusetts men win 3 cents an hour in arbitration proceedings. F. A. Cummings issues dissenting opinion

An increase in wages for carmen employed by the Eastern Massachusetts Street Railway, Boston, Mass., has been awarded by the special arbitration board. It amounts to 3 cents an hour, and will date back to last May and continue in force a year. The extra cost to the road is computed at $126,000 a year. The vote of the arbitration board on the question of wages was two to one, as Fred A. Cummings, who represented the company, dissented. James J. Kerwin of Lowell, who was chairman, and James H. Vahey, representing the men, voted for the award.

The board of public trustees met immediately after the award had been announced, but took no action.

Other decisions of the arbitration board were adverse to the carmen. The union had demanded a larger differential in favor of operators of one-man cars; this was denied. The board declined to re-establish the seniority that was taken away by the State Board of Conciliation in 1921. The men's demand that two men be employed on each tractor and on electric cars with snow scrapers attached was denied. Certain questions of discipline were decided in favor of the company. The union sought to compel the company to submit reports in writing to employees against whom complaints were made, before the employee would be obliged to make any comment thereon. This demand was also refused by the board of arbitration, which decided that the company ought to have the right to designate officers to deal with the employees on all questions which arise involving breach of rules.

Vice-president Cummings in his dissenting opinion alleged that from 1923 to 1928 the employees had their wages increased 12½ cents an hour besides being given time and a half rates for work performed after eight hours, and that today they are receiving 8 per cent more in wages than in 1920, although according to the Massachusetts commission on necessaries of life, the cost of living is 20.8 per cent less than in 1920. In this connection he said:

"These facts naturally bring one to a query as to where and how this arbitrary wage raising at the expense of the company and the public is going to end."

Mr. Cummings believed the increase threw an unjustifiable burden upon other wage earners who were car riders on the railway system. It was inevitable that the award would ultimately work out to the distinct disadvantage of the employees and that it would necessitate increased fares in practically every operating district throughout the system. He was sure it would lead to the discontinuance of certain railway and bus lines which could no longer stand the pressure of almost annual increases in wages. He compared the lot of the Eastern Massachusetts railway workers who "are enjoying steady employment" while thousands of men and women in the textile cities and towns under many handicaps are struggling.

On the financial status of the company his statement follows:

Evidence submitted by this company shows that our gross revenue from all sources for the six months ending June 30, 1928, was approximately $205,000 less than for the six months ending June 30, 1927.

Further evidence shows that our gross revenue from all sources for the year ending June 30, 1928, was approximately $400,000 less than for the year ending June 30, 1927.

Concluding his protest Mr. Cummings stated:

There was no dispute during the hearings before this board of arbitration that the company officials have strained every effort and have acted intelligently and efficiently in reducing expenses and would be confronted by a stupendous task in proceeding further along those lines in the event of any additional burden being placed upon the company.

Compromise Sought by Columbia's Mayor

The transportation situation in Columbia, S. C., more or less acute since March, 1927, when all street cars were driven into the carhouse where they have remained since, has again been occupying front page space in the South Carolina capital and bids fair to draw much comment. Mayor L. D. Owens, impatient at the delay, and seeing nothing advantageous in further litigation, has proposed that the city and the Broad River Power Company reach a compromise. He proposed to the Columbia City Council that an agreement be entered into whereby the power company turn over to Columbia its equipment, consisting of cars, tracks, wires and so forth and in addition that the power company pay the city a certain amount of money—the sum of $200,000 has been tentatively mentioned. This money would not be used by the city to operate the street cars, but the street car equipment would be offered to some company as an inducement to operate the system. To this same company would be given a franchise to operate street cars and bus lines, so that the two modes would function co-operatively and not competitively.

The compromise suggestion has been discussed in the City Council and other propositions looking toward a solution have been advanced.

Recently W. S. Barstow of New York, head of the utility company, was in Columbia and said that his company had made no offer of any sort of compromise and had no intention of making any.

Meanwhile the decision of the Supreme Court approving or rejecting the appointed referee's report is being awaited.

Hearings Held on Chicago Elevated Injunction

Charges that suburban passengers were riding over the elevated lines at less cost than residents of Chicago were made recently by Congressman Frank L. Reid, special counsel for the city of Chicago, opposing the railroad's application for a permanent injunction restraining the Illinois Commerce Commission from enforcing its order denying a 20 per cent increase in elevated fares. Hearings on the application are being held before Federal Master in Chancery Roswell B. Mason, who was appointed to hear the evidence after the federal court had granted the company a temporary injunction last July. Congressman Reid further charged that if the elevated system was receiving a proper return from its track leases to the Chicago, North Shore & Milwaukee and Chicago and the Aurora & Elgin Railroads, an advance in rates would not be necessary.

Replying to this attack, Harry A. Dumbaugh, attorney for the Chicago Rapid Transit Company, insisted that the leases in question had been approved by the Illinois Commerce Commission and argued that they could not be made an issue in the present case.

Charles A. Thompson, vice-president of the Chicago Rapid Transit Lines, testified that the cost of operation has been increasing constantly and that the present wage scale and cost of materials indicate that operating costs in the next two or three years will not be less and probably will be more than during the last four or five years. Attorney Reid contended that many items that should go into capital account have been placed under operating expenses and that maintenance figures are out of proportion to what should be allowed.

Following vice-president Thompson on the stand, John Seymour, auditor of the company, was summoned to identify figures on operating and maintenance costs. One of the contentions of the company in seeking to have the injunction made permanent is that it needs an increase of $815,000 a year for its maintenance account.

Date Set for St. Louis Wage Hearing

The Missouri Public Service Commission has set Oct. 3 as the date for opening the hearing on the wage dispute between the St. Louis Public Service Company, St. Louis, Mo., and the street carmen's union. Jointly the company, union and city of St. Louis asked the commission to arbitrate the wage question. The hearings will be held in the City Hall, St. Louis.

The union had asked increases ranging from 5 cents upward and that the top scale for carmen be reached within one year instead of three years as at present. Also improved working conditions, including time and half for all overtime, instead of time and one-fourth as at present. Originally the company requested that the men accept an average decrease in pay of 8.42 per cent, but later withdrew this proposal.

McGraw-Hill Effects New Merger

Affiliation of the Bragdon, Lord & Nagle Company, publisher of *Textile World*, oldest business paper in its field, with the McGraw-Hill Publishing Company has been announced by James H. McGraw, president of the latter organization. The consolidation adds a new and important division to the McGraw-Hill organization and increases its business, industrial and engineering publications to 23. In addition to *Textile World*, which was established in 1868, three years after the Civil War, the merger includes the Consolidated Textile Catalog, *Textile Advance News*, Official American Textile Directory, the American Knitting Trade Directory, and a group of technical books devoted to the textile industry.

Affiliation of the Bragdon, Lord & Nagle Company with the McGraw-Hill organization marks the second large-scale development to be effected by the latter company within three months. On June 29, Mr. McGraw announced a merger with the A. W. Shaw Company of Chicago which, as a division of the McGraw-Hill Company, is the publisher of the *Magazine of Business*, devoted to the general executive interests of all business, and of *System*. In addition to the broad sweep of business, the McGraw-Hill publications cover the fields of metal mining, coal, the electrical industry, food manufacture, industrial management, power, electric railway and bus transportation, machine tools, civil engineering and heavy construction, radio and chemical engineering. The *Textile World* covers the major branches of its field—cotton, wool, silk, rayon, and other fibers; the knitting industry, and bleaching, dyeing and finishing.

Recent Bus Developments

Humanitarian Work by C. E. Millen Rewarded in Washington

In recognition of extraordinary devotion to duty during the severe storm that struck Washington, D. C., recently, Calvin E. Millen, bus operator of the Washington Railway & Electric Company, was awarded $200 in gold by the directors of the company. President William F. Ham, in presenting the money to Millen at the last safety meeting of the company, stated that in all his experience he had never heard of a greater performance of service than operator Millen gave to the nineteen women entrusted to his care.

He was the operator of a special bus in which nineteen members of the Washington Sodality Union were returning to the city from southern Maryland. He investigated before crossing bridges. Soon, however, a bridge behind being swept away, he and his nineteen women passengers were marooned on a temporary island for two days and a night. During this time he tried by every means possible to arrange for rescue, walking miles to reach a telephone line and procuring blankets from neighboring farmhouses.

After arriving back in Washington these women showed their appreciation for Mr. Millen's services not only by singly and collectively commending him to his superiors, but also by presenting him with a purse of $20.

Chicago Ordinances Repassed Over Mayor's Veto

BY A VOTE of 39 to 6 The Chicago City Council repassed the ordinances providing for feeder bus service by the Chicago Surface Lines. Mayor William Hale Thompson had vetoed the ordinances recently and the Illinois Commerce Commission denied the right of the surface lines to purchase the buses. The commission held that it was illegal for the company to operate buses. This is in direct opposition to the opinion of the commission a year ago when a similar order was given to establish the feeder service on Diversey Avenue.

Alderman Joseph B. McDonough, chairman of the committee on local transportation, will urge the Chicago Surface Lines to buy the buses and begin operation. The company has expressed a willingness to buy the buses and begin operation in order to give the needed service.

New Service for Alameda Authorized

The Key System Transit Company, Oakland, Cal., was recently authorized by the California Railroad Commission to abandon its franchises, tracks and service on four lines in the city of Alameda. The lines affected are the Haight Street bus line and the High Street, San Jose Avenue and the Santa Clara Avenue car lines. Permission was made subject to the condition that a bus line be operated in Oakland and Alameda as an integral part of the Key System and with all the transfer privileges now in force on the present car lines. Also that the company remove rails, ties, overhead wires and other equipment from the streets of Alameda over the routes abandoned within six months of the effective date of the commission's order and place the streets in the same condition as the remainder of the street. In its decision the commission said that this operation was largely experimental

Digitized by Google

and that there should be co-operation among officials of the company, the people and city officers.

Suggest Buses for Annapolis

Removal of the cars of the Washington, Baltimore & Annapolis Electric Railroad from the streets of Annapolis, Md., has been suggested to officials of the company by the Annapolis authorities and is now under consideration. The city officials also suggested that the company substitute bus service through Annapolis in place of the cars. Lines of the south shore branch of the company now travel through the city. It is claimed by the municipal authorities that the heavy cars interfere with traffic.

Substitution on East St. Louis Line

G. W. Welsh, vice-president of the East St. Louis & Suburban Railway, East St. Louis, Ill., has announced that effective Oct. 15 railway service will be discontinued between Edwardsville and Collinsville and between Collinsville and Edgemont. The Illinois Commerce Commission has authorized the substitution of buses, which will operate from Edwardsville to Edgemont.

St. Louis Rides Buses

The number of revenue-passengers hauled during August by the St. Louis Public Service Company, St. Louis, Mo., showed a decrease of 5.13 per cent compared with a similar month in 1927. Records disclosed that in August, 1928, but 79 per cent of the number of passengers hauled in August, 1925, used the company's street cars. Passenger revenue for August was $1,546,003, an increase of $7,185, due to the increase in fares from two tokens for 15 cents to 8 cents straight. In August, 1928, some 19,695,555 revenue passengers were hauled, compared with 20,760,233 in August last year. Average Sunday revenue on street cars this August was $35,586 against $33,341 last August. This gain of $2,245 per Sunday is due to the popularity of the 25-cent Sunday pass, 40,000 being sold each Sunday.

The St. Louis Bus Company, subsidiary of the car system and operated by the St. Louis Public Service Company, increased its business 63 per cent for the month, carrying 733,623 revenue passengers as against 461,240 in August of last year, a gain of 272,383. Bus revenues totaled $31,408 for August this year and $12,164 for August, 1927, while the increase in revenue passengers was 59.05 per cent.

The bus figures are the fares paid on the buses and do not include those passengers who originate on street cars and later transfer to buses. The increase in bus travel is due to the decrease in fare from 10 cents to the same rates charged by the street cars along with free interchange of transfers. Bus traffic to the Municipal Opera increased 25 per cent over 1927.

Financial *and* Corporate

South Shore Readjustment Plans Projected

New management petitions for permission to issue securities for retirement and extension purposes. Rehabilitation work reviewed.

THE first step in the readjustment of the financial structure of the Chicago, South Shore & South Bend Railroad was taken Sept. 19, when petitions asking approval of new securities were filed with the Public Service Commission of Indiana, and the Illinois Commerce Commission. Authority is asked by the South Shore Line to issue the following securities and sell them at prices which will yield $8,150,000 for the company. They are:

$1,000,000 first mortgage 6 per cent three-year bonds.
$1,500,000 par value 6½ per cent class A preferred stock.
$3,500,000 par value 6½ per cent class B preferred stock.
265,000 shares of common stock without par value.

It is stated in the petition that the money raised by the sale of these new securities will be used to reimburse the company's treasury for the retirement of old bonds aggregating $4,000,000, and for capital expenditures made for additions, extensions, and improvements in the property since July 14, 1925.

In the petition filed with the Indiana commission, the railroad, being an Indiana corporation, asks for authority to amend its articles of association, increasing its authorized capital stock to 600,000 shares of common stock of no par value, and $6,000,000 of preferred stock, consisting of 60,000 shares with a par value of $100 each.

The securities retired are $2,000,000 of first and refunding mortgage 30-year 6½ per cent gold bonds, $250,000 second mortgage 50-year 6 per cent gold bonds and $1,750,000 adjustment mortgage 50-year gold bonds. These were authorized by the commission in 1925 at the time of the purchase of the railroad and have recently been re-acquired, cancelled and retired in order to clear the way for the new plan of financing.

The Chicago, South Shore & South Bend Railroad acquired the old Chicago Lake Shore & South Bend Railroad on June 29, 1925, at a receivers' sale conducted by the United States District Court at Michigan City. The railroad had gone into receivership in February, 1925. The present South Shore line is one of the subsidiaries of the Midland Utilities Company of Chicago, which owns the Gary Railways, Shore Line Motor Coach Company and a number of other public utility properties in northern Indiana and Ohio.

A comprehensive rehabilitation program has been carried on. New steel passenger cars have been placed in operation and freight service has been improved by the purchase of new electric locomotives. The railroad was completely re-electrified in 1926.

Improvements included the laying of several miles of track, construction of passenger and freight stations and remodeling old ones and the introduction of dining and parlor observation cars. Increased headway was effected between South Bend and Chicago and between Gary and Chicago.

Favorable Showing in Kansas City

During the first week in September, for the first time this year, the report of the Kansas City Public Service Company shows an increase in street car patronage. During that week 1,995,332 passengers paid $148,452 in fares compared with 1,987,157 passengers and $148,043 in fare during the corresponding week in 1927. Although tram receipts increased, the buses during their last week at the 15-cent rate showed a 25 per cent decrease over a similar week last year. No figures are available as yet on the new two for 25-cent bus fare which went into effect on Sept. 15.

Easy Payment Plan for Public Service Preferred

Another opportunity to buy public Service preferred will be given on Oct. 1, when the Public Service Corporation of New Jersey will sell to customers its $5 cumulative preferred stock, no par value, for cash or under the popular ownership plan of partial payments. The price is $100 and accrued dividends per share, or $10 down and $10 per month. Installments will draw interest at the rate of 5 per cent per annum. Public Service Preferred has been offered under a customer-ownership campaign since October of last year.

Motorman Connolly an Interborough Director

Patrick J. Connolly, president of the Brotherhood of Interborough Rapid Transit Company Employees, was elected a director of the system on Sept. 26 at the annual meeting of the company's stockholders. He fills a vacancy on the board. Other directors were re-elected.

In a statement issued after the meeting, Frank Hedley, president of the company, declared that Mr. Connolly's election was the fruition of a policy of allowing employees first-hand representation in the company's affairs.

Mr. Connolly, who is 42 years old, has headed the Interborough Brotherhood since 1919. For many years an employee of the company, he is at present a motorman on the Sixth Avenue elevated line.

New Director of B.-M. T.

Fred C. Marston, secretary and treasurer of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., was elected a director on Sept. 17 to succeed George S. Franklin. Mr. Franklin became a director of the company upon its organization, in July, 1923, as a representative of the stockholdings of the War Finance Corporation in the company. The War Finance Corporation has since been liquidated and Mr. Franklin felt that he should retire from the board because it no longer represented a group holding a substantial interest in the company.

Purchase of Small Line by Associated Gas & Electric

The Calais Street Railway, reaching the towns of Calais and Milltown, Me., and Milltown and St. Stephen, N. B., Canada, was purchased recently by the Associated Gas & Electric Company. Complaints had been registered by the new owners to the New Brunswick and Maine Utilities Boards stating that the railway was selling power in its territory. The railway operated 8 miles of single track.

Receiver's Account Approved

Stockholders of the subsidiaries of the New York Railways, New York, N. Y., have approved and accepted the account of Hugh J. Sheeran, as receiver of the New York Railways, filed on July 11, showing the allocation of earnings of the receivership period. They also approved and authorized an operating agreement between the respective companies and the New York Railways to be dated as of Jan. 1, 1928, and to provide for the operation of the property.

The companies which held special meetings were the Sixth Avenue Railroad, 42nd Street & Grand Street Ferry Railroad, 23rd Street Railway, 34th Street Crosstown Railway, Christopher & Tenth Street Railroad, and the Bleecker Street & Fulton Ferry Railroad.

Stroudsburg Property for Sale

After more than 50 years of operation by horses, steam dummy and finally by electric power, the whole property of the Stroudsburg Traction Company is being scrapped by the bondholders. Twelve miles of track, including the scenic Delaware Water Gap line, has been abandoned.

Buses have been gradually replacing the cars for the past three years. Three Garford buses are in operation, with two other types as spares. The fare charged is 10 cents and the bus operation is successful, but only about one-third the gross business is done with buses now, compared with the business done in the same territory five or six years ago with the electric cars. The bus operation is conducted under the name of the East Stroudsburg Bus Company, which is owned by the bondholders of the old railway company, but the business is for sale in order to close up the affairs of the traction company.

Michigan Road to Go at Auction

The property of the Grand Rapids, Grand Haven & Muskegon Railway, serving a territory in Muskegon County and northern Ottawa County out of Grand Rapids, Michigan, will be sold under a mortgage foreclosure on Oct. 25 under the direction of Kirk E. Wicks, master in chancery. Certain properties, including land released from the mortgage, will not be sold.

Operation of this line ceased on April 18, less than a month after Federal Judge F. M. Raymond in United States District Court in Grand Rapids signed an order ending the life of the railway on petition of the Guaranty Trust Company, New York. This petition asked that the Grand Rapids Trust Company, which had been receiver since July 31, 1926, be authorized to end its endeavors to put the road back on a paying basis. The Guaranty Trust Company was trustee for holders of $1,500,000 in bonds, upon which interest amounting to $75,000 annually had been defaulted for a year prior to the receivership.

Following the cessation of the interurban service various bus applications were presented to the State Utilities Commission. After much agitation a deal was closed by commission order whereby the Greyhound Lines took over the buses and route of the interurban company known as the Lake Line Company.

Slight Decline in Brooklyn City Income

For the two months' period ended Aug. 31, 1928, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $1,778,639, compared with $1,778,445 for a similar period of 1927. After the consideration of operating expenses, taxes and income deductions the net corporate income was $92,566 for the 1928 period compared with $118,100 for the 1927 two months' period.

Dismisses Receivership Suit of Indianapolis & Cincinnati

The petition of Fred H. Kelly of Peoria, Ill., to dismiss his suit for receivership of the Indianapolis & Cincinnati Trust Equipment Company, has been granted in Federal Court in Indianapolis. In the petition it was stated that the new owners of the Indianapolis & Cincinnati Traction Company, of which the defendant firm was a subsidiary, had bought the stock of the equipment company at prices suitable to the plaintiff, who held shares.

Hudson & Manhattan Issue Approved

Issuance of $5,631,000 in common stock of the Hudson & Manhattan Railroad has been approved by the New Jersey Board of Public Utility Commissioners. The proceeds will be used to refund other securities.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Personal Items

H. C. Cordell Heads Important Department at Highwood

Henry C. Cordell, whose election as chairman of the transportation section of the Wisconsin Utilities Association has been mentioned in ELECTRIC RAILWAY JOURNAL, is responsible as master mechanic of the Chicago, North Shore & Milwaukee Railroad for the operation of 523 cars which are run more than 13,000,000 miles a year. He has held this post since September, 1916. At that time the road was in a run-down condition and a complete rehabilitation program has been carried on for several years.

At the age of eighteen Mr. Cordell arrived from Sweden where he spent his early boyhood on a farm. He worked his way through a year in a technical school, and deciding that this country held better promise for him than his native land he went to Chicago in the fall of 1893. Soon the opportunity appeared to work as an apprentice in The Featherstone Foundry & Machine Shop, manufacturers of refrigerating machines and mining and marine repair machinery. His four-year apprenticeship gained for him a wide experience.

When the company dissolved in 1904, he went as machinist to the Chicago & Northwestern and on March 5, 1905, entered the service of the Chicago Rapid Transit Company as machinist foreman at the Wilson Avenue Shops. Five years later he was appointed master mechanic, where he remained until he was sent to Highwood.

He has been a member of the Wisconsin Utilities Association since 1920, and was appointed president of the A.E.R.A. company section in 1926.

P. J. Little Resigns

P. J. Little, formerly president of the Southern Cambria Railway, has resigned and Evan M. DuPont, president of the Johnstown Traction Company, is now president of the former company. The secretary and treasurer of the Southern Cambria Railway is now Joseph McAneny. These changes were effected when the controlling stock interest in the Southern Cambria Railway was purchased by the Johnstown Traction Company, Johnstown, Pa.

E. J. Mehren Honored

Edward J. Mehren, vice-president and editorial director of the McGraw-Hill Publishing Company, has been appointed editor of the *Magazine of Business*, which recently came under McGraw-Hill control through the consolidation of that organization and the A. W. Shaw Company of Chicago.

The *Magazine of Business* is published for the leaders in every branch of American business and treats of those major developments that affect business in general. It, therefore, has a strong appeal to the policy-forming executives in banking and finance, manufacturing and production, sales and distribution and in the servicing fields, such as transportation, communication and electric light and power.

The editorship of such a paper required someone with a broad experience in business, a thorough knowledge of editorial and publishing practice and an acquaintanceship with all the editorial resources of the McGraw-Hill organization. It is for these reasons that Mr. Mehren, who has been with the McGraw-Hill organization for 21 years, was selected for the editorship. He will continue as vice-president and editorial director of the McGraw-Hill Publishing Company.

Mr. Mehren began his publishing career as an associate editor on *Engineering Record*. Subsequently, he became editor of *Engineering Record* and of *Engineering News-Record*. For the last five years he has been vice-president and editorial director of the McGraw-Hill Publishing Company, in charge of the editorial activities of the organization. He has a wide acquaintance throughout business and is noted for his writing and addresses on engineering, industrial and business topics.

Changes in Louisville

Charles L. Christopher, superintendent of construction of the Louisville Railway, Louisville, Ky., for many years, will be retired from active duty, but retained as consultant, effective Oct. 1, 1928. He entered the company's service in 1891.

Howard C. DeVoe, assistant superintendent of construction, who entered the service in 1895, will be made superintendent of construction.

A. E. Gleason, becomes assistant superintendent of construction.

Appointments on Virginia Electric

C. B. Smith has been appointed to the position of purchasing agent for the Virginia Electric & Power Company, in Richmond, with general supervision over the purchases in Norfolk.

F. F. Kuyk is appointed general storekeeper for all of the storerooms on the company's system.

New Missouri Commissioners

Judge T. J. Brown, chairman of the Missouri Public Service Commission, has resigned, effective Oct. 1. Governor Baker has designated Judge Almon Ing, member of the commission since early in 1925, to succeed to the chairmanship, while J. Perry Painter of Milan, Mo., will succeed Judge Brown.

Judge Brown was appointed to the board on July 12, 1923, and was named chairman by Governor Hyde in 1924, when Judge Merrill E. Otis resigned to accept the position on the federal bench. He plans to devote his time to the private practice of law and will open an office in Jefferson City.

Obituary

GEORGE M. HASKELL, for 34 years New England representative of the J. G. Brill Company, Philadelphia, died at his New York residence, the Engineers' Club, on Sept. 22. The final cause was heart failure, but Mr. Haskell had been ill for several weeks before his death. He is survived by his widow, Mrs. Alice M. Haskell, and by a brother. The interment was at Wakefield, Mass., where he formerly lived.

Mr. Haskell was born at Wakefield, on July 10, 1867. His first business connection was in 1889 with the Thomson-Houston Electric Company at Lynn, Mass. Here he took what was known as the expert course and as a result was sent to Honduras in 1891 to install a municipal lighting plant. Upon his return, he joined the Boston office of the General Electric Company as railway appliance salesman, a position which he held for three years. He resigned on May 30, 1894, to enter the employ of the Brill Company, as New England representative, with New Haven as first headquarters. For the past sixteen years his headquarters have been in New York City. Mr. Haskell was a member of a number of clubs, including the Sleepy Hollow Country Club, Engineers' Club of New York, Engineers' Club of Boston and Boston Athletic Club. He had a wide acquaintance in the electric railway field and was very popular for his ready wit as a *raconteur*.

HENRY MATTINSON, general manager and chief engineer of the Manchester Corporation Tramways, Manchester, England, died on Sept. 2. An administrator, organizer, engineer, and originator, he was known and esteemed by the whole tramway fraternity. Educated as an engineer, he held appointments in various towns until he entered the Manchester municipal tramway department in 1901. He was largely responsible for the reconstruction of tramway tracks necessary at the time when electric traction superseded horses. Holding successively the posts of permanent way engineer and chief civil engineer, he became general manager and chief engineer in 1922 when J. McElroy, the then general manager, retired on account of ill health.

During Mr. McElroy's time with the Manchester tramways, Mr. Mattinson accompanied the gentleman on a visit to America to study traffic problems. He early appreciated the importance of the bus, and built up the local municipal bus services.

Manufactures and the Markets

Large British Railway Orders

Metropolitan-Vickers Corporation, London, has received three contracts for electric railway equipment, totaling about £750,000 in value. The Metropolitan Railway has ordered 30 motor coaches and a number of trailer coaches. Each motor coach equipment will include four 275-hp. motors. The Southern Railway has ordered electric equipment for 72 motor coaches and 58 trailer coaches. The New South Wales Government Railways, Australia, has ordered 100 motor coach equipments and 100 trailer coach equipments for the Sydney Suburban Railways. There will be two motors of 360 hp. each on each motor coach.

Pacific Electric Plans $245,539 Improvements

Work orders calling for the expenditure of a sum aggregating $245,539 were approved by the Pacific Electric Railway, Los Angeles, Cal., during the month of August, covering improvements and betterments at various locations over the entire system.

On East Ninth Street between San Pedro Street and Hooper Avenue, this company is to reconstruct and pave tracks replacing present 72-lb. material with 128-lb. A.S.C.E. grooved girder equipment, to replace redwood with treated ties, install 79,000 sq.ft. of asphalt concrete pavement, etc. Entire cost of this project is estimated at $87,313.

At Las Tunas Drive, San Gabriel, it is planned to reconstruct approximately 6,370 ft. of single track and lower same to street grade, renew present 50-lb., 60-lb. and 75-lb. rail and fittings with 128-lb. A.S.C.E. grooved girder rail and fittings, install approximately 59,900 sq.ft. of asphalt concrete pavement, which work is necessary to conform to improvements to be made by the city of San Gabriel. Estimated cost of this work is $106,036.

At Del Rey on the Del Rey-Redondo line, Pacific Electric will construct spur track 618 ft. in length. The estimated cost of this project is $3,565.

In Redlands, Smiley Heights line, at Center, Cypress and Cedar Streets it is planned to renew 1,000 untreated ties with redwood ties, renew bolts and spikes and to install oil screening pavement in order to conform to improvements made at these locations by the city. The estimated cost of this work is $4,640.

In Los Angeles on the West Sixteenth Street line it is planned to renew double track 72-lb. narrow gage turnout from combination gage track with 128-lb., double-track turnout, renew redwood ties with treated ties, renew ballast and asphalt concrete pavement. The estimated cost of this work is $6,591.

On the Hollywood Line, it is planned to reconstruct and pave approximately 626 ft. of track, renew 7-in. asphalt concrete pavement, replace redwood with treated ties, and renew crushed-rock ballast and track bonding. This work is estimated to cost $5,139.

At Ohio Avenue, Sawtelle, it is planned to lower grade of west track approximately 8 in., reconstruct and pave tracks in the street, replacing 60-lb. material with 128-lb. grooved girder rail, install two reinforced concrete culverts replacing redwood culverts, and replace oil macadam with 7-in. asphaltic concrete pavement. Total cost of this work is estimated at $3,652.

At Whittier it is proposed to remodel store building to provide suitable quarters for Pacific Electric and Southern Pacific ticket office, waiting room and concessions at an estimated cost of $3,489.

Springfield Starts Trackwork

Springfield Street Railway, Springfield, Mass., has completed the construction of 800 ft. of double track on Main Street from Broad to Locust Street. This work is the most modern type of construction, on which steel ties have been used.

In connection with the new highway being constructed on Rockrimmon Road, this company is engaged in relocating its tracks from the side of the road to a center location. The double track will be extended northerly from the city line about 1,000 ft. There will also be a 500 ft. turnout where the former Rockrimmon turnout was located. This job is of considerable magnitude and will cost about $70,000.

Location and reconstruction of track on State Street at Benton Lawn has been started. This will be a complicated track work job and will cost about $45,000.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	Sept. 25, 1928
Copper electrolytic, cents per lb.	15.025

Turpentine (bbl. lots), N. Y., per gal	$0.57

New Tracks and Yard for St. Louis

The Interstate Commerce Commission has received an application from the St. Louis Electric Terminal Railway, St. Louis, Mo., and the Illinois Terminal Company, Springfield, Ill., for authority to construct a new line from McKinley Bridge, in St. Louis, to Twelfth and Washington Avenues. This will involve the rebuilding of present tracks over a part of the route. The improvement is to be financed initially through advancement from the Illinois Power & Light Corporation. Later the amount will be repaid by an issue of capital stock. The application explains that the St. Louis Electric is to be converted from a passenger line to one carrying both freight and passengers. The project includes the construction of a freight yard.

Worcester Plans More Trackwork

Worcester Consolidated Street Railway, Worcester, Mass., has started the relocation and reconstruction of both tracks on Grafton Street, Worcester between Posner Square and Mendon Street. It is estimated this job will cost $28,000, and will require the following material: 88 tons of rail, 6,100 ties, 105 thermit welded joints, 3,200 tie plates, 500 tierods and 21 kegs of spikes.

It is planned to reconstruct 2,252 ft. of track on Lincoln Street between turnout 13 and 166, at an estimated cost of $13,000. This job will require 63 tons of rail, 1,126 ties, 15 kegs of spikes, 2,252 tie plates and 320 tierods.

It is also planned to reconstruct 2,016 ft. of track on Lincoln Street from Dixon Avenue to Andrews Avenue, at an estimated expense of $14,600. This job will require 55 tons of rail, 1,000 ties, 2,016 tie plates, 336 tierods and 14 kegs of spikes.

Illinois Terminal Orders Equipment

Illinois Terminal Railroad System, Springfield, Ill., has ordered one hundred 40-ton box cars from Mount Vernon Car Company and one hundred 50-ton drop bottom gondolas from American Car & Foundry Company.

TRADE NOTES

EDWARD S. SULLIVAN, 751-753 Monadnock Building, San Francisco, Cal., has been appointed special coast representative for the St. Louis Car Company, to assist Gus Koch, coast agent for the St. Louis Car Company for many years. During Mr. Koch's enforced absence from the Coast on account of illness, Mr. Sullivan will take care of the routine of his office for him. Messrs. Koch and Sullivan have been office associates for over twenty years.

From Those Who Have Proved their Right of Leadership

RECAPITULATION of the high spots of the recent Cleveland Convention would be fruitless unless that recapitulation led local transportation men to take to heart the things that were developed at this memorable meeting. No one individual could attend all the convention proceedings, but they have been spread upon the record so that he who runs may read. Mention of Messrs. Stevens, Sawyer, Young, Bradlee, Kettering, Storrs, Williams and Wherry, to name just a few, ought to flood the mind with a background panoramic of accomplishments that should make every earnest worker in the industry avid to absorb every new thought in this mental feast. Surely any property can undertake to follow in the paths charted by these leaders who have tried in the crucible of experience the policies advocated for the improvement of the local transportation business.

The American program was so arranged that several points of view were presented, designed to bring out what the public ought to know about the industry, what the industry ought to know about itself and what the industry ought to know about the public's viewpoint. Mr. Young's address on Advisory Council night was different from the others in some respects. Its scope was broader. He took for his text the whole subject of the economics of the local transportation situation as it exists today. If the industry had undertaken to prepare its own Magna Charta the document could not have been drawn with more skill nor have presented the situation more succinctly than did this address. The plea was for the right of the industry to live. But that right was based only upon the industry's ability to serve as the most efficient form of public transportation, after the public, on its part, has recognized the need for rates of fare that will insure the necessary flow of private capital to enable the industry to keep pace with growing requirements and changing conditions. Private enterprise cannot function effectively if it is to be hamstrung financially through economic limitations imposed by an uninformed and unthinking public. This world-wide respected leader of American thought declared emphatically that it is high time that the public understand that efficient public service is impossible by a servant that is being starved into impotency.

Legal aspects of this situation were pointed out by Mr. Wherry, and Mr. Harriman on his part made plain the functions of the municipality, if the immense sums are to be raised that are needed in the financing of rapid transit lines, an obligation that has become a public matter rather than a private one. Local transportation men, lacking an understanding of these problems, cannot be said to be well informed. Neither can the man be said to be properly qualified to face the future who is not abreast of what has been done in modernization and merchandising as brought out at the American session on Wednesday. Here and there the tendency may be to scoff at some of the things suggested, but the scoffer is doomed just as he always has been. The spectacular progress of the automobile industry has been due to the lack of inhibitions on its part. That industry's will to do accounts in large measure for its success. Mr. Kettering made this plain in what he said.

The struggle against inertia is always a heroic one. The leader of thought knows what it is to be subjected to ridicule. But were it not for the advocate of change to meet changing conditions, the record of the progress of civilization would be a sad one indeed. The local transportation industry is now merely engaged in taking up the slack in progress resulting from the economic pressure of post-war conditions. Its record in the past contains many chapters of rapid change and readjustment. It quit the horse car for the cable, the cable for the electric car, and it has during recent years, even under severe economic limitations, made rapid progress in coordinating the bus with the rail vehicle.

Technicians need not neglect their fields of special interest in digesting and applying the ideas that come out of this great convention. The luncheon conferences and the sessions of the affiliated associations were so arranged as to stimulate discussion and the interchange of technical experiences. Here there is much to stimulate technical thought. But however close attention the accountant, the engineer, the claims man or the transportation man may give to the deliberations of the body in which he is most intimately interested, there remain the broader lessons arising from study of the major problems of the industry. Other things being equal, it is not too much to say that the individual will benefit from the convention only in direct proportion to the time he puts into consideration of how best he can intelligently apply what was said at Cleveland. This consideration and study, to be really fruitful, must ripen into personal convictions and then into definite application of the principles and methods outlined by those who have proved their right of leadership.

Claims Men Have Highly Interesting Meeting

MOST impressive and startling among the papers presented before the Claims Association was undoubtedly that by Mr. Carstarphen on the recent investigation on ambulance chasing in New York. Like the corresponding investigation in Milwaukee a year ago, it was conducted by the bench and bar, and the railway and insurance companies were connected with it only as they were asked to supply helpful data. When claims men in the past have complained about the extent of this evil, some people were accustomed to discount their charges. Evidence at the New York hearings, however, shows that amubulance chasing and accompanying evils in that city were being carried on to an atrocious extent.

The value of Mr. Carstarphen's account of the investigation has been enhanced by the publication this week of the conclusions reached from the hearings by the presiding justice. An abstract of Judge Wasservogel's re-

Digitized by Google

port appears in the news columns of this issue. It reveals not only a most astounding condition in prevailing negligence cases but, what is more important, it outlines remedies for the ambulance chasing disclosed. The most valuable feature of this far-reaching investigation is that it was conducted under the authority of the highest court of the state and, like the investigation at Milwaukee already mentioned, upon petition of the bar associations.

If conditions like those exposed existed in New York and Milwaukee, they must be present at least to some extent in other communities. Where there is suspicion that this is the case, railway claim agents should call to the attention of the leaders of the bar in their cities the facts of the New York investigation.

Of equal practical value to the claim agent, though not of so sensational a nature, were the discussions of ways of recruiting claims staffs, promoting safety and other topics closely allied to claims procedure. Experience on methods of recruiting claims staffs was largely that for adjusters, native wit and common sense were more desirable than a good education. While this is true in many other special lines of business as well, Mr. Drown well pointed out there is a place in the claims department for the college man also, and that a well-rounded staff could well include many types of mind.

In the discussions and report on safety, there were many new ideas, since at the present day the safe operation of street cars has become almost synonymous with the proper regulation of automobile traffic, and no branch of regulation is changing so rapidly, perhaps, as that governing the use of the streets. This accounts for the perennial youth of the safety question.

Many Little Things Bulk Large in Net Results

ONE of the wisest axioms contained in Poor Richard's Alamanac runs "Trifles make perfection, but perfection is no trifle." Those who have read and studied the reports of the committees on service betterment and on traffic and safety which were presented at the recent convention in Cleveland cannot fail to have been impressed by the fact that most of the proposals call for the adoption of simple measures for attaining the desired ends—expedients at the disposal of most electric railways.

Taking up the very admirable report of the first-named committee, that on service betterment, we find recommended the extension of one-man operation wherever practical, in the interest of economy and improved service, the elimination of stops, police co-operation at important crossings, the establishment of loading zones, queue loading, improved methods of acceleration and retardation, and the improvement of personnel through better methods of employment and training. Surely nothing about this prescription is difficult to administer, yet these are all measures tried and found effective.

Perhaps a little finer discrimination and technique are, in some particulars, involved in the recommendations of the committee on traffic and safety, which call for application of the principles of psychology in the study of men and their accident tendencies. The smaller properties, perhaps, cannot go as extensively as might be desired into the finer points embraced in the study of accident characteristics, but this limitation is in part at least offset by the close contact between management and employees that is possible on the small road.

In its discussion of speeding up traffic with safety the committee again confines itself to the recommendation of simple but effective methods. Safety zones, treadle exits, double berthing, street collectors, simplified fare collection—there is nothing to prevent the adoption of these suggestions on the average property.

Here, then, are the recommendations of two committees, the membership of which was drawn from the best minds in the industry. Commendable as they are for their very simplicity, they yet represent much thought and study. Very few of the suggestions are debatable. They present a concrete program. Let us hope that by the time another year has rolled around, many companies will be able to report substantial progress as the result of the adoption of this simple program of service betterment.

Engineers Eager to Play Their Full Part

PROBABLY never before in its history has the American Electric Railway Engineering Association had so many vital problems before it for solution. A large proportion of the service improvements which are now considered essential to bring back prosperity to the railways present in the last analysis engineering problems. Rolling stock must provide for increased speed with safety, greater comfort and convenience. Track must be smooth and noiseless. The electrical department must provide increased economy and reliability of service. All of these things are being seriously considered by the engineers. This was evident from the reports, addresses and discussions at the convention.

The programs for the various divisions of the Engineering Association at Cleveland were arranged with two central thoughts in mind: first, to provide for reports and discussion of the work now actually under way by the various committees; second, to bring out new thoughts and discussion of the principal problems by having addresses on outstanding phases of each division's work. More interest than ever before was evident from the start. Each day the simultaneous sessions of the four divisions were all crowded. Comparing this condition with the attendance four or five years ago, when with all divisions meeting together it was almost impossible to get enough together to start the meeting, the contrast is striking.

The advantages that have resulted from the reorganization of the Engineering Association are many. First, with a single assignment to each committee the members have more time and inclination to make a thorough investigation. Second, the plan of continuing committees until the subject is completed has done away with hurrying of work in order to present a report at the convention. This year a large number of committees presented progress reports only. These showed that the scope of investigation is being broadened to give more thorough study to the subjects involved.

Voting on standards by letter ballot, under the new plan, gives all member companies a chance to state their views fully, regardless of whether or not they have delegates at the convention. As a result it is logical to expect more careful consideration of proposed standards and increased use of these standards after they are adopted. The disposition of delegates at this year's convention to exchange information and to tell of results accomplished is a good omen and shows that the engineers realize the importance of the part they play in helping the industry to meet the new conditions with which it is confronted.

Accident Prevention a Great Public Service

CONCLUDING a year of highly successful accomplishment the National Safety Council held its seventeenth annual safety congress in New York City during the week just closed. Although in no sense a strictly electric railway enterprise, as its activities cover the entire field of accident prevention and the spreading of safety information throughout all groups in modern society, it is nevertheless gratifying to find that the electric railway industry is credited for no small measure of the success which the movement sponsored by the National Safety Council has attained. In every considerable community in the country the electric railway companies have been prominent in the organization of local safety councils. In many instances they have supplied the most active support, both moral and financial.

Admittedly the chief problem before the council at its recent meeting was that of coping with the rising toll of traffic accidents due to the increase in the number of automobiles and the resultant vehicular congestion upon the streets and highways. This is a question in which the railways are most vitally interested, and it is to them that authorities are inclined to turn in an effort to bring the situation under control. Nor has the appeal been made in vain. Alone among the interests using the streets for traffic purposes, the railways can point to a steadily decreasing accident record. In city after city the records will show that the local transportation companies are reducing their toll of chargeable accidents. More and more evident is it becoming that in no place is a person in less danger from injury to life or limb than when riding as a passenger in a trolley car.

This is the result neither of luck nor of chance. Hazards have unquestionably increased. Safe operation is undoubtedly more difficult today than ever before, due to the presence on the streets of thousands of untrained or, at best, insufficiently trained, motorists. The results achieved can be credited to a variety of causes. Better equipment has played an important part. In the aggregate enormous outlays have been made to secure and equip safer and more dependable cars, safer signals, better track. But the answer must go deeper than physical outlay. Back of any equipment, in order that it may be effective, there must be a well-trained and efficient inspection force. And at the controller and on the rear platform there must be an alert, careful, thoroughly-drilled and carefully-chosen operator.

In the final analysis it is here that the real credit belongs. No matter how able the management, how ample the company's financial resources, how modern the rolling stock or how efficient maintenance, all will be of little avail in keeping down the accident toll and holding to a minimum that least excusable of all company expenditures, money paid out for claims, if the men at the controllers are indifferent, irresponsible or just plain careless. However high up a "safety drive" may have its inception, it must, sooner or later, come down to the man on the car. And it has done just this thing. The aim of every well-organized, efficiently-operated street railway property in the country today is to reduce accidents through the proper training of its platform men.

Hence the interest of the street railway industry in the activities of the National Safety Council. Through the agency of this great humanitarian institution the industry finds a means of allying itself with a great public spirited movement toward the preservation of human life and the reduction of injury and suffering. It is particularly appropriate that electric railways are playing a leading part in safety work. To the extent of the part they play in helping to reduce accidents they live up to the spirit of the term "public service" and strengthen their claim for public confidence and friendliness.

Accountants Alert to Their Responsibilities

REAL progress is being made by members of the American Electric Railway Accountants' Association in solving the problems which have presented themselves recently. This was very evident in the detailed reports of the several committees and the active discussions which followed the presentation of these at the convention. The addresses, too, reflected a note of progress in specific branches of electric railway accounting.

The first large work undertaken by the association was the drafting, in connection with the Interstate Commerce Commission, of the standard classification of operating accounts. For many years this, with the addition of construction and other accounts and the yearly refinement and clarification of the code, was the association's *magnus opus*. Within the last few years it has undertaken the same problem in connection with bus accounts.

Each year, however, brings new accounting tasks, and they show alike the intimate connection of accounting with the entire field of railway operation and the constant demands for original and creative thought in this field. Perhaps the most important problem of this kind now before the accounting branch of the electric railway industry is that raised by the question of accounting for depreciation, to which the Interstate Commerce Commission is giving intensive consideration.

This commission, as is well known, has ordered telephone companies and steam railroads to adopt a definite system of accounting for depreciation, and early this year asked the interstate electric railway companies to show cause why a similar order should not be issued concerning them. A sub-committee of the national relations committee of the American Association was formed to present to the commission the views of the industry on the questions involved. The Accountants' Association has co-operated with this committee and a number of joint meetings have been held. The subject is one of vital importance to the industry, and once again the accountants are bending their efforts in solving a problem that is likely to be a big factor in the future of the electric railway.

Other subjects of importance have commanded attention, notably freight accounting, price records and stores accounting. The committees handling these subjects have investigated the new phases which have developed and have prescribed definite methods of accounting for them. For example, the freight committee developed a system of accounting in connection with the handling of interline freight and C.O.D. despatch freight business and described the mechanics of this system in its report.

The responsibility of every accountant in the industry at this time should be quite apparent. To quote President O. H. Bernd of the Accountants' Association, "Every electric railway accounting officer should realize that he has a more important part to play in the progress of the industry than ever before." Mr. Bernd sounded a call to the accountants to show their qualities of leadership at this critical period in the history of industry and it is more than significant that they are responding with genuine enthusiasm.

The parade of new cars, run as specials, attracted attention. This view was taken in May, 1927, on Plume Street, Norfolk

Success Won by

Courage and Hard Work

ON JULY 1, 1925, the transportation affairs of the Virginia Electric & Power Company were in an entirely different condition than three years later. At the earlier date there seemed to exist almost a complete misunderstanding between the company and the public. The latter, as in some other cities, seemed convinced that the day of the street car had passed. Ruinous bus competition was being invited and fostered in all of the cities served by the company, four in number, Richmond (200,000 population), Norfolk (177,000 population), Portsmouth (50,000 population), and Petersburg (39,000 population). The physical property on the system was deteriorating. Renewals of expiring franchises could not be secured. Essential fare increases had not been obtained. Richmond, where electric railways were first operated in city-wide service, seemed ready to contribute spectacularly to the decline of the electric railway industry.

On July 1, 1925, the executive management of the property was taken over by Stone & Webster, Inc., and a new group of officers took charge of the problem of re-establishing the prestige and prosperity of the property. The new management decided that the first problem was to win public confidence, and this could be done only by evincing in a material manner its faith in the essential nature of its business and of rendering an adequate service at the lowest practical cost. The service betterments that did not have to wait upon new capital and the delivery of new equipment were made

The Coffin Award Committee for 1928 characterizes the recent operation of this year's prize-winner, the Virginia Electric & Power Company, in the following words:

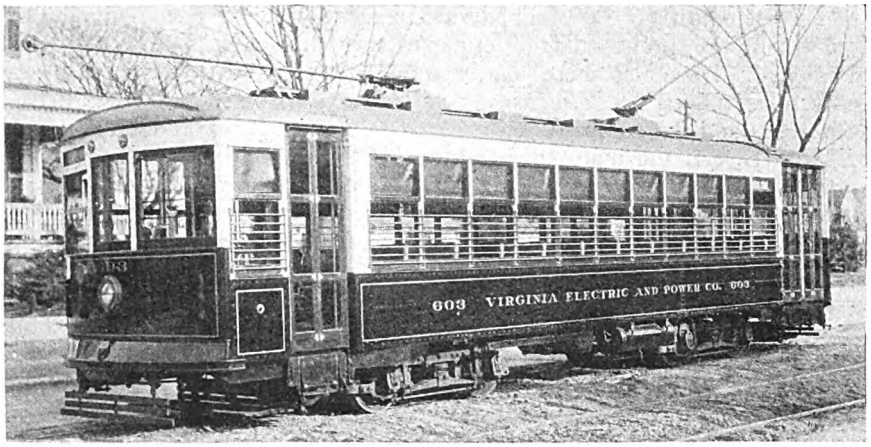
THROUGH demonstrated efficiency and confidence won by fair dealing, a bitter public in several closely associated communities imbued with keen rivalry and intense local pride was converted to friendly co-operation and to the settlement of extended and complicated franchise controversies. Co-ordination of bus and trolley service, extensive improvements in facilities and intensive merchandising led to an increase in number of passengers carried on both street cars and buses, increases in gross and net revenue and in the return on the investment; through corporate consolidations the number of subsidiaries was reduced, the financial structure was simplified and strengthened and local financing was carried out at low cost. New and modernized equipment was provided, employee co-operation enlisted and favorable financial results achieved.

It is the purpose of a series of articles in this issue to give some of the evidence upon which this conclusion was reached. The articles are based upon the figures and other data in the company's brief.—EDITOR.

Digitized by Google

immediately. Then came the problem of settling franchise problems, including abolition of jitneys and then establishment of adequate fares. Coincident were the modernization of the company's rolling stock and provision of new track facilities. The modernization was undertaken by the company without first demanding concessions on the part of the public.

Through group meetings, individual contacts, newspaper and other forms of publicity, the new management presented to the public and employees alike its ideals, hopes and plans for rendering an excellent transportation service at lowest possible cost. Suggestions and criticisms were invited, co-operation was solicited and the public generously responded to the concrete evidences of good faith and sincerity on the part of the management.



This new treadle car, with leather seats and rubber-tiled floor, for use in Portsmouth, is right up to the public's wish

On Sept. 1, 1925, only two months after entering office, the new management submitted a franchise for a unified car and bus service in Richmond. Twelve days later it announced that the Independent Bus Company had been purchased at a price deemed fair by a committee of citizens, appointed by the Chamber of Commerce. This action relieved the city of considerable embarrassment in the problem of unification because the bus company was operating under a former ordinance. The following year the company received a new franchise which is for 30 years, the legal maximum. It permits the company to charge a 7-cent fare on the cars and an 8-cent fare on the buses, plus 1-cent transfer charge from car to bus, and to make track extensions and install motor bus routes of the most thoroughgoing character.

Car or Bus Line Within ¼ Mile of Residence Area

It should be noted here that cities in Virginia are not empowered to grant a direct bus monopoly. The nearest they can come to it is to specify that (1) a concern operating any buses within the city must operate all of them, and (2) the operator of any such bus system must enter into some transfer arrangement with the local street railway. These conditions have been embodied in every bus ordinance covering the operations of the Virginia Electric & Power Company.

In accordance with the franchise program, the company arranged for improvements in Richmond totaling $1,500,000. This included the abandonment of five miles of track, the construction of 10 miles of track, largely in sparsely settled areas, the addition of 35 miles of through motor bus routes and the purchase of 15 cars and 30 buses.

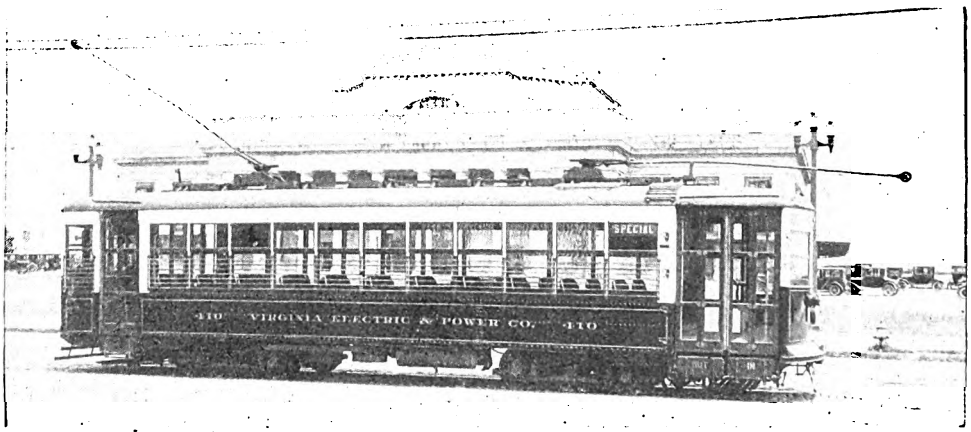
The goal of this program was to have either a car or bus route within ¼ mile of any residence area in Richmond. This gives the public a unified system of 160 miles of route with a maximum fare of 8 cents instead of 65 miles of railway for 7 cents or 17 miles of bus route for 8 cents.

The new franchise gross receipts tax is 5 per cent during the first year, decreasing to 3 per cent minimum at the rate of one-fifth of 1 per cent per annum over a ten-year period. This compares with the former average of 6¼ per cent from railway gross. The 5 per cent from motor bus gross still holds.

Norfolk Eliminates Duplication of Routes

The Norfolk program was somewhat different from that in Richmond because Norfolk had too much service and Richmond too little. In Norfolk the program of improvement led to the elimination of duplicative lines whereby 159 miles of rail and 86 miles of bus route were converted to 123 miles of rail and 86 miles of bus route. The bus mileage total is a coincidence, as the routes in many cases are different.

The fares are also changed by abandoning the old school rate of 2½ cents, the 6¼ to 7 cents per zone railway rides, and the 5 cents (colored) and 7 cents (white) jitney no-transfer one-zone fare for a universal schedule. This calls for 10-cent cash fare, 8⅓-cent token, 4⅙-cent school ride and $1.50 unlimited ride weekly pass, all with free transfers. The adoption of the one-fare plan for all Norfolk meant a single fare instead of double and triple fares in an area which was annexed to the city in 1923. This was a change greatly desired by the community, as represented by a traffic commission which had been appointed by the City Manager. The new franchise also abolished jitney competition which in Norfolk had amounted to 25 per cent of the total traffic, as compared with only 10 per cent in Richmond.



The latest Richmond car is worthy of its background, the Broad Street Station

Digitized by Google

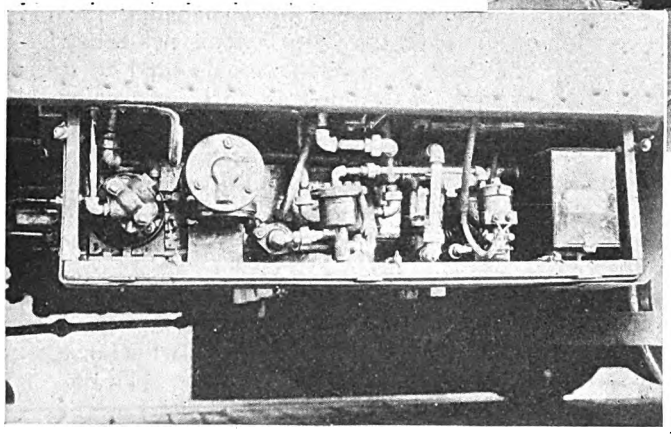
In Portsmouth (60,000 inhabitants) a somewhat different condition prevailed from either of the other cities mentioned. Here also there was extended jitney service as well as a long standing deadlock between the city authorities and the company with regard to the repaving of High Street, the main thoroughfare of Portsmouth.

Shortly after the present management took charge it settled the latter question by offering the city $130,000 to cover the company's share of the repaving program, plus track reconstruction. It terminated the jitney problem by taking over the Independent Consolidated Bus Corporation on a basis of physical value. Its present franchise in Portsmouth calls for a 7-cent fare instead of the former fare of 5 cents on the buses (7 cents on one route) and 6 cents on the railway, and a reduction of the company's paving obligations to that of furnishing concrete foundations within the track area to a depth of either 6 in. or 7 in., as may be specified by the city.

The generous manner in which the public in the four cities served responded to concrete evidences of good faith and sincerity on the part of the new management, and accepted their responsibility in the solving of the problem, is a revelation.

The chief physical factor in bringing about this change in conditions and finances were 30 new and 66 modernized street cars and 114 new and 62 modernized buses.

The $3,800,000 of new money invested under the new management earns a return of 11.6 per cent before depreciation. The story is told briefly in the accompanying table and graphs.



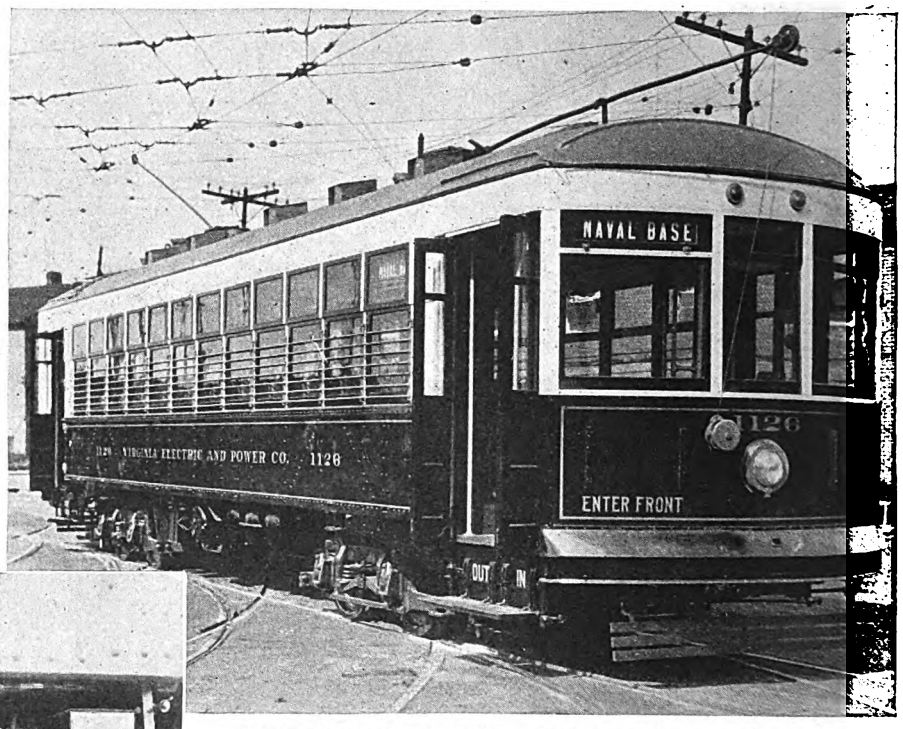
The valves in the Norfolk car are snugly mounted in an electrically-heated box under the floor

Improved Cars and Service Bring Results

As already explained, the confidence of the public was won largely by the policy adopted by the company in improving its rolling stock.

Within three months after the present management took hold in Richmond in July, 1925, an order had been placed for fifteen treadle-type, 44-seat double-truck cars, available for one-man operation. They attracted immediately favorable attention to their bright appearance and comfortable riding qualities. The exterior finish was a combination of red with gold lettering below the window level and of white above. The interior fittings included deep plush seats, rubber-tiled floors, non-swinging sanitary hand straps, mahogany interior trim, and all piping, engineer's valve, controller, brake staff and switches neatly covered. The cars are equipped with four 25-hp. motors, K-35 control, variable load brakes, and automatic slack adjusters.

The second order for treadle cars, placed during 1926, went to Portsmouth. In compliment to the large Navy Yard community there, the outside color scheme is red, white and blue, but these colors were disposed to avoid freakishness. The roof is light blue. Red with gold striping and gold lettering is used for the lower window level, and white above. These colors were not intended to hide dirt. In fact, they expose it.



Norfolk's latest red, white and blue cars for naval base service

Exceptional brilliance was given by the use of a deep blue to outline the headlights, window guards, trolley catchers, and step castings leading to the roof. The equipment consists of four 25-hp. motors K-75 chair level control, air brakes with variable load feature, automatic slack adjusters, safety door and treadle control and vestibule window cleaners. The inside fittings included seats of genuine leather, spaced 28½ in., flooring of 12-in. rubber tile, and air-operated fare box.

INCOME ACCOUNT AND STATISTICS, VIRGINIA ELECTRIC & POWER COMPANY

	Year 1926	Year 1927	Increase Per Cent
Total operating revenues	$5,786,833	$6,151,291	6.30
Total operating expenses	$4,150,047	$4,076,591	—1.77
Net revenue operations	$1,636,786	$2,074,700	26.75
Taxes	$406,925	$483,799	18.89
Balance	$1,229,861	$1,590,901	29.36
Depreciation	$738,436	$800,000	8.34
Balance	$491,425	$790,901	60.94
Miles operated	22,506,309	22,971,020	2.06
Hours operated	2,456,984	2,486,195	1.19
Total passengers carried	*98,847,208	102,423,544	3.62

*The total number of passengers reported for 1926 has been adjusted to conform to the change from zone-fare registration to single-fare registration, which was effective Jan. 1, 1927.

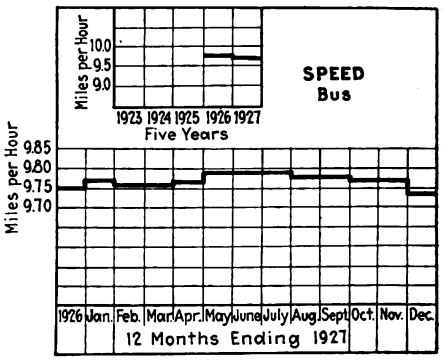
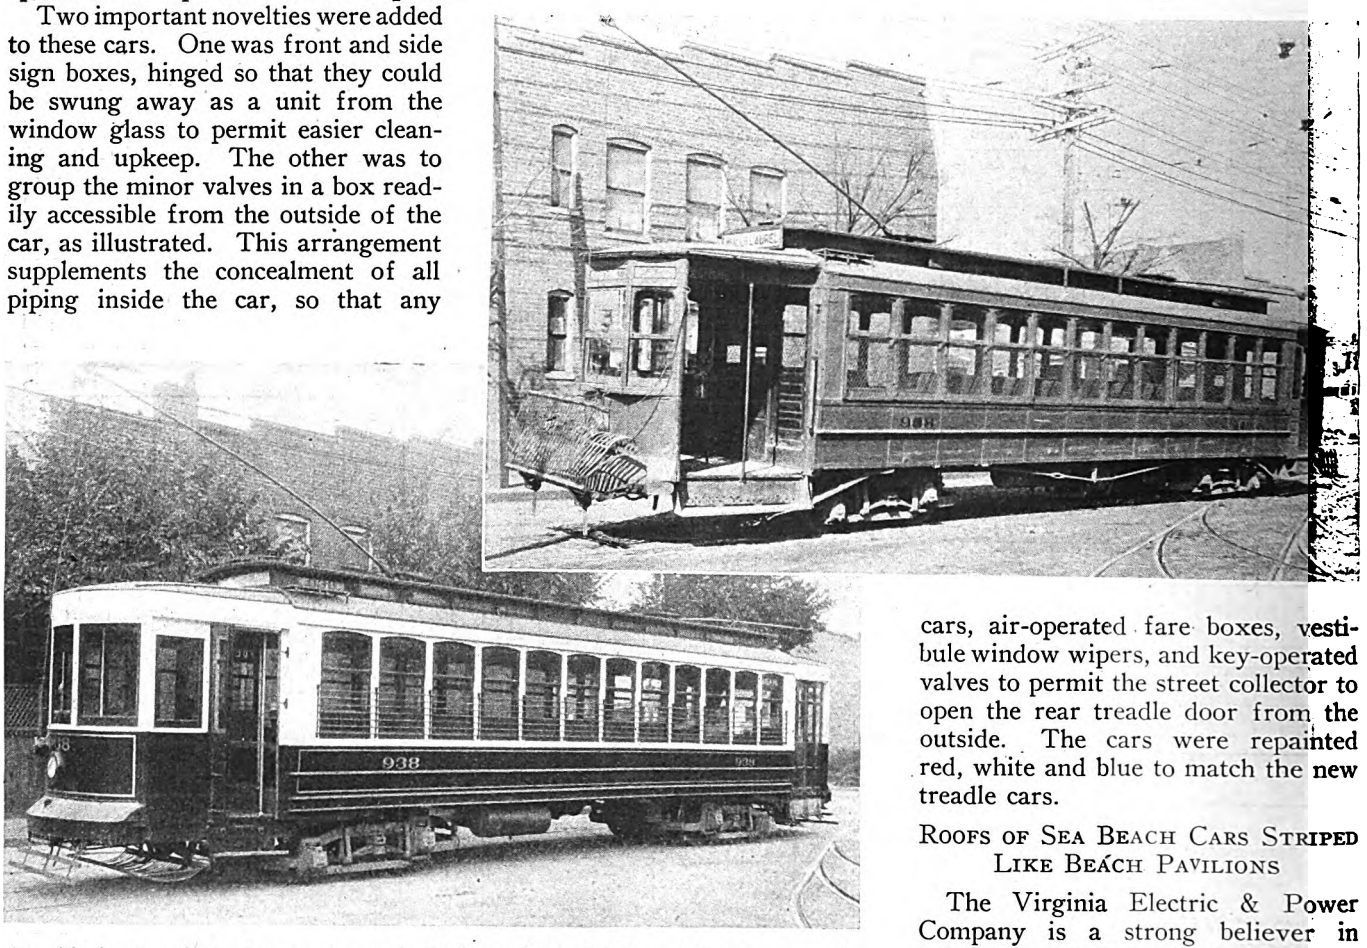
THIS series of charts, beginning with investment per dollar of gross revenue and ending with bus speeds, tells graphically a most instructive story of the way in which the railway properties of the Virginia Electric & Power Company were placed on a substantial basis



Digitized by Google

The third order for treadle cars, delivered in the spring of 1927, went to Norfolk. There were ten of them, closely resembling the Portsmouth cars, but somewhat heavier and of more advanced equipment. They have four 35-hp. motors instead of four 25-hp. motors, to permit speed of 35 m.p.h. on the long runs to the beaches. They are 43 ft. long over all, instead of 41 ft. 8½ in., and weigh complete 37,000 lb. instead of 32,000 lb. Like the Richmond and Portsmouth cars they were fitted with variable load brakes, rubber-tiled flooring, air-operated fare boxes with direct illumination, etc. The seats, however, are of twin design, upholstered in genuine leather, and with double spring cushions. They are spaced 30 in. apart instead of 28½ in.

Two important novelties were added to these cars. One was front and side sign boxes, hinged so that they could be swung away as a unit from the window glass to permit easier cleaning and upkeep. The other was to group the minor valves in a box readily accessible from the outside of the car, as illustrated. This arrangement supplements the concealment of all piping inside the car, so that any harshness due to obtrusive hardware is avoided. An electric heater in the valve box forestalls freezing.



An old, down-at-the-heel, two-man car in Richmond (at right) and the same car after receiving a "face-lift" and equipment for one-man treadle operation

Among the cars at Richmond were 40 double-truck two-man cars with 44 to 48 seats. Although built in 1911, they were so sound that it was found desirable to rebuild them for one-man operation for $4,500 each. New platforms were installed, the safety car devices and treadle combinations were added, line switches replaced circuit breakers, air brake and door valves were put under cover for greater sightliness and safety. The outside finish of red, white and gold was exactly like that of the treadle cars.

The Norfolk change from double-end two-man cars, numbering 26, to one-man treadle cars, was accomplished by alterations even more drastic than in Richmond, and $6,000 was expended on each car. The four 35-hp. motors were retained, but the control was changed from K-35, with circuit breakers, to K-75 (chair level style), with line switches. Automatic slack adjusters were added. Brake and minor valves were concealed under the seat, the door-control piping was installed behind the advertising rack, and the door engines set in cabinets over the doors. All but the first three cars had rubber-tiled flooring. Air cushioned twin leather seats replaced the rattan covered seating of shaped wood. The longitudinal corner seats were taken out so that the cars now have 24 double seats from end to end. These seats are 36 in. wide along a 26-in. aisle. With the change in seating came stanchions and corner grab handles of aluminum, also sanitary non-swinging hand holds. Other features added were: Side destination signs of the unit type devised for the new cars, air-operated fare boxes, vestibule window wipers, and key-operated valves to permit the street collector to open the rear treadle door from the outside. The cars were repainted red, white and blue to match the new treadle cars.

Roofs of Sea Beach Cars Striped Like Beach Pavilions

The Virginia Electric & Power Company is a strong believer in brightly painted cars. It might be supposed that the red body, white trim and blue roof of its Norfolk and Portsmouth cars represented the ultimate in this direction, but in the summer of 1927 there seemed to be a step further with the open bench cars that serve Ocean View. This is part of the Norfolk division.

The roofs of these cars are painted in broad stripes of orange and blue to bring to mind the gay pavilions and awnings of the sea shore. To see these cars on a warm day is to have a powerful urge to take a ride forthwith for a loll on the sands.

Single-Truck Cars Also Modernized

The car modernization program has even been extended to the company's single-truck safety cars, although not in a like measure, because they are to be the last of their kind. However, all safety cars of this type have been changed from cast iron to rolled steel wheels to eliminate chipped flanges and reduce noise from flats. Forty have been fitted with new motors and 25 with new

Digitized by Google

compressors. Two cars have been fitted with anti-friction bearings. Several have been equipped with leather seats, treadle doors and linoleum floors. All of these cars are being painted in a duotone.

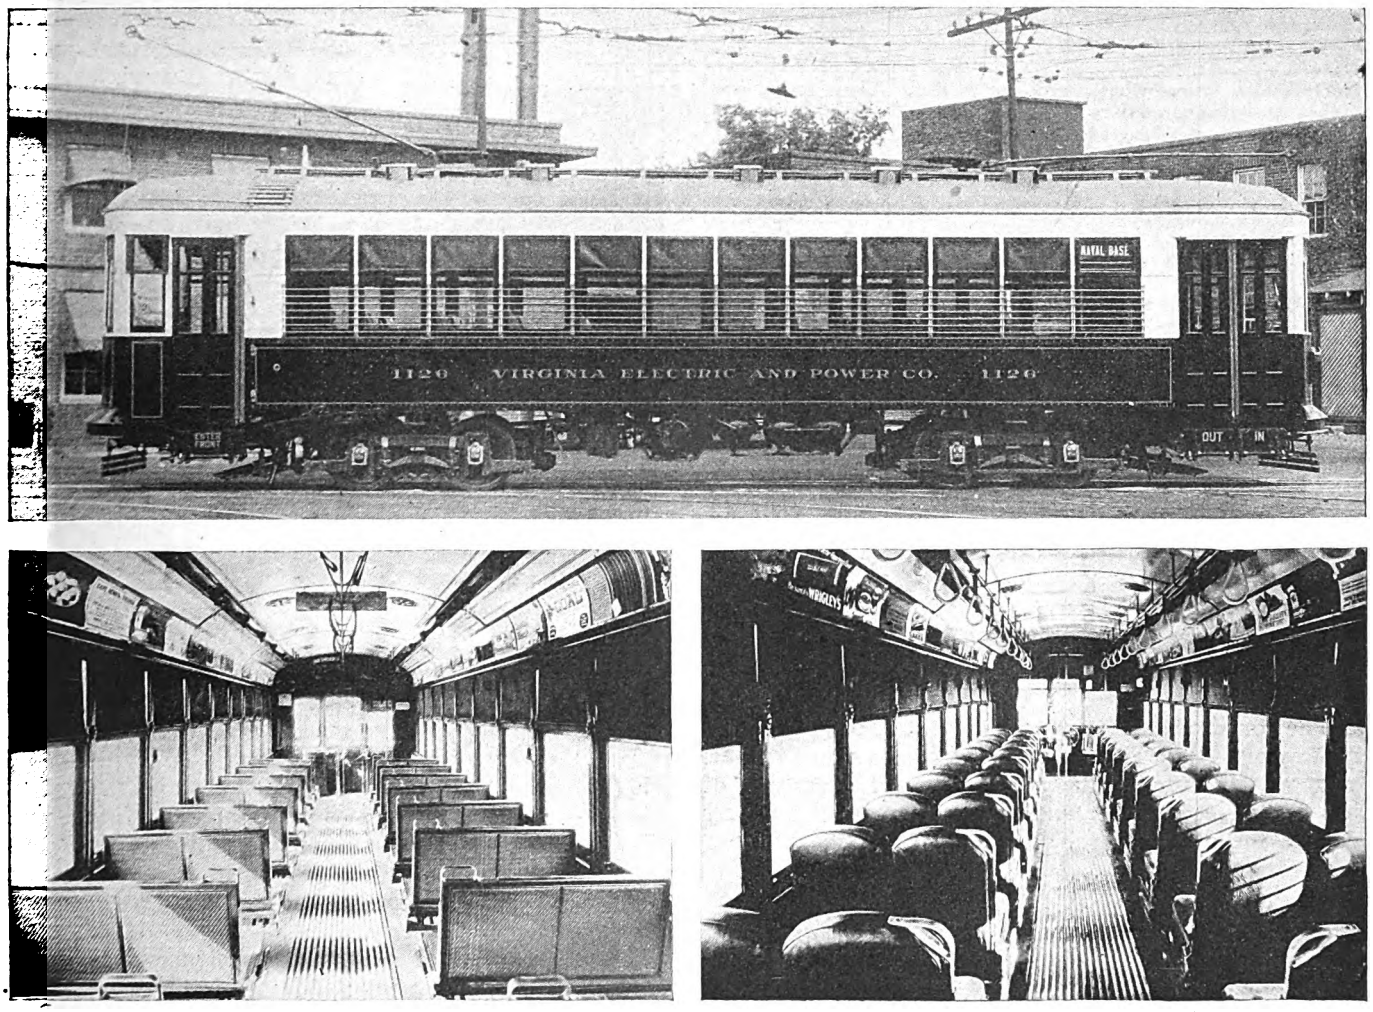
Bus Fleets Also Modernized

During 1927, the bus fleet was enlarged by the purchase of 68 vehicles. Of these, 28 were 21 and 25-passenger buses with rear doors and booster brakes. Thirty were 29-passenger buses with treadle-operated rear doors, air brakes and metal brakeshoes. The final order, placed in December, 1927, was for ten Twin Coaches of 40-seat capacity, for the Colonial Place line of the Norfolk division. The larger carrying capacity of this bus made it possible for nine coaches to do the work of eleven buses, with no appreciable lengthening of headway.

Coincident with these additions to the fleet, a number of the company's old buses were modernized. The company had taken over on both its Richmond and Norfolk divisions a number of used buses belonging to former proprietors. Only the most up-to-date of these were selected for a modernization program. The principal changes were the addition of a new hood and roof, rear door, self-starter, illuminated roller destination sign, roof ventilators and rear channel and rear bumper, with anti-climber shield to discourage hitching.

While the improvements in the way of more attractive and more comfortable cars and buses have a great deal to do with the improved riding, it was not the only factor in bettering conditions on the property. Another important factor was an increase which was made in schedule speed.

Realizing the demand by passengers for more speedy service, a study was made of every item of delay. Such causes may be the fault of street or track layout, of changes in traffic use of the highways operated over, of the car design, of the rates of acceleration and retardation used, of the technique and motions of the operator, of the method of fare collection, etc. The study disclosed some causes possible of correction by the company, and others within the control of the municipality. The latter related primarily to unnecessary congestion of highways through parking abuses, change in the character of traffic signals, removal of obstructions, provision of car and bus loading spaces, etc. To assist the municipality, the company conducted in both Richmond and Norfolk cordon counts of traffic. They were of help in pointing the way to means for higher speed. By patience, study and the reduction of some of the greatest causes of delay, the average speed of the cars during two years was finally raised from 8.75 to 9.25 m.p.h.



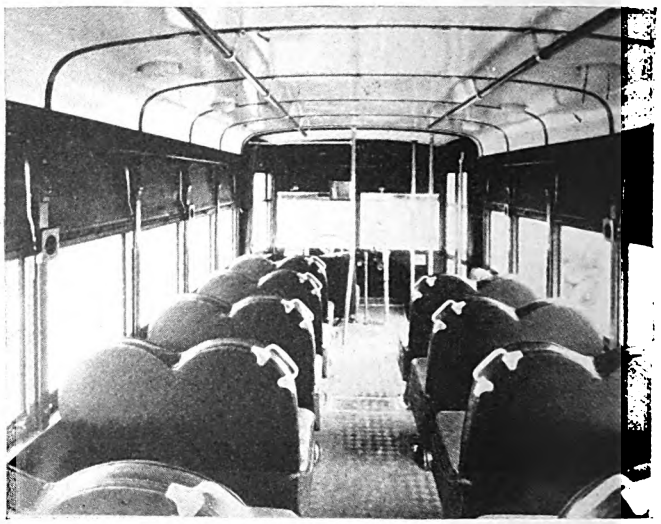
After a "one-man treadle treatment" with leather cushions in place of wood and a dress of red, white and blue, Norfolk cars were made to look quite different. The upper view shows the reconstructed car; the two lower views, the interior before and after

Charts Tell the Story

Outstanding features in the rehabilitation program of the company will be told in this and later issues. It is satisfactory to follow these changes graphically so far as

Digitized by Google

Norfolk now knows what a real bus is like. These buses, with their treadle-operated rear doors and comfortably-upholstered leather seats, were a great change from small jitneys



they can be charted, as well as the financial rehabilitation of the company which accompanied them. For this reason considerable space is given in this issue to the charts contained in the company's brief.

The first chart reproduced shows that the investment per dollar of gross revenue to carry on transportation with car and bus had a rapid decline for 1926 to 1927. In part this result was obtained, despite the large addition of new capital, through the writing off of useless property from the rate basis. Another reason was the lower investment per dollar of gross revenue obtained from new and self-sustaining bus operations.

The charts giving the gross revenue of railway and bus show an increase in gross revenue for the property as a whole both in total and in cents per vehicle-mile. Bus earnings began only in 1926, but both types of transportation increased their earnings during the years 1926 and 1927.

The fourth chart shows the operating expenses of the railway and bus. The increase in 1926 over the previous year was because of the acquisition and expansion of bus operation, but 1927 showed a reduction in expenses despite the mileage rise, given in a later chart.

Net Revenue Mounted Rapidly

The fifth chart illustrates how the net revenue of railway and bus mounted rapidly during 1927, after a modest beginning in 1926.

The next two charts give the operating ratios of railway and bus respectively. That of the railway alone shows a decline as early as 1925 from the 1924 top, approaching 68 per cent. By the end of 1927 it was under 63.5 per cent. The operating ratio of buses was so close to 100 per cent in 1926 that there was a deficit on the year's operation. By the end of 1927 the operating ratio stood around 75 per cent and there was a profit on bus operation.

The next chart showing the combined operating ratio of railway and bus lines is presented only to round out the record, because these two ratios really are not on a comparable basis.

The next chart shows the total vehicle-miles operated and illustrates the expansion of the company's operations as a whole.

The next chart gives the nominal number of total passengers, but owing to the use of the zone system in 1926 and earlier years a false impression is given by the chart. During those early years some riders were counted a second time and others a third time. To adjust 1926 with the present fare basis it is necessary to deduct 2,964,347 riders who were counted the second time and 373,932 riders who were counted a third time. This gives the equivalent of 98,847,208 riders for 1926 against 102,423,544 for 1927, making the gain for 1927 equal to 3.6 per cent.

The other charts on page 627 are self-explanatory, as are also those on page 631. Further reference should be made, however, to the earnings on the new capital, for, after all, money counts.

New Capital Earned 11.6 Per Cent Before Depreciation

To provide the greatly improved and unified transportation service which has been pictured in the preceding article, the new management has spent since the date it took over the operation of the property on July 1, 1925, up to Dec. 31, 1927, approximately $3,800,000. Of this amount $1,860,000 was for the purchase of competitive bus lines, together with new buses and other equipment. The remainder was for new track and overhead, largely in connection with the rerouting program, new cars, rebuilding and modernizing existing cars and for new car and shop equipment.

This is a large amount of money to put into a business

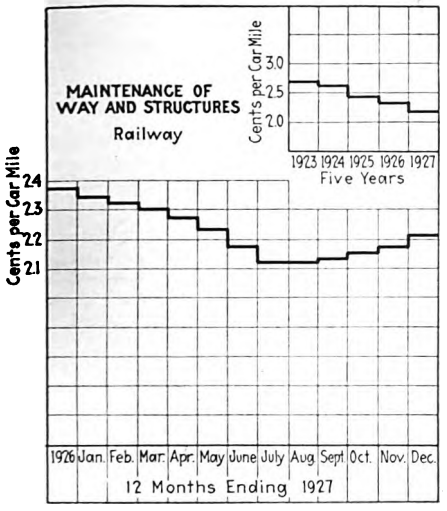
Digitized by Google

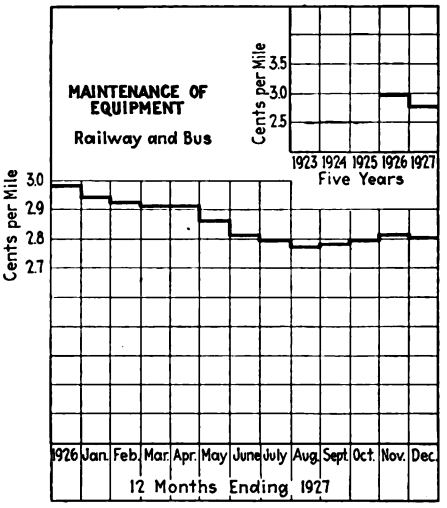
which, from the standpoint of local popular opinion, was in the discard, and the question is, has it been soundly spent and what are the results.

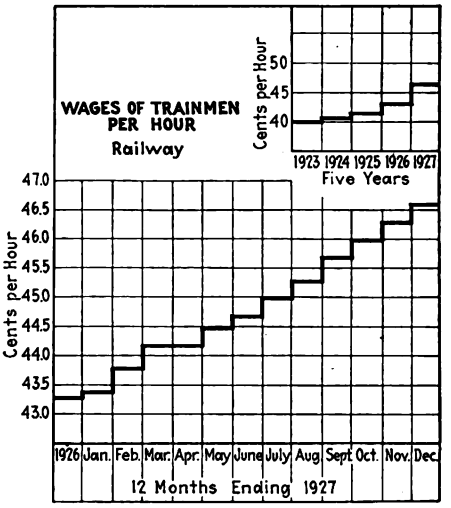
The company is proud of the contribution that it is making to the transportation industry through its public relations and operating achievements, but it is also tremendously proud of the fact that the new money put into the property has brought big returns. The net earnings, after all operating expenses and taxes for the twelve months service ending Dec. 31, 1927, showed an increase of $441,651 over the twelve months period ended June 30, 1925, which increase amounts before depreciation to which, from the standpoint of local popular opinion, was 11.60 per cent on the $3,800,000. This record indicates that the company was not throwing good money after bad and proves again that it pays to modernize.

Wage Policy Brings Lower Unit Cost and Lower Labor Turnover

Extensive use of labor-saving appliances and means for securing co-operation of employees have enabled the company to raise wages and lower operating costs

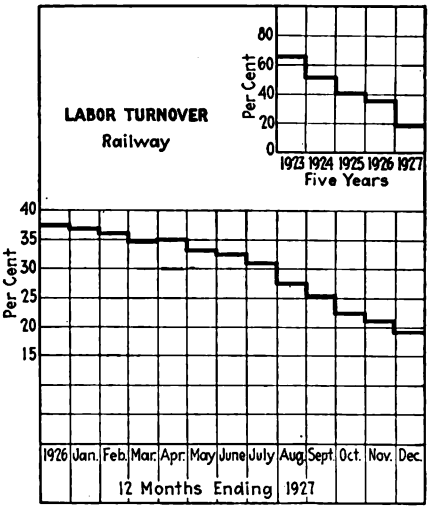






WHEN it assumed control of the Virginia Electric & Power Company in 1925, the present management told its employees that their wages were too low, and if the public was willing to pay more for improved service the men would get their share. On Sept. 1, 1925, two months after taking control, when the Richmond fares were raised from 6 cents to 7 cents, the company announced an increase of 3 cents an hour for trainmen in all of the cities it served. At the same time the hours of both shop men and track men were cut from ten to nine hours a day without change in pay.

On Jan. 1, 1927, following fare increases in Norfolk and Petersburg, the wages of trainmen and other employees were raised 6⅔ per cent throughout the system. The hourly platform rate in 1927 averaged 46.6 cents against 40.6 cents for 1924. The advance is shown in an accompanying graph covering five years.



Unit Costs and Wages in 1927

These charts show (1) cost of maintenance of way and structures per car-mile, (2) maintenance of equipment, railway and bus, per car-mile, (3) a steady increase in the wages of railway train men, all granted voluntarily, and (4) a steady decrease in per cent of railway turnover

The vacation policy also has been liberalized and all monthly employees now enjoy two weeks' vacation with pay.

The employees have reacted to this policy: (1) by giving better transportation service, as shown by the figures and graphs, showing more riders and more revenue; (2) in the rendering of this better service at lower cost through the improved efficiency and economies of operation; (3) in enthusiastically working at all times to attain the company's ideals of service through meeting the highest requirements of individual performance and by whole-hearted co-operation in assisting in those things which promote the general welfare of the company.

Through group meetings and individual contacts involving all employees, the company has endeavored to inculcate in their minds the ideals, requirements and fundamentals of good transportation service and the

Digitized by Google

obligations of good citizenship. They are also taught thoroughly to understand the requirements of their jobs and thus shoulder the responsibility that is rightfully theirs of doing good work, whatever the task may be.

Thus trainmen are told they are the contact men of the company and should carry out its ideals that customers receive good service; they should have the ability to merchandise transportation; understand the mechanical and electrical equipment of the car, be able to maintain good schedules, operate the car safely and at a minimum cost, be able to collect fares and issue transfers accurately and quickly, observe the riding habits of the passengers so as to suggest ways of improving the service, and report any defects in the company's rolling stock and overhead lines. The company aims to assist the trainmen in these matters by studies on how to make the service more attractive, means for developing riding, causes of accidents, etc.

Modern Tools Provided for Employees

The same broad policy of helping employees to do their work better is followed with the other departments, as in the shop department, by furnishing them with modern tools and other equipment to enable them to turn out better work. This policy has been of benefit to the company, as well as to the men. Thus, in the way department, the use of modern tools has permitted the company to reduce the number of men in the department, though it has changed their day from one of ten hours to one of nine hours at the same pay per day. In detail:

Sixteen men with hammers and chisels were replaced by four men with air hammers.

Three men with paint brushes and buckets were displaced by one man with a paint gun.

Ten men with cross-cut saws were replaced by one man with a power saw.

Ten men loading rails were replaced by two men and a crane.

Eight men with tamping irons were replaced by four men with air tampers.

Twelve men with hacksaws were replaced by one man with an acetylene torch.

The saving in track maintenance per car-mile effected by modernization is shown in one of the accompanying five-year graphs. Accompanying this record has been an equally gratifying one in increase in mileages between derailments. A chart for the car maintenance department is also shown.

The charts on wages and labor turnover, also published, are further evidence of the liberal wage policy of the company and of the willingness of the men to hold on to an organization that is giving them a square deal.

Incidentally, the employees have purchased a considerable amount of the recent issues of stock of the company. A large majority of them are now stockholders in the company.

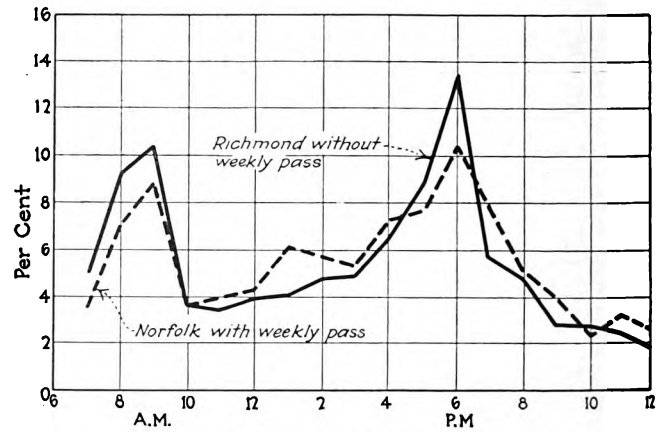
THE foregoing articles, with the two which immediately follow, give the main reasons for the award of the Coffin prize this year to the Virginia Electric & Power Company. Later issues will contain details of some of the most interesting practices of the company in bus, track and car maintenance.

Weekly Pass Helps Load

Comparison of riding in Richmond and Norfolk affords interesting comparison of effect of weekly pass on traffic

RICHMOND and Norfolk, both in Virginia, are very much alike in size, Richmond having about 200,000 inhabitants and Norfolk 177,000. The electric railway system in each city is controlled by the Virginia Electric & Power Company, though as the cities are many miles apart there is no physical connection between the two electric railway systems.

While alike in these respects, the cities differ in others. They are not the same from a traffic standpoint, as Norfolk has a large population of craftsmen, mechanics and laborers, including the United States Navy Yard and shipping workers. Richmond, though also active industrially, has a higher proportion of middle-class citizens



Hourly distribution of railway and bus passengers in and out of the business district, Richmond and Norfolk, 6 a.m. to 12 p.m.

of a more conservative trend. Richmond has 106 route-miles of track and Norfolk 209. Nevertheless, the conditions are so nearly alike as to make interesting results of policies which the company has worked out in a somewhat different way in both cities.

One of the differences in practice is on fares. The Richmond system is on the flat basis, the prevailing rate being 7 cents on the cars and 8 cents on the buses. In Norfolk the fare is 10 cents cash, three tokens for 25 cents, and an unlimited-ride transferable weekly pass for $1.50.

So far as is known, the traffic characteristics of Norfolk and Richmond were not substantially different when neither had a pass, but the accompanying load graph, derived from counts made by company traffic checkers in 1927, discloses quite a difference in load characteristics, the difference being in favor of Norfolk. The better distribution of load, particularly the peak between 12 and 2 p.m., indicates that in Norfolk many more workers go back for lunch than in Richmond. The company attributes this patronage largely to the pass holders. Another difference is the bulge in the Norfolk graph just before the evening peak. This is thought to be partly a "before supper" shopping movement from districts where food stores are not abundant and is attributed to the use of the family pass by the wives of "early to home" workers, who are encouraged to make such shopping trips daily, rather than a couple of times a week.

Again, the early evening load in Norfolk is better, be-

Digitized by Google

cause after the supper hour the Norfolk pass holder is more inclined to go to the movies by trolley or bus than the resident in Richmond. He has no extra fare to pay for himself and hardly realizes that he is paying cash or token fares for his wife and children.

Experience with the pass in Norfolk indicates that where a weekly pass is used for 30 rides during the week (a fair estimate for most of them), twelve of these rides are during the morning and evening peaks, as before the use of the pass, but that the other eighteen are off-peak rides.

Another difference shown by the statistics of the two cities is that Norfolk carries more passengers with fewer vehicle-miles. While this reduction in vehicle-miles is largely due to rerouting and unification of services, it is also true that 1927 in Norfolk, as compared with 1926, shows 10 per cent fewer vehicle-miles for more rides. In the opinion of the management, this shows that the extra rides on a pass come, but they can be absorbed without extra cost.

Method for Stimulating Rides

Virginia Electric & Power Company tries various methods with interesting results

METHODS of traffic promotion are apt to follow rather conventional lines. The Virginia Electric & Power Company has made several signal departures even to the extent of giving free rides, on the theory, probably, that "variety is the spice of life" and that the fortunate individual who got his ride free will become so much of a booster for the company that his co-operation was worth the price of his car ride.

This particular form of advertising was known as the "shoppers' free ride special" which was run from 10 a.m. to 4 p.m. every Friday for six weeks in 1927. The novelty was that the person boarding the car did not know a ride was free until he was on the car and received a pamphlet captioned "You're a lucky rider." The public knew, however, that one car on the system was of this character because the company advertised "Watch for the Shoppers' Special" through the newspapers. Of course, a helpful feature of this publicity was that it emphasized the desirability of doing shopping between 10 a.m. and 4 p.m.

Many other free rides were given to citizens of Richmond during the last two years, according to the brief of the Virginia Electric & Power Company filed this year for the Coffin Award, but these free rides were given at the expense of someone other than the company. For instance, a well-known department store, on the occasion of an anniversary of its establishment, advertised to give a car token to any customer who would bring to the store on that particular day a coupon cut from its advertisement in the newspapers. A similar offer was made by one of the principal movie theaters to patrons who brought a special coupon obtained from a car operator and who then bought a 50-cent ticket to the theater.

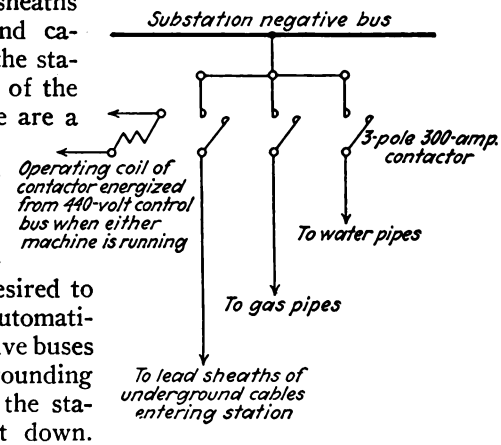
Another instance is that of a manufacturer of shoes, in Portsmouth, who advertises to give a car ticket to any customer who will carry his order home rather than having it delivered.

Another plan of selling tokens to be given away, developed by the company, is to put them up in neat packages of 24 in December for sale as Christmas presents. Such a plan simplifies the problem of presents for many people, because there can be no question as to their acceptability. Everyone can use car tokens. No reduction was made, of course, on the price per token, but the envelope in which they were inclosed is very attractive and carries an appropriate card wishing the recipient the season's greetings.

Automatically Disconnecting Negative Grounds

By J. H. Lohrfink
General Electric Company, Baltimore, Md.

FOUR of the automatic substations of the United Railways & Electric Company of Baltimore do not operate except on load demand. The substation negative bus in each case is grounded to water pipes, gas pipes and the lead sheaths of underground cables entering the station. In view of the fact that there are a number of gas mains and water mains paralleling the negative cables, it was desired to disconnect automatically the negative buses from the grounding circuits when the stations are shut down. If this were not done, the stray currents would attack these water and gas lines to quite an extent, as they would offer a better means for the flow of the negative current to other stations at that time in operation.



The accompanying diagram shows how this was accomplished. Four 300-ampere, three-pole contactors were used, one in each of the four automatic substations. The operating coil of each contactor is energized from the 440-volt control bus when the machine is running. When the machine stops, the coil is de-energized and the contactors open.

Relief From Paving Obligation in Ohio

TEN Ohio electric railways have been granted relief of some character from paving charges, according to a bulletin issued by the American Electric Railway Association and quoted by the Ohio Committee on Public Utility Information.

The degree of relief varies in the cases of these ten companies, which are: Northern Ohio Power & Light Company; Wheeling Traction Company; Cincinnati Street Railway; Columbus, Delaware & Marion Electric Company; Cleveland Railway; Toledo, Bowling Green & Southern Traction Company; Western Ohio Railway; Southern Ohio Public Service Company; Community Traction Company of Dayton, and the Springfield & Xenia Railway.

Some of the companies have been granted only partial relief, while in other cases the relief has been more general and extensive.

Accountants Discuss Need for Coping with New Problems

Interesting addresses and detailed committee reports show the work of the association in solving the problems of standardization of accounts, bus accounting, price records and depreciation changes. O. H. Bernd elected president for coming year

REALIZATION of the need for solving several important problems now before electric railway accountants created a lively interest in the three regular sessions held by the Accountants' Association. The meetings were characterized by the interesting addresses and reports, and the lively discussions which followed these. The meetings were all well attended and those present showed much enthusiasm in the work being done. They were presided over by O. H. Bernd, secretary Des Moines City Railway, who became acting president of the association with the passing of T. B. MacRae.

The reports of the committees on standard classification of accounts, bus accounting, stores accounting, price records and freight accounting showed definite progress in these important phases of the association's activity for the past year. The reports on bus accounting and depreciation brought forth much discussion, an indication of the importance of these two subjects. Among the interesting papers presented were "Accounting in Steel Works," by Walter C. Bird, assistant to the auditor American Steel & Wire Company, and "Auditing Control in Manufacturing Industry," by F. H. Corregan, assistant general auditor General Electric Company.

On Wednesday, Sept. 26, a joint session of the Accountants' Association and the purchases and stores division of the Engineering Association was held. Stores and pricing problems, common to both groups, were discussed in the several reports presented. An interesting paper, entitled "Pricing Problems," was read by R. A. Weston, special accountant of the Connecticut Company. Following the joint session, a business meeting of the accountants was held, at which officers for the coming year were elected. O. H. Bernd, the acting president for this year, was elected president.

No regular session was held on Tuesday, the day devoted to the inspection of the exhibits, but a "get-together" luncheon was held at the Cleveland Athletic Club, which served the purpose of bringing together the members of the association.

Opening Session on Monday

A moment of silent prayer, a few words of tribute from friends of long standing, and the reading of a resolution on the death of T. B. MacRae, preceded the opening of the Monday session of the association.

O. H. Bernd

After welcoming members of the Accountants Association to its 31st annual convention, Acting President O. H. Bernd expressed a wish to have the incoming administration set a goal of 150 individual accountant memberships in 1929. He stressed the important and effective part railway accounting officers must play in the progress of the industry, and urged that they co-operate with all other departments in seeing that revenues are fully developed. He also pointed out that the association is a clearing house for ideas and experiences. He then commented on the work of the committees during the past year and called special attention to the subject of depreciation accounting. In connection with this subject Mr. Bernd said:

> The sentiment of the industry is not that of objecting to depreciation accounting, but to the imposition of a system of depreciation accounting at this time when the industry—and especially that part of it which reports to the Interstate Commerce Commission—is not in a strong financial position, but just feeling its way back to prosperity.
>
> Depreciation is ultimately an accountancy matter, and those who are handling it in its judicial and economic phases fully realize that the solution of the problem lies in having an enlightened and sympathetic group of accountants and auditors.
>
> Every electric railway accounting officer should realize that he has a more important and effective part to play in the progress of the industry than ever before. The management of his company, the investors, the regulating authorities and the public must rely upon his accurate and sworn statements of his corporation's affairs and needs. He must be an active co-operator with all other departments in seeing that the revenues are fully developed, and that expenses are made for the company's benefit. He must also act as an interpreter for the management of the various current operating accounts, results and statistics, as well as the capital account expenditures and its fixed and current assets and liabilities. In this way he will find that the electric railway accounting profession is placed on a higher plane.

Important Reports Presented

The report of the sub-committee on bus accounting was made by E. A. Tuson, chairman. Two outstanding developments of the last year with respect to bus accounting classification systems have been the adoption by the Pennsylvania Public Service Commission of a definite standard classification and the tentative promulgation of a standard system by the Railroad Commission of Wisconsin. The report calls attention to the fact that the class A specification as finally adopted contains potent major differences from that of the Accountants' Association. First, the item "Taxes" is included as an "Operating Expense" account and "Other General Expenses"

Digitized by Google

instead of a separate "Operating Revenue Deduction" group as in the association classification; second, "Rents," for leased properties which entitle the carrier to the exclusive use and possession of such properties are charged as "Other Rents" under "Income Deduction" instead of the various rent accounts under "Operating Expenses" as in the association classifications; third, a separate operating expense group entitled "Depreciation and Amortization" is used, whereas in the association's classification the retirement expense is included under "Maintenance of Plant and Equipment," fourth, but one operating expenses group, i.e., "Conducting Transportation," is used instead of the two groups "Operating Garage Expenses" and "Transportation," as in the association's classification.

Mr. Tuson emphasized in this report the need for a standard measure of the financial result of bus operation. Bus operators, said Mr. Tuson, should have a ready basis of comparison and, as nearly as possible, talk the same accounting language. The same arguments that make it desirable for an individual state commission to have a uniform system of accounts for all utilities of a given class which report to it, apply with equal force to the desirability of having a uniform standard for the entire country. Attention was also called to the additional point referred to in last year's report concerning the adoption of different classifications in the various states, which, it is believed would occasion a duplication of work.

W. L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa., represented the Accountants' Association at the annual convention of the National Association of Railroad and Utilities Commissioners held in Dallas, Tex., in October, 1927, and his report presented a résumé of matters considered of general interest to the Accountants' Association.

An address on that branch of accounting which deals with manufacturing costs, known as manufacturing accounting, was given by W. C. Bird, assistant to the auditor American Steel & Wire Company, Cleveland, Ohio. He gave a complete description of the accounting system used by his company in the production of steel.

It was shown how the foundation job of preparing the cost of products is performed by the works' accounting organization, and because of certain expenditures and values not available at the works, how the job is completed in the general office. The works' accounting organization consists of seven divisions, a chief clerk being responsible for their correlation. These divisions are weighing, timekeeping and payroll, payroll verification and distribution, stores, production and stocks, freight and receiving and billing.

The speaker supplemented his talk with three reels of moving pictures showing the source of supply of raw materials entering into the manufacture of steel, the manner of producing coke and the mining and transportation of ore.

On Wednesday the Accountants' Association held a joint session with the purchases and stores division of the Engineering Association. The report of this meeting is included in the report of the purchases and stores division.

"Auditing Control" Subject of Address at Thursday's Session

The Thursday session was presided over by E. H. Reed in the absence of O. H. Bernd. Four important committee reports were read and discussed and an address delivered by F. H. Corregan, assistant general auditor of the General Electric Company.

Speaking on the subject of auditing control in manufacturing industry, Mr. Corregan said that the industry with which he is connected has adopted a standard accounting and cost system. This system recognizes four broad fields of industrial activity as a basis for the classification and segregation of financial transactions, namely, research and engineering; selling and distributing; manufacturing; general administrative. There are two general reasons for that segregation: (1) The several fields of activity are ordinarily under the direction of different individuals, and (2) the factors influencing the financial transactions in each field are quite different.

The financial transactions pertaining to each field of activity are divided between revenue and disbursements. The revenue is subdivided according to lines of product and the disbursements are subdivided between expenditures of an investment character and those relating to current operations. Operating expenditures are further subdivided according to the general character of the items of which they are comprised.

The analysis of these various accounts, Mr. Corregan said, while very valuable as a picture of what has happened, would not be fully effective in controlling expenditures principally because it is after the fact. It is very essential that information regarding expenditures be had before they are made, so that judgment may be passed upon the desirability and necessity of making them. In other words, budgets of forecasts which serve not only as a guide in making expenditures, but as bogies for judging them, are most important.

Recognizing that the amount of revenue will be limited to selling prices and that the aggregate will be dependent upon the volume of sales, the first requirement is a forecast of sales. Inasmuch as certain expenditures, principally for plant, must be made today with respect to future business, it becomes important to have a forecast of sales not alone for the ensuing year, but well into the future.

Methods for Reducing Accidents

Command Attention of Claims Men

They also discuss departmental organization and traffic regulation and hear address on recent court investigation of fraudulent claims in New York

WHEN President Joseph S. Kubu of the Claims Association called the opening meeting of the association to order Monday afternoon, Sept. 24, he found himself facing the largest gathering of claims men since the Chicago convention in 1924. The meeting marked the 25th milestone in the history of the association.

Mr. Kubu in his presidential address paid tribute to the men of other years who had carried on the work of the association for a quarter of a century. He declared they had lent courage and inspiration to the men of today. Claims work is no exception to the need for making adequate preparations for following it as a profession, and there is every evidence of the Claims Association lending force in transforming the individual into an interrelated personality, ever widening his conception of his work, President Kubu said. One of the most vital measures under consideration by the Claims Association is the recommendation presented to the executive committee of the parent association asking that body to support the enactment of an "imputed negligence law" throughout the various states. The policy committee of the American Association favorably considered the matter and recommended a committee to work in connection with the Claims Association. He also called attention to the need by the claims departments for especially trained men and to extensions of the safety movement.

J. S. Kubu

John J. K. Caskie, general attorney Philadelphia Rapid Transit Company, read an interesting paper on "Selection of Claims Department Employees." It is Mr. Caskie's opinion that the best men available today for claim work are to be found on the platforms of the street cars. An abstract of his paper will be found on another page of this issue.

In discussing Mr. Caskie's paper, H. V. Drown, Newark, N. J., said that Mr. Caskie's practice closely paralleled his own. In the early years of his claims career, he believed that college men, or at least high school graduates, would make the best claims men, and that a claims school for them should be started. Later, he found that men with considerable book learning did not necessarily excel, and no school of instruction was founded. Recently, in analyzing the makeup of a number of his company's one-man operators who had had perfect records for over a year, he found not one had gone beyond elementary school. The collegian, as a rule, quickly becomes impatient and discouraged at the comparatively slow progress toward a high position and earnings and usually departs after a short experience. Comparing these two types, No. 1, the man of higher education and No. 2, the man with an elementary school education only, or less, on the theory that each came into the world with identical mental and physical qualifications, he found that the men with higher education who were induced to stay in the service have an advantage in dealing with persons of culture and prominence. As investigators they are superior in the making up of reports and phrasing statements and turn in work that the department is proud to exhibit. As adjusters, on the whole, they are not as effective, except in dealing with cultured and prominent persons. The rank and file, with whom most claims dealings are made, are likely to stand in awe of them, quickly sensing their superior training and being in fear that they are not mentally fit to cope with them. This lack of a feeling of fellowship or equality also handicaps this type of employee in securing statements from witnesses as he often fails to get the sympathy of the witness. If this type continues at the work long enough he overcomes much of this disadvantage and is likely to make a better executive.

Type No. 2 makes the better adjuster, either as a beginner or as a seasoned employee. The majority of claimants with whom he comes in contact are of the rank and file and have much in common with him. His use of corruptions of the English language strikes a responsive chord. His dealings with men from his early youth have made him keen and shrewd. As an investigator he is likely to obtain statements where Type No. 1 would fail. The statements may be poorly constructed but they usually contain the essentials and answer the purpose. It is a happy combination to build a department composed largely of men sufficiently educated to have acquired a fair vocabulary and of sufficient practical experience in the world, particularly in dealing with all types of humanity, to round out the organization with the addition of a few of the extreme types mentioned. To counteract the havoc of time, fairly young men should be taken on with the idea of always having a vigorous and virile organization.

Digitized by Google

The speaker agreed with Mr. Caskie as to the adaptability of the platform man for claims work, but did not think the department should be made up largely from this type. Some of his own best adjusters are ex-platform men, and some have developed into good investigators, but the speaker did not think the average platform man has sufficient education, particularly for investigating work.

As to the training of the new men, he thought the method generally followed is the proper one. This is first to give applicants completed cases to study in which they can determine by the statements and write-ups largely what is required; then to send them out with experienced men for a while and then put them to work. From then on they should constantly receive instructions so they are really tutored as long as they are in the business.

S. W. Baldwin, general attorney Connecticut Company, agreed in general with Mr. Caskie's conclusions. He listed the requisite qualities of a good claim department employee as follows: (1) A clear and truthful conscience never dormant. (2) An ability to approach unknown people of all sorts in such a way as to create in their minds an abiding confidence in the claim man. (3) A knowledge of transportation and traffic conditions in the locality. (4) A general acquaintance with the people—particularly doctors, business men and lawyers—to determine which are absolutely trustworthy and which are not. (5) A knowledge of the law in regard to transportation accidents. He said that the first is fundamental. The second, third, and part of the fourth, are usually well acquired by the proper sort of a man on the platform. The latter part of the fourth and the fifth are a proper instruction to be given in the claims department itself. His methods of instructing new employees is for them to begin by studying old and rather typical files. When the new employee begins actual work and brings in statements, they should be gone over with him, and his attention called to mistakes and omissions. No matter how long a man has been in claim work, the speaker urged that he should, if possible, be present at the trial of every case he has investigated in its early stages. He will then see what a plaintiff's lawyer does to the witnesses produced by the defense. The speaker also urged that one or more among the younger members of the claim departments be sent each year to the convention. Then after the convention that each company's claim department have an informal meeting or meal, at which those who attended may talk it over with their less fortunate associates—some of whom will be able to attend the following year.

Ambulance Chasing in New York City as Disclosed by Investigation

The latter part of the session on Monday morning of the Claims Association was devoted to the consideration of a paper on the investigation of "ambulance chasing," which has been conducted in New York during the last few months. It was presented by Frank E. Carstarphen, vice-chairman and general counsel of the Citizens' Committee against Fraudulent Claims, of New York City. Mr. Carstarphen gave a review of the recent campaign in New York City against fraudulent claims and told of the whole-hearted support given the committee by bench, bar and citizens alike. A brief abstract appears on another page.

On the afternoon of Tuesday, the day on which there were no sessions of any of the associations, the claims men were invited to inspect the offices of the claims department of the Cleveland Railway. The few hours taken by them in doing so were very profitably spent in the company of Messrs. Kubu and Weh.

At the second session of the Claims Association, a luncheon meeting devoted entirely to informal discussions, about 40 members were present.

L. H. Butterworth, claims attorney Boston Elevated Railway, presented a paper on the public reaction to operation of the Boston Elevated Railway by the state, so far as it affected claims. He said that when the company began operation under the public authority the members of the claim department were rather hopeful that the financial interest of the car riders in the economical administration of the company's affairs would be reflected in a decreasing claim department expense. This hope was doomed to disappointment. The cost of claims and the size of verdicts have steadily mounted, although the number of accidents and claims have shown no proportional increase. This increase in cost is naturally due to other causes than public operation, such as the increased accident hazard due to auto traffic congestion, increase in bus operation, general economic conditions of inflated prices and legislation and Supreme Court decisions making the law more favorable to the plaintiff in negligence suits. In brief, from public operation there has been practically no reaction of any kind so far as claims are concerned.

In the open discussion which followed the reading of Mr. Butterworth's paper, W. F. Weh, Cleveland Railway, said that his company had experienced the same result so far as damages were concerned. He stated that any attempt to dwell in the court room on the subject of the car riders paying the bill was promptly ruled out.

Discussion on Safety

The final session of the Claims Association held on Thursday afternoon saw another record-breaking attendance. A large part of the session was devoted to the reading and discussion of the report of the committee on safety.

In commending the report on safety, H. V. Drown, Newark, N. J., said he was particularly interested in the comments on compulsory insurance for automobile drivers in Massachusetts. Often the railway in cases of joint negligence finds that its co-defendent is worthless, so that the plaintiff naturally collects from the solvent transportation company. Because of the irresponsible driver, also, the company often is unable to collect for damages done its property by automobiles. A penniless driver, driving a worthless car, is apt to be a reckless driver. The speaker also thought that improved traffic regulations would reduce accidents. He approved the "stop street" regulation, which, he said, has come to stay and should be more strictly enforced. He pointed out that reckless driving is not always driving at very high speeds and gave as examples the crossing of a blind intersection at a speed of 25 m.p.h., and blindly turning out of lines of traffic into oncoming traffic. Arrests seldom follow such offenses. He thought that to engender a wholesome respect for the law was an excellent way to educate drivers of motor vehicles.

Wallace Muir took a negative view on this point and again began stumping for concerted action on the part of all claims men for a uniform imputed negligence law. It was his contention that a greater benefit would enure both as to the reduction of accidents as well as the saving of thousands of dollars in damages.

Digitized by Google

I. S. Fairty then presented a paper on "Methods of Claims Department Operation in Toronto." An abstract appears elsewhere.

The paper of G. T. Hellmuth on the "Effect Upon Accidents of Automatic Traffic Control Installation and Parking Restrictions" was read by J. W. Seabright. In discussing traffic lights the paper said that the introduction, in 1923, of synchronized traffic signals on Michigan Avenue, Chicago, for a distance of 2¼ miles was followed by some slowing up of the non rush-hour traffic, but in the morning and evening periods of greatest need the avenue was able to handle a steadily moving traffic mass at greater speed and with a most satisfactory reduction in accidents. It is estimated that in little more than a year's time nearly 60 lives were saved. The physician in charge of the receiving ward of a large neighboring hospital stated that the automobile injury cases coming into that institution had been reduced by more than half in number and by more than 50 per cent in seriousness. It is estimated that the introduction of the progressive traffic signal system in the Loop district in Chicago in 1926 reduced accidents there by 20 per cent.

In Detroit the traffic lights were first in general use in the downtown area in 1926. The fatal and personal injury accidents in this area had shown an increase in 1925, compared with 1924, of 56 per cent, but in 1926, compared with 1925, there was a decrease of 3 per cent, and in January and February, 1927, a decrease of 9.5 per cent, compared with the previous corresponding months. In parts of Cleveland the lights have speeded car schedules 20 per cent and automobile movement 30 per cent. In East Cleveland automobile accidents were reduced from 369 in 1925 to 155 in 1927, in the face of the usual increases in machines operated.

As to parking regulation, on January 10, 1928, parking was prohibited in the Chicago Loop area between 7:30 a.m. and 6 p.m. from Monday to Friday and from 7:30 a.m. to 3 p.m. on Saturdays. Six months later it was found that traffic had been speeded up 10 per cent in the non-rush hours and 14 per cent in the period between 4:30 and 6 p.m. Accidents in the Loop area have been reduced about 30 per cent.

In Cleveland, as a result of the enactment of an ordinance forbidding parking on main thoroughfares during rush hours, there were 900 fewer accidents in the six months following the ordinance as compared with the same six months of the year previous.

Officers elected to serve for the ensuing year are as follows:

President, L. F. Wynne, Georgia Power Company, Atlanta, Ga.

First vice-president, Walter E. Robinson, Cincinnati Street Railway, Cincinnati, Ohio.

Second vice-president, C. E. Redfern, United Electric Railways, Providence, R. I.

Third vice-president, W. E. Foley, Third Avenue Railway System, New York, N. Y.

Secretary-treasurer, J. W. Welsh, American Electric Railway Association, New York, N. Y.

Executive committee: the officers and the following members-at-large: L. H. Butterworth, Boston; Seth W. Baldwin, New Haven; J. W. Giltner, Akron; Trevor C. Neilson, East St. Louis.

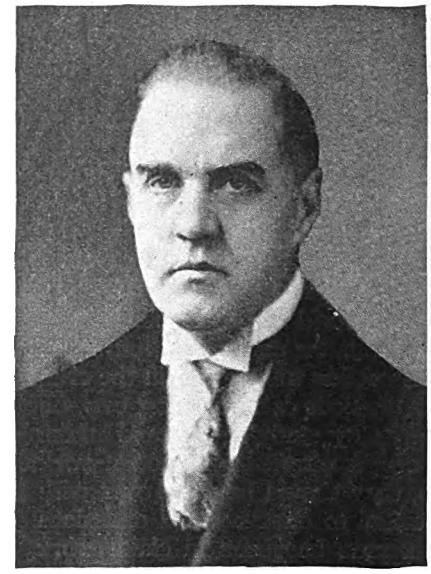
In turning over the gavel to Mr. Wynne, Mr. Kubu, the retiring president, spoke feelingly of the co-operation he had enjoyed in carrying on the work of the association during the past year.

Ambulance Chasing in New York Exposed*

Genesis of the movement that resulted in the information of the citizens' committee against fraudulent claims and hearings on the evil by justices of the Appellate Divisions of the Supreme Court

By Frank E. Carstarphen

Vice-Chairman and General Counsel Citizens' Committee Against Fraudulent Claims, New York City



Frank E. Carstarphen

IN THE late spring of 1927 a committee of lawyers appointed by Hon. Victor A. Dowling, presiding justice of the Appellate Division of the Supreme Court for the First Judicial District, investigated the conditions of the calendars of the courts of record of New York County and reported a tremendous congestion of cases awaiting trial. Its survey indicated that negligence actions composed the majority of the many thousands of cases pending and that in a single month such actions to the number of many hundreds had been filed by four or five attorneys, one attorney alone having started nearly 400 suits in that time.

During the period of this committee's investigation and later, the New York *Evening World* and the Brooklyn *Eagle* attacked the evils of the contingent fee system, publishing exposés of ambulance cases, and the *Panel*, a monthly bulletin of the Association of Grand Jurors in New York County, urged that concerted action be taken to find remedies to prevent these evils. Then a group of public-spirited citizens, headed by Robert Appleton, president of the Association of Grand Jurors in New York County, organized a committee known later

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

as the "Citizens' Committee against Fraudulent Claims." This committee soon had an enrollment as associate members, thousands of citizens, including representatives of the interests most directly affected, such as stock casualty companies, mutual casualty insurance companies, steam railroads, local transit and taxicab companies, food manufacturers and distributors, real estate companies, etc. This committee, with the assistance of the press, carried the burden until several bar associations filed in the Appellate Divisions of the Supreme Court for the first and second judicial districts (New York County and Brooklyn), petitions for the investigation of the deplorable conditions which had been exposed.

On Feb. 14, 1928, the Appellate Division of the First Judicial District handed down an opinion designating Judge Isidore Wasservogel to sit in a series of hearings to be held under the order of the Appellate Division, and the Bar Association for the First Judicial District designated Isidore J. Kresel as the attorney to investigate the complaints and to present testimony in private and public hearings before the court. In the meantime, the Appellate Division of the Second Judicial District designated Judge Leslie Faber to sit in hearings in that district, though this investigation was to be conducted privately. In this respect the procedure differed from that of the hearings conducted before Judge Wasservogel.

The public investigations continued from Feb. 20 to July 20, 1928. During this time the insurance companies and others interested prepared and sent to the attorneys in charge of the several public investigations schedules containing the names of those attorneys who within the previous three years had been most active in instituting suits against them, the titles of the cases, the amount of adjustments or settlements, etc. Using these lists as a basis, the attorneys examined numbers of witnesses, as a result of which many valuable data were obtained upon which to base future action. The hearings under Judge Wasservogel were completed about the middle of July, although a few hearings were held in early August. Judge Wasservogel is now engaged in drafting his report, which is to be submitted to the Appellate Division of the First Judicial District on the first Tuesday in October.

What May Be Done

It is easy, of course, to criticize any existing evil but sometimes more difficult to devise a remedy or do something constructive in the way of legislation to prevent its recurrence. It is expected, however, that Judge Wasservogel will not only point out flaws in existing laws or rules of practice, but will indicate how, in his opinion, such laws can be changed to protect society against the evils which have been exposed. It is expected also that the report will cite the names of a number of attorneys-at-law against whom disciplinary measures will be recommended. Already testimony against more than twenty has been sent to the office of the district attorney of New York County, and indictments have been returned against about one-half that number. These figures do not include the large number of lawyers' runners and physicians against whom testimony was adduced at the hearings, for the reason that the Appellate Division of the Supreme Court has jurisdiction only over attorneys. This does not mean that the other persons mentioned will escape unscathed, though action against them will have to be from other sources.

Exceedingly interesting testimony was taken during the closing days of the hearing, wherein representatives of local traction companies, insurance organizations and others reported a great decrease in a number of negligence suits filed against them since the beginning of the hearings, and the chairman of the joint committees of the Bar Associations said that in his opinion ambulance chasing cases brought in the New York Supreme Court had decreased 43 per cent in number.

Fixed Maximum Fee Suggested

During the hearings a number of constructive suggestions were made. Thus, William D. Guthrie, president of the New York City Bar Association, suggested that compensation in accident cases should be fixed along the principle of the workmen's compensation law. While he thought that the contingent fee could not be entirely dispensed with, he believed a maximum should be fixed by law. He thought 20 per cent would be proper generally, whereas, under the present system, the fee is frequently 50 per cent of the amount recovered. The law on perjury should be changed to give power to the judge before whom perjury is apparently committed to pass judgment on it immediately, with the right of review and appeal reserved for the defendant. The purpose of this suggestion was to have prompt and effective enforcement against this crime. Mr. Guthrie also argued in favor of increasing the requirements for admission to the bar.

The point should be understood that the hearings so far have not been a series of trials. No one has been a defendant nor has there been an accused person at the bar. The hearings have been in the nature of a "preliminary investigation," undertaken by the court which has both inherent and statutory control over the conduct of lawyers, such an investigation being ancillary to its power to disbar and discipline. It is impossible to anticipate the suggestions to be made by Judge Wasservogel, but if he should cite any individuals for discipline, proceedings against them would have to be instituted *ab initio*.

The situation of the inquiry before Judge Faber is somewhat different, in that a smaller number of attorneys were found implicated in ambulance chasing. As to these, a preliminary report has already been made by Judge Faber and proceedings are now under way before a referee appointed by the Appellate Division, while in other instances indictments have been sought and found.

Some fear has been expressed that unless proper precautions are taken, something like the old conditions may return. It is the purpose of the Citizens' Committee against Fraudulent Claims to see that the good work is continued.

Furthermore, there should be a differentiation between the kinds of perjury that are committed. The difficulty now is that, first, it is very difficult, under the definition of perjury in most penal statutes, to secure an indictment and, secondly, the penalty is so severe that juries usually fail to convict. Why not divide perjury into two classes, making one a misdemeanor and the other a felony, and take into consideration the fact that a man who swears falsely in applying for a dog license is not quite so bad as the one who deliberately and with malice aforethought, during the trial of a case in court, falsely swears after being warned? Apply the rule of reason to the statutes on perjury and I believe you will have more indictments and more convictions for perjury than are now possible.

Another suggestion is that the trial judge address in a solemn manner every witness that appears before him, explaining the need for testifying truthfully and explaining to the witness the penalties of perjury.

Claims Department Operation in Toronto*

Many favorable conditions. Ontario courts follow civil law doctrine of division of fault instead of common law. Injuries expenses low

By Irving S. Fairty
General Counsel Toronto Transportation Commission, Toronto, Canada

TORONTO is a city of 570,000 population, but with the tributary suburbs it constitutes a community of, roughly, 750,000 persons. About seven-eighths of this population is Anglo-Saxon or Celtic in origin, a circumstance which will probably be conceded to be an advantage from a claims standpoint. There are few grades of consequence to be overcome by the street railway, and steam railway grade crossings are practically non-existent. On the other hand, although there is a motor car for every six of the population, the principal downtown streets are only 66 ft. in width with 42 ft. roadways.

The Toronto Transportation Commission has complete control of the transportation system of the city proper which it serves by street cars and feeder buses. It also operates through a subsidiary company coaches for sight-seeing and chartered work, a de luxe special fare system of motor coaches and motor coach routes to outside points, as far in one case as Buffalo, a distance of 100 miles. Under arrangement with suburban municipalities it operates at cost six separate street car and bus services in such municipalities. It also operates interurban railways 67 miles in length and the ferries between Toronto Island and the mainland.

By far the bulk of its roadbed and equipment is either new since 1921 or has been substantially rebuilt, and all of its rolling stock is now equipped with the latest safety devices. Our trainmen, from the standpoint of neatness, courtesy and operating skill, set a very high standard, a fact which not only bears upon the number of accidents but is of substantial advantage to us in our relations with the public. Our management does not believe in the bonus system for accident prevention. Rightly or wrongly, it feels that men should not be rewarded for doing their duty and that a strict but fair discipline is the best way to secure a comparative freedom from avoidable accidents. On the other hand, every effort is made to encourage the organization's *esprit de corps,* by such methods as a house magazine, a band, competitive sports, concerts, picnics, etc., and more important from our standpoint, by instruction in first-aid work. Over 1,100 men have passed first-aid examinations, the commission paying for the time spent in attending the necessary lectures.

There is a justifiable public confidence in our system of administration of justice in Canada. For the past three years we have had in Ontario in contributory negligence cases the civil law doctrine of division of fault and damages in place of the common law doctrine that contributory negligence completely bars a plaintiff from recovery. I own that I had substantial misgivings as to the expediency of the change but I am now of the opinion that natural justice is more nearly served by the new rule and I question if defendants do not on the whole gain by its adoption.

Irving S. Fairty

The type of legal practitioner known as the ambulance chaser is absent from our city. I do not know that members of our legal profession are any more ethically disposed than in other cities or that the temptations in the path of the young and impecunious lawyer are less, but the discipline of our profession is left entirely in the hands of the profession itself through elected Benchers and this body has always largely succeeded in maintaining a high standard of professional conduct and ethics. It may also be said that the medical profession in Toronto seems to be successful in guarding itself against its black sheep. So in our claims work we have many extremely favorable surrounding conditions, but this does not prevent us from being at times extremely busy.

Under our organization scheme the claims work is made a branch of our legal department and, while our experienced supervisor of claims and his competent as-

**Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

sistant are in practice given a free hand in the conduct of their work, we feel that the arrangement in question, insuring as it does close and continuous legal co-operation whenever necessary, has much to commend it. Incidentally, for reasons which this association has had elaborated before it, the title of "Claim Agent" was discarded some time ago for that of "Supervisor of Claims." The balance of the staff of the claims branch comprises a chief clerk, eight investigators, two salaried part-time physicians, and the necessary stenographic assistance. All the investigators have been with the organization a substantial period. They are men of mature age, this being a distinct advantage for this occupation, but only two came with any special qualifications for their positions.

In all our contacts with the public fair dealing is continuously our watchword. We aim to pay all just claims and believe that square dealing to others breeds in return square dealing from others. A necessary corollary of fair treatment to others is fair treatment to oneself and we impress upon the public with whom we come in contact that we will not be willingly imposed upon and that we will resist with all the resources open to a wealthy corporation any extortionate and improper claim. A settled claim means the preservation of amicable relations, litigation, usually bitterness and ill will, no matter what the outcome. And we in Toronto often especially strain a point to keep on the best of terms with what were formerly regarded as the three learned professions, the lawyers, the physicians and the clergy. The idea of maintaining especially the good-will of the gentlemen of the cloth may be regarded as novel, but most will agree that in view of their large circle of influence it is not out of place to cultivate such good will.

To come to the actual machinery in use with us for handling accidents and claims we may say that serious accidents are reported by the crew or the first inspector they meet, during office hours, to a special telephone in the claims office separate from the main switchboard, and after office hours to the main switchboard to be relayed to the supervisor of claims or his assistant at their residences. All accidents, serious or trivial, must be reported by trainmen immediately on signing in, on forms supplied at the divisions. These forms are copied by clerks at the divisions for the use of the operating department but the originals are sent at once to the legal department for attention. Failure to report an accident, even if trivial, is treated by our operating department as a very serious offense.

When a report is received by our claims department of an obviously serious accident our first step is to insure adequate hospital and medical treatment for the injured. The occurrence is then given whatever investigation is necessary. Only in exceptional cases is any effort made to interview an injured person or his family, for our experience leads us to believe that the motives for seeking such an interview are usually misinterpreted. Nor will we as a rule discuss settlement with a person still suffering from injuries. If he expresses a desire to open the subject he is told that we will be very glad to discuss the matter with him at our office on his recovery. Further, we make no effort to influence or cajole a claimant into a settlement and frequently advise married women who are willing to settle to discuss the matter with their husbands first. Almost invariably the wives return stating that their husbands approve of the settlement.

1927 STATISTICS

	T.T.C.	Gray Coach-Lines, Ltd.	Total
Revenue-passengers	201,748,884	2,227,526	203,976,410
Car-miles	28,764,561	1,346,509	30,111,070
Total revenue	$13,190,439.61	$570,994.23	$13,761,433.84
I. & D. expenditures (including overheads)	$121,062.78	$17,261.19	$138,323.97
Percentage of total revenue	0.92	3.02	1.00
Accidents reported	6,752	446	7,198
Claims made	1,001	185	1,186
Claims settled in first instance	479	131	610
Claims repudiated in first instance			576
Repudiation acquiesced in			461
Settled after first repudiation			53
Action brought in			62
Total			576
Actions settled before trial			18
Verdicts for commission			16
Verdicts against commission			10
Plaintiff has failed to bring to trial			18
Total			62

This system may not be adopted by all transportation companies but we feel it can be defended on psychological grounds. The old idea of the claims man hurrying to a hospital with a roll of bills is still surprisingly prevalent and a claimant is frequently taken aback to discover that a company is not hastening to settle. He may wonder whether such a detached attitude does not spring from a well-merited confidence in the company's position.

When we find it necessary to repudiate a claim we try to act in no dogmatic or arbitrary manner. Apart from disclosure of the names or number of our witnesses we are always willing to discuss fully the details of an accident with a claimant and to try to convince him that, while his statement of the facts may be perfectly correct, we have to proceed upon the weight of testimony which is against him.

The investigation of accidents is by personal call of an investigator. Our experience of investigation by mail has not been sufficiently satisfactory to warrant its adoption except in the case of out-of-town witnesses in relatively unimportant matters. The investigator takes notes of a witness's statements and afterwards transcribes them in longhand and attaches them to the file. Of course every effort is made to see that these reports are uncolored, for a report biased in our favor would be very greatly to our detriment in the average case. Except in a very important case no effort is made to secure signatures to such statements, as they are rarely repudiated.

When action is brought in the courts as a result of a repudiated claim the matter becomes more the care of the legal branch than the claims branch. Prior to the trial we have in Ontario a right to examine an opposing party on oath for discovery and as a result of the enlightenment obtained thereby many actions are settled out of court which would otherwise go to trial. On the whole we have a surprisingly small number of cases which actually reach the courts.

There is one further matter that may be of interest. We believe in collecting from others for damages to our equipment. This work is done by a general utility inspector attached to the operating department, it not being considered good policy to have him in the claims branch. However, we try to maintain close co-operation with him in his work and when, after failure to collect, he requests the legal department to take action, conference is always had with the supervisor of claims before such action is taken, to insure its advisability from a standpoint of policy.

Some statistics of the claims branch for 1927 are given in the table above.

How May New Claims Men Be Recruited?*

By John J. K. Caskie
General Attorney

Philadelphia Rapid Transit Company, Philadelphia Bus Lines, Yellow Cab Company of Philadelphia, International Railway of Buffalo

John J. K. Caskie

DURING the last decade, through the ever increasing use of automobiles, a mass of negligence litigation and accident claims has arisen greater in the aggregate than those of the street railway companies. We no longer occupy the predominant position in the courts that we once had although we are still the most important single litigant. The accident insurance companies, in the growth of their business, have absorbed many of our trained men, without providing us with a new source from which we can draw.

The striking characteristic of the best type of street railway employee is a peculiar loyalty and devotion. These qualities are even more important than the shrewdness and discretion required in our business. When employing trainmen, we choose vigorous men to cope with present-day traffic conditions. They are schooled in the mechanical construction of our cars and in their operation, as well as in strict rules of discipline. They are also taught to make use of a courteous and tactful approach to all sorts of people.

The trainman who takes a car out on the streets, especially if he is a one-man car operator, undertakes the responsibility of transacting a business independent in its character, although subject to strict rules of operating discipline. His work develops that initiative and good sense which helps to overcome difficulties and he comes to look upon the discharge of his duties as a personal responsibility. He meets so many tricky people that he finds himself continually defending the company while he is serving it. As a rule, every man becomes devoted to anything over which he has to exercise a protective care, and this is true of our trainmen.

A trainman, moreover, when he leaves the school of instruction and goes on the extra list must bide his time until he can earn a favorable run. He has to report early and late, and this also is essential discipline of a claims department employee. If, then, we check up the special qualities required in the claims business, we find it calls largely for the qualities of discretion, good judgment, persistence, patience, loyalty, vigor, shrewdness and discrimination which tend to become developed by a trainman.

When selected for the claims department, such a trainman should feel that his transfer is a promotion into a field where he will have wider opportunities and that his selection is an especial recognition of merit. This should insure us a good, satisfied employee for a long period of service.

The trainman selected may have had some experience with our courts and juries through appearance as a witness in accident cases. If not he should be made acquainted with court machinery when he starts in on current investigating work. Afterward it may be desirable to assign him to duty as a depot accident clerk. Then he is ready to start in on the grind of the current investigation desk, the adjuster's desk, the court investigation desk and the special investigation desk, as his qualities and the necessities of the department may require.

Opportunities for College Men

Colleges and universities have not, as yet, turned to our claims departments as a field for their graduates, though it should provide an opening to, and good training for, the career of a trial attorney. It should also provide a stage in the development of a street railway executive to that exceptionally intelligent and dependable university student who, if wise, will also work on the platform and on the roadway. But, in general, we find the college student impatient to be on his way to the end of his career and chafing at the slow and arduous discipline required in our work. Unless he sees a way clearly pointed out to him to a position of importance which he can attain without too great delay, we cannot expect that long and efficient service which we may expect from the man who comes up from the platform.

Desirable material can sometimes be had from other departments of a street railway, but we do not often find such men.

A list of the desk men in the claims department of the International Railway shows a great variety of previous occupations. One very efficient and dependable desk head started work as a bottler in a patent medicine place conducted by a woman clairvoyant doctor. A desk head in the Philadelphia claims department once worked as a book agent and lightning rod man up and down the Mississippi River. Another most respected and reliable man emerged through all of the devious ways of street fairs, carnivals and summer amusement parks.

It will be seen that although I think the best material is our platform men, I have a latent feeling that along with them we should have a seasoning of Huckleberry Finns and Tom Sawyers, that is to say, the lightning rod salesman, the book agent, or whatever the present-day equivalent to Huckleberry Finn and Tom Sawyer may be.

Inactive Stocks*

By A. S. Duncan

Assistant Director of Finished Stock Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

EFFICIENT stock-keeping methods, while they may vary as to details of operations in different lines of business, are all based on one fundamental principle—that is, to have material in stock to supply the demand when needed only—no surplus. By this method the investment, labor for handling, and storage costs would be reduced to a minimum. This principle, while theoretically sound, is recognized as practically a physical impossibility, and will continue as such until the world has arrived at a complete standardization and improvements and expansions have reached their maximum.

Recognizing that advancements will continue, it means that a minimum amount of stock must be carried over actual withdrawals so as to service anticipated needs, take care of delays due to manufacturing, transportation delivery difficulties, other delays in ordering regardless of cause, etc.

In ordering this extra stock for servicing purposes, it must be recognized that there is an investment situation which will financially cripple different organizations if it is not reduced to a minimum and kept in as liquid a condition as possible.

A. S. Duncan

By taking a specific account and comparing the total issues to the total amount in stock and have it show a fair rate of turnover, does not signify by any means that the account is in a healthy condition; in fact, it may show just the opposite when a detail study is made of all the individual items of which it is composed, as some of the very active accounts which are being replaced by "shipments into and issues out of" on a weekly or semi-weekly basis will, naturally, carry a lot of material for an indefinite period that has long passed the obsolescense stage.

It behooves all who are in any way responsible for the ordering, storing and distribution of stocks, regardless of lines, to scrutinize thoroughly each item of their accounts one or more times each year, and by means of a predetermined penalty system set up some method whereby the inactive content will be reduced to its actual book value so that in the eventual disposition of this stock you will have taken your losses by easy stages instead of dropping from a 100 per cent book value to scrap. In addition, it is but fair to assume that where an error is known, efforts will be concentrated first, to utilize this inactive stock, even at an additional cost over new material, and second, use past experience to prevent a reoccurrence.

Inactive stock is interpreted as material on hand one year or more, of which the quantity on hand at a predetermined date is in excess of a two years' supply, based on the preceding twelve months' activity.

From a manufacturing standpoint, the following penalties are applied: The first time material comes under the inactive classification it is penalized 10 per cent; the second time an additional 20 per cent; the third time 50 per cent of the remaining value. This makes a total of 64 per cent in penalties. If reported for the fourth time, the material is arbitrarily disposed of by scrapping or dismantling.

Penalties of any kind are not effective unless they are charged to the division or department responsible for the ordering of the material.

If these penalties are so classified that the different interested operating branches would know that they were absorbing certain indirect expenses, it would not only be productive of results from a supervisory standpoint, but from an interest standpoint of those operating heads who heretofore did not take any interest except in a passive way, assuming that their charges, if any, were small and considered them as a part of the hazard of the operation.

At a predetermined period each year each stocking point checks each item in their accounts and those having reached the inactive stage are reported on Form 11734 as shown in the accompanying illustration. Three copies are made of this report—one original and two carbons. The original and first carbon are sent to headquarters; the second carbon is retained by the office making out the report.

After all field inactive reports have been received at headquarters, they are thrown together with the plant reports of the same class of material; first laid out according to lines of apparatus; next put in numerical order by style numbers, or description; then separated and handled as follows:

The original is compared with the book account at headquarters' stocking point. From this it is deter-

A stock record form

mined whether the material is actually inactive or whether it is improperly located. If the stock at headquarters shows that it is inactive, both plant and field stocks are penalized, following the penalty rule of 10, 20 or 50 per cent. After penalties have been assigned a journal entry is made and sent to the accounting department reading: "Charge loss on material scrapped and depreciated (location point) and credit the individual stock accounts."

The accounting department then re-charges this into the operating expenses of the different location points.

The carbon copy, in the meantime, has been turned over to the ledger man handling the account at headquarters. He compares it with his account and, if he has any unshipped orders, his account is credited and the field location point notified to ship the frozen material to the requisitioning point f.o.b.; the freight to be absorbed in the selling expense of the shipping office. If, however, there are no open orders, he posts this on Form 12961 which is shown in accompanying illustration, attaches it to the ledger account, and applies it on the first order received.

One of the surest and most effective ways to reduce inactive stock is to dispose of it before it reaches that stage. For this reason an "Excess Report" is used, which is nothing more than a request from the field point to headquarters to help them move material which for some reason has been ordered in excess of actual requirements. Very often by an expenditure of extra transportation and handling material will never reach the inactive stage but will be used very shortly after it has been reported.

The accompanying figures which illustrate losses resulting from inactive stock are based on using 5 per cent of the total stock as coming under the inactive content rule, which, if anything, is low for the first time the rule is put into effect.

By taking the inactive content, using the year 1927, 55.6 per cent of the total, or $118,000, would come under this caption; $43,563, or 20.5 per cent under the second depreciation period; $50,787, or 23.9 per cent under the third period; or a grand total of $212,500.

Under the "depreciation charge," however, if the first year content is moved or used between the first and second period, there would be a saving of $36,796, to say nothing of $28,450 that would be removed from the scrap content.

Also, once material is scrapped the salvage content is rarely over 1 per cent of the original value, except on non-ferrous material, and even that is questioned if the labor cost of salvaging is properly considered.

In closing, a stock in excess of the daily requirements of one's operating department is an expense that can only be fully determined by some method of determining depreciation, and, in the foregoing, will safely meet the average condition of the street railway operations.

Hamburg Uses Reinforced Concrete Track

HAMBURG ELEVATED RAILWAY
HAMBURG, GERMANY, Aug. 25, 1928.

To the Editor:

In the article on "Concrete for Street Railway Track," by C. C. Boone, in your issue of Aug. 4, 1928, I see that the Cincinnati Street Railway is using a system of track construction in concrete very similar to that of the Street Railway Department of the Hamburg Elevated Railway. Steel I-beams have been satisfactorily used by us to anchor track in concrete for several years. At first we employed the same method to attach the rail to the tie as in Cincinnati, namely by clamp plates and bolts. We found, however, that the method was rather slow and also that during the laying of the rail some of the attachments would become locked. Our engineer of track construction, Mr. Weltzien, thereupon designed a cast-steel clamp which we have since used. It permits the connection of the I-beam with the rail to be made quickly and reliably. From the sketch of the clamp and the picture of a section of track on a curve, the construction, as well as the method of attachment, can be observed.

At certain points, particularly on sharp curves, this clamp is supplemented on one side by a rail brace, as shown in the second drawing. These rail braces are attached to the I-beam by welding and to the rail by two bolts. Besides the strength they give, they help the track gang to adjust the gage during the process of track laying.

I am forwarding this information with the thought that this construction may be of interest not only to the Cincinnati Street Railway, but possibly to other American street railways which are using similar construction.

C. WALTHIER,
Manager.

World's Largest Escalator System

ELEVEN escalators will be installed at the new station of the London Underground Railway in Piccadilly, according to a recent decision. This is more than in any other individual railway station in the world. Five of the escalators will lead down two shafts to a common landing. The remaining six will branch off from there in different directions to serve the Bakerloo Railway and Piccadilly. Railway platforms—both sections of the Underground system.

When this installation is completed there will be 76 escalators installed on the Underground system, in comparison with 21 four years ago. The number of elevators has been reduced during the same period from 208 to 160. The huge reorganized station at Charing Cross will have eight escalators instead of five.

The elevators of the London Underground system make altogether an average of 63,000 journeys per day, traveling 800 miles. The escalators, although they are fewer in number than the elevators, cover in the aggregate more than 1,500 miles in a working day of twenty hours.

Both the lifts and escalators rarely break down, owing to the care they receive. A staff of 250 men is constantly inspecting and repairing them. The mechanical equipment of the lifts is overhauled every seventeen weeks and the electrical equipment every six to ten weeks. It has been the experience in London that the escalator needs very little attention the first year. Afterwards its mechanical equipment is overhauled every seventeen weeks and its electrical equipment every eight weeks.

The safety gear in the elevators is inspected very closely once every two weeks by two men called rope specialists, who spend their lives examining elevator ropes and can tell to a day, almost to an hour, how long a rope will last. Each elevator has a secret door. This door is entirely hidden by advertisements of new plays and department stores, and a passenger would never discover it without aid. It is for use in case of jamming. Should an elevator jam, the adjoining elevator is brought level with the stationary one, the advertisement frames are taken down and the door thus revealed is opened for the passengers to walk into the other elevator and complete their journey.

At some of the new stations, the elevators are operated by a remote control-button located in the booking office. In the intervals between shooting tickets and change out of the passimeter slots, the attendant in the booking office operates the elevators.

Maintenance Methods and Devices

Flashing Lights for Cars in Single Track Operation*

By Farrell Tipton
Electrician San Diego Electric Railway, San Diego, Cal.

SAFETY on the San Diego Electric Railway, San Diego, Cal., has been enhanced by a flashing signal placed on its electric rolling stock. Many runs on the system are on

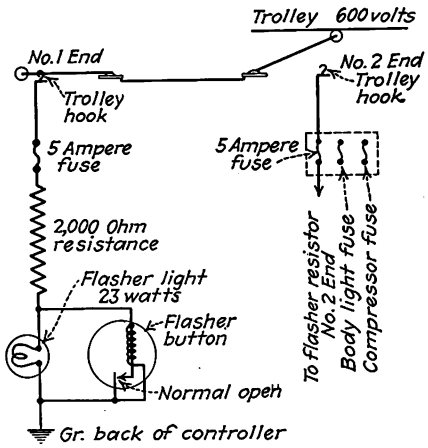

Diagram of connections for flashing light

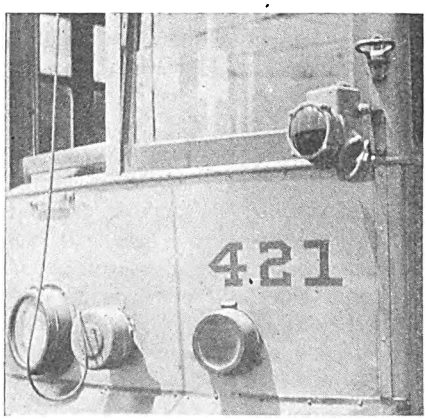


Flashers are installed on the upper left-hand side of car dashers

single track and the signal warns motorists of an approaching car. The flasher is mounted on the upper left-hand side of the car so as to give the approaching motorist an idea of the clearance for passing.

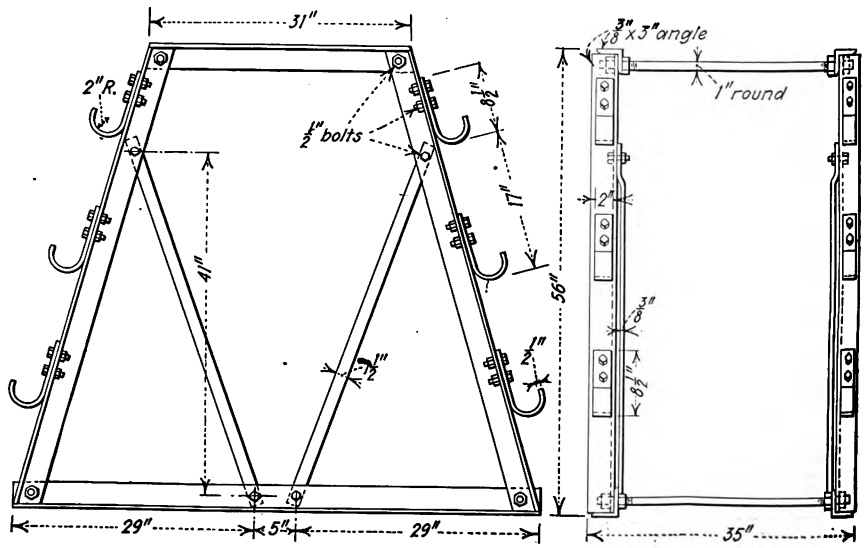
By wiring the flasher lamp and button in parallel, as shown in the accompanying diagram, it is possible to use a 110-volt, 60-watt flasher button in the 600-volt car circuit. This makes it possible for the flasher button to break the arc without difficulty. The button is held in a receptacle by a 6-amp. fuse plug located inside the car above the controller. The fuse plug acts as a protection for the flasher button and also as a means of holding it in place.

The signal housing has three lenses, two small ones at the bottom throw light to the ground; the center one is a yellowish red bullseye, 5 in. in diameter. This allows the various rays of the light to be seen when directly in line with the lamp. It is also visible for a considerable distance during the daytime.

*Submitted in Electric Railway Journal Prize Contest.

Steel Armature Rack

DAMAGE to repaired or rewound armatures is likely if they are not taken care of properly prior to installation in the motor frames. Often such injury is not detected until after installation or when a road failure has developed and interrupted service. In the shop of the Richmond Railways, Inc., Staten Island, N. Y., a steel rack in the armature room is used for the storage of the armatures until they are required for installation in the field frames. The general appearance and construction of the rack are shown in the accompanying sketch. The two side frames are made of $\frac{3}{8}$x3-in. angles held together by four 1-in. tie rods. A $\frac{3}{8}$x$1\frac{1}{2}$-in. diagonal brace installed from the base to each upright gives additional strength. The base occupies a floor space of 35x63 in., tapers upward to 35x31 in. and will accommodate six armatures. The hooks for supporting the armatures are made of 2x$\frac{1}{2}$-in. steel bolted to the uprights by two $\frac{1}{2}$-in. bolts. These hooks are made with a 2-in. radius and are spaced 17 in. apart. This rack is located near a chain hoist so that the armatures can be handled to and from the rack quickly.



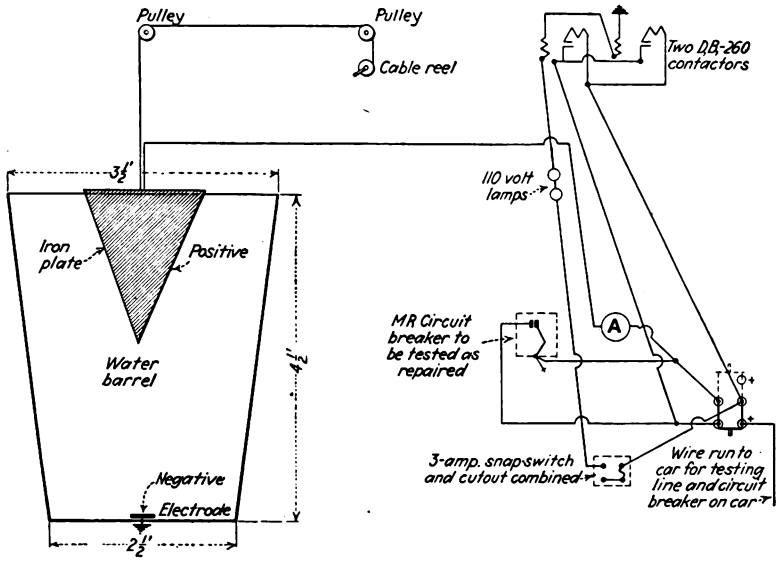
Substantial construction for armature rack

Water Rheostat for Testing Line and Circuit Breakers*

By H. J. Beadle
Engineer of Equipment Dallas Railway & Terminal Company, Dallas, Tex.

LINE breaker and circuit breaker testing is facilitated by the recent addition of a 500-amp. water rheostat to the shops of the Dallas Railway & Terminal Company, Dallas, Tex. The water rheostat has been found the most convenient method of dissipating electrical energy necessary for this testing. The water box is made of 2-in. pine. It has a diameter of $3\frac{1}{2}$ ft. at the top, $2\frac{1}{2}$ ft. at the bottom, and is $4\frac{1}{2}$ ft. high. It is mounted on porcelain insulators. Suspended above the box by an insulator is a triangular iron plate $\frac{3}{16}$ in. thick, which serves as the positive electrode. It is arranged so that it can be lowered. A $\frac{1}{4}$-in. iron plate

Digitized by Google



Water rheostat used by the Dallas Railway & Terminal Company to test line and circuit breakers

serves as the negative electrode and is connected to the return rail.

Two contactors make and break the current during the testing. A 3-amp. snap-switch connected in the control coil circuit is used for opening and closing the contactors. The two lamps shown in the diagram in series with the control coil act as a warning signal during tests. The iron plate was made triangular in order to facilitate current adjustments. An ammeter with scale 0 to 600 is placed in series with the line breaker for indicating values of current.

When a line breaker is being adjusted the wire for testing is run to the lower side of the series tripping coil, while the upper side is connected to the trolley wire. The breaker under test is then closed and the main contactors are closed by the control circuit. The positive plate is then lowered slowly into the barrel of salt water. When the breaker trips the current is recorded and another trial setting is made until the breaker is set at the proper predetermined value. If a circuit breaker is to be tested the main switch is thrown in the upward position and the resistance is varied by lowering or raising the plate in the liquid. In this manner we are able to set breakers quickly, and know definitely the approximate tripping points.

The water rheostat has also been found of assistance in the shop as a load for a railway motor run as a generator and coupled mechanically to another motor of like characteristics during tests.

Car Wheel Truck with Removable Platform

HEAVY pieces of apparatus often must be transported from one end of the shop to the other, and due to limited-aisle space it is impracticable to use a hand truck. Again, on account of the lack of storage space it is impossible to use a truck designed for use on the car rails. In the shop of the New York & Queens County Railway, Long Island City, N. Y., car wheels with a portable platform are used for the purpose. The platform is made of two 2x6-in. longitudinal oak beams to which 1x6-in. oak planking is spiked.

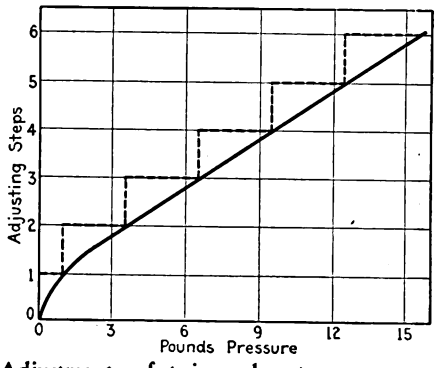
Grooves with the contour of the wheel axles are made about 10 in. from either end of these beams and extend across the entire width. They are spaced 6 ft. center to center.

This platform can be placed on any mounted pair of wheels and be used for transporting material. When it is not in use it can be stored against a wall out of the way and takes little floor space.

Spring Pressure on Railway Motor Brush-Holders

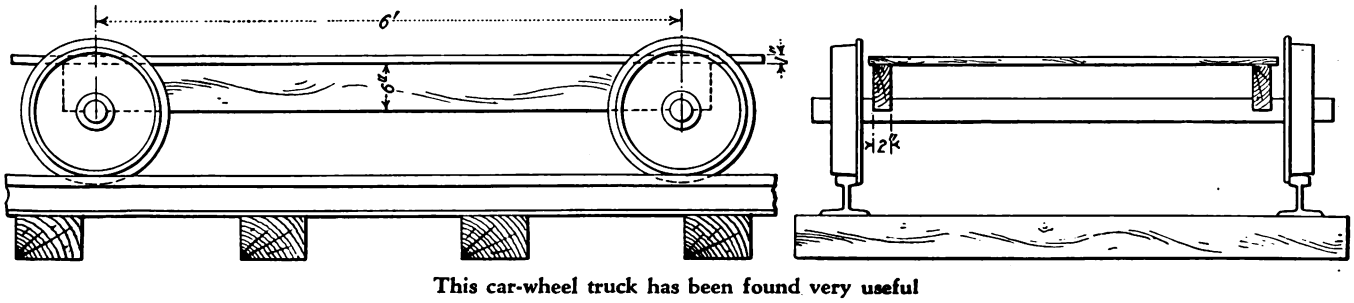
By John S. Dean
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

PROPER spring tension for the pressure fingers on railway motor brush-holders is that which gives best results in the specific service which the motors are supposed to meet. The values adopted for new motors as furnished by one large manufacturer range on the average from 6 to 8 lb. per finger. This has been increased on some railway motors in service to 12 lb. in order to compensate for or to offset certain undesirable factors which affect the motor's operation. Some of these are poor track, rough and uneven commutators, and badly worn armature and



Adjustments of twin-washer type pressure finger. Each step represents a 3-lb. change in pressure

axle bearings, which result in unusual vibration of the carbons. Everybody seems to agree that the sensible thing would be to correct the fundamental causes, but in many instances this cannot be accomplished. Experience has shown that rough and uneven commutators are among the worst offenders. So it is recommended that



This car-wheel truck has been found very useful

Digitized by Google

the surfaces of all commutators be kept trued up and given a smooth finish, and that the mica be undercut properly.

It is frequently assumed that this increased pressure will cause rapid wear on the surface of the commutator and the brush at the rubbing contact. In general this is not so, as the friction due to the increased spring pressure is offset by the better contact. The maximum wear of these parts is caused mainly by the arcing and burning due to poor surface contact. Thus by increasing the pressure within reasonable limits a better contact is obtained with minimum sparking, and often a reduction results in the wear on both the carbon and the face of the commutator.

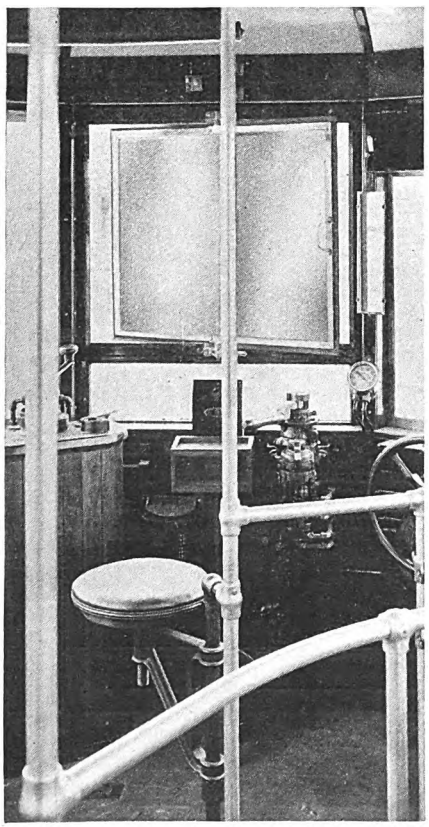
The uniform adjustment obtained by the spring pressure finger mechanism, known as the twin washer type is shown in the attached curve. This mechanism is designed so that it can be used readily in many of the older types of brush-holders originally fitted with other designs of pressure fingers. Few parts are included and none of them move to wear the spindle or the adjusting tension barrel.

New Equipment Available

Reversible Window Easy to Keep Clean

CLEAR vision for motormen and bus drivers during sleet and snow storms can be obtained by use of a reversible window invented by M. Comerford, Ottawa, Canada. It is being manufactured by the Ottawa Car Manufacturing Company.

The window also gives effective ventilation during hot weather. It is built complete for use on cars or buses, being designed for use in the front end before the operator. The window may be pivoted either horizontally or vertically, as desired. In winter the window is made weatherproof by double strips of rubber all around the outside of the metal sash. This rubber is vulcanized at the corners and is free from holes and cuts. When the window is pressed into place a lock holds the rubber flange tightly against the window frame. The window can be locked in any position, thus permitting ventilation as desired during hot weather.



Reversible window fitted to the front end of an electric car

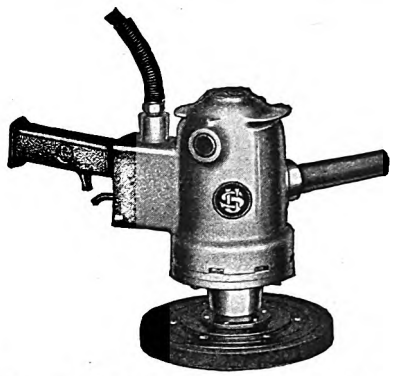
During sleet storms the reversing of the window once on each trip usually provides clear vision. As soon as one side on which sleet has formed is turned inward, the heat of the car melts it, and the window is wiped with a piece of cotton or cheesecloth.

Some of the advantages claimed for the Comerford reversible window are that it is airtight, that it gives clear vision under extreme climatic conditions, and permits perfect ventilation with no direct draft. Storm sash are unnecessary where this window is used, and it can be washed on both sides from either inside or outside the car.

Sturdy Disk Sander

PARTICULAR attention has been given in the design of a sanding tool announced by the United States Electric Tool Company, Cincinnati, Ohio, to make it sturdy and powerful. A fan-cooled motor operates the 9-in. disk at a speed of 3,600 r.p.m. under load. A two-pole trigger switch in the handle is included.

The new disk sander handles easily, which increases production. Fine, medium and coarse sanding disks are furnished, together with 12 ft. of flexible rubber cable, two-piece attachment plug and armored cable guard. The weight is 12 lb.

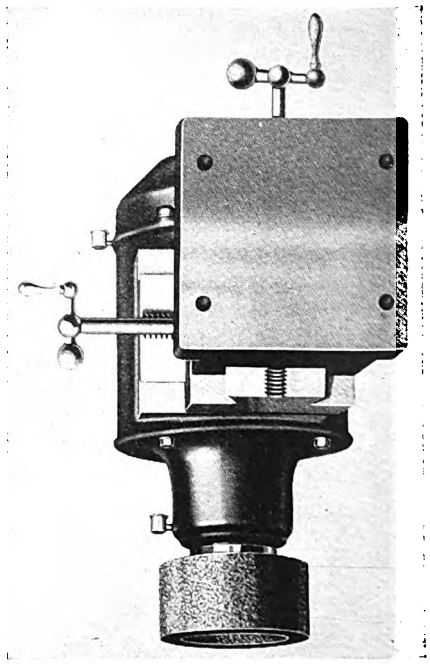


Disk sander designed for large production

Vertical Spindle Grinders

CONSTRUCTED primarily for thrust grinding with the spindle in horizontal position, or with the grinding wheel swung down at an angle are the three new types of grinders announced by the Hisey-Wolf Machine Company, Cincinnati, Ohio. The three types are made in 1-hp., 2-hp. and 5-hp. sizes for alternating current and in 3-hp. size for direct current. They are furnished with double slide adjustment, single horizontal slide adjustment, and with single vertical slide adjustment.

When used in connection with a boring mill, many internal and surface grinding jobs can be done with the same setting.



Vertical spindle grinder with double slide adjustment

Association Activities

Safety Congress Held in New York

Favorable showing of electric railway industry is a feature of seventeenth annual meeting of National Safety Council

IN THE face of the appalling increase in accidents in general and of traffic accidents in particular the street railway companies of this country have within the past year registered a safety record that stands to their credit as an outstanding achievement. This has been done in the face of a heavy increase in the number of automobiles on the highways and in spite of increased traffic congestion in the metropolitan areas. Not only this, but many local transportation companies have materially raised the average speed of their cars. All of these facts were brought out in papers presented and in roundtable discussion at the meetings of the electric railway section of the National Safety Council, which held its seventeenth annual congress in New York City during the past week.

The sessions which brought together several thousands of delegates representative of a fair cross-section of American industry, constituted in fact a congress of safety. Subjects covered in the papers and brought up for discussion covered a wide range, swinging from safety in the home to the elimination of harmful noise, but centered largely upon the matter of traffic control and safety upon the streets. The sessions attracted widespread attention among men of the street railway industry and the meetings of the electric railway section were well supported, although the fact that the gathering took place so closely following the annual convention of the American Electric Railway Association at Cleveland undoubtedly had the effect of somewhat reducing the attendance. A feature of the railway sessions was the presence of 24 delegates representing the Pittsburgh Railways, headed by H. O. Allison, manager department of accident prevention, and including nineteen platform men chosen by their fellows from the various carhouses of the company. The men gave close attention to all that took place and on several occasions took animated part in the discussions.

Traffic Departments Urged

The meetings got under way at the Hotel Waldorf-Astoria on Monday afternoon, Oct. 1, with a general joint session of the electric railway, public utilities, steam railroad and taxicab and fleet owners' sections, at which President Homer E. Niesz of the National Safety Council presided. Dr. Miller McClintock, director Albert Erskine Bureau of Street Traffic Research, Harvard University, spoke on "Facts vs. Guesses in Solving the Traffic Problem," and made an earnest plea for the organization of traffic departments under trained engineers in all communities where the traffic problem is assuming serious proportions, to the end that an unbiased study based upon determinable facts could be made the groundwork of any approach to a solution of the difficulties presented. He cited the work of such departments in a number of the larger cities and the excellent results obtained. The discussion that followed developed the fact that serious consideration is being given in a number of communities to the separation of grades through the construction of double level streets, subways for rapid transit and the development of better facilities for speeding up surface traffic.

Ernest W. Corn, field representative National Safety Council, spoke on the subject "Getting the Community Interested in Safety," and took occasion to pay tribute to the public utility companies, particularly the street railways, as being the staunchest supporters of local safety councils and the ones most apt to come forward with helpful and constructive suggestions. He outlined, briefly, the methods to be followed in organizing councils in small cities. Robert I. Catlin, secretary Aetna Life Insurance Company, explained the interest of the great casualty insurance companies in the safety movement. Outlining the principles upon which automobile rate-making is determined he showed how any community with a dependable volume of accident experience makes its own rate. He pointed out that not to exceed 25 per cent of autos are covered by casualty insurance, the delinquency being most pronounced in the smaller towns and rural districts. He recommended an intensive study into the causes of accidents, and held that this should come before a detailed study of compensation. In the discussion of the Massachusetts compulsory insurance law, which seemed to be very much in the minds of some of the delegates, the fact was developed that there has been a marked downward trend in the number of fatalities and injuries to pedestrians since the law became effective. The contribution of the electric light and power industry to the safety movement was set forth in a paper prepared by John W. Lieb, senior vice-president New York Edison Company.

Separate Sessions Held

Separate sessions of the electric railway section were held on Tuesday, Wednesday and Thursday mornings. A. W. Koehler, superintendent of accident prevention the Milwaukee Electric Railway & Light Company, presided as chairman at the Tuesday morning meeting and gave a résumé of the activities and accomplishments of the section during the past year. He urged particularly the necessity of a deeper study of the causes of accidents and their possible prevention, and made a plea for continued support by the railway companies of the work of the National Council. Daniel Fennell, general superintendent of transportation Kansas City Public Service Company, Kansas City, Mo., presented a paper on "Overcoming Transportation Hazards," in which he reviewed the methods and accomplishments along that line on the property which he represents. The company had made a considerable outlay for mechanical improvements tending to reduce accidents, coincident with changing its service over to 100 per cent one-man operation. An analytical study of accidents was being made and the trainmen were carefully trained and coached in accident prevention methods. He paid tribute to the work of the local safety council, which had co-operated extensively. Mr. Fennell's paper will be abstracted later in the Journal. Questioned as to the disposition of the surplus men made available by the change to one-man operation Mr. Fennell explained that in anticipation of

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Oct. 8-12*—American Welding Society, fall meeting, Philadelphia, Pa.**

***Oct. 17-19*—Society Automotive Engineers, national transportation meeting, Newark, N. J.**

Digitized by Google

possible complications the company had refrained from hiring any new men for a number of months prior to the change. Coincident with the change, service had been increased 25 per cent, thus taking care of some of the surplus. A few men had been retired, others had been assigned to lighter jobs.

John J. Reynolds, claims attorney Boston Elevated Railway, read a paper on "Promotion of Accident Prevention Through Inter-Departmental Co-operation." The speaker reviewed various phases of safety organization, humanitarian work and educational activities, with particular reference to the company which he represented.

D. A. Scanlon, general superintendent of railways Northern Ohio Power & Light Company, Akron, Ohio, presented a review of one-man car operation from a safety standpoint, in which he pointed out not only the excellent results which had followed the introduction of one-man cars on his property, but also a compilation of similar results obtained in other cities. The papers of Messrs. Reynolds and Scanlon will be presented in abstract in a later issue.

Speed with Safety Discussed

Lucius S. Storrs, managing director American Electric Railway Association, addressed the session on Wednesday morning on the subject "Reconciling Speed with Safety," in which he quoted from the experiences of a number of representative urban and interurban properties, showing that in practically every case where a determined effort had been made, the number and seriousness of accidents had been decreased simultaneously with increases in average schedule speeds. At the conclusion of his paper he made a special appeal for a more general interest and participation in the annual contests for the Brady Safety Award. Mr. Lynch, director Kansas City Safety Council, emphasized the need for improved braking equipment on street cars, holding that otherwise attempts to increase speed would increase accidents. This started a general discussion in which a number of those present voiced their opinions. Interest was added by the participation of a number of Pittsburgh motormen, who spoke from the standpoint of the platform man, and took the position that the provision and proper inspection of mechanical apparatus must come first in any program directed at the attainment of higher speed. Charles Gordon, editor Electric Railway Journal, took the floor for the purpose of getting into the record the point that the attainment of greater speed in city operation depended almost entirely upon quicker acceleration and deceleration, shorter layovers, freedom from traffic interference and less delay in loading and unloading passengers. He emphasized the fact that discussion of increased speed by electric railways does not involve higher maximum speeds, and that greater alertness on the part of operators, and equipment of which particulars the human element, as represented by the platform men, that permits faster acceleration and braking rates—the only available means of decreasing running time in frequent stop city service—both tend toward the reduction rather than the increase of accidents. H. O. Allison, manager accident prevention bureau Pittsburgh Railways, read from the recent report of the committee on service betterment in support of Mr. Gordon's position.

T. G. Brabston, superintendent transportation Birmingham Electric Company, Birmingham, Ala., taking up Mr. Lynch's objection, gave specific instances where speed had been increased with safety. So far as his company was concerned speed had been quite materially increased, and chargeable vehicular accidents were being reduced month by month. Summing up the discussion, Mr. Storrs took the position that the operating company must, as the preliminary to any safety program, provide safe and suitable rolling stock, that intensive training of the platform men should follow, and that the program should be rounded out with an effort to educate the public into a proper appreciation of the company's problems. A paper on "The Shop Employee's Contribution to a Safe Railway," was presented by Harry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad. Mr. Cordell dug into the psychology of the man in the shop. His views will be published in an early issue.

Safety Playlet Presented

At the Thursday morning session, Arthur T. Warner, general manager of traffic Public Service Co-ordinated Transport, Newark, N. J., spoke on "Bus Operation from a Railway Man's Viewpoint," in which he reviewed the experience of his company in expanding its use of buses until it is now the largest bus operating concern in the country. The program was concluded by the presentation of a safety playlet, "Whose Fault?", by a company made up of platform men of the Public Service Co-ordinated Transport. Based on an every-day incident in the life of a street car man, the playlet had a special appeal to those present, and was enthusiastically received.

The following officers were elected to carry on the work of the electric railway section during the coming year:

Chairman, E. K. Eastham, St. Louis Public Service Company, St. Louis, Mo.; vice-chairman, H. K. Bennett, manager Providence Safety Council, Providence, R. I.; vice-chairman, Melvin W. Bridges, Chicago Rapid Transit Company, Chicago, Ill.; vice-chairman, Glenn H. Shaw, Northern Ohio Power & Light Company, Akron, Ohio; secretary, Paul Hodson, East St. Louis & Suburban Railway, East St. Louis, Ill.

The following chairmen of committees were selected:

Membership, chairman, Samuel H. Reid, Bureau of Safety, Chicago; vice-chairman, Arthur Gaboury, Quebec, Canada.

Publicity and News Letter Editor, Buell W. Nutt, The Safety Equipment Service Company, Cleveland, Ohio.

Poster and Slide, L. R. Brown, New York State Railways, Rochester, N. Y.

Program, T. G. Brabston, Birmingham, Ala.

Engineering and Statistics, Edward Maltz, Cleveland Railway, Cleveland, Ohio.

Members-at-Large, R. W. Emerson, G. T. Hellmuth, Daniel Fennell.

An interesting program of special events had been prepared for the entertainment of the delegates, including safety motion pictures, plant visits, luncheons and dancing. Of special interest to visiting railway men was an inspection trip through the subways of the Interborough Rapid Transit Company on Friday afternoon, during which the guests were shown the functioning of the intricate signaling and safety devices of the system.

Central Master Mechanics Meet at Cleveland

Members of the Central Electric Railway Master Mechanics' Association held a meeting at Cleveland, Ohio, on Sept. 25, which was featured by the presentation of a paper by A. D. McWhorter, general superintendent Memphis Street Railway, outlining the details of organization of the Electric Railway Association of Equipment Men, Southern Properties, and the work it is undertaking. Inasmuch as this southern group of railway mechanical men parallels in general interest and activities much of the program of the master mechanics in the C.E.R.A. territory, the information supplied by Mr. McWhorter was listened to with considerable attention.

Twelve questions covering practically all phases of electric railway maintenance were used as the basis for a discussion. The subject of lacquer spray painting occupied the major portion of this part of the meeting. There was a wide divergence of opinion among the delegates.

Automotive Engineers to Meet

Motor truck and motor coach operation is to be the subject of addresses and general discussion at a three-day national transportation meeting to be held by the Society of Automotive Engineers at the Robert Treat Hotel, Newark, N. J., on Oct. 17, 18 and 19, 1928.

At the first session short haul and long haul of passengers will be the subject of addresses by speakers whose names have not yet been announced. Another session is to be devoted to the store-door delivery of freight by motor truck. The business aspects of fleet operation will be dealt with at one of the meetings and a number of reports are to be presented covering various phases of operation, maintenance and service. It is expected that the speaker at an evening banquet will be Dr. Miller McClintock, expert on highway traffic. At the close of the last day's session an inspection trip will be made through the Holland Vehicular Tunnel.

News of the Industry

Program of Economy Urged for Seattle Municipal Road

George B. Avery, superintendent of public utilities at Seattle, Wash., may be asked to take direct charge of the municipal street railway and appoint his department heads to manage the system. A decision to this effect, it is pointed out, would dispose of the question of naming a successor to D. W. Henderson, general manager of the system, who has been ill since last May.

Possible action to this end was intimated by Chairman E. L. Blaine, of the budget committee, during a discussion of Mr. Henderson's condition and the problem of fixing his salary for the coming year. Mr. Blaine said:

> It is my understanding that it is the ultimate intention of the Council that the railway system be placed under the direct charge of the superintendent of city utilities, and that he appoint his department heads as has been done in the past by Mr. Henderson.

Although the utilities department which Mr. Avery heads is related to all city utilities, the railway system has been operated almost independently under Mr. Henderson's leadership.

Superintendent of Utilities Avery believes a saving of 10 per cent can be made in the operating expenses of the municipal railway, but that it would take two or three years to effect the full saving of $500,000 a year and the result could be accomplished only if those who sought to make it were really given a free hand.

Higher Speed from Evanston to Chicago Loop

Work on track elevation through the city of Evanston in the interest of the Chicago Rapid Transit Company, operating the elevated lines, is progressing rapidly. The track elevation work extends from Church Street north to the city limits of Evanston at Isabella Street. The trestle work for the temporary northbound track is practically completed and it is expected that trains will be running over it about Oct. 10. Engineers estimate that the southbound track will be "up in the air" by the middle of November, so that work on the permanent tracks can be commenced at that time and carried on to a finish without any interference with traffic.

The track elevation is being financed by the Chicago, Milwaukee, St. Paul & Pacific Railroad, which owns the right-of-way, but the tracks will be used exclusively by the trains of the Chicago Rapid Transit Company and the North Shore Line. This track elevation work will add to the fixed charges of the Chicago Rapid Transit Company, but the service to Evanston and Wilmette will be improved. The cost of maintaining and operating gates at street crossings will be eliminated and the running time of trains from Wilmette to the loop in Chicago be reduced.

Under the present plan of surface operation north of Church Street in Evanston safety stops have to be made at a number of the busier street crossings. The track elevation will eliminate the necessity for such stops, so the customers of the elevated lines will benefit by the faster running time. The completed tracks will be laid on a solid-fill roadbed with concrete retaining walls and steel and reinforced concrete bridges over streets similar to the completed roadbed from Wilson Avenue north.

Ambulance Chasers Castigated

Seventy-four New York lawyers named in Justice Wasservogel's report on recent investigation submitted to Appellate Division

POSITIVE evidence exists of the need of reform in New York court procedure to suppress evils connected with "ambulance chasing," according to a report submitted to the Appellate Division of the Supreme Court on Oct. 2 by Supreme Court Justice Isidor Wasservogel. The report is based on extended hearings conducted before this justice during the past six months, at the request of the Appellate Division. Further particulars of the investigation are given in a paper on page 638 read before the American Electric Railway Claims Association by Frank E. Carstarphen. It was prepared, however, before Judge Wasservogel's report was made public so contains nothing about the contents of the report itself.

The report declares that most of the actions for personal injury damages had gotten into the hands of a few attorneys. Several lawyers had testified that they had had as many as 750 to 1,000 such cases a year, and there were a number of attorneys who averaged more than 500 cases a year. This business had been built up by elaborate systems for obtaining information about accidents from a number of sources. One was from the police department, much of the information in the hands of the police having been sold by "slip boys" employed to assist news reporters at Police Headquarters.

"Many police officers doing traffic duty are in the pay of the 'ambulance chasers.' These traffic policemen carry the cards of ambulance chasing lawyers in their hats," says the report. Other sources of information were hospitals. Of solicited negligence cases 90 per cent were settled out of court. The report also says that the conduct of some of the corporate defendants has been equally reprehensible, their representatives racing with the ambulance chaser to the bedside of the injured person to obtain a release from him while he is overwrought and in pressing need of money.

The report names 74 attorneys to the Appellate Court for discipline. More "flagrant" cases have been referred to the District Attorney, the report disclosed.

Chief among the recommendations of Justice Wasservogel was one cutting the maximum percentage attorneys can fix as contingent retainers, from 50 per cent to 33⅓ per cent. Another was that all oral contracts of retainers are void as are also those written contracts obtained at the hospital or within 15 days of the accident, unless made with the approval of the court. Another was to make soliciting of such cases criminal contempt. Another, urged by many prominent lawyers with whom the Justice concurred, was to make perjury a misdemeanor instead of a crime. The purpose of this change was to provide for its more certain punishment.

The report contains the very satisfactory statement from the Justice that as a result of the investigation, ambulance chasing in New York is now "dead."

Electric Service to Wilmington from Philadelphia

COINCIDENT with the change to fall and winter schedules by the Pennsylvania Railroad on Oct. 1 the starting of full electric service took place, affecting local and commuting trains between Philadelphia, Chester, Wilmington and intermediate points.

Under the terminal improvement plan, which centers on the erection of a new main passenger station in Philadelphia on the west bank of the Schuylkill River, local and commuting trains will pass over a new river bridge and through a subway, now under construction, to an underground suburban station to be located at Fifteenth Street, north of the present Broad Street Station.

Reconstruction Obligations in Buffalo

Proceedings instituted by the city of Buffalo, N. Y., to force the International Railway to undertake track reconstruction and repaving in certain streets through which the company operates is in violation of an agreement entered into earlier in the year with the municipal authorities under the terms of which the railway appropriated a specified sum for reconstruction work in 1928. This program now is nearing completion. Bernard J. Yungbluth, president of the company in a letter to the Buffalo City Council, says that during the years of controversy and litigation between the city and the company little track and paving reconstruction was done because the revenues of the company at the rates of fare then in effect were not enough to warrant large expenditures. It was during this period, he says, that company stockholders contributed $4,140,445 to carry passengers at less than cost.

In his letter President Yungbluth said that the company stated its desire that the city and company would co-operate for the benefit of public service. When the present rate of fare became effective, it was never asked or expected that the company should spend all the additional revenue from increased fare for reconstruction of tracks and paving, yet the company has devoted it all and more to that purpose. He alluded to an editorial article in The *Financial World* of New York on the Buffalo transit situation which viewed the attitude of President Yungbluth as a move to protect car riders against a higher rate of fare.

No further move by the company was made until repaving work was started between the tracks of the railway on the East Seneca Street line by city contractors. Then the company president issued a statement saying application would be made at once for a 10-cent fare on the city lines so that increased revenue will be made available to finance the paving work. The Buffalo city fare is now three tokens for 25 cents with a 10-cent cash fare. The work undertaken by contractors will be paid for by the city of Buffalo and assessed against the railway. In his statement to the public, President Yungbluth says:

When the Public Service Commission in June, 1927, ordered present fares, it advised the city and the railway to co-operate in making a program of street paving and reconstruction. That advice has been followed. The company agreed to spend $250,000 in 1927 and $375,000 in 1928 for the reconstruction of tracks and paving in streets selected jointly by the city and company. The company did spend the sums mentioned. The company was not expected to spend in track and paving reconstruction all the additional money obtained from the new rate of fare, but it has spent all the money and more for this purpose. The additional demands now being made by the city are unreasonable and unfair to the company and car riders.

In view of the additional demands for more track reconstruction and paving, the company has only one course open, the immediate prosecution of its case to secure rates of fare that will enable it to pay these track and paving charges and other costs of service and that will assure to the stockholders the fair return to which they are entitled but for which they have been waiting since 1918.

Notice has been served by the International Railway, Buffalo, upon municipal authorities of Buffalo, Niagara Falls and Lancaster that it intends to apply to Federal Judge John R. Hazel in the United States district court at Buffalo on Oct. 15 for permission to increase local fares in these cities. The company contends the present rates are confiscatory. No application will be made to the New York State Public Service Commission.

In Buffalo, the railway asks a 10-cent fare instead of three tokens for 25 cents. In Niagara Falls the company will ask an increase from 5 cents to two tokens for 15 cents and the same rate of fare will be asked in Lancaster. The International also will ask for a 5-cent fare for children between the ages of five and twelve years in the three cities in place of the 3-cent half fare now in effect.

The city of Buffalo already has engaged Milo R. Maltbie and W. C. Hine, New York, public utility experts, to oppose the proposed fare increase. The city says it will attack the jurisdiction of the federal court on the ground that application was not preceded by an appeal to the Public Service Commission.

Removing Chicago's "L" Pillars

The third and final step in the work of removing columns of the Chicago Rapid Transit Company's elevated structure in the so-called Loop district at street intersections in accordance with the provisions of the city contract ordinance of 1925 is nearing completion. The work of this year has been carried on in Lake Street, supporting columns having been moved from the street to the curb line at Dearborn, Clark, LaSalle and Wells Streets. The caissons for the new columns were put down to hard pan at a depth of about 70 ft. on the average. The cost of the work for this year is approximately $186,000. It will be completed about Dec. 1.

Other structural changes are being planned at LaSalle and North Water Streets, made necessary by the widening of LaSalle. The present span across LaSalle for the tracks running into the North Water Street stub terminal is 46 ft. The new span will be 90 ft.

In the Interest of Baltimore School Children

The United Railways & Electric Company, Baltimore, Md., has opened branches in six of its carhouses in various sections of the city at which school children may obtain identification cards which will enable them to purchase 5-cent fare tickets for use going to and from school. This relieves the children from going to the center of the city to get the cards. The branches are open daily from 2 to 7 p.m.

Philadelphia Fare Suit Dismissed

The case against the increased fare on the lines of the Philadelphia Transit Company was dismissed on Oct. 1 by the Supreme Court upon motion of the taxpayers who brought the suit. Daniel J. Furey and other taxpayers entered the Federal District Court in May, 1926, to enjoin the increase, contending that the 5-cent rate was fixed in 1907 by contract between the city and the company and could not be increased by the state commission until 1957. The district court dismissed the suit for want of jurisdiction, taking the view that it was without power to interpret the state laws.

D. W. Henderson Improved

D. W. Henderson, veteran superintendent of the Seattle Municipal Street Railway, Seattle, Wash., has been removed from the Meadows Sanitarium to Providence Hospital, where he underwent a successful blood transfusion operation. Numbers of his old employees on the railway offered themselves for the operation when it became known that blood transfusion would be necessary. No secret has been made of the fact that Mr. Henderson has been very low. He is believed now to have passed the point of greatest danger, but his recovery will probably be a matter of months.

Map to Guide the Car Rider in Chicago

To assist those who want to use a street car in going from one part of the central district to another the Chicago Surface Lines has issued a new map of this district. Car lines passing through the district are indicated by the numbers, and by reference to the map, it is possible to know just what car to take to reach any given location. The map will be distributed through department stores, banks, hotels and at railway station information desks.

Known in Des Moines By Their Weekly Pass

Blank lines are printed on the back of the weekly pass in Des Moines, Ia., so that pass holders can write in their names and addresses and telephone numbers. The plan was adopted after several patrons had written officials of the Des Moines City Railway suggesting that this would help to recover lost passes.

Would Equalize Stockton Fares

The Central California Traction Company has applied to the California Railroad Commission for permission to increase the fare on its Sunnyside line in the city of Stockton from 6 cents to 7 cents, or four tokens for 25 cents. This change will place the fare on that line on a parity with other fares in Stockton.

Digitized by Google

Investigation of Proposed Rate in Illinois

Proposed advanced rates sought by the Illinois Power & Light Corporation for Urbana and Champaign, Decatur, Galesburg and East Galesburg, Quincy, Danville, Bloomington and Normal, Jacksonville and South Jacksonville have been suspended by the Illinois Commerce Commission until Nov. 24 in order that investigation may be made. In the case of all of the seven lines the company is asking a 10-cent cash fare with three tickets for 25 cents, with rates for children at 4 and 5 cents.

This then leaves only eight other lines in the state operating at their old rates without requests for advances as increased rates were granted by the commission to the Illinois Power Company on its line in Springfield in August and to the Illinois Power & Light Corporation on its line at Cairo in June.

Unable to Do Improvement Work in Hammond

In opposition to a petition filed by the city officials of Hammond, Ind., which sought the revocation of the franchise of the Hammond, Whiting & East Chicago Railway for failure to improve its right-of-way, Charles Lawrence, general superintendent of the railway, testified that his company could not comply with the city's demands because it was losing $11,000 a month and was now almost hopelessly in debt. Both the mayor and the city attorney of Hammond charged that the railway had promised to raise its tracks to grade level on the newly paved Hohman Street, an important traffic artery. Although the improvements were completed several months ago, it had been deemed unsafe to open the thoroughfare to traffic because of the hazard created by the unprotected car tracks.

Mr. Lawrence said that he had made the promise to the city of Hammond to improve the right-of-way at a cost of $10,000 on the condition that his company could raise the money. His company had $1,000,000 of first mortgage bonds on which interest was in default.

Shore Line Motor Coach Company buses, which operate over the same streets on which the railway's right-of-way is located, are said to have hurt the railway financially.

Point Won by Seattle Man in Puget Sound Suit

A victory was won by J. G. Von Herberg in his court fight against the Puget Sound Power & Light Company, Seattle, Wash., when the United States Circuit Court of Appeals recently dismissed the company's suit against him. The suit attempted to enjoin the Seattle man from making demands that trainmen's wages be given priority over payments of principal and interest on municipal railway bonds, and Von Herberg is now free to press his claims that trainmen's wages should receive priority over payments on the debt. The action was made part of the traction company's suit to force the city of Seattle to recognize the bonds as a first lien upon revenues of the line. The whole case was reviewed by the circuit court in Seattle on an appeal by the traction company from an adverse decision in district court. The suit against the city was taken under advisement while the action against Von Herberg was dismissed to open court, after a presentation of his cause by his attorney, R. P. Oldham.

Enforcement of Parking Restriction Necessary

MAYOR MACKEY is about to ask the City Council to pass the parking ordinance of last summer which was then laid aside because of the severity of its restrictions. The extent to which the public already utilizes the parking areas, established by the Philadelphia Rapid Transit Company and others, outside the central business district indicates that present congestion is to some extent bringing about its own remedy. Drivers are finding it doesn't pay to bring their cars into the center of the city during the rush hours. It is too much to hope, however, that any lasting remedy will come through voluntary action. —Philadelphia *Public Ledger*.

Hearing on Indiana Merger

Approximately 500 notices, announcing Oct. 9 as the date for a preliminary hearing on a proposed $70,000,000 merger of electric power and traction interests into the Indiana Electric Corporation, have been sent out by Harvey Harmon, a member of the Indiana Public Service Commission, in the first step toward bringing the merger proposal under scrutiny of commission members and the public. Notices were sent following an analysis and explanation by Mr. Harmon to the entire commission of the work he thus far has done toward gathering data and otherwise preparing for hearing evidence upon which the commission will base its action. The entire membership of the commission approved the plan and ruled that the hearing should be held before it.

The petition was filed with the commission by Halsey, Stuart & Company, of Chicago, consolidation managers, and involves a merging of the electric power interests in central Indiana owned by Samuel Insull of Chicago, with those of the Terre Haute, Indianapolis & Eastern Traction Company and power interests. The meeting will be held in the chamber of the House of Representatives at the State House. In view of the fact that a hundred or more attorneys may be engaged in the case, the commission has asked that spokesmen be named whereby a few can present the respective sides.

Five-Cent Fare Continued in Lorain

Residents of Lorain, Ohio, will continue to pay a 5-cent fare until Nov. 1, when the State Public Utilities Commission will take up again the plea of the Lorain Street Railroad. The bare possibility exists, however, that the hearing may be resumed at an earlier date if City Solicitor Wesley L. Grills completes the city's side of the case before that date. Mr. Grills said he would ask the Council to employ a special engineer to make an inventory of the railroad's property before the hearing would be resumed. The railroad is seeking a 10-cent cash fare, with seven tickets for 35 cents.

Five-Cent Fare to Decatur Must Be Retained

An order permanently enjoining the Georgia Power Company from discontinuing railway service to Decatur has just been signed by Judge John B. Hutcheson, in the DeKalb Superior Court. This comes as a result of an attempt on the part of the company to discontinue service on the North Decatur line, where a 5-cent fare is in force.

Two years ago the company served notice on the city of Decatur that the service on this line would be discontinued and the tracks taken up. The company claimed that it was losing money on the line under a 5-cent fare and that it was unfair to allow patrons to ride from Decatur to Atlanta for 5 cents while patrons riding from Atlanta into town on the same line, a shorter distance, paid 7 cents. Decatur secured a temporary injunction compelling the company to continue its service.

Judge John B. Hutcheson holds that the company must abide by its contract to charge not more than 5 cents between the two cities.

Omaha to Vote on Bond Issue for No-Toll Bridge

The County Board at Omaha, Neb., has voted to submit at the coming election an $800,000 bond issue as its contribution to the construction of a no-toll bridge across the Missouri River at that point. Pottawatomie County, Iowa, in which Council Bluffs is located, has not yet acted on a petition to submit a $400,000 bond issue as its share of the cost. The only bridge connecting the two cities is owned by the local railway through a subsidiary, the Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Iowa, which operates it on a toll charge basis. The officers of the company assert that if a competing bridge or a no-toll bridge is erected, the loss of revenue may be so great as to force the railway into a receivership. Attorneys say that there is no law which permits a county to vote bonds in aid of a bridge, but that it may construct one itself by the proceeds of bond issues.

Digitized by Google

Fares Increased by Eastern Massachusetts

The public trustees of the Eastern Massachusetts Street Railway, Boston, Mass., announce a general increase in fares in all divisions of the system to take effect on Oct. 1. This increase in fares is due to the award of the board of arbitration increasing wages of employees retroactive to May 2, 1928. This increase in wages will mean an increased expense of approximately $126,000 annually.

There will be no change in the rate of cash fare, the present rate being 10 cents in all divisions. In general the ticket fares will be changed by reducing the number of rides on the ticket.

The new rates of fare effective in the various divisions are as follows:

Chelsea—Six rides for 50 cents.
Melrose-Woburn—Twelve rides for $1.
Lynn—Sixteen rides for $1.
Salem—Fourteen rides for $1.
Lowell—Thirteen rides for $1.
Lawrence—Fourteen rides for $1.
Norwood—Fifteen rides for $1.
Quincy—Thirteen rides for $1.
Brockton—Thirteen rides for $1.
Taunton—Twelve rides for $1.
Fall River—Eight rides for 50 cents.

In Haverhill and Weymouth the eleven rides for $1 punch card ticket will be abolished and a 10-cent cash fare substituted, and in Hingham the ten rides for 60-cent punch card ticket will be abolished and a 10-cent cash fare substituted.

A Tramway Up Mount Hood

Refusal of Col. W. B. Greeley, former United States Forester, to allow the construction of a tramway to the summit of Mount Hood has been overridden by a committee of Oregan citizens appointed by Secretary of Agriculture Jardine to consider an appeal of the promoters of the line.

The committee, after a three-day trip on the mountain, voted to recommend that a permit be issued for construction of the line. It will submit its report to Mr. Jardine when he returns from Alaska.

If Mr. Jardine issues the permit, and he indicated that he would be bound by the report of the committee, a tramway will be built from Cloud Cap Inn, at the 6000-ft elevation, to Cooper's Spur, a distance of 2 miles and an elevation of 8,500 ft. From there a cableway, equipped with cages of 40-passenger capacity, will be constructed to the summit of the mountain, 11,220 ft. above sea level.

3,000 Volts for Lackawanna Suburban Lines

Direct current of 3,000 volts will be used by the Delaware, Lackawanna & Western Railroad for propelling suburban trains on 173 miles of track to be electrified in the northern New Jersey zone, plans for which are now being made. This high voltage system was decided upon because it seems the best suited to meet the operating requirements applying in both suburban and main line service, in the event that later it is considered desirable to carry the electrification of the road over the Pocono Mountains to Scranton and the anthracite coal fields.

Emblems Will Mark North Shore Boosters

Lapel buttons and pins of bronze, silver and gold made in the form of miniature North Shore Line emblems will be given to the men and women business boosters as special and distinctive awards. In addition five diamond-set buttons or pins will be given to the first five members of the North Shore Line family who earn the required number of credits. To win a bronze emblem a "Better Business Account" must show ten credits; a silver award requires 50 credits; a gold button 300 credits and a diamond award 2,000 credits. All credits are cumulative. According to *The Highball,* the official publication of the company, the emblem will identify the wearer "as a member of the North Shore Line family who has done his bit towards selling the 'Road of Service' to the public."

Ten-Token Purchasers Receive Containers in St. Louis

The St. Louis Public Service Company and its subsidiary, the St. Louis Bus Company, are giving metal taken containers to each patron purchasing ten tokens for 80 cents. This move is intended to speed up traffic by reducing the number of one, two and three-token purchases. The initial supply of 50,000 containers was exhausted within three days after the company offered them to its patrons. A noticeable improvement in handling passengers has taken place since the containers were distributed.

"Two Bells" Now a Monthly

In accordance with an announcement made several weeks ago, the September issue of *Two Bells,* the official publication of the Los Angeles Railway, Los Angeles, Cal., has come out in new dress as a monthly under the editorship of W. T. Shelford with Janet Converse acting as publicity manager. In an explanatory paragraph the paper says that if it has been at all interesting as a weekly it is going to try to make itself more interesting as a monthly.

Another Proof of Progress in Street Railway Advertising

Wage Bonus Discontinued in Salt Lake City

Trainmen and shopmen of the Utah Light & Traction Company, Salt Lake City, Utah, have been notified of the discontinuance of 2 cents an hour bonus, which has been in effect most of the time since May, 1923. The operators are on a base scale of 57 cents an hour, with an increase or decrease clause contingent on the cost of living throughout the United States. The 2-cent bonus has been continued to the 57-cent basis in view of the fact that living costs have been at 172 points or more, according to statistics issued by the United States Department of Labor.

During the last six months, however, the cost of living has dropped from 177.4 to 170. The base pay of 57 cents an hour remains in effect as long as there is not more than three points variation above 169 points and below 159 points. The cut of 2 cents merely puts the workers on the agreed basis.

More Inclusive Pension Plan in Omaha

A change in the pension plan of the Omaha & Council Bluffs Street Railway, Omaha, Neb., has been approved by the board of directors. Accordingly, the pension plan has been amended to include any of the employees of the company who have served for twenty years or more, and who have become incapacitated by sickness for any further useful work.

The clause now included applies whether or not the employee has reached the pension age requirement of 65 years. He must, however, have served for twenty years and have become disqualified for any further work with the company. J. W. Salyards, about 60 years of age, has already benefited by the new provision. In his case the pension was made retroactive to June 1. He was thus enabled to share in the plan to receive a pension, although he was nearly five years younger than the previous minimum age limit.

New York Fare Case Over to Oct. 15

Argument of the appeal of the city of New York and the Transit Commission from the Interborough Rapid Transit Company 7-cent fare decision of a federal statutory court, scheduled to be heard by the United States Supreme Court on Oct. 1 has been postponed until Oct. 15.

The adjournment was granted on motion of Irwin Untermyer, acting for Samuel Untermyer, special counsel for the Transit Commission, whose illness was given as the reason for delay. Former Judge William L. Ransom, special counsel for the Interborough, joined in the motion and Charles L. Craig, special counsel for the city, informed the court that although the municipality was ready to proceed it had no objection to the two week's delay.

Chief Justice Taft requested counsel in the case to submit written statements of the total time desired for argument as well as the time to be allowed each attorney who participates. Pending argument on Oct. 15 the 7-cent fare stay granted by the court last May remains effective.

Interurban Would Use Cincinnati Subway

The Cincinnati, Hamilton & Dayton Electric Railway is said to be considering the use of the Cincinnati subway to bring its cars to the heart of the city instead of having its terminal on Spring Grove Avenue as at present. If the idea is consummated it will mean that the subway, a part of the unfinished rapid transit system of the city, will be put to the use originally intended for it, that of bringing interurban lines to the center of the city. Failure of some of these lines while the system was being built almost obscured the idea behind the original plan. It is said that the use of the subway by the interurban does not present any insurmountable engineering obstacles. The subway could probably be made ready for use by an interurban for less than $300,000.

Investigators for Massachusetts Needs Named

The House membership of three on the special commission to investigate the rapid transit needs of Boston, Chelsea, Revere and vicinity have been announced by Speaker Hull. They are Representatives George A. Gilman and William H. Hearn of Boston and Newland A. Holmes of Weymouth.

Traffic Study of Pittsburgh Business Area

Some interesting figures have been developed in a traffic survey taken in the central business district of Pittsburgh, Pa. Between 8 a.m. and 6 p.m. 594,016 persons entered and departed from the business area using modes of transportation as follows:

		Per Cent
Street car	307,256	51.76
Passenger auto	119,200	20.08
Pedestrian	87,517	14.75
Steam railroad	65,375	10.98
Taxicab	9,500	1.60
Bus	4,915	0.83

Analysis showed that during the period of the count 21,228 more persons entered than left the business area, indicating that this number, approximately, remained downtown after 6 p.m. Another phase of the survey showed that automotive vehicles constituted 90 per cent and street cars 8 per cent of the vehicles using the downtown streets during this time, other vehicles, including those drawn by horses, making up the 2 per cent not already accounted for.

Fifty-Mile Interurban for Canada

The Winnipeg Power Company, Winnipeg, Manitoba, is planning to construct an electric railway to use surplus output of the recently authorized project at Seven Sisters Falls. It is expected that this line is to run from the Falls 14 miles to Whitehouse and thence 50 miles further south. The rails to be used have already been purchased and are ready to be laid.

Interurban cars from the Winnipeg-Selkirk line for passenger service will be used. For heavier traffic it is proposed to buy second-hand electric locomotives. Needed plant equipment will probably be bought in Canada on account of duty difficulties.

Not only is this a new development in power marketing, but it is the first railway electrification of its kind in western Canada.

Extension of Youngstown Grant Under Consideration

Study of the railway situation in Youngstown, Ohio, in which the Youngstown Municipal Railway operates under a modified service-at-cost grant, has been begun by a citizens' advisory committee appointed by Council President W. L. Buchanan. A. E. Adams, president of the First National and Dollar Banks, is chairman. At its first meeting on Sept. 24 the committee considered phases of the proposed new franchise.

The old grant expires in January. It provides that the city must decide on one of three courses: Extend the franchise for more than fifteen years; permit scrapping of the lines during the next fifteen years with permission of the company to charge off each year a certain amount of the capital value, or take over the lines for municipal ownership. The present franchise was drafted in 1919.

Under its provisions the company is entitled to a return of 7 per cent on capital invested, that return to be insured by a fluctuating fare.

Charges Made Against Des Moines Supervisor

An attempt was made recently to secure the removal of Col. Harry Wilkins, city street car supervisor of Des Moines, Iowa. Petitioners before the City Council charged that Colonel Wilkins had failed to use the office to better railway service or for suggesting ways and means for keeping the company out of the receivership, ordered on Nov. 11, 1927.

Under the present franchise, any member of the City Commission has power to nominate a new car supervisor, and the Council can remove and re-elect car supervisors at will. The petitioners suggested Andy Swanson to succeed Colonel Wilkins. The matter was referred to Councilman W. F. Mitchell, by whom Mr. Wilkins was named originally.

Foreign News

Paris Surface Lines Show Increased Earnings

The report of the Paris Surface Railway and Bus System (Société des Transports en Commun de la Région Parisienne) for 1927 shows increased earnings of about 13.07 per cent, the aggregate earnings for the year amounting to nearly $25,000,000. During 1927 there was a decrease in passengers carried of 6.82 per cent compared with 1926. The increase in earnings with the reduction of passengers is accounted for by an increase in fares of approximately 25 per cent on Aug. 1, 1926. These increased fares were in force during all of 1927, but for only five months during 1926. The operating statistics are given in Table I.

Table II gives the annual operating report of the system, with results after amortization charges, and Table III the profit and loss statement of the company. It made a profit although there was an operating loss on the property. It will be remembered that last year the operating contract between the company and the Department of the Seine was changed. Full particulars were published in an article on page 1185 of ELECTRIC RAILWAY JOURNAL for Dec. 31, 1927.

In its report the company points out, among other things, that wages now constitute 64.98 per cent of total receipts, and that payment for both taxes and power increased during the year more than 9,000,000 francs each.

The company's passenger, rolling and floating stock on Dec. 31, 1927, consisted of 2,287 electric motor cars, 875 electric trail cars, 1,411 buses of various types, 55 steamboats for use on the river and a number of miscellaneous smaller boats. In addition, the company had a short steam line for suburban use with 19 locomotives and 79 passenger cars.

TABLE I—STATISTICS OF S.T.C.R.P. FOR 1927

Kind of Service	Vehicle-Kilometers	Vehicle-Miles	Passengers Carried	Total Receipts—Francs	Total Receipts—Dollars
Tramways, electric	100,254,916	62,659,325	683,839,499	381,582,394	15,263,296
Tramways, steam	2,264,629	1,415,393	1,607,483	3,683,405	147,336
Total tramways	102,519,545	64,074,718	685,446,982	385,265,799	15,410,632
Motor buses, day service	53,627,004	33,516,878	328,867,981	219,685,981	8,787,439
Motor buses, night service	265,074	165,671	573,615	1,422,263	56,891
Total buses	53,892,078	33,682,549	329,441,596	221,108,244	8,844,330
Boats on the Seine	379,080	236,925	2,868,841	2,846,978	113,879
Miscellaneous passenger receipts (supplementary fares, etc.)	.....	.....	.....	172,284	6,891
Freight and package service	.....	.....	.....	7,518,002	300,720
Grand total	156,790,703	97,994,189	1,017,757,419	616,911,308	24,676,452

TABLE III—PROFIT AND LOSS STATEMENT FOR 1927 OF S.T.C.R.P.

	Francs
Balance from previous year	251,153
Interest at 6 per cent paid by department on capital stock	3,600,000
Contract payment	4,190,075
Operating bonus earned under contract	4,580,230
Miscellaneous receipts	253,150
Operating revenue	12,874,608
Corporate operating expenses and sinking fund payments of company	5,227,224
Net income of company	7,647,384

New Subway in Oslo

Subway construction which has been under way for several years in Oslo, Norway, was completed recently and the subway was officially opened by the king on June 27, 1928. This underground line runs from the National Theater in the center of Oslo to Majorstuen at the city limits, and continues to Holmenkollen, Frognersaeteren, and other suburban points. Since there are no other stations in the city, the residents in the neighborhood of Majorstuen and the suburban stations will benefit chiefly by the new line.

The signal system installed is of a modern type which is being used for the first time in Norway, although it has been tested in several foreign countries and is actually in use in the Berlin subway. The system is entirely automatic and must necessarily operate with great precision, as the cars in times of heavy traffic may run with intervals of only 1½ minutes.

TABLE II—ANNUAL OPERATING REPORT OF PARIS TRANSPORTATION SYSTEM FOR 1927 WITH RESULTS AFTER AMORTIZATION CHARGES

	Francs	Dollars
Passenger operating revenue (cars, buses and boats)	609,393,305	24,375,732
Freight operating revenue	7,518,003	300,720
Miscellaneous operating revenue	6,055,500	242,220
Total operating revenue	622,966,808	24,918,672
Operating expenses	624,411,615	24,976,465
Net revenue from operation (deficit)	1,444,807	57,793
Fixed charges (including interest and amortization of purchase money and first cost)	83,785,423	3,351,417
Deficit of system	85,230,230	3,409,210
Remuneration paid to company for operation	12,370,305	494,812
Deficit of department	97,600,535	3,904,022

Note: 1 franc taken as equal to 4 cents.

Buys Pernambuco Utilities

The public utility properties of the city of Pernambuco, Brazil, have been acquired by the Emprezas Electricas Brasileiras, an American & Foreign Power Company subsidiary. Pernambuco, with a population of about 360,000, is a state capital and the center of a rich sugar and cotton district.

The purchase entails the taking over of the Pernambuco Tramways & Power Company, Ltd., an English company, which operated electric power and light properties, street cars, telephones and gas services. The Brazilian company earlier this month acquired a contract to conduct all the public services of Bahia, and has properties in Victoria, Porto Alegre and Curityba, Brazil.

New Tramcar at Plymouth

A new type of car, sixteen of which are being built at the Plymouth Corporation Tramway's own works, has been introduced on the tramway system. This car carries a total of 72 passengers, eighteen more than the capacity of any previous models. The inside seats are of the high-sprung mattress type, and covered in moquette, while, on top, tip-up leather chairs take the place of the former wooden seating. The panelling is in mahogany, and a new and improved system of lighting has been adopted, with two red lamps at the rear. The windows are of the salon kind, and can be raised and lowered easily. The car is fitted with air brake equipment.

Electric Locomotive Completed in Japan

The Shibaura Engineering Works has recently completed the manufacture of a 105-ton electric locomotive for the Imperial Government Railways. It is 20 meters in length and is said to have cost 200,000 yen.

London's Only Tunnel Tramway

Permission has been given the London County Council, London, England, to enlarge the tramway tunnel between the Thames Embankment and Southampton Row to allow the passage of double-deck cars.

This line is the only tramway connection north and south through the center of London, an area where no surface tramways are allowed. It was constructed about twenty years ago largely on the score of economy. The tunnel was made only high enough for single-deck cars. The traffic on the route has grown enormously and hence the need for double-deck cars with their greater carrying and earning capacity.

Recent Bus Developments

New Bus Routes in Chicago

Right to operate 70-mile system awarded to independent company. Surface Lines sought similar grant

PERMISSION to add to its present 145-mile system approximately 70 miles of new bus route extensions on the west and northwest sides of Chicago was given to the Chicago Motor Coach Company by the Illinois Commerce Commission on Oct. 2. Regular twenty-minute bus service was started the following day on Diversey, Austin and Sacramento Avenues, and coaches are expected to be in operation on all new routes within three weeks. Among the other lines which are to be extended are routes 44, 45, 31, 32 and two short routes on the southwest side.

John A. Ritchie, president, has announced that the company has arranged to borrow 120 buses from the Omnibus Corporation in New York and St. Louis until the new ones necessary to take care of the additional service are delivered. It is understood that the company will purchase a fleet of new single-deck, 22-passenger Yellow city-type coaches for its extended operations.

A petition asking the commission for authority to establish 100 miles of new bus routes was filed by the Motor Coach Company on May 16. The application was opposed by the Chicago Surface Lines, which sought permission to provide feeder bus service on the same streets at a 7-cent fare with free transfers. The motor coach company asked a 10-cent fare.

Responding to petitions signed by thousands of northwest side residents who favored the Surface Lines' co-ordinated coach and rail service, the City Council last month drafted and approved fourteen separate Surface Lines bus ordinances, only to have them vetoed by Mayor W. H. Thompson on the grounds that they were illegal. The Illinois Commerce Commission likewise decided against the feeder bus franchises, maintaining that the Surface Lines have no legal right to use any part of their equipment funds for the purchase of buses and for other expenses in the operation of feeder bus lines. It was the commission's opinion, furthermore, that feeder bus operation might interfere with the permanent transit settlement now being worked out by the City Council.

Although the City Council last week repassed the ordinances over the Mayor's veto, commentators agree that no further action can be taken in the matter until the courts decide upon the legal status of feeder buses.

The Chicago Surface Lines has been operating a line of feeder buses on the north side of the city for more than a year under Judge Oscar Hebel's ruling that such operations were justified by the emergency existing. The Chicago Motor Coach Company appealed this decision, but just before the present applications were filed abandoned the appeal.

Buses to Wappingers Falls

Members of the Board of Supervisors at Poughkeepsie, N. Y., have voted in the affirmative on the purchase of the South Road right-of-way of the Poughkeepsie & Wappingers Falls Electric Railroad. As a result the county has accepted the less expensive of the two alternatives for the acquisition of land for the widening of the Albany Post Road when it is rebuilt from Wappingers Falls to Poughkeepsie.

The railway will be paid the agreed purchase price of $150,000 when the state Department of Public Works requests the county acquire land for the new right-of-way. All rails and equipment owned by the company must be removed by Jan. 1, 1929. Under these conditions, the company must proceed almost at once to remove the rails and wires in the South Road, but highway officials say the South Road will not be reconstructed until 1930.

To maintain its service to Wappingers Falls, the railway must obtain the consent of the Public Service Commission to operate buses over the route and it also must obtained consent from the town of Poughkeepsie and the village of Wappingers Falls. It seems unlikely that either the town or village will actively oppose the operation of buses. The company is prepared to change to buses as soon as consent and permission are secured.

Operation Continues in Palo Alto

In a supplemental order the California Railroad Commission has authorized the Peninsular Railway to continue the operation of buses in Palo Alto until Sept. 30, 1929. The ruling is conditioned on the company's discontinuing this service on 90 days' notice to the city authorities in the event that the revenues derived are not sufficient to pay operating expenses, depreciation, taxes and 6 per cent on investment required.

All Local Service in Paterson

The discontinuance of the Park Avenue railway line, in Paterson, N. J., by the Public Service Co-ordinated Transport will remove from the streets of Paterson the last trolley car operating wholly within the city and leave only those being operated on the Hudson River, Newark and Hoboken lines, all other public street transportation being carried on by means of buses. There were eight street car lines in Paterson as recently as three years ago. The population of Paterson is 143,000.

Iowa Ton-Mile Tax Upheld

The Iowa motor carrier law, under which operators of buses and trucks between fixed terminals are required to pay a ton-mile tax for the use of the public highways, was unanimously upheld by the Iowa Supreme Court in a full bench opinion handed down on Sept. 28.

The law was attacked by the Iowa Motor Vehicle Association on the ground that it was discriminatory. The first legal test of the issue was in the Polk County District Court, where Judge W. G. Bonner ruled there was nothing unconstitutional in the statute. The high court upheld Judge Bonner.

The Supreme Court decision was written by Justice Lawrence De Graff. He declared the statute violates neither the state nor the federal constitution. The ruling points out that the appellants, the carriers, comprise a class "entirely separate, distinct and different" from other motor vehicles operating over the highways of the state.

One of the main objections raised by the Iowa Motor Vehicle Association was that the measure discriminated against them in that it failed to charge ton-mile fees to operators of taxicabs, farm trucks, oil trucks, moving vans, funeral cars and miscellaneous carriers in general use on the highways.

However, the court emphasized that such use of the public roads "is without any conscious or organized effort to create or assemble or concentrate traffic for hire upon particular localities or sections of the highway."

The court went on to explain that, "the right of a citizen to travel upon the highway and transport his property thereon in the ordinary course of living and business is radically different from that of one who makes a certain portion of the highway his place of business and uses it for private gain in the transportation of freight and passengers is under the terms of the statute in question."

Another decision of the court of wide importance in the field of highway transportation in Iowa settled the disputed question as to whether the State Board of Railroad Commissioners can enforce its orders in granting or refusing certificates to common carriers under the same law. In this case the court upheld the law which gives the board full power to go to court to enforce its jurisdiction over motor common carriers.

The court reversed the decision of Judge C. C. Hamilton of Woodbury County, who held that the board could not bring suit to enjoin W. J. Holdcraft, who was refused a certificate to operate a line between Sloan and Sioux City, both in Iowa.

Mid-State Coach Sale Postponed

The sale of the Mid-State Coach Lines, Syracuse, N. Y., at public auction scheduled for Aug. 15, was deferred until Sept. 15 and then postponed until Oct. 15. Several railways in New York state are interested in this project.

Financial and Corporate

The Story of the Pass in Des Moines

The ratio of weekly pass revenue to total passenger revenue, and the average number of rides taken on the weekly pass sold by the Des Moines City Railway, Des Moines, Iowa, are practically constant regardless of the season of the year or the condition of the weather. Figures gathered over a period of slightly more than six months, beginning last February, show that the relation of pass revenue to the total stays around 36 per cent, while the average number of car rides taken by pass users approximates 27.

Week		Percentage of Weekly Pass Revenue to Total	Number passes Sold	Average rides per Pass
Feb.	12 to 18	35.78	12,413	26.4
	19 to 26	37.41	13,081	26.6
	26 to March 4	37.66	12,895	27.2
March	5 to 11	39.15	12,989	26.3
	12 to 18	37.22	12,418	26.7
	19 to 25	37.55	12,648	26.9
	26 to April 1	36.89	12,305	27.3
April	2 to 8	35.69	12,073	26.7
	9 to 15	36.60	12,151	26.8
	16 to 22	37.14	12,147	27.3
	22 to 29	37.23	11,974	27.0
	30 to May 6	36.18	11,578	27.0
May	7 to 13	37.15	11,800	27.4
	14 to 20	35.95	11,247	27.3
	21 to 27	36.96	11,481	27.4
	28 to June 3	34.15	10,603	26.8
June	4 to 10	35.14	11,157	26.8
	11 to 17	36.12	10,922	27.0
	18 to 24	37.13	10,960	26.6
	25 to July 1	36.61	10,742	27.5
July	2 to 8	34.95	9,787	26.7
	9 to 15	36.17	10,419	28.2
	16 to 22	36.12	10,155	27.5
	23 to 29	36.41	10,078	27.2
	30 to Aug. 5	34.13	9,747	28.5
Aug.	6 to 12	36.24	10,089	27.4
	13 to 19	34.23	9,829	26.5

Although the number of weekly passes sold was much larger during the winter and spring months, the number of rides per pass remained almost constant, and the ratio of pass revenue to total passenger revenue remained about the same. Des Moines has a flat 10-cent cash fare, but the constant car riders, through the $1.25 weekly pass, are enjoying a fare that averages slightly under 5 cents.

Number of Cash Riders Reduced in Omaha

A curious result has followed the experiment recently entered into by the Omaha & Council Bluffs Street Railway, Omaha, Neb. For several years it has been selling six tickets for 40 cents. After President Shannahan took charge, he acceded to a demand that three be sold for 20 cents. As a result the number of passengers has been stimulated about 5 per cent, but the number of cash fares paid has been so reduced that revenues have been cut nearly 3 per cent.

The August report of the company shows that, compared with August a year ago, revenues decreased from $216,093 to $210,093. Operating expenses were practically the same, $166,700, and with taxes deducted there was a net operating income of $16,651, compared with $25,427 for August, 1927.

When some months ago the bondholders agreed on an extension at the time their securities fell due, they insisted on a higher rate of interest, with the result that for August the company fell short of meeting its interest obligations by $25,364, compared with $11,413 a year ago.

Will Consider Hudson Valley Abandonment

Stockholders of the Hudson Valley Railway will meet on Oct. 11 to pass upon a resolution approved by the board of directors at a recent meeting in New York City calling for the abandonment of all of its lines now operating. The resolution provides for the abandonment of the Lake George-Glens Falls-Saratoga and the Stillwater-Troy interurban lines and the local line from Glens Falls and Hudson Falls to Fort Edward and Glens Falls to South Glens Falls, N. Y. If approval of the stockholders is secured operation of the trolleys will cease, after sanction by the Public Service Commission and a reasonable notice to the public. Officials of the company did not reveal what steps might be taken to accommodate the public on the heavily patronized branches.

The Delaware & Hudson Company and the United Traction Company, owners of the Hudson Valley system, have operated it with increasing loss for years, despite the lopping off of units on which the liability was heaviest.

Combined California Earnings Reported

PUBLIC utility corporations operating under the jurisdiction of the California State Railroad Commission had an increase in total operating revenue for the calendar year 1927 of $23,718,871 over that for 1926, according to the annual report of the department of finance and accounts of the commission, just compiled.

Electric railways reported total operating revenue for the year of $58,964,373, compared with $58,634,283 in 1926, operating expenses of $49,355,803 and $48,381,640 for 1927 and 1926, respectively, resulting in net operating revenue of $9,608,570 and $10,252,642, or a decrease of $644,072. A decrease was noted in revenue passengers transported, 708,641,500 being carried in 1927, against 712,569,466 the previous year.

June Quarter Profitable in Syracuse

An increase in business is shown in the financial statement of the New York State Railways, Syracuse, N. Y., as filed with the Public Service Commission for the quarter ending June 30. Operating revenues increased over those of a corresponding period a year ago, to the extent of $53,294. The total was $497,728 for 1928 and $444,434, for 1927. Fixed charges were also less, while the net corporate income increased by nearly $60,000. The comparative figures follow:

	1927	1928
Operating revenues	$2,390,955	$2,402,929
Operating expenses	1,797,079	1,752,466
Net revenue, railway operations	$593,876	$650,463
Net deficit, auxiliary operations	1,098	139
Net operating revenue	$592,778	$650,325
Taxes assignable to railway operations	148,444	152,595
Operating income	$444,434	$497,728
Non-operating income	23,415	22,596
Gross income	$467,748	$520,325
Deductions from gross income—		
Rent for leased roads	13,056	12,616
Interest on funded debt	322,736	322,550
Other deductions	14,117	13,912
Total deductions from gross income	$379,066	$373,696
Net corporate income	$88,682	$146,620

Projected Purchase Involves East St. Louis Properties

The Union Electric Light & Power Company, St. Louis, Mo., has petitioned the Missouri Public Service Commission for permission to purchase from the North American Company the East St. Louis & Suburban Railway, the Alton Railway, the St. Louis & Alton Railway, the Alton Light & Power Company, the Alton Gas Company and the Union Electric Light & Power Company of Illinois, operating company for the Cahokia Power plant south of East St. Louis, Ill., which supplies the Union Electric Light & Power Company of St. Louis with much of its power.

For these properties the price would be $18,111,697, arrived at as follows: cash cost to North American Company of acquiring properties, $11,377,556; undistributed surplus of various companies, $2,068,725 and money advanced $4,665,414. The Union Electric Company, which is also controlled by the North American Company, would pay the holding company 420,000 shares of no par value common stock at $25 a share, or $10,500,000, and the balance from the accumulated surplus of the Union Electric, or $7,611,697.

The price agreed to for the East St. Louis & Suburban is $3,964,612 and for the four Alton companies, $2,422,944. Bus lines operated by the railways would be involved in the transfer.

The chief purpose of the transfer is to place control of the North American Company's subsidiaries in the St. Louis district under the Union Electric Light & Power Company, of which Louis H. Egan is president.

Partial Dividend Paid in Harrisburg

The Harrisburg Railways, Harrisburg, Pa., has resumed dividends on its preferred stock. Stockholders received checks on Oct. 2 for a 2 per cent semi-annual dividend on the 6 per cent (annual) cumulative preferred issue. It is presumed the dividend was made possible by the increased revenue due to the recent advance in fares from 6 to 7 cents.

The 2 per cent dividend is 1 per cent less than the normal 3 per cent semi-annual dividend for which the company is obligated, and the omission of the 1 per cent at this time makes a total of 30 per cent of dividends accumulated in the last decade. The company has never paid any dividend on its common stock.

The dividend due on April 1 last was omitted because of reduced revenues under the old 6-cent fare. Three months after passing that dividend the increase in the fare was announced.

11,187,173 Passengers in Cincinnati in August

The Cincinnati Street Railway, Cincinnati, Ohio, transported 11,187,173 passengers during August, and found itself with $419,997 in the fare control fund at the end of the month—$15,303 less than the sum in the fund at the end of July. The report follows:

Operating revenue	$725,925
Operating expense	525,441
Net operating revenue	$200,483
Taxes	69,234
Operating income	$131,349
Non-operating income	3,240
Gross income	$134,490
Rental, interest, sinking fund and return on capital	149,794
Deficiency	$15,303
Total in fare control fund, July 31, 1928	$435,201

Revenue passengers	8,285,514
Transfer passengers	2,777,643
Free passengers	124,016
Total passengers carried	11,187,173

Initial Engineers Public Service Common Dividend

The Engineers Public Service Company New York, has declared an initial dividend of 25 cents quarterly on its common stock, placing the issue on a $1 annual basis. The directors have also announced that, beginning on April 1 next, the company will also pay stock dividends on the common stock at the anual rate of 1-25 of a common share on each common share held. There are 3,000,000 shares of no par common stock authorized of which 897,240 shares were outstanding at the end of 1927.

Quarterly dividends at the rate of $5 per annum have been paid regularly on 320,000 shares of $5 cumulative convertible preferred stock of no par value, of which 400,000 shares are authorized. There is no funded debt.

Among the properties which the company controls is the Virginia Electric & Power Company.

Danbury and Bethel Utilities Merge

The Danbury & Bethel Gas & Electric Light Company, Danbury, Conn., has acquired the franchise and equipment of the Danbury & Bethel Power & Transportation Company, covering the town of Newton, Conn., and the district between the towns of Danbury and Monroe on the Housatonic River.

Traffic, Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 225 companies to the American Electric Railway Association for August, 1928, compared with August, 1927, is as follows:

Aug., 1928	772,661,141
Aug., 1927	782,111,878
Decrease, per cent	1.21

The variation in the percentage decrease from the corresponding month of the previous year, amounting to 1.21 per cent, is accounted for mainly by the fact that weather conditions in August, 1928, were practically normal, that is, it was hot and sultry for the most part and generally fine, which condition stimulates private automobile riding to a great extent. August, 1927, was one of the coldest, wettest and dreariest summer months on record, and undoubtedly railway traffic was thereby stimulated.

Average cash fare in cities of 25,000 population and over:

	Cents
Sept. 1, 1928	8.2155
Aug. 1, 1928	8.1767
Sept. 1, 1927	8.0449

The increase in the average fare was produced by an increase in Lynchburg, Va., from 5 cents to 7 cents, an increase in Roanoke, Va., from 5 cents to 7 cents, an increase in Sacramento, Cal., from 5 cents to 7 cents, an increase in Schenectady, N. Y., from 7 cents to 10 cents, and an increase in Stockton, Cal., from 6 cents to 7 cents. The changes in Sacramento and Stockton, previously reported as effective in July, were not effective until later. The average fares for Aug. 1 and Sept. 1, 1928, have been adjusted accordingly.

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track were:

	Average Hourly Rate	Index Number 1913 = 100
	Cents	Per Cent
Sept. 1, 1928	57.48	210.94
Aug. 1, 1928	57.48	210.94
Sept. 1, 1927	57.27	210.17

Vote on Purchase of Philadelphia Underliers Postponed

The Mackey Administration at Philadelphia, Pa., has abandoned its plan to obtain electoral approval at the November election of the contemplated purchase of the Philadelphia Rapid Transit Company underliers at a cost of $139,000,000.

At Mayor Mackey's suggestion, however, the City Council's transportation committee unanimously passed a resolution calling for a popular vote on municipal acquisition of the P.R.T. subsidiaries "at the earliest practicable moment." It is proposed that a special election be held in February.

That legislative action followed a stormy session on Oct. 1, during which the Mayor. city and P.R.T. officials and W. W. Atterbury, president of the Pennsylvania Railroad, were questioned by George J. Campbell, president of the United Business Men's Association.

General Atterbury explained that the $80,000,000 program of the Pennsylvania Railroad in connection with its proposed West Philadelphia Terminal would suffer radical reduction unless the city votes to purchase, through condemnation proceedings, the franchises of the street car underlying companies in Philadelphia.

In his prepared statement the railroad president reviewed the plans to erect a new station and said that "nearly every step of the way, in one form or another, we have been met by objections from the underlier companies."

General Atterbury urged that the city take over the underliers and transform part of the present Market Street elevated into a subway west of the Schuylkill River. The railroad plans to run trains into Broad Street from the projected West Philadelphia Station through a tunnel under the river.

The P.R.T. has pointed out that when the city becomes its landlord in place of the underliers, the $8,300,000 rental will be more than sufficient to meet the fixed charge on the $139,000,000 borrowed for the acquisition of the underliers' holdings and that an annual saving in the transaction of $1,000,000 a year will accrue to the city.

Furthermore, the P.R.T. contends the city will have a voice with the P.R.T., with the Public Service Commission as choirmaster, in the ultimate disposition for the benefit of the car riders of the $1,400,000 a year tax charges paid on account of the underliers which the P.R.T. will save when the city is in a position to exercise proper control.

New Directors on Eastern Massachusetts

L. Sherman Adams, Roger Amory and F. T. Miller have resigned as directors of the Eastern Massachusetts Street Railway, Boston, Mass. Their successors are H. R. Hardwick and F. H. Baird of Hayden, Stone & Company, and N. L. Amster.

Digitized by Google

Favorable Showing in Toledo Under New Plan

Under the new transit plan which has combined the bus and railway service of Toledo, Ohio, under the single control of the Community Traction Company, revenues are showing a gain and elimination of duplicated services has enabled some cuts to be made in cost of operations. These facts were disclosed by the report of Commissioner E. L. Graumlich to the street railway board of control at its September meeting. A net surplus of $11,907 after all taxes, expenses, and charges for required reserves was shown for August operations compared with a deficit of $44,590 for August, 1927. Commissioner Graumlich indicated that elimination of competitive service would add approximately $250,000 to the revenues in a year.

The August report showed total revenue of $293,637 comparing with $264,370 and passenger revenue $272,852 compared with $247,833 for August a year ago. The railway system alone had operating revenue of $242,683. Operating expenses were $159,880 and taxes $15,666, which gave a net income from railway operation of $67,137, compared with $34,896 last year.

Coach revenue totaled $49,808 against $21,253 for August last year. New lines are largely responsible for this big gain. Net income was $4,616. Increasing traffic is held largely responsible for the better average revenue and lower average cost of operation.

The traction system has put in a new system of transfers in which colors indicate groups of parallel routes and hour is indicated by length of the transfer. While more extensive operations have been responsible for a 1 per cent increase in transfers purchased there has been an 8 per cent increase in the purchases of the regular token fares. Commissioner Graumlich says this showing indicates that a considerable amount of return riding by means of transfers has been eliminated. The company is now getting the benefit of lower power rates, a power refund, and has been enabled to increase its depreciation set-up and cut down its monthly accident charge.

From several sources the company has been asked to establish a 5-cent fare for school children. Present fares are 1 cent for children eight years or younger and straight token or 10-cent fares for all others.

Ohio Interurban to Suspend Railway Service

Abandonment of the Columbus, Newark & Zanesville Railway, Newark, Ohio, between Columbus and Zanesville, is proposed by the Southern Ohio Public Service Company. The railway furnishes current for light and power to towns and communities along its line. This part of the company's business is showing a profit while the interurban cars are operated at a deficit. The application to the Public Service Commission for the right to suspend will be heard on Nov. 1. The railway will contend that it is operating at a heavy loss, and that its railway revenues are constantly decreasing to such an extent that its receipts do not meet its operating expenses. The company will continue its electricity and power service.

Abandonment of the railway as proposed would enable the Columbus Railway & Light Company, Columbus, Ohio, to save a part of the $160,000 that it otherwise would be required to spend on new tracks, special work and turnouts to provide a new route for the cars of the interurban in East Main Street.

Additional Issue of Arkansas Power & Light

A syndicate including Harris, Forbes & Company, New York, is offering an additional issue of $3,000,000 first and refunding mortgage gold bonds of the Arkansas Power & Light Company at 96¼ and interest, yielding more than 5.25 per cent. The bonds are dated Oct. 1, 1926, and are due Oct. 1, 1956. The Arkansas Power & Light Company operates the electric railway systems in Little Rock and Pine Bluff. The company is included in the system of the Electric Power & Light Corporation.

Hydro to Operate Windsor Road

Legal technicalities that have a bearing on the taking over of the Windsor Essex & Lake Shore Railway by the Ontario Hydro Electric Power Commission have been straightened out at a conference attended by the Premier, members of the Hydro Commission and J. H. Rodd of Windsor, counsel for municipalities interested in the road's operation. The taking over of the radial line was authorized at the last session of the Legislature.

The Premier said:

The chief difficulty at present, is that since the different municipalities have been formed into one unit, they have not the authority to create working capital. I have told them to go ahead and that we should ratify their action by legislation at the next session.

It seems likely now that Hydro operation of the road will be commenced without further delay.

New Director in Boston

Edwin M. Richards, New York, has been elected a director of the Boston Elevated Railway, Boston, Mass. He succeeds the late Henry S. Lyons.

Legal Notes

FEDERAL CIRCUIT COURT OF APPEALS—*Combined Street and Interurban Railway Cannot Take Advantage of Federal Bankrupt Act.*

The federal bankrupt act provides that any person "except a municipal, railroad, insurance or banking corporation," may become a voluntary bankrupt. The Circuit Court of Appeals, Fourth Circuit, held that the Columbia Railway, Gas & Electric Company, operating 20 miles of lines in Columbia, S. C., and neighboring villages, was more of a "railroad" than a simple street railway in one town or city, and could not take advantage of the act, thus affirming decision in the case of the same company in 24 F. (2d), 828, and 25 F. (2d), 329. [Columbus Ry. Gas & E. Co. vs. State of South Carolina, 27 F. (2d), 52.]

MARYLAND—*Basis for Determining Fair Return on Fair Value of Utility Property.*

The Public Service Commission acts for the Legislature, and as it is informed by experience and assisted by a trained corps, its establishment of rates for a public utility cannot be disturbed except on clear evidence that its decision is unreasonable and unlawful. A schedule of rates by such a commission permitting a return of 6.26 per cent on the fair value of the utility's property is not confiscatory. The return calculated, however, should be sufficient to include an allowance for depreciation, which should be based on the present value of the property, not on its original cost or taken as a percentage of its gross revenue. Such allowance should include loss from ordinary obsolescence, but need not include loss from extraordinary obsolescence, as its occurence in the future is a matter of speculation and conjecture. [West vs. United R. & E. Co., 142 A, 870.]

ILLINOIS—*Income Tax Deductible to Determine Net Revenue Under Agreement.*

A railway and a city entered into an agreement twenty years ago under which a percentage of the net revenue of the company should be paid to the city. Later the federal income tax was imposed. The court held it to be a tax on the real and personal property of the company within the meaning of the ordinance and that it was a deductible item before the net revenue was determined. [City of Chicago vs. Chicago City R. Co., 245 Ill. App., 473.]

MASSACHUSETTS—*Company Not Responsible for Injury From Automatically Closing Door.*

A passenger on a crowded platform placed his hand against the edge of an opened sliding door and did not remove it before it was caught between the door and the casing into which the door slides when closing. There was no evidence that the guard knew or was careless in not knowing that the hand was in a place of danger, or that the crowd striving to enter was unusual and called for special precautions. The accident was a mishap of travel and not due to negligence, and the trial judge was not in error in directing a verdict for the

Digitized by Google

defendant. [Power vs. B.E.R., 161 N.E., 623.]

MINNESOTA—*Employee in Emergency is Not Required to Adopt the Wisest Course.*

A street car was caught on a railroad crossing which it had entered while the gates were up. The one-man car operator had not gone forward to look for an approaching train, as required by the rules. Both steam railroad and electric railway requested the court to charge that in an emergency involving danger to the lives of others, an employee was not negligent merely because he did not adopt the wisest or best means of avoiding an accident. The refusal to give this charge was reversible error. [Sandberg vs. Great N. R., 220 N.W., 949.]

NEW JERSEY — *Ordinance Against Double-Deck Buses With Solid Tires Held Unreasonable.*

The city of Camden passed an ordinance prohibiting the use of double-deck autobuses not equipped with pneumatic tires in certain parts of the city. It was declared void by the court because unreasonable, the weight and not the height of the vehicle being the proper basis for classification for regulations to conserve the highway, in the opinion of the court. The offending company operated interstate buses, but this fact was held not to have affected the operation of the law against the defendant's buses, provided the law had been legal otherwise. [Pennjersey R.T. Co. vs. City of Camden, 142 A., 821.]

NEW YORK—*Refusal to Charge that if Collision Occurred as Specified by Certain Witnesses the Railway was Not Negligent, Held Error.*

Witnesses for a railway testified that a taxicab driver attempted to cut in front of a car between crossings when there was not sufficient room to do so, and the motorman was unable to stop the car in time to avoid an accident. The counsel for the railway requested the court to charge that if the jury believed these witnesses, the company was not liable. The neglect of the court to do so was held prejudicial error.—[Liggio vs. Third Ave. Ry. Co., et al, 229 N.Y.S., 537.]

OHIO—*Policy in Issuing Transportation Certificate Defined.*

The purpose of the Ohio Motor Transportation Act is to serve the public convenience and necessity, as distinguished from serving the advantage and profits of motor transportation companies. It is not the policy of such legislation to create destructive competition with existing transportation facilities and thereby decrease or destroy them. The grant of a certificate which will result in depriving the public of an equal or greater existing transportation facility is opposed to public convenience and necessity. It is the duty of the Public Utility Commission to permit an existing railway company to make its service adequate, if it is not already adequate, before granting a certificate to a motor transportation company to render competing service. [Stark E.R. Co. vs. P. U. Comn. of Ohio et al., 161 N.E., 208.]

SOUTH DAKOTA—*Duty of Driver of Automobile Approaching a Crossing Defined.*

An automobile driver approaching a street intersection saw a trolley car about 200 ft. away. He then tried to avoid a collision by crossing ahead of the car but was struck. The street car was exceeding the speed permitted by ordinance. Two extended instructions requested by the defendant's counsel were upheld in the Supreme Court as correctly stating the law as applied to tracks. One was to the effect that the plaintiff, after first seeing the car, should have paid reasonable attention to it and not tried to cross the track unless he had plenty of time to do so. While he had a right to assume the car was not running more than 12 m.p.h. (the legal limit), as soon as he could have learned by reasonable care and observation that it was running faster than this speed it was his duty to stop his automobile and not take any chances at the crossing. The second instruction declared that as the car had a right of way on its rails by law and the necessities of the case, the driver should have approached the crossing at a speed not greater than allowed by ordinance or 8 m.p.h. When he arrived at a point where he could see up the track, he should have looked to see if a car was approaching. [Miller vs. Sioux Falls T.S., 220 N.W., 451.]

WISCONSIN—*Validity of Highway Tax Upheld.*

The constitutionality was upheld of a law imposing a ton-mile tax on all auto transportation companies operating motor vehicles for compensation upon a public highway between fixed terminals or over a regular route, but exempting hotel and school buses, vehicles transporting agricultural or dairy products and freight and passenger vehicles within municipalities, and requiring freight trucks to pay double the tax imposed on passenger vehicles. [State ex rel N.P. Co. vs. Railroad Comm. of Wis. et al., 220 N.W., 390.]

Personal Items

S. W. Coleman, Former Railway Man, Retires from Utility Field

S. Waldo Coleman, California utility operator and financier, has retired from the public utility field, following the sale of the Coast Counties Gas & Electric Company, of which he was president, to A. E. Fitkin. Mr. Coleman devoted his entire career to the electrical industry in the West. After obtaining some practical engineering training in the shops of the General Electric Company he became connected with the Petaluma & Santa Rosa Railroad Company as master mechanic, moving to Santa Cruz in 1906 as manager of the Union Traction Company.

In 1908 Mr. Coleman was made manager of the Coast Counties Gas & Electric Company and in 1913 he became president, taking charge of the affairs of that organization in its San Francisco office. He devoted his attention especially to public relations and was an early advocate of customer ownership.

Mr. Coleman is a member of the American Institute of Electrical Engineers.

R. L. Horsfield New Manager at Leeds

The tramways committee of Leeds (England) City Council unanimously agreed on Sept. 11 to recommend the appointment of R. L. Horsfield to the post of general manager and engineer of the city's tranmway and transport department, succeeding W. Chamberlain, who has accepted the position of general manager of Belfast City Tramways.

Mr. Horsfield has held leading positions with Bradford & Walsall Tramways, and since 1920 has been general manager of the Cardiff Tramways. Both in Walsall and Cardiff he opened up bus services as auxiliaries to the municipal tramways. For the year 1926-1927 he was president of the Municipal Tramways & Transport Association.

W. Chamberlain Heads Association

At the annual conference of the Municipal Tramways & Transport Association held in Manchester, England, from Sept. 12 to 14, W. Chamberlain, hitherto general manager of the Leeds Tramways, and now about to take up a corresponding position with the Belfast Tramways, was elected president of the association for the ensuing year.

GEORGE A. COOPER, superintendent of materials of the Monongahela-West Penn Public Service Company, Fairmont, W. Va., has been appointed an assistant chief business specialist in the Division of Simplified Practice of the Bureau of Standards, United States Department of Commerce. Mr. Cooper has had considerable experience in the actual application of simplified practice within a company as his concern reduced its financial investment in inventory by 33 per cent and eliminated 16 per cent of items carried in stock.

Track Material Buying Continues Brisk

Market for line materials also active. Boston Elevated extension proposed. Terminals for St. Louis and Aurora to start soon

CONFIRMING earlier reports that the market for track and line materials is continuing to be active, this week's reports from a number of electric railways show substantial purchases of these products. The Georgia Power Company, Atlanta, Ga., has ordered a minimum car of 70-lb. A.S.C.E. rail. Other track equipment ordered by this company includes a special curve, 350 6-in. x 8-in. x 8-ft. cross ties, 750 AA-5, Arcweld bonds, and signal equipment. Ten thousand creosoted red oak ties have been ordered by the Cleveland Railway, Cleveland, Ohio.

Chicago Surface Lines, Chicago, Ill., has ordered 1,000 ft. special rolled guard rail for 5-in. 80-lb. rail, 250 gross tons of 9-in. 145-lb. rail, and during the previous month 2,000 gross tons of 9-in. 130-lb. rail and 42 special track layouts. Ten steam and electric railroad crossings, 215 tongue switches, forty 9-in. 90-deg. S. P. crossings, forty type B crossover frogs, twenty-two 9-in. type B spiral frogs, forty-two type B crossover frogs, and twenty-two 7-in. tongue switches are included in other orders. This company also purchased 15,000 6-in. x 8-in. x 7-ft. long-leaf yellow pine ties. Paving materials was another large item purchased, including 12,000 square yards of granite blocks, 5,000 square yards of 4-in. yellow pine paving blocks, and during the month previous 100,000 vitrified repressed paving bricks. Other equipment purchased by this company includes 100 Toledo wheelbarrows, 6,000 ½x6x11-in. tie plates, 13,000 rail clips, 12,000 T-head bolts and nuts, 1,500 tie plate wedges, 2,500 tie plate clips, 2,000 ft. of ¾-in. pneumatic hose, 100,000 Fetter drive screws, 17,000 M.I. rail clips, and twelve paving breakers.

The Denver Tramway Corporation, Denver, Col., has ordered 30,000 6-in. x 9-in. x 6-ft. spur cross ties treated, 10,000 6x9-in. flat bottom tie plates, 350 pairs of fish bars for 52-lb. rail, and 100 kegs of $\frac{5}{16}$x5½ in. track spikes. Cement, lumber, track bolts, tie plates and spikes to the value of $10,000 have been purchased by the Portland Electric Power Company, Portland, Ore. Ten thousand ties, 45 tons of rail, 3,800 tie plates, 300 pairs of splices, and 59,100 lb. of asphalt were ordered recently by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. Virginia Electric & Power Company, Richmond, Va., has placed orders for 50 kegs of track bolts, 200 rail tierods, 50 rail plates, 101 rail bonds, and 25 kegs of track spikes. Washington Railway & Electric Company, Washington, D. C., contemplates the order of four Chicago-Pneumatic Company Type MM back fill tampers.

The United Electric Railways, Providence, R. I., has ordered special track work, 16,000 tie plates, 1,000 5-ft. 2-in. tierods, 250 kegs of track spikes, 90 kegs of track bolts, and 500 36-in. bonds. Other track equipment ordered by this company includes 50 grinding wheels, one complete reciprocating car grinder equipment, one gross Toledo torches, 25 grinding wheels, 300 corundum bricks, two lots of special work, 250 rail weld portion, 4,000 tie plates and 1,000 flat tierods.

The Northern Ohio Power & Light Company, Akron, Ohio, is rebuilding its track from Bowery to State Street. When this work is completed new track will be laid between Mill and Bowery Streets on Main Street. The Public Service Company, St. Louis, Mo., has started work constructing a loop at Third Street and Franklin Avenue, and finishing the double tracks on Franklin as far west as Ninth Street.

Permission has been granted the Delaware Electric Power Company, Wilmington, Del., to lay a double track across the new Market Street Bridge. A new loop will be constructed along the Lawrence Road by the Trenton & Mercer County Traction Corporation, Trenton, N. J.

The Dominion Power & Transmission Company, Hamilton, Ontario, proposes to rebuild, 5,000 ft. of double track on Burlington Street, from James Street to Wellington Street, with 90-lb. rail and steel ties. This company is rebuilding about 1 mile of double track, using 90-lb. girder rail and steel ties.

Power and Line Materials

Ten cars of poles and two cars of W. P. wire have been ordered by the Milwaukee Electric Railway & Light Company. This company also contemplates the purchase of one car of insulators. Five hundred marathon ears, 100 trolley splicing ears, 100 trolley yokes, twenty trolley frogs and two reels of trolley wire have been ordered by the Virginia Electric & Power Company.

The Denver Tramway Corporation has ordered 100 class D 30-ft. western red cedar poles. One-half carload of hard-drawn bronze round trolley wire has been ordered by the Cleveland Railway. The Georgia Power Company has ordered 175 35-ft. creosoted pine poles, and 125 30-ft. creosoted pine poles. Poles, wire and miscellaneous line hardware to the value of $20,000 have been ordered by the Portland Electric Power Company.

Five miles of No. 10 three strand galvanized iron wire, 5,000 ft. of $\frac{5}{16}$-in. seven wire Copperweld span wire, 500 No. 00 trolley ears, 500 caps and cones, 50 No. 00 R.M. frogs, and 50 No. 00 20-deg. L.M. frogs have been ordered by the United Electric Railways. Forty-seven tubular steel poles have been ordered by the Washington Railway & Electric Company.

Electric equipment ordered by the Chicago Surface Lines include 125 long-leaf yellow pine poles creosoted, 8 in. x 35 ft.; 500 Tru-Lay span centers, 56 three-cell unit aluminum lightning arresters, 6,260 lb. of cast lead burning strips; 720 pairs of split pole sleeves. The electrical department of this company has also ordered 90,000 lb. of sulphuric acid, gravity 1.600; 70 shallow lead-lined tanks; 3,000 wood separators; 480 oil insulating units; 90 pieces of 22⅝x20⅛x⅜ in. rough skylight glass and 396 pieces of 23$\frac{5}{16}$x27⅞x⅜ in. rough skylight glass.

Car Repair Parts

The Georgia Power Company has ordered 250 26-in. car wheels and 300 6-in. trolley wheels. Three thousand dollars worth of car repair parts were ordered by the Portland Electric Power Company. The Connecticut Company, New Haven, Conn., is equipping twelve cars for treadle-operated exit doors. The Dallas Railway & Tramway Company, Dallas, Tex., has ordered 150 steel car wheels.

Four hundred cast grids, five sets of armature coils, 600 lb. of sweeper rattan, 15 G.E. 80-19 tooth pinions; 500 R.G. cast grids; 25 anti-telescoping plates; 40 ft. of 24-in. rattan seat covering and 50 G.E. 80 brush-holders have been ordered by the United Electric Railways, Providence, R. I. The Washington Railway & Electric Company has ordered 120 30-in. steel wheels. Kansas City, Clay County & St. Joseph Railway has remodeled all cars on its ten limited trains between Kansas City and St. Joseph.

United Electric Railways has ordered eleven twin coaches from the Twin Coach Corporation, and the Washington Railway & Electric Company contemplates the order of four type Z 29-passenger coaches from the General Motors Truck Company. Pittsburgh Motor Coach Company contemplates the purchase of three buses. An ordinance has been passed authorizing the Municipal Belt Line, Tacoma, Wash., to purchase two new buses. Key System Transit Company has received twenty urban type twin coaches.

The Philadelphia Rapid Transit Company, Philadelphia, Pa., plans a car

Digitized by Google

repair shop to cost approximately $70,000.

A third converter station to cost approximately $75,000 is planned by the Knoxville Power & Light Company, Knoxville, Tenn. This will be an automatic substation to provide power to the street car system. The Connecticut Company is installing substation equipment in Hartford, which includes a 33,000-kw. converter. The Milwaukee Electric Railway & Light Company is making an addition to its Thirty-second Street substation. The Dominion Power & Transmission Company is constructing a substation to house a mercury arc rectifier. United Electric Railways has ordered 30,000 S.M. bricks.

$5,000,000 Boston Elevated Extension Proposed

A bill to permit the Boston Elevated Railway to use the New Haven Railroad tracks from the present elevated terminal at Forest Hills, to one at Spring Street has been filed in the office of the House clerk by Representative George A. Gilman of Boston.

The plan is similar to that under which the Shawmut branch was taken over for the use of the elevated to Dorchester.

The passage of the proposed bill, Representative Gilman declares, would provide additional transportation facilities for Roslindale and West Roxbury. The total cost of the project would be approximately $5,000,000.

May Start St. Louis Terminal in 90 Days

If the Interstate Commerce Commission and the Missouri Public Service Commission give their approval construction of the Illinois Terminal System's $5,000,000 terminal development in St. Louis, Mo., will be started within the next three months, according to James A. Hooke, consulting engineer for the company. Final construction plans are now being prepared by Mr. Hooke's office and it is probable actual construction work will be started about Jan. 1.

The terminal company filed an application with the Interstate Commissioners on Sept. 25 for permission to proceed with the improvements, which will include an elevated and subway line connecting the McKinley Bridge with a new underground passenger and freight terminal at Twelfth Boulevard and Lucas Avenue. The company will also build a new freight building and convert a large commercial building at Twelfth and Washington Boulevards into a modern passenger depot.

Fall Rail Buying Starts

The customary fall rail buying movement has started, and the large amount of business on hand and still coming, has caused a number of steel mills to stiffen their attitude on prices. Increased production is noted throughout the steel industry, some districts reaching as high as 85 per cent of ingot capacity.

A number of steam railroads have recently given orders, mostly for winter rolling, for 155,500 tons of rail. In addition, the New York Central Railroad and the Pennsylvania Railroad are each expected to soon be in the market for approximately 200,000 tons of rail.

Hearing on Oregon Line

Hearing of the application of the Portland Electric Power Company, Portland, Ore., for permission to construct a railroad between Albany and Lebanon, has been set for Oct. 13 in Portland. The hearing will be conducted by representatives of the Interstate Commerce Commission.

$1,000,000 Aurora Terminal to Start

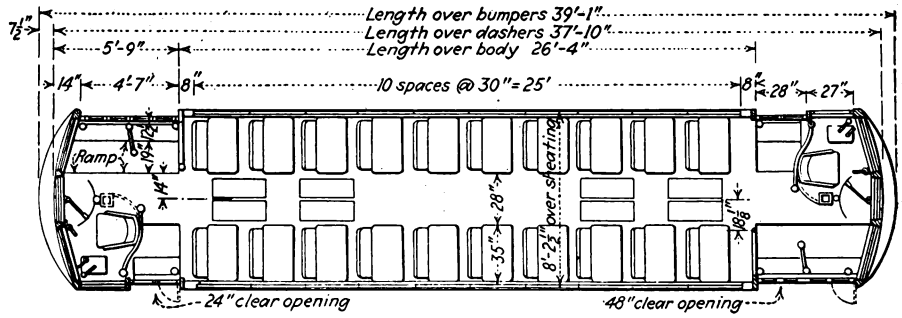
The Chicago, Aurora & Elgin Railroad has completed negotiations for the purchase of river front property in Aurora, Ill., from the American Well Works. This completes the final step in the $400,000 track replacement program of the traction line necessary to the opening of the new terminal at New York Street and the river in Aurora. Work upon the project will begin at once, Col. Edward C. Blair, general manager of the railroad traction line, has announced. Retaining wall-dredging operations and track work will cost about $400,000 and the terminal building construction, which will be several stories high, will bring the total cost of the undertaking to $1,000,000, it is estimated.

Eighteen One-Man Cars for Phoenix

Eighteen one-man, two-man, double-truck, double-end, 40-passenger, motor cars have been ordered by the Street Railway Department of the city of Phoenix, Ariz., from the American Car Company, St. Louis, Mo. These cars are 39 ft. 1 in. long over the bumpers, the width is 8 ft. 5 in., and the height from rail to trolley base is 11 ft. The truck centers are spaced 16 ft. 10 in., the wheels being of 26 in. diameter on a truck wheelbase of 5 ft. 1½ in.

In the body construction the side sill angles are one continuous length and the dasher angles are joined to the side sill angles with gusset plates riveted. The side rest angles and window rest angles are machine fitted to the post and riveted. The cross sills are joined to the side sills and dasher with gusset plates riveted, while the crown pieces are bolted to the sills. The corner post tees are extended in one continuous piece from side sill to side sill, and joined to same with angle iron riveted and fastened to oak posts and head pieces with screws.

The vestibules are of the removable type and have folding doors on the right hand side of both ends which open 48 in. in the clear. Folding doors on the left-hand side of both ends open 24 in. in the clear. All doors and steps are operated by air. The call for bids on these cars was mentioned in the Aug. 11 issue of the JOURNAL.



The Phoenix cars have a seating capacity of 40 passengers

Total weight	30,000 lb.
Bolster centers	16 ft. 10 in.
Length over all	39 ft. 1 in.
Length over body posts	26 ft. 4 in.
Truck wheelbase	5 ft. 1½ in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	11 ft.
Window post spacing	30 in.
Body	Semi-steel
Air brakes	Westinghouse
Axles	Brill
Car signal system	National Pneumatic
Compressors	Westinghouse
Conduit	Flexible
Control	General Electric
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	American Car National Pneumatic engine
Doors	Folding end
Fare boxes	Johnson Fare Box Company
Floor covering	Rubber mat in aisle
Glass plate	D. S. A.
Hand brakes	American Car Company's drop type
Headlights	Ohio Brass Company
Headlining	Haskelite
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Brill
Lamp fixtures	General Electric short circuit type
Motors	Four General Electric, inside hung
Painting scheme	Orange and ivory paint
Roof type	Arch
Roof material	F. & G. boards
Safety car devices	Safety Car Devices Company
Sash fixtures	American Car Company
Seats	Brill 201-E
Seat spacing	30 in.
Seating material	Rattan and leather
Steps	Folding
Step treads	Feralun
Trolley catchers	Ohio Brass
Trolley base	Ohio Brass
Trolley wheels	Ohio Brass
Trucks	J. G. Brill Company 177-E-1-X
Wheels, type	Steel, diameter 26 in.
Wheelguards or fenders	American Car Company

New Railway Projected in Texas

Construction of an electric railway from Point Isabel, site of the proposed valley harbor, to San Benito, Tex., and electrification of the present railroad from Point Isabel to Brownsville is expected to be started soon by the Port Isabel Transportation Company. This company has been granted a charter and expects to begin soon on the electrification project. The tramway is to handle freight and passengers. Traffic from the west end of the lower Rio Grande Valley will be handled through San Benito. C. R. Tyrrell, Brownsville, is president of the railway.

F. R. Fishback, Vice-President of Electrical Manufacturers

F. R. Fishback, president of the Electric Controller & Manufacturing Company, Cleveland, Ohio, has just been elected vice-president in charge of the apparatus division of the National Electrical Manufacturers' Association. Mr. Fishback was elected at a meeting of the executive committee of the board of governors and replaces N. A. Wolcott, resigned.

Mr. Fishback's business experience with the Electric Controller & Manufacturing Company has been on the commercial side. He has held the position of sales manager and in 1924 was appointed vice-president and secretary. The following year he was elected president, which position he now holds.

As vice-president of the apparatus division of N.E.M.A., Mr. Fishback will represent a group which includes about 85 per cent of all the manufacturers of electrical apparatus and machinery in the country.

Pipe Unions Standard Approved

Approval of a proposed commercial standard for malleable iron or steel screwed unions for use with standard weight pipe, was given Sept. 24, 1928, by a general conference of interested elements of the industry. This conference was held under the auspices of the commercial standards unit of the Bureau of Standards, Department of Commerce. This commercial standard pertains to black and galvanized types of brass-seated malleable iron or steel unions.

Auto Parts Associations Unite

Completion of the merger of the Motor and Accessory Manufacturers' Association and the Automotive Equipment Association was announced recently following a ratification meeting of members of the former body. The consolidated organization has been named the Motor and Equipment Association.

Members of the new body number more than 800, including manufacturers of virtually all automotive products except complete vehicles, and wholesalers of the various equipment lines.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

	Oct. 2, 1928
Metals—New York	
Copper electrolytic, cents per lb	15.025
Copper wire, cents per lb	17.125
Lead, cents per lb	6.5
Zinc, cents per lb	6.60
Tin, Straits, cents per lb	49.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.40
Somerset mine run, f.o.b. mines, net tons	1.90
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.50
Central, Ill., screenings, Chicago, net tons	1.175
Kansas screenings, Kansas City, net tons	1.75
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.3
Weatherproof wire base, N.Y., cents per lb.	17.625
Cement, Chicago net prices, without bags	2.50
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.4
White lead in oil (100-lb. keg), N. Y., cents per lb	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.585

M. L. Heminway, general manager of the Motor and Accessory Manufacturers' Association for approximately ten years, is managing director of the new association. B. W. Ruark commissioner of the Automotive Equipment Association, is assistant managing director.

Detroit Rejects Car Bids

The bids of five companies on 100 new street cars for the Detroit Street Railway, Detroit, Mich., were turned down by the commission. The commission then ordered Joseph E. Mills, commissioner of purchases and supplies, to readvertise for bids.

Illinois Terminal Railroad Improvements

The Illinois Terminal Railroad System, Springfield, Ill., is building a large freight car repair yard along its lines 4 miles south of Edwardsville, Ill., where damaged freight cars will be rebuilt. This company is also completing a 14-mile extension from Troy Junction to a point near O'Fallon, Ill. Company officials are also considering extending the line southward to East Carondelet, Ill.

TRADE NOTES

Ideal Commutator Dresser Company, Sycamore, Ill., is now represented in the New England territory by Albert E. Mace Company, Inc., 93-97 Heath St., Boston, Mass., for the sale of ideal commutator and motor maintenance products.

International Oxygen Company, Newark, N. J., has taken over the business of the Tariffville Oxygen & Chemical Company, Tariffville, Conn. This plant will be conducted by the newly formed Tariffville Oxygen Company as the New England division of the International Oxygen Company.

Bassic Manufacturing Company, 2650 North Crawford Avenue, Chicago, Ill., has changed its name to Alemite Manufacturing Corporation. The address remains the same.

Linde Air Products Company, New York, N. Y., has opened a new plant in Akron, Ohio, to produce oxygen. This plant will be operated under the direction of A. Deagon, superintendent.

Atlas Conveyor Company, Philadelphia, Pa., announces that A. J. Forschner, who joined the company in July as vice-president, has also taken over the duties of secretary for the company. E. A. Thumlert, formerly employed in this capacity, is no longer connected with the company.

Ralph K. Weber was elected president of the Mount Vernon Car Manufacturing Company, Mount Vernon, Ill., Sept. 24. He succeeds W. C. Arthurs, deceased. Mr. Weber had been vice-president of the company for twenty years and has a wide acquaintance among railroad executives throughout the country.

Lincoln Electric Company, Cleveland, Ohio, announces the opening of a San Francisco office at 533 Market Street in charge of W. S. Stewart. L. P. Henderson, formerly of the Chicago office, has been transferred and put in charge of the Minneapolis district. Robert Notvest has been transferred from Kansas City to Indianapolis where he will have charge of the Indianapolis district, and R. E. Mason has been sent to Kansas City. N. L. Nye has been stationed at Akron, Ohio, under the direction of R. P. Tarbell, manager of the Cleveland district.

P. A. Terrell, formerly manager of the new industries division of the Mississippi Power Company, has taken charge of central stations and railroad sales for the Copperweld Steel Company, Chicago, Ill. Mr. Terrell's appointment brings to the states of Tennessee, Mississippi, Alabama, Georgia and Florida the Copperweld engineering service on such problems as sag, tension, etc.

ADVERTISING LITERATURE

Nichols-Lintern Company, Cleveland, Ohio, has recently issued a 40-page booklet containing a complete description of the 22 types of N-L universal signal lanterns, together with lantern flasher controls and reflector units for steel mill, factory and highway use. The booklet also contains a detailed description of the lintern electro-magnetic sander for overhead cranes, and N-L mechanical sanders for locomotive cranes.

General Electric Company, Schenectady, N. Y., has issued bulletin GEA-990 descriptive of type E Form L emergency valve for straight air brake equipment with emergency feature. Aside from a description the bulletin contains several cross-section drawings.

Transportation Association Offers Many Definite Service Improvements

IF ONE thing more than another stood out through the sessions of the American Electric Railway Transportation and Traffic Association it was the opinion of all who attended of the need for speed, comfort and safety in the betterment of service. The reiteration of that need took precedence over all other subjects. Not for one moment, however, was sight lost of the fact that the necessary element in procuring this result is the creation of the proper spirit on the part of every employee. Since practically all committee reports and discussions at the convention centered on these three factors in improved service, many valuable ideas were brought out.

Common sense seems to be asserting itself in the consideration of traffic relief measures. There the trend is toward more practicable and reasonable methods. Transportation men can be charged with fostering the idea of the elimination and regulation of parking, the encouragement of commercial loading spaces and the establishment of adequate by-pass routes, but it was especially significant that the impracticable advocate of three-deck streets, moving sidewalks and other out-of-the-question relief measures did not expose himself to the withering shell fire of the man who inquires into these things on the basis of both their expediency and their cost. Of course, speed with safety can be secured easily if the element of cost can be ignored entirely, but since it can not, the opinion of the majority was that the greatest factor opposed to speed in congested districts is the parking of automobiles, fostered by downtown merchants, who must be shown how parking really decreases their business and causes decentralization of shopping areas.

The report of the committee on service betterment, an excellent presentation, discussed freely, dealt principally with methods of saving time and increasing the speed of operation. Here indeed was a wealth of suggestions. There can be no question but that the sources of time saving are to be found in scientifically located passenger stops, increased frequency of service, better spacing methods, adequate traffic regulation, careful fare collection, superior equipment and instruction of trainmen, on all of which the report dwelt. Recommended for increasing the speed of cars were the elimination of unnecessary stops and the re-location of others, the skip-stop plan, the staggered skip-stop, the installation of loading zones, express street cars with local bus operation, express bus and local street car operation, the adoption of one-way streets, elimination of left turns and the restriction of heavy loading on congested streets to certain hours of day or night. Speed can be increased and time saved only as the possibilities of each and every one of these things are exhausted.

Though the report of the committee on service betterment evoked much interest, it was typical of the others, all of which represented much hard work and study. The Transportation and Traffic Association is to be commended for the progress it has made during a period when congestion and accident hazards have increased enormously. It is to be hoped that many managers will adopt for their systems the practices recommended, since these improvements are all within the range of minor modifications in methods involving relatively little capital outlay. Only in so far as these suggestions are generally applied will the excellent work of the Transportation and Traffic Association during the past year prove not to have been in vain.

A Good Example is the Best Sermon

FOR the past six years the Coffin prize has been the highest honor each year, the *magna cum laude,* in the electric railway industry. The selection is limited, it is true, to those companies which enter the contest and submit specified data from which relative performance can be judged, but this does not detract in any way from the importance of the award. Such limitation is necessary in every contest for which a prize is offered, and the number of contestants for the Coffin award each year has been sufficient to make the competition a very real one.

The obvious purpose of any such award is twofold. One is to give proper recognition to distinguished merit and services in the field. The other is to encourage other properties to make similar effort toward excellence. Both results have followed in the electric railway field, where the effect has been notably wholesome. It has helped many companies struggling with adverse conditions to realize that success is possible, even on small properties. It has shown them concretely what practices to follow, and it has silenced the croakers and crêpe-hangers, who see nothing ahead for street railways but lingering death and disaster. There is still another benefit from such a contest not often emphasized or even realized, yet it is none the less real. Every contestant participates in it, whether he wins the prize or not. This is the benefit gained by any organization which puts itself through a self-examination as to the results of its own work. If such an analysis is at all thorough, it is bound to disclose the weak as well as the strong points in the undertaking and so result in higher efficiency. It is notable in this connection that since 1923 when the first prize was offered two of the winners have been Stone & Webster companies, indicating that this organization, at least, thinks participation in the contest worth while.

The story of the Virginia Electric & Power Company, the winner this year, is particularly interesting because it operates in four cities of less than 200,000 population, that is to say, it belongs to a class of which there are a great many in this country. It is also worthy of note that the company has no hard and fast rules to apply to all

Digitized by Google

of its four properties. As well might a doctor prescribe the same medicine to all his patients. In the Virginia case, the operating methods, fares, etc., vary to a considerable extent with the local conditions in each city. All of these points, with the practice employed, are set forth briefly in articles in last week's and this issue, with two more articles to follow.

A feature of these accounts is the graphical analyses with which several are accompanied. These graphs permit the high points in the story of the company for the last four or five years to be read at a glance. For companies in cities of about the size of Richmond, Norfolk, Portsmouth and Petersburg, these articles should prove very helpful. As an old proverb says: "A good example is the best sermon." With this example, other companies, similarly situated, need not despair of ultimate success.

Speed—Without Sacrifice of Safety

EXCELLENT progress has been made toward increasing the safety of the street car as a means of transportation, but little has been done toward increasing the speed of the cars, even though this is one of the most important objectives in any program of service betterment. It may seem to some that the one result must necessarily have been attained at the expense of the other. Where schedule speeds have not been reduced it may be held that much has been gained through the elimination of parking and better regulation of street traffic, thus offsetting a studied overcaution which has set up a mental barrier against faster movement.

Schedule speeds of street cars and other vehicles as well are governed by three distinct factors: maximum speed that can be attained, rates of acceleration and retardation, and standing time. The first two of these factors are to some extent inherent in the design of the vehicle, while the third is largely under the control of the operator and of the traffic signals. However, it is possible to do much toward elimination of waste time with no increase whatever in the accident hazard. Then, too, many operators do not get the most that they can out of the mechanical equipment which they are controlling, even though at the moment there is no possibility of danger. Neither acceleration nor retardation in the average city is as fast as that for which the devices involved were designed.

Before much can be done toward an improvement in speed the car operators must be assured that their mechanical equipment will function as it should. Even though not of the latest pattern, the devices should be maintained to a standard worthy of the confidence of the men. The operator is entitled to know that brakes are so effective that they will stop the car within the prescribed distance, that switches will remain placed when once set, that block signals are dependable and that sanding devices will function. With his mind assured on such points he will feel able to take advantage of every possible opportunity to move his car over the road, and have the assurance that it can be done without subordinating the accepted precepts of careful operation. Besides this, the operator should have the advantage of careful training so that he will know whether or not he is taking full advantage of the possibilities for saving every second and utilizing every break in traffic to move his car.

Thus the responsibility for higher speed comes back to the management in practically every instance. It does little good to preach about the need for faster service if the individual is not told as to how he can obtain it. This requires organization such that not only will the equipment of the system be in mechanically good condition, but such that the supervisory forces and the men will have the spirit and the will to do what is necessary to move the cars on a fast schedule without sacrifice of safety.

Streets Were Made for Moving Traffic

IN URGING the enactment and then the enforcement of the parking ordinance before the City Council of Philadelphia, the *Ledger* says that it is too much to hope that any lasting remedy for the parking evil will come through voluntary action. This is also the opinion of Mayor Mackey, who insists that the ordinance shall be passed. Advocates of the measure show no disposition not to give full credit for the effect which the parking areas established by the Philadelphia Rapid Transit Company and others outside of the business district have exerted as a measure of relief, but they are convinced that such arrangements alone will not bring about a solution of the problem.

It would seem that congestion must in the end be self-correcting, but while this idea is good as a theory, it does not work out practically, since the traffic jams of the private vehicles inflict their penalties alike on the private user and the user of the public transportation service who in the aggregate has rights paramount to those of the individual.

One of the things advocated at Cleveland as an end toward the solution of the problem, namely, co-ordination of public transportation agencies, has been carried out on a scale probably more nearly complete in Philadelphia than in any other city in the United States, yet that alone is not the answer. There the local railway management has played its part and played it well by co-operating in the effort to reduce congestion, particularly by so distributing the taxis which it operates as to reduce to a minimum the number of cruising vehicles. But any good that might have come out of such efforts has been negatived since the street space so saved has been quickly appropriated by others.

Not because railway men made the statements, but because they are sound, the note of warning contained in the report of the committee on service betterment presented at Cleveland is of great interest in this connection. Streets were made for moving traffic. Their use for storage purposes should be allowed only when such use does not interfere with traffic. These things are irrefutable. Their acknowledgment is merely a matter of time, irrespective of any question of political or personal expediency.

The entering wedge in the restriction of the private car to the purpose for which it was originally intended has been most effectively driven. At this stage of the matter, however, it may seem like fustian to say so, but it is only a question of time when adequate relief will be secured by legislation, which, among other things, will eliminate parking on heavily-travelled streets during the peak traffic movement and undoubtedly prohibit parking entirely throughout the day on the busiest thoroughfares. Of course the millenium in traffic regulation is not at hand, nor is it likely soon to dawn, but the notable work in this direction already done in Chicago, Philadelphia and other cities and the instance presented in the case of Mayor Mackey do hold out hopes that rapid progress toward congestion relief may be expected in the near future.

Training Essential to Teamwork

TRAINMEN, mindful of the possibilities of their jobs, alert to the industry's necessities, and willing and able to co-operate with the management, represent the greatest operating asset that any electric railway can possess. With the advent of the automobile, there has come about a greater appreciation of the importance of the part played by the individual trainman in his relations with those who use public transportation service. He not only must be courteous, but he also must give efficient and reliable service, obtain the greatest possible speed and be ever alert to prevent accidents. He is also the direct representative of the company and in this capacity wields a powerful influence upon the attitude of passengers toward the railway. Unquestionably, the platform man has the biggest opportunity of any other member of the company in improving the attitude of the public toward the railway.

Contact between employees and customers affords the best medium for disseminating information to the public and, likewise, the most logical way of receiving complaints and suggestions from patrons. Unsatisfactory public relations are most always caused by neglecting to give the public information to which it is entitled. Although newspaper advertisements, car cards and other publicity means are effective and necessary, the man on the platform offers the best medium of approach because personal contact is the most powerful of all factors for influencing opinion.

A proper mental attitude on the part of the employee himself is recognized as the first requirement in developing satisfactory relations with the public. To achieve this, the employee should be acquainted with all facts about his company. He should be drilled in the proper methods of handling various situations that arise on a car platform and should be brought to understand that a friendly public improves the conditions under which he works and helps to make his job more desirable. Thus, in the increased attention that is being given today to the question of employee-customer contact there is the promise not only of improving the situation of the company, but of raising the standards and bettering the working conditions of the man himself.

Brady Safety Contest Extended

IF SAFETY were merely a preachment among the electric railways the excuse for their seeming indifference to the Brady safety contest would not be far to seek. But safety is not merely a preachment among the companies. Its intensive practice is a fact. Of this there is evidence on every hand, but particularly in the presentations of the Coffin award contestants. True, the Brady award was re-established only last year, but the disposition of the companies not to compete for the honors in larger numbers may be due more to their not having appraised the value of the award correctly than to any other reason. In this connection it should be remembered that the Brady award by its very nature does not impose the necessity for the preparation of any elaborate brief. The presentation is more a matter of the compilation of the record of accomplishments. The award ought to be highly coveted. Since the electric railways take first rank among the industries for their safety work it behooves them to spread their stories on the record. It is to be hoped that the mere reiteration of the fact that under the extension of time recently arranged they have until Nov. 1 to make their presentation will serve to bring in additional contestants. There is no company that can afford to regard lightly the prospect of its being successful in winning the Brady medal.

Buffalo Acts in Bad Faith Toward Its Railway

JUST as it is beginning to see the light of day, the International Railway, Buffalo, finds itself confronted with one of the worst cases of breach of faith on the part of city representatives that is on record. In the last few years stockholders have poured more than $4,000,000 into the property during a period in which car riders were carried at less than cost. Finally came a measure of fare relief, but meanwhile under an understanding with the city in the matter of street improvement the company accepted a huge burden as part of the whole plan to re-establish the railway on a sound basis. Briefly, this program called for the expenditure of $250,000 in reconstruction work during 1927, and a similar program to cost $375,000 in 1928. These amounts were in excess of the additional earnings of the company under the revised rate of three tokens for 25 cents, with a 10-cent cash fare, effective July 1, 1927.

It was never asked or expected that the company should spend all the additional revenue to be derived from the increased fare for reconstruction of tracks and paving, yet the company has devoted all that sum and more to that purpose. The streets in which this money was to be spent were selected co-operatively in a joint conference of city and company officials. Despite this, the Council ordered the commissioner of public works to sign contracts for additional paving at a cost of $102,000, to be collected from the railway. Including track reconstruction in the areas affected, the total cost of the work will be more than $300,000. The Council rejected the suggestion of the railway company that co-operation be continued.

Last August President Yungbluth issued a frank and business-like reminder of the fact that the company is financially unable to undertake any work in addition to the large amount being done this year, and that if the city continued to demand that the company pay for more work after all the work the railway can afford has been done, it was acting unfairly and the only course open to the company was to take immediate action to obtain the additional money required. This letter from the president was not intended as a refusal to do the additional work demanded by the city. Neither was it intended as a threat that the company would seek a higher fare. The company is prepared to do the additional work, but it cannot do it on the basis of its present revenues. There can be no question about that. In consequence the responsibility for the plea of the company for a straight 10-cent fare rests squarely upon the city. No other alternative was open to the company.

Since the city has insisted upon carrying out work not included in the original program, the cost of which would even have exceeded the return from rates as at present in force, the company has done well by its frank statement to fix the responsibility where it rightly belongs—on the city. It is to be hoped that a way out of the matter will be found, but if the city officials remain obdurate, then the people of Buffalo will have only their accredited political representatives to blame if they are called upon to shoulder the additional burden of an increase in fares.

The Gary Railways has proved the practicability of one-man car operation in peak-load service. At the time of changes of shift at the steel mills, the railway sometimes has to carry 15,000 passengers

New Equipment Increases Riding

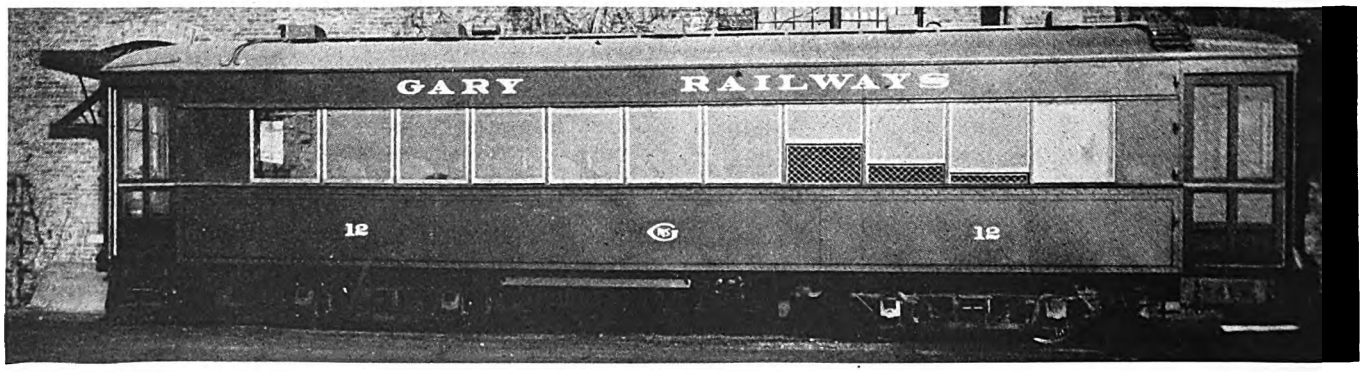
Gary Railways finds new cars and shorter headway bring increase in revenue. Adopts novel method of advertising the improvements in service introduced. Ingenious mechanical and electrical kinks

SINCE the present management of the Gary Railways has had charge of the property, or since 1918, there has been a continuous improvement in the type of rolling stock operated and a corresponding increase in the earnings of the company. This railway system now comprises 73 miles of street and interurban railway, with 22 miles of motor coach routes. The latter serve as feeders to the street and interurban railway lines. The principal city business done is in the city of Gary, Ind., with its population of 110,000 people. They are spread over an area equivalent to that of the city of Indianapolis but with only one-fourth of that city's population. Some particulars of the practice of the company, taken from its 1928 Coffin prize brief, follow:

During the five years from 1923 to 1927 the company expended $2,500,000 for physical improvements, additional equipment and extensions. It has now 100 per cent one-man operation, and these cars are found to be able to handle successfully peak loads of the severest intensity, such as occur in an industrial center as Gary. During the past five years the company has laid a great deal of track with steel ties, 90-lb. rails, concrete pavement and sub-structure and thermit-welded joints.

Largely because of these improvements, it has been able to reduce its operating expenses per car-mile during the past two years from 34.1 cent in 1925 to 29.8 cent in 1927. During the last three months of 1927 the operating cost was only 27.4 cent per car-mile. This figure was accomplished in spite of a wage schedule of 78 cents per hour, said to be exceeded by only two companies in the United States.

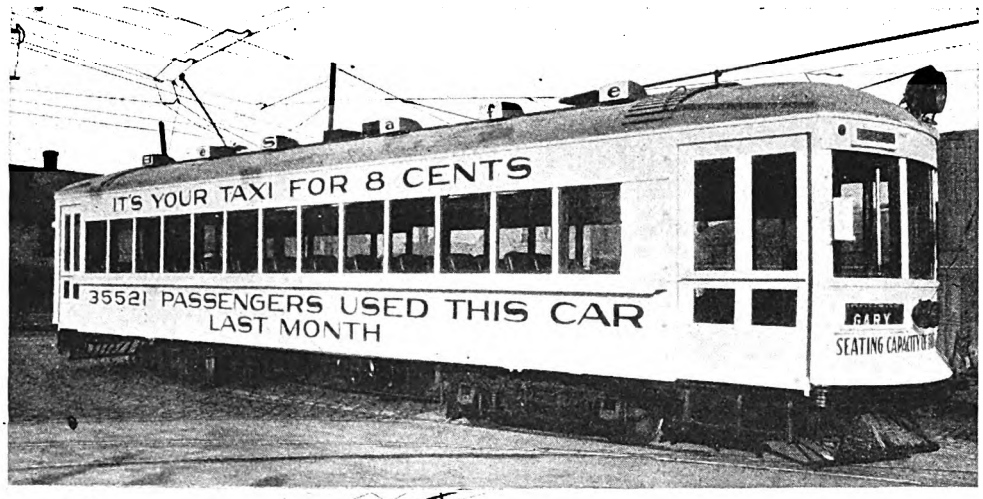
A conspicuous feature of the rehabilitation of the

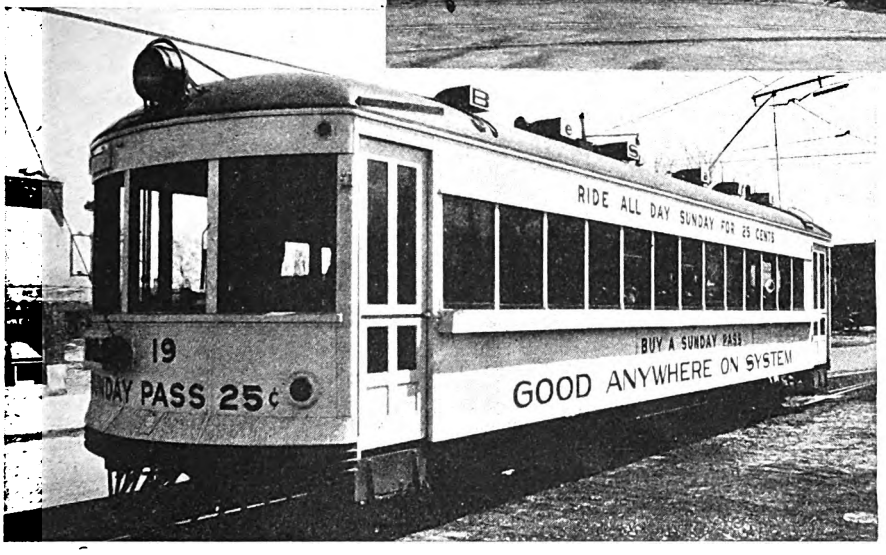


Features of these new one-man cars are the drop letterboards, low streamline construction and the attachment of a window screen to the bottom of the sash so that when the window is raised the screen is pulled into position

Digitized by Google

property has been in the rolling stock. Five new double-truck one-man cars were bought in July, 1926, seven in January, 1927, and eleven in July, 1927. In addition, sixteen old center-entrance cars were completely remodeled in the shops of the Cummings Car & Coach Company, making them, in the opinion of the management, almost the equal of new cars.





One car has been painted white and lettered to advertise the service. On such occasions it travels over all of the lines of the system. The car painted in two ways is shown in the accompanying views

Features of the 23 cars purchased in the past two years are their low streamline construction, upholstered seats, linoleum-covered floors, low steps and complete safety equipment. The exterior is painted the standard orange. The seats are individual, upholstered in genuine brown Spanish leather, and the floors are covered with green battleship linoleum.

All the new cars have the drop letterboard which provides a more rigid car frame and less window space to repair and replace. It also results in a car which can be more easily heated in winter, and it simplifies car washing.

Another interesting feature of these cars is a new type of screen which is attached to the bottom of the sash in such a way that when the window is raised this screen is pulled up into position. This improves the appearance of the car as it dispenses with window guards.

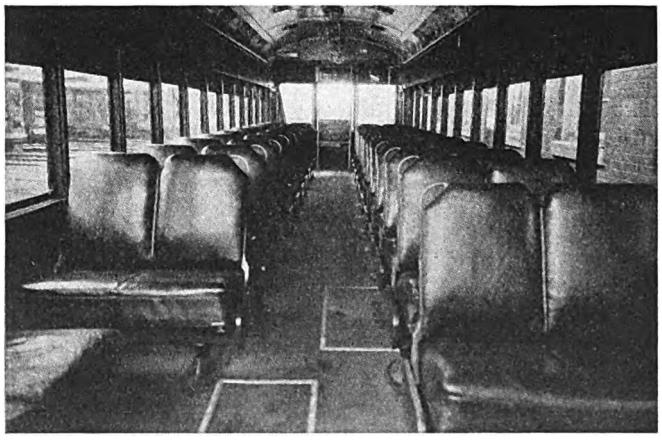
Another change made in the cars has been the removal of the whistles from all city cars. It was found by experience that automobilists on the track paid very little attention to the sound of a whistle, and so long as whistles were part of a car's equipment, the motorman used the gong but seldom. When the whistles were removed all gongs were placed in first-class condition, and a close check was made as to results. It was found that the trainmen were more alert and careful than before, and accidents were reduced.

While the subject of accident reduction is being mentioned, the explanation should be made that the company gives a vacation of five days with full pay to all trainmen who have served an entire year without an accident. Last year 70 per cent of the men enjoyed this reward. The percentage has been as high as 83. This vacation is in addition to one given to all employees who have been two or more years with the company. The length of this latter or service vacation is one-half day for every year of service.

The principal changes in the remodeled cars were to redesign them for one-man operation. This meant the removal of the existing folding center doors and the addition of six seats at the center, increasing the seating capacity of each car from 44 to 52. Passenger circulation was promoted by providing rear treadle exits and increased width of the entrance at the front end. The passenger's comfort was cared for with seating and fixtures similar to those on the new cars. If these entirely remodeled cars are considered to date from 1927, the average age of the 100 cars of the company is only 5½ years, as compared with an average age of 7.6 years for the 93 cars owned in 1925.

Mass Transportation Accomplished With One-Man Cars

Reference has been made to the success of the one-man cars in handling heavy peak loads. To adopt such a



In spite of the fact that Gary is a steel mill town, the seats are individual and upholstered in genuine brown Spanish leather, and the floors are covered with linoleum

Gary Railways gives the public the benefit of its weather observations daily, through one of the leading newspapers

step for a railway in an industrial city like Gary was a bold undertaking. During the shift changes at the steel mills, the railway is called upon to transport more than 15,000 workmen. This results in heavy car loading, the average per car being well over 100. The question naturally arose as to whether one-man operation would be too slow under such conditions. Actually, however, it was found that there is no appreciable difference in this respect between the two modes of operation.

Fortunately the company is in a position to testify as to the effect of new rolling stock and reduced headway on traffic. Reduced headway was possible because of the reduction in expenses following one-man operation. Changes in headway were made as follows:

Jan. 6, 1927—Hammond division	30 to 20 minutes
June 25, 1927—Broadway—45th Avenue	15 to 10 minutes
Nov. 25, 1927—Broadway—26th Avenue	5 to 3 minutes
Dec. 26, 1927—Ambridge division	10 to 5 minutes

No change was made in the headway of the cars on the Indian Harbor division.

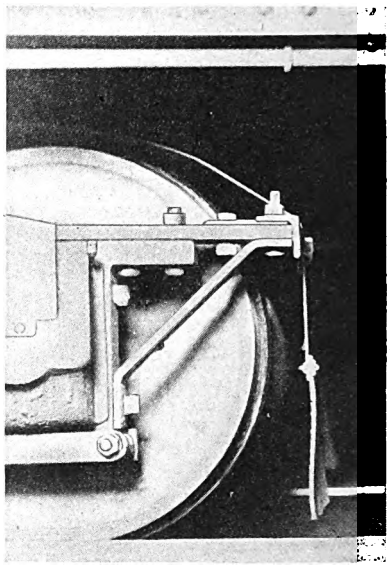
The combined results of reduced headway and new equipment on revenue are shown in the table on page 671.

Increasing and Improving the Service

Of course these results in increased patronage did not come about without some effort to call the attention of the public to the fact that modern cars were being placed in service on various routes. A program of newspaper publicity, both in the news columns and in the advertising columns, was carried out for several weeks preceding the arrival of the cars, as well as following their introduction to the service. During this campaign a car painted white with lettering on it was operated over various routes. One of the expressions used was: "35,325 people used this car last month. It is your taxi for 8 cents."

Since that time the car has been repainted and used to advertise other improvements made by the company, such as the introduction of the Sunday pass for 25 cents. The accompanying pictures of the car in each of these situations tell the story. On such occasions the car travels over all of the lines of the system. It will be retained as an advertising feature of the railway.

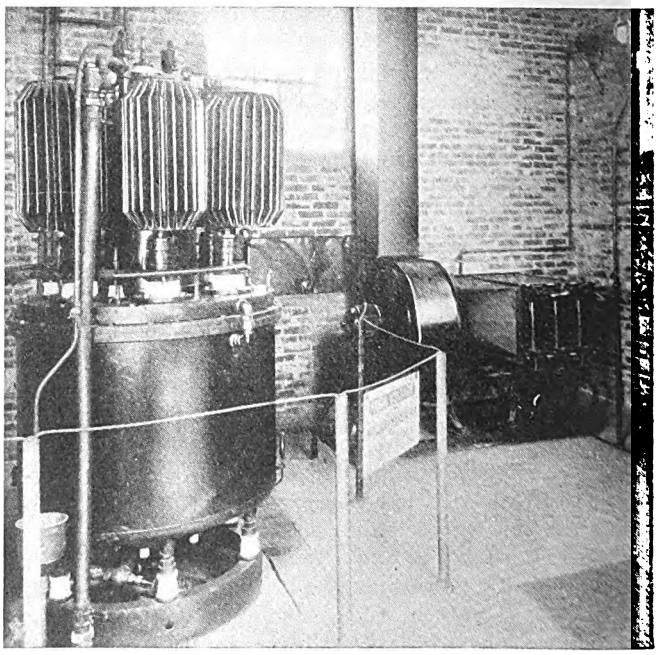
Another novel way by which the company's name and service are kept before the public is through its weather observations. The company, like many other electric railways keeps a regular record of barometer and thermometer readings from self-recording instruments, to help the operating department determine storms in advance. The management found that the newspapers were glad to have these figures and would publish them adjoining the space devoted to government weather bureau forecasts. In consequence, these data appear regularly in each issue of the *Post-Tribune,* with credit to the Gary Railways. A reproduction of a typical forecast is published on this page.



This shield is carried over and in front of the wheels to keep mud from being thrown on the resistance grids

Some time ago it was found that in spite of the usual square sheet-iron guard, which is fastened adjacent to the bank of resistance grids on the car body, dirt and wheel wash would be thrown on these grids. To overcome this trouble the master mechanic of the company developed a wheel guard very similar to an automobile mudguard. It is shown in the illustration above. It consists of a bent piece of light sheet iron, fastened to the car truck and conforming to the curvature of the wheel. It is mounted within 6 in. of the wheel itself. It acts as a very effective shield for mud and water thrown from the wheel.

During 1927 the company installed a 500-kw., 600-volt rectifier on its Gary-Valparaiso division. After this rectifier had been in service practically a month it developed serious trouble with electrolysis of the metal hose fittings of the water cooling system. To meet this situa-



A connection on the rectifier protects the hose connection from electrolysis

TABLE SHOWING REVENUE BEFORE AND AFTER INTRODUCING MODERN CARS AND SHORTER HEADWAYS, GARY RAILWAYS

Route	Type of Cars	Revenue	Car-Miles	Revenue per Car-Mile, Cents	Period
Broadway-26th Ave.	New	$9,057.28	22,872	39.6	21 days in December, 1927
Broadway-26th Ave.	Old	5,537.99	13,394	41.3	21 days in November, 1927
Broadway-26th Ave.	Old	8,353.74	17,367	48.0	21 days in December, 1926
Broadway-26th Ave.	Old	8,613.65	17,373	49.5	21 days in November, 1926
Ambridge	New	795.88	2,313	34.4	7 days, Dec. 16–22, 1927
Ambridge	Old	429.92	1,313	32.7	7 days, Dec. 9–15, 1927
Indian Harbor	New	2,972.96	9,954	29.9	14 days, Aug. 1–14, 1926
Indian Harbor	Old	2,663.65	9,954	26.8	14 days, July 1–14, 1926
Broadway-45th	New	55,841.69	103,500	54.0	90 days, June 25-Sept. 22, 1927
Broadway-45th	Old	53,516.89	91,371	58.6	90 days, March 25-June 24, 1927
Hammond	New	8,978.90	22,033	40.6	14 days, Jan. 9–22, 1927
Hammond	Old	8,335.59	15,632	53.0	14 days, Dec. 9–22, 1926

tion the superintendent of power stations devised and has applied for a patent for a device which overcomes the trouble. It consists of a small platinum wire suitably mounted and inserted through the hose a short distance from the fittings to be protected. An electrical connection from the fittings to the platinum, either with or without a small emf in series therewith, is so designed that it effectively transfers the flow of current from the fitting to the platinum and the cooling water.

Kansas City Modernizes Its Training Equipment

UPON the completion of the $6,600,000 rehabilitation program inaugurated in 1926 by the Kansas City Public Service Company it became necessary, among other things, to incorporate the features which have been added to the company's rolling stock into the instruction equipment in the training school. Prior to the rehabilitation the company had in service some ten or twelve types of cars with nearly as many types of control and it had been necessary to equip the instruction school accordingly. The cars are now of one general type and are equipped alike as to control and safety appliances. All have automatic air-control door engines, line switches, air governors, relays, sanders, thermostatic heat control, compressors, air reservoirs and brake cylinders. Controllers have been reduced to three types, HL, K-10 and K-35, which function alike for all practical purposes.
